Mr. MITCHELL. I am sure that they can be used especially in the line of coffee. We have in the service now several tea experts that used to be with coffee. In fact, at the port of New York and at the port of San Francisco at the present time we give the Bureau of Chemistry considerable help in identifying coffee.

The CHAIRMAN. Between the two of you, can you state positively that there will be an increase or decrease in expenditure?

Mr. MITCHELL. If we are allowed to swap over I can conscientiously say that after we get shaken down we will have a considerable saving.

Mr. McLAUGHLIN of Michigan. Please refer to the tea law.

Mr. HARRISON. The reference is given in the letter which I have handed to the chairman to be inserted in the record.

Mr. MITCHELL. We are having quite a lot of trouble getting examiners at the present salaries. Of course, every department tells you

that, but I have lost three examiners—three of my best tea examiners—in the last year and at the present time I am lacking at the port of New York, because I can not get a competent man to take a job at \$3,000, which is the highest salary we have.

Mr. McLAUGHLIN of Michigan. You might give a list of salaries, or give it offhand.

Mr. MITCHELL. Yes; I will insert it.
(The statement referred to follows:)

Salaries of Tea-Inspection Service.

1 supervising tea examiner.....	\$2, 750	4 samplers, at.....	\$1, 200
1 tea examiner.....	3, 000	1 sampler.....	1, 400
2 tea examiners, at.....	2, 500	1 clerk.....	1, 400
1 tea examiner.....	2, 000	1 clerk.....	1, 300
1 tea examiner.....	1, 800	1 messenger.....	900
2 tea examiners, at.....	1, 500	1 laborer.....	840
1 assistant tea examiner.....	1, 200	1 clerk to Board of Tea Ap- peals.....	1, 800
1 sampler.....	1, 350		

This does not include compensation for Board of Tea Appeals or board of tea experts or for occasional temporary assistance.

Then there is one other thing. This Board of Tea Experts that are appointed once a year fixes the Government standard. They are appointed by the Secretary of the Treasury. It is an honorary position; they get only \$50 a year salary and their traveling expenses, and the comptroller has recently ruled that they do not get their actual expenses. They have to come long distances; some of them come from the Pacific coast, and some from the Middle West, at the same rate as other Government employees, which is \$5 a day; and those men, who are much bigger than \$5-a-day men, have come here and served the Government in an honorary capacity for \$5 a day.

The CHAIRMAN. Are they employees of the Government?

Mr. MITCHELL. No; they are all merchants.

The CHAIRMAN. The same rule would apply in your bureau, Doctor?

Dr. ALSBERG. We do not have that kind of employee, Mr. Chairman. This is a board of experts specially provided for in this act.

The CHAIRMAN. Your board would be selected from your regular employees?

Dr. ALSBERG. We could not select these people from our regular employees.

Mr. MITCHELL. No, sir.

The CHAIRMAN. You would have to have the same board?

Dr. ALSBERG. Yes, sir.

The CHAIRMAN. That does not involve a change, then?

Mr. McLAUGHLIN of Michigan. Would this not be subject to a point of order—to make an appropriation under an agricultural bill to carry out an act having nothing to do with the Department of Agriculture?

Mr. MITCHELL. This Board of Tea Experts only meets once a year in the city of New York. They fix the Government standards; they fix the lowest quality of tea that can come into the country.

The CHAIRMAN. I am at a loss to know why there should be a change in expenditure if the same board is to be maintained.

Mr. MITCHELL. I believe if you decide to transfer this law you should give us a limit of \$45,000, because without that I believe we are going to lose a lot of our examiners. As I say, I lost three.

The CHAIRMAN. Did you say the highest salary was \$3,000?

Mr. MITCHELL. We pay the man at New York \$3,000. We have to pay that to get a man. My own salary is less than that.

The CHAIRMAN. What is your salary?

Mr. MITCHELL. My salary is \$2,750. It is a statutory position.

The CHAIRMAN. What is the lowest salary?

Mr. MITCHELL. It runs down to as low as \$1,600, which, I think, the man at St. Paul gets, and I estimate that the man at Honolulu should get about \$1,500.

There is one other point. The salary of the supervising tea examiner is included in this \$40,000, but that is on the statutory roll now. I have included it in here to make an estimate of the cost when it goes over to the Agricultural Department.

The CHAIRMAN. That salary is included in the \$40,700?

Mr. MITCHELL. Yes, sir; but it is now on the statutory roll. My idea is that it should go on a lump-sum appropriation.

The CHAIRMAN. I take it that the Treasury Department would drop that if the transfer was made?

Mr. MITCHELL. That is what it would do.

If there is any other thing about the administration of this matter that you do not understand the chief of the customs, who has charge of the administration of it and knows all about that phase of it, would be glad to come up here.

The CHAIRMAN. I do not think that is necessary.

Mr. MITCHELL. My work is exclusively the technical part of it.

The CHAIRMAN. Thank you, Mr. Mitchell. We will now recess until 2 o'clock.

(Thereupon, at 12.45 o'clock p. m., the committee took a recess until 2 o'clock p. m.)

MORNING SESSION.

WEDNESDAY, JANUARY 7, 1920.

BUREAU OF CHEMISTRY—Continued.

STATEMENT OF DR. CARL L. ALSBERG, CHIEF OF THE BUREAU OF CHEMISTRY, DEPARTMENT OF AGRICULTURE—Continued.

The committee met pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. The committee will come to order. Mr. Harrison, who do you desire to appear.

Mr. HARRISON. If agreeable to the committee, we will continue with the estimates of the Bureau of Chemistry, the consideration of which was suspended yesterday. The first item is No. 67, on page 146, "For investigating the character of the chemical and physical tests which are applied to American food products in foreign countries," etc.

Dr. ALSBERG. Item 67, page 146, Mr. Chairman, probably requires no comment. No change is proposed. The work under this item

consists in making analyses and furnishing official certificates to exporters of food or drug products to those countries, chiefly South American countries, which will not permit foreign products to enter unless they are accompanied by the official Government certificate from the country from which they are exported.

Mr. McLAUGHLIN of Michigan. Does the exporter pay the expense of making these examinations?

Dr. ALSBERG. Yes. Prior to some five or six years ago, when this item was inserted, the work was done without charge; but it seemed to us that the exporter ought to pay the cost, and at present he is charged, as nearly as we can estimate, the cost of making the examination and furnishing the shipping certificate. That money, of course, is covered into the Treasury and does not become available.

Mr. JONES. How much of this total appropriation was paid back by the exporter last year; do you know?

Dr. ALSBERG. It varies from \$400 to \$1,000 per annum; last year, owing to the fact that exports to South America were less, it was only \$400.

Mr. McLAUGHLIN of Michigan. At how many places, and what are they, where you maintain this inspection service?

Dr. ALSBERG. It is not an inspection service. It is more of an analytical service. That is to say, a sample is drawn from the proposed material and analyzed in the laboratory. It is done in any one of our branch laboratories, whichever one happens to be nearest to the main office of the exporter. The main work is done at those ports from which exports to South America go—that is, San Francisco, New Orleans, and New York. We do not maintain a separate force nor do we maintain a separate laboratory for that purpose. It is done in the regular laboratory by our regular force.

Mr. McLAUGHLIN of Michigan. It would look as though you did maintain a separate force with a chemist in charge at \$3,000 and a chemist in charge at \$2,760?

Dr. ALSBERG. Only a part of the time of these men is paid from this fund. That is a matter of bookkeeping. We, as I explained yesterday, maintain for our own purposes a sort of budget system, and this sum is prorated among the various laboratory budgets at the various places, according to the amount of this kind of work that the individual laboratory does. Of course, the \$3,000 covers the chemists who actually do the work and, of course, we only pay a small part of their salary from this particular fund. There are no special men who limit themselves to this kind of work. Obviously, we could not maintain much of a force on \$4,280; and also, obviously, there is not enough of this work to maintain a separate force.

Mr. McLAUGHLIN of Michigan. Then this \$3,000 is not paid to one chemist?

Dr. ALSBERG. A small part of his salary is paid out of this fund, that part being as near as we can estimate will correspond to the amount of time that he gives to this work.

Mr. JONES. Have you a fixed charge to be paid for the service?

Dr. ALSBERG. No, sir; because the service varies with the nature of the material. Sometimes the analysis is an intricate and difficult one which may take a couple of days of the chemist's time to do. Sometimes it is an analysis that can be carried out in an hour.

Mr. JONES. How do you figure the service; on what basis; by the hour or day?

Dr. ALSBERG. We figure it by the time it takes to perform the work.

Mr. McLAUGHLIN of Michigan. Do you make these charges with the idea that the total of them will meet the entire expense of the service?

Dr. ALSBERG. We have not been doing it exactly on that basis. We have been doing it on the basis of handling each individual analysis on what we estimate to be the cost of that individual analysis. We have not been making an effort to exactly get back from the exporters what is spent here because we can not foresee in any one year how much work there is going to be. Some years there is more and some years there is less. Also there is other work than the actual testing of samples for exporters done under this item. We investigate the character of the chemical and physical tests which are applied to American food products in foreign countries, and study methods of analysis as is authorized by the item.

Mr. JONES. For instance, if the chemists spend one day at it, what do you charge?

Dr. ALSBERG. We charge one day of his salary plus what we estimate to be a fair overhead charge. Of course, it is an estimate. Some years there is an excess in this appropriation, and some years there has not been.

Mr. JONES. So if their requests for reports would take up practically the entire time of your corps you would be reimbursed for the full amount plus a reasonable charge for overhead?

Dr. ALSBERG. Yes; but this corps is not occupied anywhere near their full time on that.

The CHAIRMAN. According to the estimates the salaries are \$3,600?

Dr. ALSBERG. Part time.

The CHAIRMAN. The part time is estimated at \$3,600, and in 1919 you expended \$3,313.34?

Dr. ALSBERG. Yes. We figure on that \$680 or \$700, or thereabouts, as the cost of material and overhead.

The CHAIRMAN. What is the next item?

Dr. ALSBERG. The next item is item 68, page 147:

For investigating the preparation for market, handling, grading, packing, freezing, drying, storing, transportation, and preservation of poultry and eggs, etc.

There is no change suggested in that item. I might use this particular item as an illustration of the conditions which arise under the present arrangement of lump-sum appropriations. The director of that particular line of work, Dr. Mary Pennington, resigned from the service this fall. She was drawing a salary of \$3,780 in the bureau. Her place was not filled by a new appointment at her old salary, but her chief understudy, who was getting a salary very much less than that, was advanced to take her place with a moderate promotion in salary, which brings his salary not anywhere near her salary. His salary is \$2,760 now. He was advanced to \$2,760 from \$2,520, and an additional young man at a low salary was appointed to move into his place.

By that method we are able to utilize the difference between the salary which Dr. Pennington received and the salary paid now for

the promotion of the work. Had we had a statutory position it would have been necessary to appoint a new man entirely at that particular salary, or advance Dr. Pennington's understudy to Dr. Pennington's full salary before it was fully demonstrated that he was going to be an ideal man for the place. Now, if he turns out to be the kind of a man that we anticipate he will be, he will ultimately get her salary. In the meanwhile he gets some promotion. Thus we have some flexibility.

The CHAIRMAN. Where the salary is fixed by the statutory roll, you hold that you have to pay the full salary and can not pay anything less?

Dr. ALSBERG. That would be the case unless in the next year's estimates the salary was reduced.

The CHAIRMAN. You are called upon to pay the full salary whether they are worth it or not?

Dr. ALSBERG. We could not do otherwise.

The CHAIRMAN. Do you do it?

Dr. ALSBERG. We could not do otherwise unless you changed the salary in the next appropriation bill.

The CHAIRMAN. Is there anything in the law compelling you to pay the full salary?

Dr. ALSBERG. Either that or leave the place vacant.

The CHAIRMAN. For instance, if the salary is \$3,500, you are compelled to pay the full \$3,500?

Dr. ALSBERG. As far as I know, the law is very clear on that point. We would either have to create a new position on the lump fund at a lesser salary, or else fill the \$3,500 place, or else leave the place vacant and have the money revert into the Treasury. I think there is no other alternative. If there were no lump fund, of course, no position at a less salary could be created.

The CHAIRMAN. That is the law?

Dr. ALSBERG. As I understand it, I am right on that.

The CHAIRMAN. If that is the law, and that is the way you construe it, it can be easily fixed. We could make it read "not to exceed" that amount. That should be written in the law if the practice is as you state.

Dr. ALSBERG. It is like this, Mr. Chairman. Suppose we had under this appropriation a statutory position, say of \$4,000. We would either have to fill that position at \$4,000 or leave it vacant. I do not see any alternative.

The CHAIRMAN. Why would you have to fill it? Why would you have to pay the salary?

Dr. ALSBERG. Because that salary is fixed by law and the only way you could appoint a man at a less salary is by creating a new position on the lump fund at a less salary.

The CHAIRMAN. Then we should insert the words "not to exceed."

Dr. ALSBERG. Might I point out also this phase of the situation? Dr. Pennington's understudy was getting \$2,520.

The CHAIRMAN. Mr. Harrison, what is the law on that?

Mr. HARRISON. We can fill a statutory vacancy only at the salary provided.

The CHAIRMAN. It is so construed; who passed upon it?

Mr. HARRISON. So far as I know, no one has rendered a specific opinion on the matter.

The CHAIRMAN. It is based upon the law?

Mr. HARRISON. It is the law itself.

The CHAIRMAN. Can you refer us to that law?

Mr. HARRISON. If, for instance, Congress provided a place at \$4,000, the man who occupies it must receive that amount. That is the law itself. Congress fixes the compensation of Members of Congress at \$7,500. No one has any authority to pay them a smaller amount. The amount is fixed by law.

Dr. ALSBERG. Might I, in that connection, point out in this specific instance the way it works out? This man, Dr. Pennington's understudy, got a salary of \$2,520 when Dr. Pennington was in charge. He was put in charge of the work when she resigned and in recognition of that was advanced to the salary of \$2,760. He knows that he is on trial in that place, that if he does good work of high grade he may under existing conditions look forward to being promoted as he deserves it from time to time; to, at least Dr. Pennington's salary, and possibly, if he turns out better than Dr. Pennington, to a salary limit which is fixed by you gentlemen at \$4,500. That is a tremendous spur and stimulus to that particular man to do his best. If the salary is fixed, if it is \$2,760 on a statutory roll, he is at the end of his future in the department unless the salary is changed and a new statutory position created at the higher salary. That is the way the psychology of it works out for the individual. I thought I would like to illustrate in this specific instance just exactly how not having a statutory position works out. We appoint a young man at a lower salary very frequently.

The CHAIRMAN. How many on the statutory roll are overpaid? They are finding fault with the statutory roll. You say you are compelled to pay them the full amount.

Dr. ALSBERG. Our scientific staff is not on the statutory roll. Only clerks, inspectors, laborers, etc., are on that roll. I do not think at the present time the positions are overpaid, on account of the change in the general cost of living. I do believe that four or five years ago the minor positions on the statutory roll, which in our bureau are all clerical positions, were in a considerable number of instances overpaid. I mean to say that five or six years ago we were paying in many instances more than the market rate for stenographers and clerks. Those are the only kinds of statutory positions we have in the bureau except my own and that of inspectors and laborers. At the present time, with readjustment going on, I do not think anybody is being overpaid on the statutory roll, but I do believe that throughout the Government service five or six years ago the minor positions on the statutory rolls, which are of a clerical type, and those are the only statutory places we have, were in a number of instances overpaid. Miss Pennington's place was not on the statutory roll. I am using it as an illustration. If she had been on the statutory roll I would have had to fill it at the full salary. I give this illustration to show what would happen.

Mr. TINCHER. You are saving \$1,000 a year on the salary of the man who is now doing her work?

Dr. ALSBERG. If he makes good, he will ultimately get to her salary. If he does not make good, we have saved money.

The CHAIRMAN. Would inserting the words "not to exceed" overcome it?

Dr. ALSBERG. Yes, sir; so far as this particular difficulty is concerned, but there are other objections to an inflexible statutory roll which would not be overcome, and that, in effect, is what you gentlemen have already done. You have fixed a limit of \$4,500 in every lump-sum salary in the Department of Agriculture, and neither the Secretary nor the President himself has authority or power at this moment to pay anybody on a lump fund in the Department of Agriculture, no matter what his position may be, over \$4,500.

The CHAIRMAN. I am not talking about salaries fixed here, but statutory salaries.

Dr. ALSBERG. Yes.

The CHAIRMAN. My understanding was that when you found a man that should be demoted you demoted him to a lower salary. It has always been the contention in this committee that that matter could not be taken care of. It seems to me that you now contend that there is an injustice to the Government, so that the Government is compelled to pay a salary which the employee does not deserve.

Dr. ALSBERG. I think that would be a very frequent result of putting the scientific and technical men on the statutory roll.

The CHAIRMAN. Then we should insert the words "not to exceed."

Dr. ALSBERG. That would avoid that very difficulty, Mr. Chairman. You gentlemen perhaps do not realize that the average salary of the scientific staff paid under the lump-sum fund in the Bureau of Chemistry, averaging them all, is \$2,000, which, I think, is the most direct answer that I can give to the question of the payment of excessive salaries. If our average is \$2,000 for technical men who have been through college, many of them having degrees of doctor of philosophy, I think you will have to admit that under present conditions there can not be much abuse in taking advantage of our paying people on the lump-sum fund.

Mr. HARRISON. There are over 15,000 employees in the department who receive less than \$2,740.

Dr. ALSBERG. Our chemists have all been through college and had a technical education and many of them a Ph. D. for graduate work before they came to us. Our average salary on the lump-sum fund is \$2,000.

The CHAIRMAN. When will the Reclassification Commission make a report?

Mr. HARRISON. I understand that it is expected to submit its report by the 12th of March. It was originally contemplated that the report would be in the hands of Congress by the first week of January, but the date has recently been changed to March 12.

The CHAIRMAN. Have you any report from them?

Mr. HARRISON. I understand the commission has stated definitely that it will submit its report by that time.

Dr. ALSBERG. I might say in that connection, Mr. Chairman, that it was stated to me that the commission could make some kind of a report right now, but it was not a report with which they were completely satisfied.

The CHAIRMAN. For the information of the committee, will you state exactly what that board did?

Dr. ALSBERG. They made a very thorough investigation of the Bureau of Chemistry. As a matter of fact, they asked that a man from the Bureau of Chemistry be detailed to assist them. Prof. Johns, of the Bureau of Chemistry, has been working with the commission and spending all his time with the commission from early in the summer—along in June, I think it was—until the present time. In addition to having charge of one of the laboratories, he is what might be called the bureau's personnel officer. I mean he handles the appointments of scientists and all that sort of thing for me; so he was the man best qualified for that particular work. He has secured for the commission a statement concerning the nature of the work of every employee of the Bureau of Chemistry in Washington. He has tabulated them on cards, the salary they get, when they were appointed, nature of their work, quality of their work, and what that work would correspond to in industrial or commercial life. I mean what rank such a man would hold in an industrial corporation.

These cards have been classified and arranged by the commission and studied by them and grouped in proper groups with other cards for similar employees in other services so that the commission can establish a series of classes and can group these various individual employees in the Government service. An exceedingly thorough study of what is going on in the Bureau of Chemistry has been made, and I assume the same thing has been done in other bureaus. Of course, their plan is to group the positions. They have classified positions rather than individuals. They classify the position in definite classes, and, having established the definite classes, they plan to make definite recommendations to Congress as to what is a proper salary scale for the positions in each individual group. I think that they have done a tremendous lot of very thorough work.

The CHAIRMAN. Upon what information do they base their estimates?

Dr. ALSBERG. On the salaries paid.

The CHAIRMAN. Where does the man that represents your bureau get his information? Do you make a comparison with salaries in the department and outside?

Dr. ALSBERG. He did not do that, but the commission sent around men to do it. They sent them to the leading universities and manufacturing establishments and conferred with the presidents and managers to learn the salary scale being paid there. They sent their men to the leading chemical industrial plants. For instance, they sent them to the Du Pont company to get the salaries paid there. They sent them to the General Electric Co., in Schenectady, to confer with such men as Steirmetz and Whitney, and learn what salary scale was being paid there. They sent them to the National Aniline Works, in Buffalo, to learn what salaries were being paid there. This material was laid before the commission.

The CHAIRMAN. But they were department people—Government people—all of them. Did they employ experts of their own?

Dr. ALSBERG. Yes. The commission has employed, as I understand it, the firm of Arthur Young & Co., of Chicago, efficiency engineers, or organization engineers, who, I am told, have been advising great

corporations on the matter of hiring and firing, to use the ordinary parlance of the industries. This firm has done an exactly similar job for the Canadian Government. They have classified for the civil-service commissioner of the Canadian Government—they have a commissioner there instead of a commission—the civil-service of Canada and turned in a report to the Canadian Government and to Parliament. They did that this fall. I have not heard whether their report and their recommendations to the Canadian Government have been adopted or not.

This firm working under instructions for the commission has brought in some of its own investigators, men who are absolutely unconnected with the Government, who, as far as we know, have never been connected with any government, State, city, or Federal. My understanding is that this group of men who were sent out to investigate current rates of pay in the universities and research institutions of the country like the Rockefeller Institute and the Carnegie Institute, and corporations like the General Electric and the Du Pont Co. were working under the direction of the employees of the commission. The commission also sent letters direct to many commercial concerns asking for similar information. They have secured much data bearing on the matter.

Having the scale of pay in the industries and universities for jobs of a certain type, and having the specifications for the jobs in the Government service, they can compare them.

Mr. HUTCHINSON. Do you mean to say they are going to fix a statutory roll on those lines during war times?

Dr. ALSBERG. I do not know what they are going to do. I only know to a certain extent what kind of investigations they have made. What they are going to recommend is known only to the members of the commission.

Mr. HUTCHINSON. You know that the chemical firms you name will pay any salaries?

Dr. ALSBERG. These chemical firms will pay any price for a star. They will not pay any price for the average man. This is true of business anywhere. If you are looking for a president of a large corporation, looking for a star, you will pay anything to get the particular man you want.

Mr. HUTCHINSON. Just in these particular war times they did not consider wages. They paid anything to get the man.

Dr. ALSBERG. Yes.

The CHAIRMAN. Especially when there was 10 per cent plus.

Dr. ALSBERG. Yes.

The CHAIRMAN. At any rate, the investigation was made by disinterested parties?

Dr. ALSBERG. It was made under the direction of disinterested parties. Some of the facts regarding salary were collected, I believe, by Government employees who worked under the direction of the commission. Much of the information was collected by correspondence conducted by the commission.

Mr. HUTCHINSON. How did Young & Co. get into it? Were they recommended by Government employees?

Dr. ALSBERG. The Government employees had nothing to do with it.

Mr. HUTCHINSON. How did Young & Co. get into it? They did not do this thing for nothing.

Dr. ALSBERG. They were employed by the commission. They were induced to go into it by the commission, whether on the basis of employment or voluntarily, or what the arrangement between the Government and Arthur Young & Co. was, I have not the least idea, or who suggested Arthur Young & Co. I have not the least idea. I imagine the commission looked around to see what had been done in this direction and discovered that Arthur Young & Co. had been retained by the Canadian Government.

The CHAIRMAN. Has that firm been employed by the Government before? Has some of that work been done heretofore?

Dr. ALSBERG. I do not know. I never heard of Arthur Young & Co. until this fall, when I was told that they were working for this joint commission. I know nothing about the firm of Arthur Young & Co., except what I have heard in this very indirect way. Then, of course, when I heard about them I got the report which they made to the Canadian Government because I was interested in seeing what they had done.

Mr. ANDERSON. It is supposed that when this report is finally perfected it will resolve all doubts with regard to every question of departmental operation with respect to the payment of Government employees, and after that everything will be easy.

Dr. ALSBERG. I should hope that that would happen.

Mr. ANDERSON. The thing will just right itself after that.

The CHAIRMAN. What provisions are to be made for the promotion and demotion of clerks on merit under this plan?

Dr. ALSBERG. Mr. Chairman, the joint commission asked me to serve on a committee, an advisory committee on employment policy. I represented a minority of one on that committee. I did not agree with the majority, and I do not now agree with the recommendations that were made by the advisory committee. I do not know whether the commission is going to adopt the recommendations of the majority or minority. I made a minority report. I do not know what they are going to recommend, I do not feel quite at liberty to say what the recommendations of this advisory committee might be. In the first place I do not agree with it, I might misrepresent it, and in the second place it was made to the commission, and I do not know that the commission is going to accept it. I do not know what they are going to do. But they are proposing to provide machinery for promotion or demotion to do away with all confusion.

The CHAIRMAN. But merit is to be given consideration?

Dr. ALSBERG. Merit is to be the whole thing. We differ, this advisory committee and I, as to how merit shall be established. I was a minority of one on this advisory committee. I do not know anything about what the commission is going to do.

Is there anything further on item 68?

The CHAIRMAN. I think you had better say something about what has been done and what you contemplate doing. It is an old item and one that has created a great deal of interest.

Dr. ALSBERG. There have been interesting features in connection with this item. One feature deals with the prevention of the breakage of eggs when they are shipped in interstate commerce, as a matter of conservation. You may recall that some years ago I reported

the results of an investigation to determine what was responsible for the tremendous breakage of eggs coming to eastern points from the egg-producing sections in the Middle West. We were able to show that of the main causes was unsatisfactory practices in the packing of eggs and in the stowing of egg crates in the car. The methods of doing it had not been standardized. Everybody was doing it a different way, and a great many ways of doing it were very bad, so that a tremendous quantity of breakage resulted. We were able to undertake educational work, which brought a great diminution in the amount of breakage. This educational work diminished the breakage in the metropolitan district of New York to a small fraction, as judged by claims which are made, of what it had been.

The CHAIRMAN. How was the difficulty removed?

Dr. ALSBERG. By recommending a standard egg package and standard methods of stowing eggs in crates in the cars and making demonstrations among the big egg handlers and big egg centers in showing people how to handle eggs.

The CHAIRMAN. By a change in the construction of the package?

Dr. ALSBERG. Not a change in the construction of the package but the universal adoption of one type of package, which was at that time not universally used; also by emphasizing the importance of having the fillers that come in egg cases made of a certain quality of paper stock, and, further, by education on the danger of using fillers a second time. If you use them more than once, the second time they are no good. Just here we have had an interesting development in that direction in that we have been able because the Government has control of the railroads to cooperate with the Railroad Administration. The Railroad Administration sent to us a group of men from its freight department, who were trained and instructed by our people in these methods of preparing and handling eggs. Then whenever an egg car arrives at its destination in bad order one of these men was sent by that particular railroad to the shipper to visit with him and watch him ship a car of eggs and to explain to him that he was not doing it right. Of course, we do not pay these men's salaries, as they were railroad employees. In that way we have been able, acting through the Railroad Administration, to get before the individual shipper that we had never been able to reach before these methods. We have been able to eliminate damage and loss of eggs from breakage to a very considerable extent. Because of the Government control of the railroads we were able to cooperate with the employees of the railroads in a way that we would hardly have been able to do under the old conditions.

The CHAIRMAN. The remedy, then, was in using a proper filler of uniform size?

Dr. ALSBERG. Yes, and the work has been largely educational and demonstration work. Another thing we have been able to do in this connection is to increase the number of small egg cooling and chilling plants in the producing section. We have worked out, as I have reported in the past, the best methods of slaughtering and packing poultry, chilling it and eggs and egg products. Following that, we saw the need of the establishment of small local chilling plants so that the eggs could be chilled and shipped under conditions in which they would arrive without much spoilage at the terminal points. It seemed to us that this was tremendously important if the egg indus-

try and poultry industry were not to fall into the hands of a few large people. So we have designed, as I think reported in a previous year, a small poultry chilling plant, which is chilling with ice, and also one slightly larger, which is chilled by refrigerating machinery, the establishment of which will cost on a prewar basis—I have not the figures on the present basis—it will cost for the ice plant less than \$1,000 additional equipment and for the machinery plant something around \$7,000 or \$8,000, which will take care of anywhere from a carload to several carloads of poultry and eggs a week. We have been giving assistance to small men all over the production section in equipping and in the establishment of such plants. A large portion of the time of our force is spent in explaining to these people just how to operate and helping them to get started, the idea being that a logical thing to do is to get your poultry and your eggs in shape, so that they will keep before being shipped. It will then arrive without spoilage and without loss and enable these small men to compete successfully with the large men who have had cold storage plants at their disposal.

The CHAIRMAN. Have you any suggestion as to the eggs before they reach these plants from the farm or the store?

Dr. ALSBERG. Here is where an interesting relation can be pointed out between law enforcement and this kind of constructive work. We could not do very much with the eggs before they reached the collecting point for shipment under any such arrangement as this. So several years ago we began proceedings under the food and drugs act, after we had conducted an educational campaign, against individual shippers of eggs who shipped eggs with more than 5 per cent of rotten eggs. That was a tremendous stimulus to the man on the farm to bring the eggs in quickly instead of waiting several weeks. It was a tremendous stimulus to the country-store keeper not to watch the market hoping the price would rise while his eggs were in a hot shed spoiling fast.

The CHAIRMAN. Is there hoarding or holding of eggs for a higher price? Is it not a fact that the farmer markets his eggs at the most convenient time? Those who live 8 or 10 miles from town who can not come to town every day wait until they have several cases or somebody comes to town.

Dr. ALSBERG. That is very true, Mr. Chairman, but it is a fact that since we have objected to shipping eggs that contained an undue amount of rotten eggs in interstate commerce, the quality of eggs that have been shipped has been tremendously improved. The store-keeper used to hold them for a rise in price and ship them 25 to 30 per cent rotten, regardless of their condition.

The CHAIRMAN. I understand that. What can be done to overcome that and to save the eggs? I think very few do it purposely.

Dr. ALSBERG. Very few of them do it purposely.

The CHAIRMAN. What is the remedy?

Dr. ALSBERG. The remedy is to candle the eggs.

The CHAIRMAN. How can they keep them from rotting?

Dr. ALSBERG. You can not keep them from spoiling except by keeping them cool and shipping them promptly. The action that we have been able to take under the food and drug act has enormously stimulated the cooling of the eggs and the shipment of them promptly so that there is no question but what there has been an

enormous conservation of eggs as the result of our action under the food and drug act in cooperation with the States.

The CHAIRMAN. What is your action under that?

Dr. ALSBERG. The action under the food and drug act is to proceed against a shipment of eggs that contain more than 5 or 10 per cent of rotten eggs, if those eggs have been shipped in interstate commerce.

Mr. McLAUGHLIN of Michigan. And the seizure of the eggs and the arrest and prosecution of the person handling or owning them; or what is it?

Dr. ALSBERG. The seizure of the eggs results in the release of the crate with the understanding that the eggs will be candled before they go through.

Mr. McLAUGHLIN of Michigan. Then you have to go into court in the first instance?

Dr. ALSBERG. Yes; sometimes.

The CHAIRMAN. They generally settle without that?

Dr. ALSBERG. They generally settle without, and it is a lesson to the man. He does not ship that kind of eggs again. The case usually is in rem instead of criminal, and it is a lesson to him so that he does not ship that kind of eggs again. We cooperate with States which have passed what are known as the model egg handling law. We called a conference in St. Louis two years ago with all the States to see what could be done. At that time a model State egg bill was drafted, which has been passed by a great many State legislatures; it makes it obligatory for a dealer to candle his eggs before he ships them. Anybody can candle eggs if he wants to take the trouble to learn. The result has been that eggs which are likely to become bad are recognized either on the farm or by the storekeeper and are not shipped. You know perfectly well that a cracked egg, for example, or a dirty egg, or an egg that has become wet, and had the bloom washed off is absolutely sure to spoil in shipment. It may be at the moment that you candle it a perfectly good egg, an edible egg. That egg should be consumed locally. Those which have become cracked, wet or dirty, are kept to-day at home more than formerly and are not shipped. The result has been that the storekeeper in scores and scores of cases candles out the eggs; uses for his local consumption those liable to get out of condition and only ships the prime eggs which will stand up. This result has been brought about by the combination of efforts of State officials in the passage of State egg laws, largely as the result of suggestions of State officials and the Bureau of Chemistry in a number of important egg-producing States.

The CHAIRMAN. Have you issued a bulletin on it so that they have that information?

Dr. ALSBERG. Yes.

The CHAIRMAN. You tell us in the bulletin how to treat them. What has been done in the way of suggestions as to artificially canning or preserving the eggs on the farm?

Dr. ALSBERG. The only suggestion which has been made by us in bulletins, literature, or press notices scores of times is to have the farmer learn to candle and keep for his own use those eggs liable to go out of condition, to keep those eggs which he has to store in the

coolest place just exactly as he keeps the milk, and never let them get wet or put them any place where the eggs will sweat.

The CHAIRMAN. At what temperature should they be kept?

Dr. ALSBERG. The ideal temperature is just above freezing, 34 or 35° F. Naturally, in the summer time the farmer can not get that temperature.

The CHAIRMAN. Have you made suggestions to the merchants?

Dr. ALSBERG. We have worked out a lot of suggestions to the merchants and have published all these suggestions.

The CHAIRMAN. It is just a matter of refrigeration?

Dr. ALSBERG. It is a matter of refrigeration. It is a matter of candling, and it is a matter of prompt shipment.

Mr. HUTCHINSON. I suppose you have noticed the great increase in the freezing of the cold-storage eggs. How do you account for that?

Dr. ALSBERG. That is a different proposition. I do not want to seem to tell you things that you are fully informed on, but we have in storage four kinds of egg products. We have shell eggs which have to be kept at a temperature of about 34° F. so that they will not freeze, because if they freeze crystals of ice form and penetrate through the yolk and white so that the yolk and white get weak and run together. That is why we must not freeze the egg.

Mr. HUTCHINSON. I mean the broken eggs—the frozen eggs.

Dr. ALSBERG. These frozen eggs are put up in that manner for economical reasons. In the first place, an egg which is not good enough to go into storage as a shell egg, you can hold frozen at 10 below zero if it is broken out. In addition, when you break the egg out you will get more eggs into a 10-gallon can than you could put into cases. You require less storage space.

Mr. HUTCHINSON. These eggs are frozen for the bakeries. They are not first-class eggs.

Dr. ALSBERG. That depends upon what the bakeries want. There are bakeries that make high-grade stuff and have high-grade frozen eggs and there are other bakeries that use second-grade eggs.

Mr. HUTCHINSON. Do you mean to say that they grade the cracked eggs and eggs that are not first class; freeze them at different grades?

Dr. ALSBERG. You are right—that as a rule the frozen eggs are the off-grade eggs.

Mr. HUTCHINSON. I do not know whether you told us about the grading of the eggs in storage. The reason I asked that is to show that by having them candle the eggs they are not sending those spoiled eggs.

Dr. ALSBERG. In the first place I do not want to be understood as saying that we have created ideal conditions or that we have been as successful as that. An egg at the start of its journey to market may be all right, but it may en route get cracked or get dirty or get wet, or the freight car may be held on a siding in July at 90° F., so that when it arrives it will not be a first-class egg. There are an immense number of eggs that become second-class eggs and some that become totally unfit before they reach the market. One of the great difficulties we have under the food and drugs act, one of the hardest jobs is to keep the egg breakers from using

addled and rotten eggs for these frozen eggs. We have a certain number of prosecutions against egg breakers for breaking out and freezing eggs that are tainted and unfit for food. However, as a rule the product is made from perfectly edible eggs, which for some reason or other it is not deemed advisable to put into storage.

Mr. LEE. What is the comparative value of frozen eggs and eggs in cold storage?

Dr. ALSBERG. The average price of cold-storage eggs for 1918 was 44.76 cents per dozen and for 1919 was 49.22 cents per dozen, according to quotations in the New York Produce Review and American Creamery. During the past two or three years the value of frozen eggs per dozen has been about 10 to 12 cents less than that of cold-storage eggs.

The CHAIRMAN. Have you anything especially in mind for next year?

Dr. ALSBERG. We have no new project in mind.

The CHAIRMAN. You just plan to continue the work along the present lines?

Dr. ALSBERG. Yes; it is now very largely demonstration work.

Mr. McLAUGHLIN of Michigan. How about this last work you have spoken about? Have you made a thorough investigation and reached a conclusion as to what should be done? Is it necessary to continue? Can we cut off some of this work and save some money?

Dr. ALSBERG. You can cut off some money, I venture to say, from most appropriations of the department or any other department. It depends upon whether you want to go on for some time longer and carry this work through and conserve more foodstuff. That is what it amounts to. It is for you gentlemen to say whether you need the money more at the present time than you need these conservation measures.

Mr. McLAUGHLIN of Michigan. How long has this item been in the bill?

Dr. ALSBERG. Five or six years.

The CHAIRMAN. It has been going on since 1914. It started with \$50,000 and has been going along at about that amount each year.

Dr. ALSBERG. Yes.

The CHAIRMAN. Next is item 69, page 148:

For investigating the handling, grading, packing, canning, freezing, storing, and transportation of fish, shrimp, oysters, and other shellfish, and for experimental shipments of fish, for the utilization of waste products, and the development of new sources of food, \$20,000.

Dr. ALSBERG. That is along the same line as the egg work. The work with fish is exactly similar work, with this addition, that it includes investigation of the canning of fish. In the case of eggs, they speak of canned eggs, but what they mean is that eggs are broken out, put into the can, and frozen. They have been cooked or sterilized and steamed like fish and vegetables.

The CHAIRMAN. A point of order was made against that item last year. What is the authority for this appropriation? It went out on a point of order.

Mr. HARRISON. Yes; and was restored by the Senate.

Dr. ALSBERG. It is the duty of the Bureau of Chemistry, as well as the department, to deal with the manufacture and production of

food. This is such a proposition. Furthermore, this work develops information necessary in the enforcement of the food and drugs act.

The CHAIRMAN. Is there anything more on that?

Dr. ALSBERG. No. The next item is 70, on page 148:

For the biological investigation of food and drug products and substances used in the manufacture thereof, including investigations of the physiological effects of such products on the human organism, \$25,000.

The CHAIRMAN. Could we not consolidate items 68 and 69?

Dr. ALSBERG. Yes; I am inclined to think it would be a very good thing. The greater part of the work is done by the same staff.

The CHAIRMAN. Why should they not go in together?

Dr. ALSBERG. There is no reason at all. The reason they were set out separately was merely because we in the bureau have been trying to make a considerable number of individual smaller items so that you gentlemen would be better informed. If it is your desire that these items be combined, there is no reason why they should not be.

The CHAIRMAN. Every time you split them into smaller items the overhead charge is increased.

Dr. ALSBERG. That is not necessarily true, but in this particular case the work is done essentially by the same people.

The CHAIRMAN. Have you any other items that might be consolidated to an advantage?

Dr. ALSBERG. Item 67, on page 146, which deals with the enforcement of the food and drugs act, and the item which deals with furnishing these certificates to exporters might be combined. It is done by the same staff that enforces the food and drugs act.

The CHAIRMAN. With what item would you consolidate that?

Dr. ALSBERG. With the food and drugs act item.

The CHAIRMAN. What number is that item?

Dr. ALSBERG. That is item 74.

Mr. YOUNG. I think Congress is responsible for these things being split up. The constant criticism all the time has been that they have been put under one group.

Dr. ALSBERG. These things were split up originally because the committee expressed the desire to have the thing in greater detail as individual items.

The CHAIRMAN. The committee discovered its mistake and has been trying to consolidate them ever since. It did consolidate some last year.

Dr. ALSBERG. There is no reason why these items should not be consolidated. They were separated because it was believed the committee wished it.

Mr. McLAUGHLIN of Michigan. Under each item there seems to be an organization with comparatively high-priced men. Each particular work of the bureau calls for a separate organization.

Dr. ALSBERG. In many cases we deal with part time of individuals. Take item 69, there is a mycologist in charge and a chemist in charge. The chemist devotes all his time to this work, but the mycologist is a man the main part of whose salary is carried on the food and drugs act fund because the main part of his time is examining foods suspected of being adulterated. With the bacteriologists, there is one bacteriologist who is also on part time. The duplication of organi-

zation is rather apparent than real. The high-priced man is investigator in charge. You can not get a research man to handle many lines at the same time. A man can not do research work simultaneously on half a dozen different fields.

The CHAIRMAN. It simply increases the bookkeeping to have men working under four or five appropriations.

Dr. ALSBERG. There is no question but it might be more efficient and easier and save a certain amount of overhead, though not so much as might appear here.

The CHAIRMAN. How about item 70?

Dr. ALSBERG. Item 71 could, if it were desired, be combined with the item on general agricultural investigations, item 65. That is an agricultural chemical investigation and it is of the same type that we carry on under 65.

The CHAIRMAN. By the same employees?

Dr. ALSBERG. No; not by the same employees. At one time items 65 and 71 were combined. They could be recombined if it is the desire of the committee and Congress.

The CHAIRMAN. Can you comment on that?

Dr. ALSBERG. Item 70, "For the biological investigation of food and drug products and substances used in the manufacture thereof, including investigations of the physiological effects of such products on the human organism, \$25,000."

That is investigation. In importance to agriculture I believe this investigation to be second to none that the Bureau of Chemistry is conducting. It deals, in the first place, with the finer chemistry of foodstuffs, and in the second place with the practical application of the information thus obtained to the problems of feeding and of dietetics. Under this provision the finer chemistry of such materials as the peanut, the soya bean, grain sorghum, and copra press cake is studied. Copra press cake is the residue that is left from the coconut when you squeeze out the oil; and I will come back to that in a moment, if I may.

The finer chemistry of these very important materials has been investigated. Prior to the undertaking of this investigation we knew as good as nothing about the chemistry of these materials. This investigation has furnished information which tells us exactly where in the scheme of foodstuffs these materials and similar materials fit in. It has been possible on the basis of the knowledge obtained in this way to work out rations in cooperation with the Bureau of Animal Industry for stock, and in cooperation with Dr. Langworthy's office, in the States Relations Service, for human beings, which will utilize to far better advantage these and other very important feeding materials. The time is past when it is sufficient to know about a food material or a feeding material how much nitrogen it has in it, how much fat, and how much starch or sugar. You have to know what protein is in it and what the nature of that protein is. Such information is being furnished by these investigations. It is information that shows, for example, what the peanut and copra contain.

Mr. YOUNG. Copra is dried coconut?

Dr. ALSBERG. Copra is dried coconut meat. Both copra press cake and soya-bean press cake contain most of the chemical ingredients which are absent from the bread grains and from the mill

feeds, the by-products of the milling of the bread grains. This investigation shows how the bread grains and the by-product mill feeds may be supplemented with small quantities of these materials so as to get a nearly perfect and complete feed. This is also applicable to the human economy. For example, you can not raise a child or a young animal from weaning to maturity upon bread as the only source of nitrogenous material. However, if you take wheat flour and mix it with about 15 per cent of peanut flour—that is, peanuts from which the oil has first been extracted by pressure and the cake which remains behind ground to flour—and bake a loaf from the mixture, you produce a very excellent and palatable loaf upon which you can raise animals from weaning to maturity and have them reproduce without any other source of nitrogen. In other words, you can make from wheat and peanuts a far more valuable loaf of bread than from wheat alone. You can do the same thing with the soya bean, which will be a nearly complete diet.

Mr. McLAUGHLIN of Michigan. How about the milk and butter fat?

Dr. ALSBERG. I was talking about a complete diet only from the standpoint of protein for animals from the time of weaning onward. Of course, you have to supplement this peanut-bread diet with certain mineral salts which can be incorporated in the loaf and cost practically nothing, and also with that necessary material, vitamine, as the physiologists call it, which is found in butter fat.

Mr. McLAUGHLIN of Michigan. Do you mean you can supply enough of that in bread?

Dr. ALSBERG. No. You can supply enough on a piece of buttered bread. We have raised in the laboratory white rats, which is the experimental animal used for this type of experiment, on bread made from wheat with a little added peanut flour and, in addition, some salts which are not found in wheat or peanuts, and, further, in addition, some butter fat, from weaning to maturity. They have produced young that were healthy and thrifty upon such a diet of wheat and peanut-flour bread, salts, and butter fat.

Mr. McLAUGHLIN of Michigan. Do your conclusions differ from those reached by Prof. McCollum?

Dr. ALSBERG. No; they are in harmony with his conclusions. You see his conclusions covered two primary points that in a diet you must have in addition to the ingredients we have hitherto assumed as necessary, two other ingredients known as fat soluble A and water soluble B. We do not know what they are. We know that the fat soluble A, as he calls it, occurs in butter fat, and that the thing called water soluble B occurs in many vegetable materials. Wheat contains very little, practically, no fat soluble food accessory. That is what they are, food accessories. It does contain the water soluble material to a considerable extent. Peanuts contain it to a very large extent, so that a loaf made in the manner I have indicated is deficient only in that material which is supplied by butter and certain other vegetable fats. The fat of animal organs, of the heart and the liver, has it.

Mr. McLAUGHLIN of Michigan. Such structures have it; but it is not found in the fats that are ordinarily used in making oleomargarine?

Dr. ALSBERG. No; it is not found in what we call the reserve fats. We have to distinguish in the animal economy between two types of fats. One is found in the protoplasm and is an integral part of living matter. The other is fat which is a reserve supply. It is found under the skin and in various places in the body. It is used as a sort of reserve supply for the animal when it gets insufficient food.

Mr. HEFLIN. Oleomargarine is a fat?

Dr. ALSBERG. Yes; it is a fat, but it does not contain these particular ingredients, as ordinarily made, to which Mr. McLaughlin refers. In other words, you can not have an animal grow on it. You can not make the young animal grow with oleomargarine substituted for milk or butter. It can supply its energy from the oleomargarine but it can not supply this mysterious growth accessory, the chemical nature of which is unknown, which has been known to scientists only for six or seven years and is apparently necessary for normal growth. That is not ordinarily found in oleomargarine, but it is found in butter. That is the essential difference from the physiological standpoint between the two substances. This growth accessory is not found in lard or suet or mutton fat, which is a reserve fat. You do get it in liver fat.

Mr. McLAUGHLIN of Michigan. In any large quantity?

Dr. ALSBERG. Not in large quantity, and that is not the kind of fat on the commercial market. Lard and suet are not made from these fats commercially, and commercially animal fats do not contain any considerable quantity of this growth-producing substance. We do not know what that substance is.

The CHAIRMAN. In other words, it is contended that a strong and healthy person can eat oleomargarine without any injurious effect?

Dr. ALSBERG. I would not put it that way. Butter does two things. It supplies us with fuel or with energy.

The CHAIRMAN. Will any fat do that?

Dr. ALSBERG. Oleomargarine will do that equally well, and any fat which is liquid at the temperature of the body will do it whether oleomargarine, butter, coconut oil, suet, or lard. Each one will supply the same amount, practically, of energy, but butter also supplies a certain ingredient which is found in milk, namely, this food accessory, this growth-promoting substance, without which young animals can not grow.

The CHAIRMAN. Experience shows that whenever oleomargarine is used in hospitals or with infants it retards the growth and health.

Dr. ALSBERG. I do not think it is fair to put it on that basis. I would not say that it retards the growth. You might just as well say that not feeding an animal at all retards its growth. It has no positive injurious effect. Oleomargarine has no positive injurious effect, but it is deficient in one essential thing in which butter is not deficient. After an adult individual has attained his growth and is in normal health, he gets enough of this material out of eggs and his general mixed diet, so it is a matter of indifference to the health whether an adult consumes oleomargarine or butter.

The CHAIRMAN. I thought I was putting it rather mildly. I know wherever oleomargarine has been substituted for butter in hospitals the death rate has been higher.

Mr. HEFLIN. I never heard of it.

The CHAIRMAN. It has often been stated before this committee.

Mr. HEFLIN. I have been on this committee and do recall that we have had testimony to the effect that many people prefer oleomargarine.

The CHAIRMAN. Some also prefer tobacco to sugar.

Dr. ALSBERG. My only point is that oleomargarine is not injurious; it is deficient in certain ingredients of which butter contains an abundance.

Mr. McLAUGHLIN of Michigan. You say one who has reached his full growth and is in normal health, using oleomargarine, will get what he needs from eggs and other food? Eggs contain this indescribable quality, too?

Dr. ALSBERG. Surely. Otherwise the chick could not grow. The mother puts it into the egg, else the chick could not grow.

Mr. YOUNG. The complaint in my town is that we can not get enough oleomargarine or butter to get by on. We would like to have either. I want to ask you a question about coconut before we adjourn. I noticed during the war times there was shipped out in my section of the country for the first time in years what I took to be dried coconut.

Dr. ALSBERG. That is what it is.

Mr. YOUNG. It was shipped in and the oil mills were engaged during the war in pressing that coconut. I am curious to know the commercial purpose. I discovered that in my own home town.

Dr. ALSBERG. I am glad you gave me the opportunity, because, in my opinion, the maintenance of the copra-crushing industry in the United States is one of the most important things that we should look after. Copra comes, in the main, from the South Sea Islands and from the Philippines. The Philippines are the largest producers of coconuts of any section in the world. Before the war the coconuts would be opened by the natives and dried. That was done sometimes by just taking out the meat and drying in the sun, sometimes drying over a fire. The traders come and pick them up and ultimately they would find their way either to Liverpool or to Hamburg or Bremen or Marseille. Very small quantities used to come to the United States. There has been one plant in California, I believe in San Francisco, that has crushed coconuts for a long time. These dried coconut meats are then ground much as cotton seed is ground, and then put through a press and the oil squeezed out.

Mr. McLAUGHLIN of Michigan. By that drying process does not a lot of oil escape?

Dr. ALSBERG. No; it does not escape; but it may turn rancid if the drying has been done unskillfully or the storage has been unsatisfactory. From such copra, instead of a nice, sweet, bland oil, you obtain a dark, black, foul-smelling product which can only be used after refining. That applies also to cotton seed. From sound seed you obtain an oil free from rancidity, but where the cotton seed has been allowed to ferment and spoil you will observe the same phenomena. Coconut oil is refined by much the same procedure by which cottonseed oil is refined. The method consists in taking out the acids developed in the substance by treating the oil with hot caustic soda, which converts the acid into soap, makes a sodium salt or soap which is soluble in water and can be separated and washed out.

That is what is called the refining of the oil. The oil is then filtered through a special kind of earth which takes the color out of it, and then it is ready for use. Coconut oil is different from other oils in this respect, that in ordinary temperatures in the North it is solid; it is not an oil at all. It is oil in the Tropics, but in our climate a good part of the year it is solid, and that is one of the reasons which leads to its use as in the manufacture of oleomargarine. They can substitute the coconut oil, which is really a solid, for beef stearine in the manufacture of oleomargarine. The copra cake is the material that remains behind when the oil is expressed from the copra.

Mr. YOUNG. That is what I want to know about.

Dr. ALSBERG. It contains about 20 per cent protein and also some of this material which is present in butter, not much of it, and also some of this water soluble unknown, mysterious material called water soluble B. The protein in the copra cake is very perfect in quality, so that copra cake represents one of the very best feeding materials known. That has long been recognized in Europe, and one of the reasons they have been so keen to get this copra imported into France and Germany is because they thus control not only a very important part of the fat and oil industry, but they get a by-product that is of immense value to them as a concentrated stock feed; in particular, as a concentrated dairy feed.

Mr. McLAUGHLIN of Michigan. It is better for matured animals than for growing animals.

Dr. ALSBERG. Oh, yes; it is, however, also good for young animals. I am not talking about the coconut oil; I am talking about the cake, the residue. Now, it seems to me, from every point of view that it is very important that we should retain in this country a copra crushing industry.

Mr. YOUNG. I want to ask you along that line. An oil mill was built in my town, for the purpose of crushing cotton seed and cake and meal ground from it, and during the war I discovered that these mill men were drying coconut cake in there for the first time in my experience. That was the first time I saw that in my country. Has that proven now to be a commercially profitable proposition for those oil mills to undertake?

Dr. ALSBERG. It has during the war because we were practically the only buyers of copra. The war came along. Shipping was hard to get. At least, the shipping of France and England was otherwise occupied. Copra kept stacking up in the South Sea Islands, Tahiti, the Solomons, the Philippines, and they could not sell it. Europe could not buy it. We could buy copra almost at our own price, and, of course, it was profitable, but whether it will continue to be profitable will depend upon whether we are able to secure what we need for our purposes at a reasonable price or whether Germany, England, and France and other countries which are in the market for this raw material will bid the price up to such an extent that we can not make a profit out of it.

The CHAIRMAN. If there is nothing further, we will recess now until 10 o'clock to-morrow morning.

(Thereupon, at 12.45 o'clock p. m., the committee adjourned until 10 o'clock, Thursday, January 8, 1920.)

MORNING SESSION.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Thursday, January 8, 1920.

BUREAU OF CHEMISTRY—Continued.

The committee met, pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

STATEMENT OF DR. CARL L. ALSBERG, CHIEF OF THE BUREAU OF CHEMISTRY, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN. What comes next Mr. Harrison?

Mr. HARRISON. Dr. Alsberg will continue the discussion of the items under the Bureau of Chemistry if it is agreeable to you.

The CHAIRMAN. Very well.

Dr. ALSBERG. The next item is No. 71, on page 149:

For the study and improvement of methods of utilizing by-products of citrus fruits, and the investigation and development of methods for determining maturity in fruits and vegetables, in cooperation with the Bureau of Plant Industry and the Bureau of Markets.

That work, I am able to report, has been, we believe, very successful in California, in which State, up to this season in the main, it has been conducted. In 1913 or 1914, when the work was first undertaken in California, or at least when it was started in California—preliminary work had been going on before that—the prices of oranges and cull lemons was about \$5 a ton, with a very insignificant demand for them at that. At the present time the price to the grower for cull oranges and cull lemons is upward of \$25 a ton. That has been the result of the development of a citrus by-products industry, the Bureau of Chemistry assisting. The industry, of course, developed more rapidly because of the war than it would have developed otherwise.

The chief products are citric acid and citrate of lime, which prior to this time were imported almost exclusively from Italy, lemon oil used for flavoring, orange marmalade and jams and jellies, candied orange and lemon peels, and the manufacture on a small scale of a few fancy products like orange vinegar, which is produced in small quantity for fancy trade—a particularly choice product.

Now, all in all, some 6,000,000 pounds of by-products were produced during the last fiscal year as against almost none in 1912 and 1913, before this work started. Of course I do not want to claim that nothing would have happened if the bureau had not been on the spot, but I think it has been able very materially to assist in the establishment of what seems to be a very nice little permanent industry, which is netting the growers of California—because most of these plants are cooperative plants owned by growers' companies—a very nice return for fruits which can not be shipped, and which formerly were practically all wasted.

The work during the current season has been transferred to Florida, in an effort to do the same thing for Florida. While the mate-

rials there are abundant, while there is a lot of culls to be utilized, the conditions in Florida are very much more unfavorable, so far as getting this kind of an industry started is concerned, than they are in California, for the simple reason that the type of business which is conducted in Florida is of a different character from that which is conducted in California. The business in California is more highly organized, and the California Citrus Fruit Exchange, which is a cooperative exchange of growers, has a representation of 65 per cent of the industry. In Florida the exchange has a much smaller percentage of the growers. Because cooperation is not practiced so widely in Florida, it is very much more difficult to get this by-products industry established in the same way in Florida that it is now established in California.

MR. PURNELL. Just what did the Government do in connection with the establishment of this industry?

DR. ALSBERG. The Government, in the first place, worked out most of the processes which are now used for the manufacture of these articles.

MR. PURNELL. Do you use the same process in Florida that you used in California?

DR. ALSBERG. We are talking about Florida?

MR. PURNELL. I am talking about any place where you do this.

DR. ALSBERG. The research work—that is what you mean?

MR. PURNELL. Yes.

DR. ALSBERG. In working out new methods the work that has to be done for Florida as compared with that which was done for California is relatively small. Methods worked out in California will only have to be modified for Florida conditions. Take, for instance, citric acid—citrate of lime. It will probably not be possible to produce citrate of lime commercially in Florida because there are not many lemons, and it does not pay to produce it from oranges or grapefruit.

MR. PURNELL. Having worked it out in California, my thought was whether or not it was necessary to continue this appropriation for that work in Florida, in view of the fact that it is profitable to fruit growers who sell.

DR. ALSBERG. It will not be necessary to do anything much in Florida under this particular appropriation, except educational and demonstrational work, to encourage Florida to go into the industry. The same methods can be used for Florida. You are quite right on that particular proposition.

MR. PURNELL. I should think that, if the Florida fruit growers were alive to the industry as a business proposition, they would send their representatives to California to learn.

DR. ALSBERG. That is just the difficulty. It is largely, in Florida, a matter of helping them to develop.

Of course the products which we make in Florida will be a little different from the products we make in California. We will not make any citrate of lime or citric acid in Florida; but in its place we have developed a grapefruit juice—carbonated grapefruit juice; it can be used carbonated or uncarbonated—which is something that the people who had worked on it heretofore have not succeeded in getting.

Mr. PURNELL. Do those experiments necessarily have to be conducted at the places where the fruit is grown?

Dr. ALSBERG. The experimental work has to be conducted where the fruit is; but to-day we have practically finished with that. We have finished with the experimental work on citrus fruits, except on one point, the matter of the production of lemon oil. The lemon oil produced in California is not a satisfactory grade. The method of producing lemon oil in Sicily is to squeeze the peel by hand into a sponge. When the sponge is saturated with the oil, you squeeze that into a bucket. That is done, or used to be done before the war, by hand, by labor which was paid the equivalent of 20 cents a day. Of course we can not think of producing lemon oil in this country by any such system. We have endeavored to devise a machine that will perform this operation mechanically and cheaply. We have devised a machine that will produce lemon oil, but we have not yet completed the work of devising a machine and methods that will produce lemon oil of the same quality as that produced in Italy. The reason why the lemon oil that is being produced commercially does not come up to the Italian standard is that the oil comes more or less in contact with the juice. The oil is then separated from the juice.

In the process a certain flavoring matter known as citral is lost so that we do not get oil of quite the same quality. Now, we believe that a little more work will finish the process so that we can produce the same quality of oil as the hand-process oil of Sicily, and then our oil will not sell, as it often does now, at a discount.

Moreover, the citrus work that we have been doing here is not the only work that has been conducted under this investigation.

Mr. PURNELL. Can these extracts be produced without alcohol?

Dr. ALSBERG. Lemon extract is made by taking five parts, by weight, of oil, and dissolving it in 95 parts of alcohol. Just enough alcohol is use to cut the oil. That is lemon extract. They do not take the lemons to-day and extract them, but they take the lemon oil and make a 5 per cent solution of lemon oil in the weakest alcohol which will cut the oil, which is around 20 to 25 per cent. If the alcohol is weaker the oil separates out. That was the ordinary lemon extract of the past. To-day, in most States, that extract can not be used, and one of the problems upon which we are working under some of the general investigation appropriations is the development of methods for the preparation of flavoring extracts without the use of alcohol as a solvent. One of the ways to do it is to make an emulsion. Instead of making a solution we make an emulsion from some acacia gum. Another method is to dissolve the flavoring matter in some neutral edible oil. There are still a number of difficulties to overcome. We have not, or rather the manufacturers have not developed entirely satisfactory methods for producing all flavoring extracts to take the place of the old methods using alcohol as a solvent.

Mr. TINCHER. There are several of the larger companies to-day that claim that their methods of making the extract and marketing it are satisfactory.

Dr. ALSBERG. Oh, yes; there are a good many different types on the market. They are either emulsions or solutions in oil. But we

do not believe that all of them are wholly satisfactory. They do not keep well.

Mr. TINCHER. Have you, as a chemical proposition, condemned any of them?

Dr. ALSBERG. When I say they are not satisfactory I do not mean that they are not wholesome. I do not mean that they are objectionable; I mean that they do not keep well, and they do not mix uniformly into dough and other viscous products. Take, for instance, these emulsions which are thick, like cod-liver oil emulsion, where the flavoring oil is split up into very fine particles. When you put them into cake batter, unless stirring very thoroughly, you do not get it evenly distributed throughout your cake. A flavor in the form of a solution goes more easily into all parts of the batter. Women using the new types of flavors in the way they used the old extracts, complain. That is what I mean. Also if handled in the same way as the alcohol extracts they are likely to deteriorate before they are used up.

Mr. TINCHER. Do you not think that the effort of the Government and the campaign of the Government should be to educate women as to how to use them?

Dr. ALSBERG. That should be a part of it.

Mr. TINCHER. When I first came here I had a little trouble on the floor of the House about this extract business. There was an effort to have these extracts exempted under the prohibition law so that they could be sold in dry territory. In my State they get along very well. The women understand the use of the other extracts, and, unless there is some objection on the score of health, there is no objection; and I understand that the Department of Agriculture states that there is nothing detrimental to health.

Dr. ALSBERG. There is nothing detrimental to health. They are just at present, however, using them in a different manner from that in which they used the old extracts. The best of them are pretty well made. A good many manufacturers do not know how to make them. There is room for improvement. But there is nothing in the flavoring extract situation which is such that the country is going to be unhappy or uncomfortable or in bad shape because alcohol can not be used.

Mr. TINCHER. Here is the first thing that is coming up on the extract proposition: The prohibition law will have to be amended if the balance of the United States is going to be dry. It is going to be amended or we are going to have to take off the market these extracts that are made with alcohol, so that they can not be used as beverages; and if there is nothing detrimental to health in the other extracts I think the department will be frank and candid with the public about it and let them understand that there is no reason why they should not use the other extracts.

Dr. ALSBERG. If I remember correctly, as long as four or five years ago we issued a press notice in which we informed the public that this new type of flavoring material was obtainable and that there was no objection to its use. I do not think that we have ever—at least, that anybody in the Bureau of Chemistry has ever—taken any other position, excepting that these products are all right. We have encouraged their manufacture, but we believe that the methods of manufacture are capable of improvement. We believe that five years

from now there will be very much more perfect preparations than there are at the present time. That is what I meant when I said they were not satisfactory. They are perfectly wholesome and there is no reason why they should not be used, but you can not use them, as at present made, in the same way in which the old types were used.

Mr. TINCHER. People who know how can use them?

Dr. ALSBERG. Oh, yes; and, as a matter of fact, bakers for years have been using them. Alcohol is very expensive, and an extract made without alcohol is cheaper than an extract made with alcohol, so that the great baking companies for years have been using the other types of extracts.

Mr. McLAUGHLIN of Nebraska. Before you leave this particular item let me ask you a question: You spoke of the value of these culls in California being increased from \$5 a ton to \$25 a ton. Is there any market at all for these culls in Florida at this time?

Dr. ALSBERG. There is not much of a market for the culls at the present time in Florida. There is a little orange juice put up there, and a little grapefruit juice, but there is not much market at the present time for the Florida culls.

Mr. McLAUGHLIN of Nebraska. Do you think a market could be built up for them in Florida as good as that in California?

Dr. ALSBERG. I am absolutely certain that it can, and it is a very serious need of the grapefruit industry of Florida that a market for the culls be made. A few years back you will remember that the country began to wake up to the fact that grapefruit was a very delicious breakfast fruit, and you will remember the prices you used to pay, 25 and 30 cents apiece, for them.

The CHAIRMAN. Why do you say "used to"?

Dr. ALSBERG. Is it still that high? [Laughter.] At any rate, an enormous acreage of grapefruit was planted, so that Florida is threatened with an overproduction. We believe that grapefruit juice properly made and carbonated can be made a rather staple product, like grape juice, for instance, and that there will be quite a wide market for it. Of course, there will not be the same wide market for grapefruit juice that you would get for alcoholic beverages, but we think there is room for a very nice little industry down there that will bring a lot of money to the people in Florida. We are trying to get it started this year.

Under this appropriation we have also undertaken some other work. There is a large demand from the industry for work on canteloupes, on prunes, and on other fruits, for the purpose of preventing waste and making by-products. Work of this kind has also been started at the present time, mostly in the West. That work is largely in its beginning.

Then, under this same appropriation we cooperated with the Bureau of Plant Industry in the study of what the botanist calls bud variation. In the old days they used to take almost any kind of buds to bud orange or lemon trees.

We have been cooperating with the Bureau of Plant Industry in studying particularly productive trees—we studying the chemical features and they the botanical—and it has been established that the property of a given tree or a given bud is transmissible through the bud as well as through the seed. That has been established

chemically as well as otherwise, and the result is that the California Citrus Fruit Exchange has established a large office for supplying the growers with the types of buds that have been studied by us. Is there anything further on that, Mr. Chairman?

By bud selection the productivity of the trees may be greatly increased and the quality of the fruit vastly improved.

The CHAIRMAN. We will take up the next item.

Dr. ALSBERG. The next is item 72, "For investigation and experiment in the utilization, for coloring purposes, of raw materials grown or produced in the United States, in cooperation with such persons, associations, or corporations as may be found necessary."

That appropriation was granted soon after the beginning of the European War, because of the dye situation, and I am glad to be able to report that a large number of very valuable contributions to the promotion of the dye industry have been made under this appropriation. I reported last year one new process that has been worked out for making a very valuable intermediate for the dye industry which formerly sold as high as \$7, but which is now being sold on the market for 60 cents, and is actually being used in the dye industry.

The CHAIRMAN. You say it sold as high as \$7?

Dr. ALSBERG. It sold as high as \$7 a pound and is now being produced for 60 cents a pound; that is the last quotation I know of. The price has been tobogganing right along. It may be less than 60 cents now.

That substance is being manufactured at the present time, by this process, by three plants with which the bureau has cooperated, and which the bureau has taught to produce it. It is an intermediate that is necessary for a whole list of dyes, and also for a whole series of medicaments. You will understand that many materials which are used in the manufacture of dyes are also used in the manufacture of medicines. For instance, carbolic acid is an example.

The CHAIRMAN. Will you state what these dyes are?

Dr. ALSBERG. The most important of the group of dyes for which this substance can be used as an intermediate are the phthalein, of which the eosines and rhodamines are the most important. The indigos can also be made from this intermediate. There are many other dyes made from this substance.

What we are doing under this appropriation is studying, for the benefit of the industry, the processes, rather than attempting to actually produce dyes. The industry is secretive; industrial chemists have not time to carry on this kind of a research. A very valuable service can be performed to the industry by doing a lot of the fundamental research which otherwise would not be done, and placing it at the disposal of the industry. A large amount of that kind of work which the industry is now using and applying has been done under this appropriation.

There have been taken out a large number of patents for processes, and a large number of patents are now pending in the Patent Office which will be of value to the industry.

In addition, we have, as a side issue, made a photographic developer. We conducted in this laboratory the bulk of the chemical investigation which the aircraft service required, particularly on the

manufacture of those dyes which you have to have for photographic purposes. If it is necessary to photograph under adverse conditions of illumination, or to photograph camouflaged objects, you have to stain your plate with certain dyes which are sensitive; that is, which absorb the particular colored light that is reflected from the object you want to photograph. These dyes before the war were imported from Germany. Nobody in this country knew how to make them. I am informed that in England and France they never succeeded in making the whole list needed, but we succeeded under this appropriation in manufacturing and making all those that had been made in Germany, and some new ones which are better than those which were known before. The production of these dyes is now going on in the United States.

Mr. LESHNER. Are the dyes you are making now as good, as a whole, and as lasting, as the German dyes were?

Dr. ALSBERG. Do you mean these photographic dyes?

Mr. LESHNER. Whatever it is that you are talking about.

Dr. ALSBERG. We are not actually manufacturing dyes, you understand.

Mr. LESHNER. You are evolving the processes by which they can be manufactured?

Dr. ALSBERG. Yes.

Mr. LESHNER. Will they be as good as the German dyes?

Dr. ALSBERG. Yes. The troubles that arose during the war with regard to American dyes were not due to the inferiority of American dyes. A chemical substance is the same whether it is made in Germany or in the United States. The trouble arose, and the trouble still exists, from the lack of variety. There were between 200 and 900 dyes of various kinds manufactured and used before the war. Now, when we went into the war we could not make the whole list. We could only make a limited number. Of course we had to use the limited list. We had to use the wrong dye for a given purpose. You understand that certain kinds of dyes are used for silk, others for wool, others for cotton, others for leather. The American manufacturer often had to use the wrong dye with unsatisfactory results because it was all he could get. But, used for the specific purpose for which the dye was intended, it is just as good made in this country as if it was imported. The difficulty came from our not having all varieties, and, therefore, we had to substitute dyes which were unsuitable.

Mr. LESHNER. Can you make them as cheaply as the Germans can?

Dr. ALSBERG. That I can not say. Nobody knows what it costs. The market price of dyes in the United States is not in any respect an index of what it is costing the manufacturers to produce, for the reason that the dyestuff manufacturer had to spend thousands and hundreds of thousands of dollars in experimentation. I suppose he figures that as investment. He had to build a plant. Sometimes he had to build the plant two or three times over, because it would not work the way he built it first. He figures that up as a charge against his investment. He does not know what conditions are going to prevail when international conditions are normal, so that he wants to write off his investment, including experimental work, two or three failures, possibly, in building his original plant, the machinery that he had to junk—he wants to write that off as quickly as possible be-

cause he does not know whether he is going to be able to compete two or three years from now or not. Of course he puts that into the present price of his dyes, so that the present market price of dyes made in the United States gives you no idea whatever as to the actual cost of production.

Mr. HEFLIN. I have seen somewhere a statement that there was an excellent silk dye made from peanut oil.

Dr. ALSBERG. I do not know anything about that.

Mr. HEFLIN. You never have made that test?

Dr. ALSBERG. No; I am not familiar with that statement. I do not know.

Dr. ALSBERG. As the bureau's dyestuff investigation involves the matter of patents, would you object if I brought to your attention the very unfortunate condition that exists with reference to Government patents? It has nothing to do with this appropriation act, and if you do not want to take the time I will not discuss the question further.

Mr. ANDERSON. That has already been presented to the Committee on Patents.

Dr. ALSBERG. Yes.

Mr. ANDERSON. It is all available in the hearings, I mean.

Dr. ALSBERG. Yes.

Mr. ANDERSON. Is there any trouble about taking out patents?

Dr. ALSBERG. Not about taking out patents; but if you take them out they are open to the use of everybody, and nobody will use them.

The CHAIRMAN. They are open to everybody?

Dr. ALSBERG. Yes; they are open to everybody; and nobody will use them. You take this particular process we have been talking about. One concern in Pittsburgh undertook to develop it commercially. It cost them possibly \$100,000 till they were actually producing commercially. They had two young chemists in their plant. Those chemists resigned, and they got the details of the machinery which these people invented, and they started competition. Now, that is what frightens people away from using Government patents.

Mr. ANDERSON. Have you been using the total amount carried in this appropriation?

Dr. ALSBERG. We have been using it.

Mr. ANDERSON. Do you think you will have to use it for the next fiscal year?

Dr. ALSBERG. That is entirely a question of the amount of work that we will do. There are very few of these appropriations under which we could not do less or could not do more, and every dollar spent would be of value to the country. It is a matter of judgment for you gentlemen to say how extensively we should go into these questions.

The CHAIRMAN. Are the investigations on vegetable dyes?

Dr. ALSBERG. No; they are mostly coal-tar dyes.

The CHAIRMAN. Are the investigations limited to coal-tar dyes alone?

Dr. ALSBERG. No; we have been experimenting with some vegetable colors.

The CHAIRMAN. The question was asked last year whether this was confined to coal-tar dyes.

Dr. ALSBERG. The bulk of the work is being done on coal-tar dyes. We are doing some work on vegetable dyes, on plants that are found in the United States or can be grown here for dye purposes; but that is a small part of the work. The bulk of it is on coal-tar dyes.

The CHAIRMAN. Your investigations, then, cover the whole field?

Dr. ALSBERG. Yes.

The CHAIRMAN. We will take up the next item.

Dr. ALSBERG. The next item is number 73:

For the investigation and development of methods for the manufacture of table sirup and of methods for the manufacture of sweet sirups by the utilization of new agricultural sources.

I am sorry to have to report that on this investigation we have not been able to make the progress that we had hoped, so as to pretty well complete it this year, at least so far as cane sirup is concerned, for the simple reason that the man in charge of this work, Dr. Hudson, who was one of the two or three most distinguished sugar research chemists living, resigned to go into industrial work, and his understudy resigned to do the same thing two months afterwards. That is one reason.

The other reason is, as I stated last year, prohibition. The methods which we had worked out for the manufacture of sirup which would not crystallize and would not ferment were dependent upon having an abundant supply of brewers' yeast. Brewers' yeast is no longer obtainable commercially, and it has been necessary for us to find a new source of material that would do the same thing as brewers' yeast. We believe we have that source of material in certain molds. Both factors have held up that work so that it has not been completed. A new man has had to be broken in, and the work will have to be carried on, in consequence, at least one more year before it can be regarded as ready to close.

The CHAIRMAN. How much money did you expend last year?

Dr. ALSBERG. We spent the bulk of the—

The CHAIRMAN. I mean for the current year. Can you estimate it approximately?

Dr. ALSBERG. We will spend \$7,000, I think, this year.

The CHAIRMAN. You will need practically all of this for next year?

Dr. ALSBERG. I think so. We did not spend the full amount because of these resignations.

The CHAIRMAN. Speaking about resignations, is it not a fact that employees of the bureau secure a liberal education from the department? Does not that account partly for the trouble that you have in keeping your men?

Dr. ALSBERG. Yes; that is true. Of course these two men did not go into the employ of sirup manufacturers. Dr. Hudson went to no manufacturer; he established himself as a consulting chemist, and of course with his standing and reputation, which he acquired while he was in the Bureau of Chemistry—that is where he made his reputation—he is earning now as a consulting chemist, and his own master, more than \$10,000 a year.

The other man, his understudy, Dr. Dale, was taken over as a research chemist. We paid him \$2,500 and they pay him \$4,000, I

think, as the chemist of this new food products corporation which is the metamorphosed Distillers' Securities Co. This company is manufacturing in their old distilleries and breweries such products as malt sirup, malt sugar, glucose, yeast, and products of that kind, the machinery for the manufacture of which is practically identical with the machinery for the manufacture of beer and distilled liquors.

In this particular case the experience that he gained with us is what these people are buying, but they are not buying his experience in regard to this matter we were speaking of, because they are not going to make those particular articles.

The CHAIRMAN. I am trying to get at the reason of the difficulty of obtaining and keeping these men.

Dr. ALSBERG. If you mean to make the point that a young man who goes into the Bureau of Chemistry and stays with us for four or five years can get a better job at the end of the four or five years than he would have achieved, other things being equal, by beginning at the bottom in a factory, you are quite right.

The CHAIRMAN. That ought to be an incentive to them to enter the service of the department.

Dr. ALSBERG. Sometimes it is of direct benefit to the Government. When a manufacturer of food products, who has been violating the food and drugs act persistently and stupidly, hires one of our young men we do not as a rule thereafter have any trouble with him. The bureau-trained man keeps him straight. Thus we save the time and the money that we otherwise would have to pay in prosecuting; so the loss of the man is a benefit indirectly to us.

Before I leave this last item—

The CHAIRMAN. You will need the same amount on that next year?

Dr. ALSBERG. Yes.

The CHAIRMAN. You think you will get through with that next year?

Dr. ALSBERG. I hope so. It depends on whether this new man that I am counting on turns out all right.

The CHAIRMAN. We discussed this last year.

Dr. ALSBERG. Yes. May I bring up one other thing that has to do with future work, not under this item but related to it? It is the utilization of the sweet potato. There have been inquiries on the part of people in the sweet-potato producing sections of the country for some work which will utilize the cull sweet potatoes and the overproduction. I wish to bring that to the attention of the committee, because Representative Crisp is one of the gentlemen who has consulted me on this matter. Of course we have no funds for the work at present. I believe it to be possible to establish ultimately a very valuable agricultural industry, using sweet potatoes as its raw material. Sweet potatoes contain naturally 10 per cent of cane sugar, and it is possible by treating sweet potatoes with a small amount of malt to convert the starch in the sweet potato into malt sugar, and thus to make a most delicious sirup for table use.

The sweet potato contains more starch than the white potato. It is one of the cheapest sources of starch, so that it should be possible to establish a sweet-potato starch industry in the United States. If you have starch, of course you can produce from it malt

sugar and glucose, and a material known as dextrine, which is used as an adhesive to gum postage stamps, envelopes, and the like.

The CHAIRMAN. Have you made an investigation of that?

Dr. ALSBERG. We have done a little preliminary work.

The CHAIRMAN. Do you suggest anything in connection with that?

Dr. ALSBERG. I think we will not be able to touch it this year, but some day I think this committee will want to have work done in that connection, because it may prove of great value to the southern part of the country.

The CHAIRMAN. What progress have you made on the sirup?

Dr. ALSBERG. We have worked out methods for making sirup that will not crystallize, will not ferment, and will be uniform in composition.

The CHAIRMAN. Is it more palatable?

Dr. ALSBERG. It is more palatable and more uniform. We offered sirup that we made from sugar cane grown in south Georgia on the New Orleans molasses exchange, simply stating that it was a cane sirup. They did not know that it was made by the United States Government, or by whom it was made. That sirup brought 10 cents a gallon more than the highest market price for any other sirup of that type during that season. Of course we did not own that sirup. It was made under our supervision by the manufacturers. We found, down where it was made, that the neighbors had bought up all there was of it because it was superior to anything else they could get in that neighborhood. We have not been able to close that investigation because we need yeast.

The CHAIRMAN. Does it cost more to manufacture it?

Dr. ALSBERG. Yes; it costs a little more. It takes a little more brains and pains.

The CHAIRMAN. Does it require any more equipment?

Dr. ALSBERG. The only additional equipment is a cypress tank, which can be bought for \$20.

The next item is No. 74, for the enforcement of the food and drugs act, for which no increase is asked. The reason that, despite the fact that the cost of operating is naturally greater than it ever was before, we have asked for no increase is that the increase asked in our fund for collaboration, which I discussed day before yesterday, item 66 on page 145, will relieve a certain burden on the enforcement of the food and drugs act, because it is the men who are doing the work on the enforcement of the food and drugs act who are required to do this collaborative work, to make the analyses for all the Government departments.

Mr. HUTCHINSON. Doctor, I see there is a mention of liquors here. We are not going to have any liquors.

Dr. ALSBERG. That is the language of the law. That is the way the law reads.

Mr. HUTCHINSON. Then you ought to change the law, ought you not?

Dr. ALSBERG. It does not say "spirituous liquors."

Mr. HUTCHINSON. I see.

Dr. ALSBERG. These soda waters and the hundreds of near beers, which contain all kinds of things, are causing us a lot of trouble.

This is just the language of the law, and we did not feel at liberty to change that.

I want to make it clear that there is no increase asked there, but that if the Congress sees fit to give us more money on the collaborative fund in this other item, that will take a part of the burden off of this particular fund.

The CHAIRMAN. Will this amount be reduced?

Dr. ALSBERG. No; I do not think this amount can be reduced. Again, the enforcement of the food and drugs act is just a question of what you want done. If you want us to do a thousand dollars' worth of work, we can do a thousand dollars' worth of work.

The CHAIRMAN. Do you need the whole amount that is suggested?

Dr. ALSBERG. Yes; and it is important.

Mr. HUTCHINSON. You say you can do a thousand dollars' worth of work if you are limited to that amount? Do you mean that you can reduce your amount?

Dr. ALSBERG. We could profitably spend twice as much in enforcing the food and drugs act. It is a question of the vigor and the amount of the enforcement that Congress wants done. That is what it comes to. We are not catching, by any means, all the violations. If we have a larger amount of money we will catch more of them, and the smaller the amount we have the less of them we will catch.

Mr. HUTCHINSON. Four hundred thousand dollars of that goes to salaries alone.

Dr. ALSBERG. Nearly all the money spent in the enforcement of the food and drugs act is, of course, for salaries of chemists. The rest of it consists of travel to court and elsewhere, chemicals, and apparatus, rent in some of the laboratories outside of Washington which are not in Federal buildings—we move them into Federal buildings as fast as we can get accommodations for them—and the payment of expert witnesses in cases where we need to hire outside witnesses. For example, if we try a case like the bleached flour case, or the saccharine case, which was just tried in St. Louis, we sometimes have heavy expenses for outside experts.

Mr. HUTCHINSON. How was that case decided?

Dr. ALSBERG. I am sorry to say that the jury disagreed—seven for the Government and five against—so that we will have to go through that trial once more.

The CHAIRMAN. What do you pay the inspectors?

Dr. ALSBERG. All of their salaries are statutory. That was a mistake on my part when I mentioned inspectors. They are all on the statutory roll. Their salaries do not come out of this fund. The employees who are paid from this fund are chemists, bacteriologists, microscopists, and other scientifically-trained people who do the analytical work.

Mr. HUTCHINSON. I would like a little more information about that saccharine case. What did you try this case on—adulteration?

Dr. ALSBERG. The saccharine case was brought against a chemical company in St. Louis for the shipment of a pound can of saccharine, which was labeled as being a perfect sweetener, healthful, and absolutely harmless. We charged misbranding—not adulteration, because it was saccharine as it purported to be. We charged misbranding on the ground that it was not a perfect sweetener, that it was not

healthful, and that it was not absolutely harmless, and we brought evidence into court to show, as we thought, that if permitted unrestricted use, the quantity which would be consumed by many people would be sufficient to produce harmful effects, those effects being in the main disturbances of digestion, delay of absorption of food in the intestinal tract.

Mr. HUTCHINSON. Does it not produce severe kidney trouble?

Dr. ALSBERG. We have not evidence for that; but people who have kidney trouble will not eliminate it, and it stacks up in their systems, which may be injuriously affected in that way.

The CHAIRMAN. Take up item No. 75.

Dr. ALSBERG. Item 75 is "for investigating the grading, weighing, handling, transportation, and uses of naval stores," and so on.

The CHAIRMAN. Is there anything new in regard to that work?

Dr. ALSBERG. That is the same type of investigational and educational work as we have been carrying on with the industry, teaching them how to produce and handle rosin and turpentine more efficiently.

The CHAIRMAN. Educational work?

Dr. ALSBERG. Yes, educational at this time.

The CHAIRMAN. Has anything new developed?

Dr. ALSBERG. The only thing new at this time is that there has been this year more than ever before an insistant demand on the part of both producers and consumers for regulatory legislation from Congress. These two branches of the industry want the enactment of some legislation by you gentlemen which will be of the type of the grain grades act. The producers feel that the middleman grades the rosin or the turpentine down when he buys it, and grades it up when he sells it to the consumer, which is of course the complaint in the grain industry.

Mr. ANDERSON. The complaint is about the same in all those things?

Dr. ALSBERG. Yes; about the same. The producer and the consumer are both clamoring for legislation. That is the main development. You are likely to hear from them. That is, of course, up to you. We have nothing to do with it.

The CHAIRMAN. Take the next item.

Dr. ALSBERG. The next is item 76:

For the investigation and development of methods of manufacturing insecticides and fungicides, and for investigating chemical problems relating to the composition, action, and application of insecticides and fungicides.

This is the second year we have had this appropriation.

The CHAIRMAN. The first appropriation was made for the fiscal year 1919.

Dr. ALSBERG. Yes; and the money became available so late the first year that very little was done with it for that reason, and considerably less than half of the appropriation was expended. Only about \$10,000 of the appropriation was expended for 1919, and the bulk of that which was expended was spent upon the equipment which we needed to get the work started; so that I am not, at the present moment, able to report any very definite progress, because we have really only just about got started. As a matter of fact, the equipment was ordered in 1919, but owing to conditions which pre-

vailed in the industrial world, some of it has not yet been delivered; so that we are just getting started on that work. I wish I could report something definite, but that is not possible.

Item 77 is the next, "For the study and improvement of methods of dehydrating materials used for food, in cooperation with such persons, associations, or corporations as may be found necessary, and to disseminate information as to the value and suitability of such products for food, \$23,500."

That is a reduction of more than half in the appropriation made last year. That work, I think, has been successful in assisting a number of firms in getting started in this very important business. What is necessary is to carry a portion of the work, which will be partly demonstrational and partly experimental, for a little while longer, in order that we may complete certain investigations which deal, for example, with the best methods of storing, the best methods of handling, and also some of the methods of producing dehydrated products or types we have not produced hitherto. We were not able to cover the whole field of all vegetables and all fruits. This we wish to complete, so that we can round out the work.

The CHAIRMAN. Is it a success?

Dr. ALSBERG. Yes; there have been produced and are being produced to-day most excellent products. There are two or three of the concerns now operating who we feel confident are going to be able to stay in the business and make a success of it.

The CHAIRMAN. Is there a market for the products?

Dr. ALSBERG. They are in process of creating a market.

The CHAIRMAN. Do people take kindly to it?

Dr. ALSBERG. Yes; they do; but you know perfectly well, as a business man, that it is the hardest thing in the world to create a demand for a new food product. It is the same thing as marketing a new breakfast food.

The CHAIRMAN. \$23,500 will be all that you need to carry on this work next year?

Dr. ALSBERG. Yes.

Mr. ANDERSON. Has your work been entirely commercial dehydration?

Dr. ALSBERG. Our work has been entirely commercial, because I do not believe, personally, that small-scale dehydration on the farm, for sale, is a feasible proposition. This is a manufacturing business, and it can not be done by an amateur.

Mr. ANDERSON. When this dehydration proposition came up a year or two ago it seemed to get a new lease of life, somehow or other. We were going to get these dehydration plants scattered all over the country, chasing up and down and dehydrating everything under the sun, apparently. [Laughter.]

Dr. ALSBERG. I think that was a mistaken enthusiasm. It is a commercial business requiring a high degree of skill, in which amateurs can not make uniform products in the way that was proposed.

The CHAIRMAN. You are cooperating with manufacturers?

Dr. ALSBERG. Yes, sir.

The CHAIRMAN. The Government has no plants?

Dr. ALSBERG. We have no plants; no. Last year we installed special machinery, designed or secured by us, in the plants of manufacturers, to see whether it was suitable for certain classes of work;

but we have built no plants and do not propose to build any plants; We do not propose to manufacture commercially except in cooperation with plants that are now operated.

Mr. HUTCHINSON. In 1919 I see that you spent \$128,050 for equipment and materials. You said you had no plants. What was that for?

Dr. ALSBERG. That was largely for material and very little for equipment. That material has been used in the effort to create a market. We have gotten large quantities of the excellent products which we have bought from manufacturers and distributed them widely among teachers of household economics, among hospitals and institutions, to demonstrate their use, in the effort to overcome these difficulties that Mr. Haugen describes.

Mr. HUTCHINSON. You do not give it away? You sell it, do you?

Dr. ALSBERG. We have given most of this away, because it is in very small quantities. In other words, we have tried to conduct to some extent the sort of campaign you would conduct if you were going to put these things on the market. Most of that \$128,000 went to the producing and distribution of that material so as to get people interested in it.

The CHAIRMAN. We will take up the next item.

Dr. ALSBERG. The next item is No. 78, "For the investigation and development of methods of utilizing wool-scouring waste, \$9,000." That is in somewhat the same shape as item 76, in that this was one of those items the money for which became available very late, and of the first appropriation there was only, I think, \$1,500 or so expended the first year.

The CHAIRMAN. What by-products do you get out of it?

Dr. ALSBERG. We have made very good progress, and I would like to show you some samples. I think it might interest you just to see the different types of products. Here is the raw material, here is the refined and the semirefined [handing samples to the committee members].

The CHAIRMAN. In the progress of your experiments do you not make a great deal of fertilizing material?

Dr. ALSBERG. Yes, potash. What we have been working on is recovery of the hundreds of thousands of pounds of potash that are wasted every year. What we wanted to do was to induce the industry to save the wool grease and to manufacture from it at least two products. One is this lanoline, which is the basis of nearly all modern pomades and ointments. It is used where we formerly used lard and lard oil. We have imported a very large quantity of it. The second product is potash. We have had first to make a survey of the plants that were scouring wool in the United States and to find out what they were doing. Having finished the survey we had to begin to develop methods for the recovery of this wool grease. These methods are known in Germany, but they have been kept secret.

There are a great many uses for this material, besides, for ointment. These wool-scouring wastes pollute the rivers. There is a great quantity of material that we hope we may save. The first year we spent a small portion of the money, and last year we did not spend it all either. Last year we spent only a little under \$1,900 because we had to make our survey and get our feet on

the ground. This year we will require the entire fund, if you will be good enough to give it to us.

The CHAIRMAN. For the fiscal year 1919 you only used \$1,900?

Dr. ALSBERG. For 1919 we used \$1,892, to be specific. The remainder, of course, went into the Treasury. There is a possibility here of doing a very useful job for the country in saving this material, of which we import annually more than \$1,000,000 worth, and in saving the potash, of which many hundreds of thousands of pounds are wasted annually.

Mr. HUTCHINSON. Are you experimenting in improving the quality of the goods?

Dr. ALSBERG. At the present time most of the manufacturers are wasting it. They did not know how to save it. There was until within recent years only one concern that was saving it at all, and that concern was doing it very inefficiently but doing it secretly; and the other manufacturers do not know how to handle it to get the most useful products of the highest value.

Mr. HUTCHINSON. That is the point on which you are working?

Dr. ALSBERG. Yes; to save it and put it on our market, and so make it unnecessary for us to import 14,000,000 pounds of it; and, on the side, to get the potash.

The CHAIRMAN. Fourteen million pounds of potash?

Dr. ALSBERG. No; as I recall it, about 14,000,000 pounds of this material—wool grease—is imported annually. We can supply our own needs, and we can also get many hundreds of thousands of pounds of carbonate of potash, which is very valuable. We need every bit of potash we can get.

Mr. HUTCHINSON. We need more than we can get.

The CHAIRMAN. The next is a new item, No. 79:

For investigating the utilization of agricultural raw materials in the production of leather and tanning and leather-making materials and for developing and demonstrating improved methods or processes for producing leather, \$15,000.

MORNING SESSION OF TUESDAY, JANUARY 6, 1920—Continued.

Mr. HUTCHINSON. I see you ask for \$15,000 for leather investigations. Where is that laboratory?

Dr. ALSBERG. In Washington here. That is not for this kind of work. That is for purely investigational work, the best manner of producing leather, which is an agricultural product from two sides; it is an agricultural product in that the hide comes off an animal, and in that the tanning material that goes into it is a vegetable product. Moreover the farmer is the largest consumer of leather, not merely in the form of shoes, but harness and other equipment.

Mr. MCKINLEY. Is not that exactly what the Bureau of Standards is organized for?

Dr. ALSBERG. Not according to statements which Dr. Stratton has made to me. It may be that I have not understood Mr. Stratton, but the line of demarcation which he is following is that the Department of Agriculture has essentially to do with production and the Bureau of Standards has essentially to do with service performances of products, which is really an entirely different proposition.

Mr. MCKINLEY. This is not production; it is investigation, is it not?

Dr. ALSBERG. It is an investigation of the best manner of production.

Mr. TINCHER. It is an investigation calculated to ascertain the best manner of producing leather?

Dr. ALSBERG. The production of leather. We have been at work on that line for about 20 years and have published a lot of bulletins on the subject. We have recently, for instance, done such work as issuing a bulletin on the method of collecting and preparing sumach. We have been trying to stimulate the production of sumach, which is an important tanning material. We have issued bulletins in cooperation with the Bureau of Animal Industry and the Bureau of Markets on how to take off hides in the country so that they may be taken off in a manner which will not cause them to be discounted as against packers' hides. It is largely owing to the fact that the average man who butchers in a small town in the country does not know how to take off a hide as skillfully as the man who is hired to do it in the packing house. He scores it, cuts it, and salts it inefficiently, and he handles it wrong; in consequence the hide may bring a tremendous discount on the market because it is partly ruined. We have made investigations in cooperation with the Bureau of Plant Industry looking toward the development of new sources of tanning material. Our natural hemlock, oak, and similar material just now is commanding high prices. We are importing large quantities of tanning materials. We have made investigations of the best way of stripping and currying and waterproofing leather; of the best manner of handling leather so that you will get the most wear out of it. I think our investigations are of a different type from those made by the Bureau of Standards.

Mr. HUTCHINSON. You say you have done that work for 20 years?

Dr. ALSBERG. In a small way, but we would like to expand it.

Mr. HUTCHINSON. You want to increase it? This is an entirely new item; of course, you did not reduce your other appropriation by \$15,000?

Dr. ALSBERG. This investigation is one of the investigations that was carried on in a small way under item 65, page 144, which is "for conducting investigations contemplated by the act of May 15, 1862, relating to applications of chemistry to agriculture." It has been done in cooperation with the Bureau of Animal Industry on the hide end of it and the Bureau of Plant Industry on the production of tanning material end of it. The investigation has been carried in a small way under that appropriation. With the increased cost of leather and the scarcity of native-grown tanning materials, we think it would be good business to increase and intensify that particular phase of the work.

The CHAIRMAN. You spoke about the difference in price tanneries paid on hides. What is the difference in prices?

Dr. ALSBERG. I do not recall at the moment.

The CHAIRMAN. There is a wide spread.

Dr. ALSBERG. There is a tremendous difference between the price paid for country hides and the price paid for packers' hides in the same market.

The CHAIRMAN. They pay more for packers' hides than for the small hides?

Dr. ALSBERG. I do not remember.

The CHAIRMAN. Not long ago they were paying 52 cents for the packers' hides and people in the country were getting 8 and 12 cents.

Dr. ALSBERG. I think you are probably right on that.

The CHAIRMAN. Is there that much difference in the value of the hides?

Dr. ALSBERG. I do not think so.

The CHAIRMAN. Have you investigated the matter?

Dr. ALSBERG. I would not like to be quoted offhand because you will realize I can not do all these investigations myself, but, as I recall Mr. Veitch's report to me, he stated that one of the reasons for this difference in prices was the uncertainty in quality of the country hide; that very frequently the country hides were just as good as the packers' hides and very frequently they were very little good at all; and that there entered into it a speculative element which was capitalized by the buyers in Chicago and Kansas City and the big centers to the disadvantage of the country producer of hides. Whether that speculative element is sufficient to account for the tremendous spread, I do not know.

Mr. TINCHER. Is it not true, Doctor, that there never was a time when the percentage of difference between the ordinary hide and the so-called packer hide was so great as it has been since the Government undertook to standardize the price of hides?

Dr. ALSBERG. That is true. I would not venture to say what is the cause of it.

Mr. TINCHER. You are sure of this. It was not caused by the misinformation that you gave the farmers as to how to prepare the skins of animals with 20 years' experience.

Dr. ALSBERG. I do not think so.

The CHAIRMAN. What is the main cause now for the difference in price?

Dr. ALSBERG. The main cause is the difference in quality, but that is not the whole cause.

The CHAIRMAN. What makes the difference in quality? Is the hide taken off a fat steer worth more than the hide from a lean animal?

Dr. ALSBERG. Yes. The difference in quality is due to the manner of taking the hide off (the hide may be scored by the knife), to the improper salting, and to improper curing of the hide after it is taken off. It may also be due to the quality of the animal itself. The main thing is that the average man in the country does not know how to take a hide off without hurting it in some place or other.

The CHAIRMAN. That is the main cause?

Dr. ALSBERG. That, and the other cause that after it is taken off he does not properly salt it and cure it.

Mr. MCKINLEY. If the Chairman will permit, I have been in the hide business. Most of the country hides, cow hides or bull hides, or semi-bull hides, are only worth two-thirds of what the steer hide is. When you speak about 54 cents quoted, or 66 cents, which it went up to, that has reference to the most perfect of steer hides.

The CHAIRMAN. Is there not some difference in the quality of hides outside of curing and taking them off?

Mr. MCKINLEY. They are mostly cow hides.

The CHAIRMAN. There is some difference in the hides?

Dr. ALSBERG. I did not understand you. I thought you meant there was a difference in quality between the steer hides taken off in the country and taken off in Chicago. That, of course, is not true. But there are more cow hides and bull hides through the country and they are not worth so much.

Mr. JACOWAY. Will you just state how you ought to take a hide off of an animal?

Dr. ALSBERG. You are getting beyond me.

Mr. McLAUGHLIN of Michigan. That is set forth in the bulletin.

Mr. JACOWAY. Just tell it in a short way.

Dr. ALSBERG. I can not tell you; I do not know myself.

Mr. JACOWAY. You have a bulletin on it?

Dr. ALSBERG. Yes.

Mr. HEFLIN. Is there a difference in the quality of a hide that comes from a well-fed cow than from a poor cow?

Dr. ALSBERG. Yes. There is also a difference according to the climate and according to the breed. Thus furs in the North are of better quality than furs from the South. You get a different quality of leather in tropical countries from that in cold countries.

MORNING SESSION OF THURSDAY, JANUARY 8, 1920—Continued.

Dr. ALSBERG. The question was raised, Mr. Chairman, at the beginning of my statement before you, whether this did not duplicate and interfere with an item of the Bureau of Standards. I am going to be absolutely frank and blunt on the situation, and say that this work is not standardizing work. It began away back about 1902 or 1903, and it has been carried on since that time in a limited way. We began it before the Bureau of Standards undertook any work on leather at all; and if there is any interference between the two bureaus it is that the Bureau of Standards is encroaching, and is operating, so far as this item is concerned, upon a field of work, which, in my judgment, is specifically and definitely a field of work of the Department of Agriculture. I may say, further, that it is not the only instance in which that particular thing occurs. I think the time has come when I should be absolutely blunt on the subject. This is an agricultural material. It is the product of both plant and animal matters. The raw materials are all products of the farm. A larger amount of leather per capita is used by farmers than almost anybody else. They need it not only for their own use but for their harnesses and for other uses, and if there is a subject which is a proper subject of work for the Department of Agriculture, it is the leather industry.

This is not the only encroachment by the Bureau of Standards on work which belongs in the Department of Agriculture. I could give you other instances. I will content myself with only one other instance, inasmuch as it has to do with the Bureau of Chemistry, and that is the encroachment by the Bureau of Standards in the field of the production of sugar and sirups.

Two or three years ago the Bureau of Standards secured an appropriation of \$30,000. I do not know who inspired that appropriation. It makes no difference.

Mr. ANDERSON. They do not need much inspiration, do they?

Dr. ALSBERG. That appropriation is so worded that it gives the Bureau of Standards authority to do anything, in the line of investigation or otherwise, for the production of sugar, excepting possibly the actual cultivation of the cane. It gives them authority to study sugar refining, to standardize sugars, to work on sirups, and to work on molasses—to cover the whole field.

I took it up with the Director of the Bureau of Standards and protested against the proposition, and he stated to me that they had no intention of entering into the field of manufacture. But in his annual report for 1918, the report that appeared in the middle of last winter, in describing the work which the Bureau of Standards is doing on sugar, the text seemed to indicate that Dr. Stratton's assistants have been done some of the things which clearly have to do with the manufacture and production of this food material.

Those are just two instances. I will say to you also very frankly, gentlemen, that one of the reasons for the insertion of this particular item in these estimates was that I might raise this issue of the spheres of the work of the two bureaus, frankly and honestly. We have been doing this work. We would like to continue it. In view of the present high price and the great shortage of leather materials, we would like to extend it; and we think that it is the public interest to do it on a larger scale. That was our main reason.

The other reason was, very frankly, to give me an opportunity to lay this situation frankly before the committee, as I have endeavored to do.

Mr. ANDERSON. We are really glad to find one case where there is an admitted duplication of effort, because we have always understood that such a thing never could occur.

Mr. HUTCHINSON. You said this appropriation for the Bureau of Standards was \$30,000?

Dr. ALSBERG. That is for sugar.

Mr. HUTCHINSON. You said that they could do anything under that? They could not fix the price of sugar, could they?

Dr. ALSBERG. I ought to have qualified that. They could not do that.

Mr. HARRISON. We prepared a memorandum and presented it to the chairman of this committee last year setting forth other lines of work in connection with which the Bureau of Standards had duplicated, or was about to duplicate, the work of the Department of Agriculture.

The CHAIRMAN. I wish you would take that up.

Mr. HARRISON. I do not have the memorandum here this morning, Mr. Chairman, but I shall be glad to bring it up this afternoon.

The CHAIRMAN. I suggested the other day that you present a memorandum showing where these duplications occur.

Mr. HARRISON. I have the memorandum at the office and will bring it up to you this afternoon.

The CHAIRMAN. This is important work. I think you referred to this the other day, at which time we went over it quite thoroughly.

Dr. ALSBERG. Yes. Might I just take a moment or so of your time to give you my views as to a proper division of work between such a bureau as the Bureau of Standards and the Department of Agriculture? I think it is unfortunate that the Bureau of Standards was given the name of the Bureau of Standards, because you can not make standards without going into all kinds of collateral things. Take the matter of grain standards; you can not make grain standards without studying the whole grain industry and also the milling industry. That is perfectly plain, is it not?

The CHAIRMAN. Yes.

Dr. ALSBERG. In the same way that applies to wool and almost anything you want to mention. We are responsible for the enforcement of the food and drugs act. We can not enforce the food and drugs act without taking into consideration what are proper standards of quality and of purity for food products. That is perfectly plain. So we have to do standardization on foods. It is unfortunate that that bureau has this name. My conception of an equitable and efficient division of work between the Department of Agriculture and the Bureau of Standards is that work upon agriculture and industries which draw their raw materials from agriculture is the proper sphere of work for the Department of Agriculture. As for cotton, you can not standardize cotton without taking into consideration the manner in which cotton will behave when you spin it. You can not do anything with cotton seed unless you go into the matter of refining cottonseed oil. I do not think that there ever will be an avoidance of duplication between the Department of Agriculture and such a bureau as the Bureau of Standards until the work is assigned, not by technique or by method, but by fields of work.

In the matter of wool standards, you have to know how the wool will behave in spinning and weaving. The same is true with regard to cotton. You have to know how these materials are produced and for what they are used. If such work is to be done in a separate bureau, then that bureau must cut across every other scientific activity of the Government service.

Mr. PURNELL. Is it your idea that the Department of Agriculture could very properly absorb the Bureau of Standards?

Dr. ALSBERG. No; I do not think that, but I think that the lines of work that are to be done by the Bureau of Standards should be designated once and for all.

The CHAIRMAN. There is work done in the Department of Agriculture that might better be done in the Bureau of Standards?

Dr. ALSBERG. Absolutely. Not merely that, but when I became chief of the Bureau of Chemistry we had in the Bureau of Chemistry a laboratory which was known as the contracts laboratory. In that laboratory were examined the materials bought by the Public Printer, by the Bureau of Printing and Engraving, by the Department of the Interior, by the Supervising Architect—cement, iron, steel, ink, typewriter ribbons, paints, and many others. We were making such examinations.

We had been doing that for many years before the Bureau of Standards. The Bureau of Standards started that work after the Bureau of Chemistry was well in the work.

Now, when I came to the bureau there were two bureaus doing that work. It was not a duplication in a sense, but still it was a duplica-

tion, because the Government had two bureaus doing the same kind of work and had the overhead for both bureaus. It was not a duplication of the work. Thus, the Government Printer thought he could get better results from the Bureau of Standards, and the Bureau of Printing and Engraving thought that it could get better service from the Bureau of Chemistry, so we examined the inks and paper for the Bureau of Printing and Engraving and they examined the inks and papers for the Public Printer. Yet we had a duplication of the overhead, and to that extent it was a duplication. I recommended at that time, and the Secretary of Agriculture and the Secretary of Commerce approved, the transfer of that laboratory. The laboratory and the whole staff were transferred from the Bureau of Chemistry to the Bureau of Standards, as well as the funds which went to the maintenance of the laboratory, an amount of about \$26,000. The men and those funds were taken off of our roll and transferred to the Bureau of Standards.

The CHAIRMAN. In reality there is not a duplication of the work, but the work is done by two different organizations?

Dr. ALSBERG. Yes, sir; that is true.

The CHAIRMAN. Could not everything pertaining to the Department of Agriculture go to the Bureau of Chemistry and everything else to the Bureau of Standards? Is it not possible for you and the Bureau of Standards to get together?

Dr. ALSBERG. I have been trying that for five years, Mr. Chairman.

The CHAIRMAN. It is a matter that the committee will have to take up. It is unsatisfactory at the present time, I think, to both Congress and the department.

Dr. ALSBERG. I think that is what could be done, but we have not succeeded. A conference of Secretary Ousley, Secretary Sweet, Director Stratton, and myself was held, but we did not get very far.

The CHAIRMAN. If you will furnish a memorandum, we will take it up with the other committee.

Dr. ALSBERG. The difficulty, Mr. Chairman, is that the Bureau of Standards and the Department of Agriculture have a different conception of the division of work. The Bureau of Standards' conception of the work is that the Department of Agriculture has to do with production and they have to do with utilization. Now, you must know for what a thing is to be used before you can know how best to produce it. In order to produce the right kind of cotton you have to know its uses; and conversely in order to know how best to use it you must know how it is produced.

Mr. JACOWAY. Is the duplication in the duplication of the overhead for carrying on this work?

Dr. ALSBERG. No; that isn't necessarily true. That was true of the contracts work, but I do not believe it is true with regard to the other work. I believe there has been direct duplication in some of it.

Mr. JACOWAY. The same is true with regard to cotton?

Dr. ALSBERG. I believe there is a direct duplication in the sugar work. It isn't in the matter of the overhead. That is where we do routine work, merely analyze samples. It does not make much difference whether the analysis of 2,500 samples is made in one laboratory and 2,500 are analyzed in another laboratory or whether

5,000 samples are all analyzed in one laboratory. It is not a duplication such as if the samples were analyzed in both laboratories.

The CHAIRMAN. Is there anything else?

Dr. ALSBERG. I think that covers the whole matter.

The CHAIRMAN. Thank you very much, Dr. Alsberg.

(The committee therefore proceeded to take up another matter.)

Activities under lump-fund items, Bureau of Chemistry.

Project.	Allotment, 1920.	Estimate, 1921.	Increase.
Agricultural investigations:			
(a) Administration.....	\$800	\$800
(b) Fruit and vegetable utilization.....	4,500	4,500
(c) Leather and paper investigations.....	13,620	13,620
(d) Stock food investigations.....	1,500	1,500
(e) Plant chemical investigations.....	14,540	14,540
(f) Straw gas utilization.....	1,500	1,500
(g) Protein investigations.....	1,200	1,200
(h) Corn-cob utilization.....	4,740	4,740
	42,400	42,400
Collaboration with other departments:			
(a) Postoffice fraud order cases.....	6,300	8,000	\$1,700
(b) Work for other departments.....	7,700	42,000	34,300
	14,000	50,000	36,000
Food products for export.....	4,280	4,280
Poultry and egg investigations.....	45,000	45,000
Oyster and other shellfish investigations.....	20,000	20,000
Biological investigation of food and drug products.....	15,000	25,000	10,000
Citrus by-products utilization.....	13,000	13,000
Color investigations.....	100,000	100,000
Table sirup investigations.....	12,000	12,000
Enforcement food and drugs act:			
(a) Administration.....	43,131	43,131
(b) Prosecuting cases.....	27,000	27,000
(c) Drug investigations.....	28,040	28,040
(d) State cooperation.....	9,700	9,700
(e) Color certification.....	4,740	4,740
(f) Food control investigations.....	59,820	59,820
(g) Microbiological investigations.....	22,910	22,910
(h) Microchemical investigations.....	15,960	15,960
(i) Stock feed investigations.....	12,150	12,150
(j) Oils and fats investigations.....	7,980	7,980
(k) Pharmacognosy investigations.....	8,420	8,420
(l) Pharmacological investigations.....	5,800	5,800
(m) Phytochemical investigations.....	6,440	6,440
(n) Special investigations.....	29,390	29,390
(o) Water investigations.....	11,540	11,540
(p) Field regulatory work—			
(1) Eastern district.....	149,440	149,440
(2) Central district.....	113,100	113,100
(3) Western district.....	64,660	64,660
	620,221	620,221
Naval stores investigations and demonstrations.....	10,000	10,000
Insecticide investigations.....	25,000	25,000
Dehydration investigations.....	50,000	23,500	26,500
Wool waste investigations.....	9,000	9,000
Leather investigations (new).....		15,000	15,000
Total.....	979,901	1,014,401	34,500

¹ Includes \$720 transferred to statutory roll.

² Includes \$15,140 transferred to statutory roll.

³ Decrease. Includes \$1,500 transferred to statutory roll.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Thursday, December 18, 1919.

AFTERNOON SESSION.

The committee reassembled at 2 o'clock p. m. pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

BUREAU OF SOILS.

The CHAIRMAN. The committee will come to order.

Mr. HARRISON. Mr. Chairman, we would like to have you hear Prof. Whitney, who will present the estimates of the Bureau of Soils.

The CHAIRMAN. We will be glad to hear you, Doctor.

STATEMENT OF MR. MILTON WHITNEY, CHIEF OF THE
BUREAU OF SOILS, DEPARTMENT OF AGRICULTURE.

Mr. WHITNEY. Mr. Chairman, there are several changes in the statutory roll. We are asking for the transfer of an administrative assistant from the kelp investigation to the statutory roll; the transfer of a soil cartographer from the soil survey investigations; a change in designation from "chief draftsman" to "draftsman," dropping the word "chief"; a change in the designation of "clerk-draftsman" to "draftsman."

Then we are asking for two additional draftsmen, one at \$1,600 and one at \$1,200. These do not change the appropriations except in the case of the two new draftsmen.

The CHAIRMAN. You said one at \$1,200?

Mr. WHITNEY. One at \$1,600 and one at \$1,200. We have to ask for these additional draftsmen in order to keep up with the preparation of our soil survey reports. We have a good deal of State cooperation now that is growing and developing, and the volume of work is getting too large for the office force that we have been depending on.

Under item 32, "for chemical investigations of soil types," we are asking for nothing new and no additional funds.

Under item 33, "for the physical investigations of the important properties of soil," we are asking an increase of \$5,000 for no new work, but simply to enable us to keep up with the volume of work that is now upon us.

Mr. McLAUGHLIN of Michigan. It appears that last year the men employed were eight, at \$10,105. This year it is the same number of men, \$15,320. It looks as if that \$5,000 was not for more work, but for more salaries for the same men.

Mr. WHITNEY. It is for more apparatus and more material.

Mr. McLAUGHLIN of Michigan. I gather, from looking over the table on page 159, that in 1919 there were eight men at salaries aggregating \$10,000, and that next year you will have eight men at salaries amounting to \$15,000. There is a \$5,000 increase.

Mr. WHITNEY. Yes; it was necessary to make some increases in salaries in order to hold the men. These are trained physicists, mechanically trained men, and it is necessary to hold them in competition with outside employment. Now, as a matter of fact, our appropriation is down to a point where we can not get sufficient apparatus or material to do the work that we require.

Mr. McLAUGHLIN of Michigan. But you spoke of additional work and additional apparatus, and for that purpose you wanted \$5,000; but it appears that for the same number of men you are going to pay \$5,000 more and that this increase is for an increase in salaries.

Mr. WHITNEY. The increase in salary has been accomplished. We had to do that during the war. Now we are short of money for expenses, general expenses.

Mr. McLAUGHLIN of Michigan. It is the same thing. If you used the money that was available for other expenses and paid salaries with it, and then make up the fund for other expenses by additional appropriations, it amounts to the same thing as an appropriation for additional salaries.

Mr. WHITNEY. Now, if we try to save money to get material, we lose the men, because we have to appeal to them now to get them to stay.

Mr. McLAUGHLIN of Michigan. It just occurred to me that it would be more nearly correct to say that the money was needed for increase of salaries than to say that it was for additional equipment, apparatus, and for additional activities.

Mr. WHITNEY. It has been caused by an increase in the rate of salaries, but the actual increase that we are asking for is, as we state, to get material.

Mr. McLAUGHLIN of Michigan. Because you have taken the money available for materials and paid it out in salaries?

Mr. WHITNEY. Yes.

Mr. McLAUGHLIN of Michigan. Now you have to replenish your fund by additional appropriations?

Mr. WHITNEY. Yes; but that had been done and it was necessary to do it. These men are highly trained men; many of them come from the navy yards, where they are getting very much higher salaries.

Mr. McLAUGHLIN of Michigan. Suppose the increase should not be given, would you still retain those men with the higher salaries with nothing for them to do?

Mr. WHITNEY. Probably they would leave.

Mr. ANDERSON. But you are only estimating for \$1,780 for equipment and material, according to the table you have here.

Mr. WHITNEY. Yes.

Mr. ANDERSON. Then that \$5,000 can not all be for equipment and material?

Mr. WHITNEY. It is for general expenses. It is for a slight increase in the volume of the work and the money that is necessary to keep up the apparatus and the supplies needed for the making of apparatus and doing the work.

Mr. ANDERSON. You are estimating, according to your estimate here, for \$15,320 in salaries. Is that correct?

Mr. WHITNEY. Yes.

Mr. ANDERSON. Then you are estimating for approximately \$1,950 for supplies and traveling expenses and miscellaneous items.

Mr. WHITNEY. \$17,225.

Mr. ANDERSON. Altogether?

Mr. WHITNEY. Altogether; yes.

Mr. HARRISON. Mr. Anderson, you will note that these tables show actual expenditures in 1919.

Mr. ANDERSON. I understand that. I am not talking about that; I am talking about your estimates for 1921, which show that you were estimating for \$15,320 for salaries, and about \$1,900 for general expenses, including travel expenses, equipment, etc. If that is correct, you can't be asking any increase of \$5,000 for equipment and material.

Mr. HARRISON. The note says:

Additional help is required in the laboratory; more funds are needed to provide for the construction and standardization of instruments.

If you will examine the column showing expenditures in 1919, you will note that two of the employees were temporary. They were not employed throughout the year, and, therefore, they did not receive compensation from this appropriation for the full 12 months. This means that we did not have eight full-time employees last year. I do not know the facts in detail, but I think I am safe in saying that we did not have more than five or six full-time employees on this roll throughout the year. If this is true, the estimates for 1921 contemplate two or three additional full-time employees next year.

The CHAIRMAN. The question is how much is for salaries?

Mr. HARRISON. No part of this increase, so far as I now know, is intended to be used for the payment of increased salaries. The purpose of the increase is indicated in the note, and, according to our information, it is entirely correct.

The CHAIRMAN. It is for increased service?

Mr. HARRISON. It is for increased service.

Mr. WHITNEY. And you will remember also that there is a year that is not mentioned here; the year that intervened between 1919 and 1921. This table gives us a contrast between the fiscal year 1919 and the fiscal year 1921.

Mr. HUTCHINSON. Doctor, have you got the expenditures there for 1920—what you paid for salaries?

Mr. WHITNEY. No; I haven't it with me.

Mr. McLAUGHLIN of Michigan. It seems to me this remains: That they had a certain amount of money for salaries and for the other work; they took several thousand dollars of that and paid it in salaries; they didn't have it for the other work or for the equipment; now they wish an additional \$5,000 to make up for the \$5,000 they took out for equipment and paid for salaries.

Mr. HARRISON. We are operating this year—that is, 1920—on a salary basis which is somewhat higher than that for 1919, but I do not think it is true that we have spent several thousand dollars for increased salaries. I do not have the facts in mind, but I do not believe that the increases we have made aggregate more than \$1,200.

Mr. ANDERSON. The increase here in the proposed estimate is something over \$5,000.

Mr. HARRISON. Perhaps Prof. Whitney can recall the facts about these employees. He may remember, for instance, whether the salary of the scientist in charge of the work was increased last year.

Mr. WHITNEY. Yes; he was increased during the past fiscal year.

The CHAIRMAN. What was the increase?

Mr. WHITNEY. The increase was, as I recall, \$250.

The CHAIRMAN. That is the only increase?

Mr. WHITNEY. No; some of the other scientists were increased.

Mr. HARRISON. As I recall it, Professor, the average increase was less than \$200, so that, even if all the employees had been increased by this amount, which I am sure was not the case, the total sum involved would be only \$1,600 instead of several thousand dollars.

Mr. ANDERSON. The system of bookkeeping here apparently doesn't carry out that condition.

Mr. HARRISON. As I have already explained, these tables are prescribed by the Treasury Department. They have been presented in this form for several years, and the committee has not heretofore objected to them.

Mr. ANDERSON. The committee occasionally has new ideas.

Mr. HARRISON. I am not raising any objection to new ideas, but I am merely trying to explain why these tables do not show what you are apparently endeavoring to get at.

The CHAIRMAN. Mr. Harrison, do you not think that the table should indicate the salaries paid?

Mr. HARRISON. Yes, sir. In fact, I think many improvements could be made in these tables. I think also that many improvements could be made in the phraseology of the appropriation bill. At various times we have sought the opportunity to change some of the phraseology, to simplify it and make it clearer, but usually the suggestion has been made that the changes should be reduced to the minimum because of the difficulty of getting them through on the floor of the House.

The CHAIRMAN. That is true of anything subject to a point of order, but the phraseology could be changed.

Mr. HARRISON. I shall be very glad next year to consult with you about this matter and see if we can not so improve the tables that they will give the committee full and complete information. I realize full well that they are not clear in the present form.

Mr. McLAUGHLIN of Michigan. I haven't the slightest objection to the increase in these salaries. I think in all probability not one of them is getting more money than he ought to have, but the increase asked here is for increase in salaries and not for increase in equipment or for increase of funds to do other work.

Mr. HARRISON. Suppose the salary of one of these men had been increased \$250 the first of January, 1919. This would mean the payment of only \$125 additional during the fiscal year 1919. The full amount of \$250, however, would be paid during the fiscal year 1920, under which we are now working. Our estimates for 1921, of course, are made on the basis of the 1920 appropriation, while these tables compare *estimated* expenditures in 1921 with *actual* expenditures in 1919, leaving out 1920 altogether.

Mr. McLAUGHLIN of Michigan. Now you say that this last column here, 1919—

Mr. HARRISON (interposing), Which closed on June 30 of that year.

Mr. ANDERSON. It is perfectly clear that last year you had \$12,225.

Mr. HARRISON. Yes.

Mr. ANDERSON. If you used all of that for salaries, which you did not, you are asking for an increase in salaries, apparently, according to your figures here, of something like \$3,000.

Mr. WHITNEY. For new men.

Mr. HARRISON. As compared with what we actually expended in 1919.

Mr. ANDERSON. No, that is what your figures were in 1920.

Mr. McLAUGHLIN of Michigan. You had only \$12,225 in 1920, the same amount in 1919, the same amount in 1918, and in 1917; and there was some of that certainly that was used for something besides salaries; so that now you propose to use \$15,320 for salaries which is at least \$3,000 more than you had for all purposes during any year up to the present time. I am not objecting to the increase of salaries, but I do take exception to Dr. Whitney's statement; I think he is in error in saying that the increases were for other objects and not for salaries.

Mr. HARRISON. If you will run down each column, Mr. McLaughlin, I think the situation will be clear. Take the first case. You will see that we paid \$3,500 to one employee in 1919, and that we are estimating for one at the same salary in 1921. The same is true of the next case, involving a salary of \$2,500.

Mr. McLAUGHLIN of Michigan. Wait a minute. Mr. Whitney says that that \$3,500 man has been increased in salary \$250 since 1919.

Mr. HARRISON. I think he was in error if he made that statement. I think the action was taken during the fiscal year 1919, that is, prior to June 30, 1919. If you will go down the line, you will see that we estimate for one new employee at \$1,800. That accounts for \$1,800 of the \$5,000. We had one temporarily employed during 1919 but he has left the service. There was one at \$1,740 in 1919.

Mr. McLAUGHLIN of Michigan. The \$1,740 one is dropped?

Mr. HARRISON. He has gone out of the service.

Mr. McLAUGHLIN of Michigan. Still the increase is \$5,000.

Mr. HARRISON. If you will examine the two columns again, you will see we had one at \$1,500 in 1919. We propose to have two at that salary in 1921, that is, we intend to employ another one at \$1,500 next year. This, with the \$1,800 already referred to, accounts for \$3,300 of the \$5,000.

Mr. McLAUGHLIN of Michigan. Less \$1,740.

Mr. HARRISON. The employee receiving that salary in 1919 was on the rolls only for a short time, perhaps two or three months.

Mr. ANDERSON. Is there any rule as to the amount of time a man can be employed as a temporary employee, designated as a temporary employee?

Mr. HARRISON. The usual period is not to exceed six months. Ordinarily, the Civil Service Commission will not authorize the temporary employment of anyone for a longer period than three months at a time. If the work requires it, however, the Commission will usually authorize the extension of the employment for a further period of three months.

Mr. ANDERSON. Then when it says "temporary" here, it means employment less than six months?

Mr. HARRISON. Yes, sir; in practically all cases.

To return to the tables, you will note that we had one employee at \$1,320 in 1919 and that we estimate for one at the same salary in 1921. The same is true of the \$2,000 and \$1,200 places.

The CHAIRMAN. What does "part time" mean?

Mr. HARRISON. It means that the salary of the employee concerned was paid partly from this appropriation and partly from some other appropriation, depending upon the work upon which he was engaged at various times during the year.

(The following statement is inserted to clarify the foregoing:)

Physical investigations.

Employees.	Estimated, 1921.	Roll for 1920.	Expended, 1919.

5 5½ months.

6 6 months.

The CHAIRMAN. What is the next item?

Mr. WHITNEY. The next is No. 34, "for exploration and investigation within the United States to determine possible sources of supply of potash, nitrates, and other natural fertilizers." We are asking for \$18,650 additional there.

The CHAIRMAN. Tell us what you can about potash and other fertilizers.

Mr. ANDERSON. Let us have nitrates first.

Mr. WHITNEY. All right. Our own force has been working steadily on the fixation of nitrogen from atmospheric air, using the Haber process and also the silent discharge, the electric spark. We have been cooperating with the War Department. During the war the War Department was our guest at the Arlington Farm. After the cessation of hostilities the War Department organized a nitrogen fixation plant of its own and asked us to become its guests at the American University. That is a research organization that is working particularly on the problems presented by the great plants that they have put up in different parts of the country, and they wanted our force to help them. We were glad to go over with them because they gave us facilities that we could not afford, and we gave them experienced men which they could not otherwise have obtained. Our own force is still working under our direction. We have our own machinery over there, and they have a big testing machine. We are working on the commercial production of ammonia by the Haber process.

Mr. ANDERSON. What is the process at Muscle Shoals?

Mr. WHITNEY. There are two plants in Alabama—the cyanamid plant and the Haber plant. The Haber plant is not in operation. Both departments are using every endeavor to get the method and the equipment down to the best possible point of efficiency. It is very largely a matter of mechanics and of mechanical equipment. The method works very well indeed, but it is very difficult work, because it has to be done under very high pressure.

Mr. ANDERSON. But the stuff that they are prepared to produce at Muscle Shoals is not suitable for fertilizer, is it?

Mr. WHITNEY. You are probably referring to cyanamid. Of course I ought not to speak for the War Department in this matter, but I will tell you that they can produce fixed nitrogen in the form of cyanamid at a very low cost.

Mr. ANDERSON. Cyanamid has to go through another process before it can possibly be used for fertilizer, doesn't it?

Mr. WHITNEY. No, sir; it has been used for a number of years as such in Europe. It is a black and very dusty powder, and is very irritating to work with. It does more or less damage to plants as it drifts over them. It is rather caustic and has not been a very great success. It is not in favor in Europe. Unfortunately it does not lend itself to mixing with acid phosphate, or to being used as a material for mixed fertilizers. Europeans are accustomed to making applications of material in an unmixed form; they commonly do it, but even they object to the use of cyanamid and are not satisfied with it. In this country we very seldom are willing to use the unmixed material. We use the mixed fertilizer to a very large extent.

Mr. ANDERSON. Does the experimentation which you are undertaking now contemplate the utilization of the cyanamid which may be made at Muscle Shoals, or does it not?

Mr. WHITNEY. Yes; it includes that also, to determine what can be done to that cyanamid to put it into a form in which it will be acceptable to our fertilizer manufacturers and to our farmers.

The work we are doing on the Haber process, which is the more extensive of the two, is the perfecting of the method for causing a direct combination between hydrogen and nitrogen gases. It is perfectly possible to do it, but it is a very difficult thing to do on a commercial scale. The War Department has had several parties go abroad to study the English works, to study the French works, and they have also seen the German works. Neither the French nor the English are any further advanced than the United States. Personally, I believe that they are not as far advanced, but that perhaps is a question of country pride.

The German works turned out a considerable amount of fixed nitrogen by the Haber process, but the methods used by them are not thoroughly understood. Apparently there is a great chance for improving the method and making it less dangerous.

The CHAIRMAN. Can it be made commercially practicable?

Mr. WHITNEY. I think it can, Mr. Chairman. We all think it can.

The CHAIRMAN. What is the present cost?

Mr. WHITNEY. The present cost of ammonia varies. In nitrate of soda, which has always been the standard, it is about \$3 a unit of ammonia, and a unit is 20 pounds. In tankage, dried blood, fish scrap, and cottonseed meal, what we call the organic ammoniates, it is from \$6 to \$9 a unit.

The CHAIRMAN. How do they compare with the prewar prices?

Mr. WHITNEY. The price I have given you for nitrate of soda is about 25 per cent higher than the prewar price.

The CHAIRMAN. Where was it obtained before that?

Mr. WHITNEY. From Chile, just where we obtain it now. The prices per unit of ammonia in the organic ammoniates followed very closely the unit price of ammonia in nitrate of soda, but in the middle part of the calendar year 1918, matters were disturbed and instead of them all going along together in order, the ammoniates went up, due in very large part, Mr. Haugen, to their use as feeding stuffs. Cottonseed meal in the past two or three years, tankage, and dried blood, and fish scrap to a less extent, have been used in increasingly large proportion as feeds. When you buy them for fertilizers you are buying them for a cheaper product.

Mr. ANDERSON. With reference to the production of nitrogen, fixed nitrogen, on a commercial scale, I understand that the completion of the Muscle Shoals project with a view to the production of fixed nitrogen in a form suitable for fertilizer would cost in the neighborhood of \$120,000,000, and as a maximum output that plant will produce a return of 5 per cent on \$58,000,000.

Mr. WHITNEY. I would rather not speak for the War Department. That is their responsibility. It has been put upon them by Congress and by the President, and we are doing our best to help them out, but as I tell you, not so much with this cyanamid, which I think you referred to, as to the Haber plant, which appears on the face of it to be a more hopeless problem than the cyanamid plant, but which we think can eventually be made to produce commercial ammonia for fertilizers. It doesn't make any particular difference what the price of the organic ammoniate is, so far as fertilizers are concerned they are going out of use. They are being applied now more and more and will be applied almost exclusively to feeding purposes. The fertilizers that the farmers use must have another source of nitrogen. It is not a question of whether you and I want it or not, it is coming. We are not going to have organic ammoniates, and we have got to reorganize our fertilizer ideas, our fertilizer requirements. We are not going to have the organic forms of ammonia that we have been using in our fertilizers in the past, and we must find something; we have got to provide a form of fixed nitrogen.

The CHAIRMAN. Just one question, Doctor; does the price quoted include the overhead charges and interest account?

Mr. WHITNEY. You mean the price of the ammonia that I gave you?

The CHAIRMAN. Yes.

Mr. WHITNEY. Yes, that is the trade quotation.

The CHAIRMAN. The cost of production, I believe you stated, was \$3 a unit?

Mr. WHITNEY. No, that is not the cost of production; that is the trade price, the market price.

The CHAIRMAN. What is the cost of production?

Mr. WHITNEY. Mr. Haugen, it is a very difficult thing to tell you.

The CHAIRMAN. Can you say approximately?

Mr. WHITNEY. Yes, I will just tell you what the difficulties are: They are waste products, the product from which this ammonia is derived. Take for instance the cottonseed meal; you buy the cotton

seed on the farm; you grind it up and crush it and it goes into oil and meal and hulls and linters.

The CHAIRMAN. I had reference to what is produced at Muscle Shoals.

Mr. WHITNEY. The cost of production of fixed nitrogen?

The CHAIRMAN. Yes.

Mr. WHITNEY. That is a War Department matter, and I would prefer not to discuss that.

The CHAIRMAN. Have you investigated it so that you could state the approximate cost?

Mr. WHITNEY. I have reports from them.

Mr. HUTCHINSON. Doctor, let me help you out. Haven't they abandoned all their Ohio plants and the Muscle Shoals plants? They are not using them, are they?

Mr. WHITNEY. They are not using them now.

Mr. HUTCHINSON. You spoke about cyanamid. You know that cyanamid is sold cheaper than ammonia, don't you?

Mr. WHITNEY. It is the cheapest source of ammonia.

Mr. HUTCHINSON. You spoke about ammoniates. Don't you think that the farmer, if he confines himself to mineral ammonia, will never be very successful? You wouldn't want to advocate that, would you?

Mr. WHITNEY. No; I would personally be very sorry to see the organic ammoniates go out of the fertilizer market, but they are going. They are going into use for feeding purposes.

Mr. HUTCHINSON. I don't think so. I find it entirely different from that. The farmers will pay three times as much for organic ammonia as they will for mineral ammoniates.

Mr. WHITNEY. Certainly they will.

Mr. HUTCHINSON. And they are getting results.

Mr. WHITNEY. They are getting results, yes; but the facts are that in 1913 there was at least 800,000 tons of cottonseed meal used for fertilizers. In 1918 there were only 270,000 tons and the amount is steadily declining.

Mr. HUTCHINSON. And what is your deduction?

Mr. WHITNEY. The ammonia that would otherwise have been supplied by the organic ammoniates has been supplied by the mineral ammoniates.

Mr. HUTCHINSON. Then your production is less, isn't it?

Mr. WHITNEY. You can't say that.

Mr. HUTCHINSON. Your cotton crop is. That is where most of it is used.

Mr. WHITNEY. There is nothing to do about it except to face it.

Mr. HUTCHINSON. I have had some experience in fertilizers. I manufacture them, and my experience is that when you use a certain amount of nitrate of soda, say 200 pounds, that is your limit; when you use 400 pounds, get it 4 per cent or more, then you are going to the extreme and you reduce your production every time.

Mr. WHITNEY. Yes; it would be unfortunate with our system of agriculture to lose the organic ammoniates.

Mr. HUTCHINSON. You speak about cyanamid—that you can't use it. Don't you know that 50 to 100 pounds to the ton of fertilizer is an advantage?

Mr. WHITNEY. Fifty or one hundred pounds, but that is not what they want.

Mr. HUTCHINSON. That is 1 per cent. The biggest part of your goods is not over 2 per cent. That is half.

Mr. WHITNEY. It can be used under those percentages.

Mr. HUTCHINSON. And you can use it to an advantage. Now that is half, so I don't see why you say it can not be used for fertilizer. If we can make cyanamid in this country which we are getting from abroad—I am using it in all my goods from 50 to 100 pounds to the ton, and it is a big advantage. That is all I want to say.

The CHAIRMAN. Tell us about this \$5,500 for the development of phosphate fertilizer investigations?

Mr. WHITNEY. We have been working for a number of years on the preparation of phosphoric acid without the use of sulphuric acid. We tried the electrical method and had success. It is perfectly possible to get the phosphoric acid out of the rock by fusing it up in the electric furnace with coke and lime and silica, but it was a little bit too expensive. It cost to produce it at the time we made the investigations on a semicommercial scale, about 5 cents a pound, and by sulphuric acid it could be made for about 3 or 4 cents a pound; therefore we have been trying to cheapen the cost by using another source of energy, particularly oil fuel, and we have built or rather are building a furnace, on a semicommercial scale, and we are just struggling along. We haven't the funds to put in as much as we would like into this semicommercial type of investigation.

Mr. McLAUGHLIN of Michigan. Where is this furnace located?

Mr. WHITNEY. At Arlington Farm. We have had to take down our electrical furnace. We hadn't money enough to keep both operations going. We are asking for a larger appropriation so that we will be freer to do work of this kind.

Mr. McLAUGHLIN of Michigan. Are you satisfied with the progress you are making?

Mr. WHITNEY. Yes, sir; we are getting very good results. The fertilizer people are watching the results with a good deal of interest.

Mr. HUTCHINSON. How are you getting along with that development? That seems to me to be the best thing I know of in the way of fertilizer, if you can get something to do away with the sulphuric acid.

Mr. WHITNEY. Yes; we can get phosphoric acid without the use of sulphuric acid. It will be in a concentrated form and we can neutralize it with ammonia or with potash, both of which we have in this country.

Mr. HUTCHINSON. Because sulphuric acid does the ground injury, doesn't it?

Mr. WHITNEY. Yes; and there is an unnecessary weight to cart around.

Mr. HUTCHINSON. I think that is one of the biggest advantages. If you can get it so that you can make phosphoric acid without sulphuric acid, you are going to do a great thing for the country.

Mr. WHITNEY. It is perfectly possible. I have a fertilizer that I have had put up as an ideal fertilizer. It is a mixture of potassium phosphate, ammonium phosphate, and ammonium nitrate. Everything is soluble, everything pays its own freight. There are no waste products in it at all, and if it requires the addition of filler you can put it in in the form of peat or anything you want to use. In making a formula with equal parts, say, 4 per cent each of ammonia, phosphoric acid, and potash, you would have to use 80 pounds of filler for 100 pounds of fertilizer. That shows how much

freight you are paying on useless material in transporting fertilizers around the country.

The CHAIRMAN. The question is what will be the expense of extracting it?

Mr. WHITNEY. I was just saying we have got it down to 5 cents a pound, but we should get it down to $3\frac{1}{2}$ or 4 cents, and we think we can get the expense down by using oil fuel instead of the electric current, unless we could get the current from some cheap water power, which no longer exists in this country.

Mr. McLAUGHLIN of Michigan. How long have you been carrying on this experimental work?

Mr. WHITNEY. We carried on the electrical work about one year before the war; then we had to suspend in order to increase work in other directions. Immediately after the armistice we were able to start again working on an oil furnace. That is a very difficult thing, because while it is perfectly possible to do the work, we had to do it—or to show that it could be done—on a semicommercial scale. We have been experimenting with the preheating, and with the scrubbing and the washing of the gases so that we could use them as fuel. That is being worked on and we have had to change our plans. What seemed a simple thing proved to be a difficult thing and we have had to change our plans repeatedly. We have the furnace and we have had several runs with it, but have not yet been able to give it a high-temperature, continuous run, which we will do as soon as we can.

Mr. McLAUGHLIN of Michigan. You say you found it necessary to stop on account of the war? Do you mean at the time we got into the war, April, 1917?

Mr. WHITNEY. Yes.

Mr. McLAUGHLIN of Michigan. How long a period before that time did you take up the work?

Mr. WHITNEY. We had been working on it up to that time, about two years, on the electrical energy side.

The CHAIRMAN. How about the quality of phosphoric acid from the various sources?

Mr. WHITNEY. So far as we know, there is no difference, Mr. Chairman, whether the phosphoric acid comes from bone or whether it comes from rock. Of course if you use bone you have nitrogen as well as phosphoric acid, but the phosphoric acid itself appears to be the same.

The CHAIRMAN. At present they ship the rock in the raw form and it is not being extracted?

Mr. WHITNEY. They ship the rock in the raw material form. They dry it and that is all they do to save the freight. They also pick out the different grades, and they must have only a small amount of lime present; they must have only a small percentage of iron and alumina, or the acid phosphate manufacturer rejects it.

The CHAIRMAN. Your suggestion is to extract it and save the freight on the filler?

Mr. WHITNEY. Extract it on the ground. And not only that, Mr. Chairman, but with this method we can use the waste material that is put on the dumps now. As a matter of fact, we are only using a very small proportion of the rock we mine, because it has to be selected. There is a great deal of the material that goes on

the dump that would yield an ample amount of phosphoric acid. We are very wasteful in our mining of phosphate rock. We send a good deal of rock to Europe and we pay the freight, on this bulky material.

The CHAIRMAN. What is the percentage of waste or worthless material?

Mr. WHITNEY. Of the stuff that is actually thrown out that could be used, that contains phosphate?

The CHAIRMAN. Of the rock that has no value?

Mr. WHITNEY. I don't remember the figures. I should say that three-quarters of the phosphoric acid that is mined is left on the dump.

Mr. HUTCHINSON. In other words, Doctor, you mean that that is such a low grade that it wouldn't pay to ship it?

Mr. WHITNEY. It would not pay to ship it.

Mr. HUTCHINSON. It just has a small percentage of phosphoric acid in it?

Mr. WHITNEY. Or it has so much iron and alumina that the manufacturers would not take it.

The CHAIRMAN. Has it enough phosphoric acid in it to pay to extract it?

Mr. WHITNEY. Oh, yes.

The CHAIRMAN. A question has been raised here as to the quality of certain phosphoric acids.

Let us turn to the next item, \$5,660 for potash investigations.

Mr. WHITNEY. The potash situation we are working on as we have heretofore, looking up material and investigating possible sources. We have done a good deal to develop domestic sources of potash in this country, and some of them have been kept up and some of them have not. It has been a very unfortunate period. During the active operations of the war, when there was an embargo on the exportation of European salts, the price went up and encouraged production, and a considerable amount, estimated at about a quarter of what we need in this country, was produced. Unfortunately sufficient care was not taken in the preparation of some of the salts, and borax got in in very large amounts in one locality and did damage in certain sections where large quantities of the material had been used in the drill.

Borax is a natural accompaniment of earthy salts that have accumulated in the way of these deposits. In the deposits of nitrate of soda, in the potash deposits at Searles Lake, in the deposits in Europe—the Strassburg deposits—borax is found with the other salts. It is only a question of the locality, of the character of the rocks from which this material has come, as to how much borax there is present, and there is also the necessity of separating it from the potash. It can be done; it is being done; it is perfectly easy and feasible to do it. It simply was overlooked. We are now getting from Chile what they sell as nitrate of potash, or high potash nitrate, as they call it, which is obtained from the mother liquor after the extraction of the sodium nitrate. It is a residue. It was a trace that was originally there, which they concentrate until they get a product containing from 11 to 17 per cent of potash in the form of nitrate of potash, and about 15 per cent of ammonia, or nitrogen figured as ammonia.

Unfortunately, like all of these natural deposits, especially when you get down to the dregs, or the final residues, there is considerable borax. In this case, this material runs from 1 to 4 per cent of borax.

Mr. McLAUGHLIN of Michigan. That is the Chilean nitrate?

Mr. WHITNEY. In the Chilean residue; not in the nitrate of soda, but in the material that is left after the commercial nitrate of soda has been extracted.

Mr. McLAUGHLIN of Michigan. Then, in that stuff that they shipped to us as potash——

Mr. WHITNEY (interposing). As nitrate of potash.

Mr. McLAUGHLIN of Michigan (continuing). There is from 1 to 4 per cent of borax?

Mr. WHITNEY. From 1 to 4 per cent borax. And unfortunately it is a low-grade potash salt, you see, only 11 per cent; but if that is taken out—if those salts are taken out by refrigeration, by quick chilling, they get a very small trace of borax, but when they prepare the material by simply evaporating the whole residue, then they get these larger amounts. They will have to install refrigerating machines and centrifugal machines, as they have in California, at Searles Lake, and get this out, leaving the final mother liquor containing practically all the borax to be thrown away or used for other purposes. It is a simple operation. It can be done, and they must do it. But we have had to protect the farmers against the possible danger of the stocks that are already here, which we don't want to shut off, because there is a shortage of potash anyway. The German and French supplies haven't yet come over in anything like the volume that we expected.

Mr. McLAUGHLIN of Michigan. If that Chilean product is used here, containing as much borax as that, it had better be shut off, because it is harmful.

Mr. WHITNEY. Mr. McLaughlin, it is not harmful if it is properly used. I have just sent out a letter to the State fertilizer officials, showing that where the percentage of borax is high, if they adjust the amount that they use per acre so that they do not exceed the limits of safety that we show, it is perfectly safe. For example, if they have one-tenth of 1 per cent—which is the limit that we have prescribed, beyond which they have to label the amount of borax present—they can use 2,000 pounds of fertilizer in the drill and have 2 pounds of borax per acre, which is a safe limit. That would be considered a trace. That is all right. Now, when they have 1 per cent of borax present in the fertilizer they can use 200 pounds in the drill and still have 2 pounds of borax per acre. Now, when they broadcast their fertilizer, the limit of safety is still further increased. They can then use five times as much, or 10 pounds per acre. By broadcasting the fertilizer, and with moderate application, the manufacturer can use almost any grade of potash salt and the farmer keep within the limit of safety.

The CHAIRMAN. Then they are necessarily limited in the use of fertilizer?

Mr. WHITNEY. No; not in a way. For instance, with 2 per cent of borax in a mixed fertilizer, which is a very large amount for mixed fertilizer, they could use 500 pounds per acre broadcast. Well, now the average application on general farming lands is not over 200 or 400 pounds to the acre, so that for general farming where the application is not over 400 pounds, the borax content would not cut any figure. But the farmer ought to know so he can protect himself.

Mr. HUTCHINSON. Up in our section we use from 20 to 30 hundred to the acre.

Mr. WHITNEY. Two thousand to 3,000 pounds?

Mr. HUTCHINSON. Two thousand to 3,000 pounds? What are you going to do with that?

Mr. WHITNEY. Of course, that is known now. We couldn't make that limit—we made it just as low as we felt we should.

Mr. HUTCHINSON. The only way you can inform them is through the experiment stations, isn't it? You can under the war power make them put it on the bag now, but the war will probably be over before the goods will be delivered next spring. Then what?

Mr. WHITNEY. I don't know. They are settling this point right now. We have sent this information out to the directors of the State fertilizer control, to the directors of the experiment stations, to all agricultural journals, and to all the county agents, showing them what they will do when this information appears on the bags, just how they can use that fertilizer. That will enable us to use this material and tide over this emergency until we can get straightened out.

Mr. HUTCHINSON. There is no borax in any potash except in Searles Lake, is there? There is none in Nebraska, is there?

Mr. WHITNEY. There is a trace; yes. You can't certify that any earthy salts that are collected in that way will be perfectly free from borax.

Mr. HUTCHINSON. They, on their contracts, guarantee no borax in their goods—the Nebraska people do.

Mr. WHITNEY. I don't think there is a guarantee of the absence of borax in anything that comes from the soil, that has accumulated in that way. Nitrate of soda has it, but in very small amounts.

Mr. McLAUGHLIN of Michigan. As to the Nebraska product, you say there is a trace. How much?

Mr. WHITNEY. I don't know. We haven't investigated. We are making a careful investigation now of all the materials.

Mr. McLAUGHLIN of Michigan. You have made an analysis of some of the Nebraska product, have you?

Mr. WHITNEY. I have some of the results; yes. I don't carry them in mind.

Mr. McLAUGHLIN of Michigan. You don't recall?

Mr. WHITNEY. It is very small.

Mr. CANDLER. Are you giving people everywhere throughout the country information as to where the danger lies with reference to borax and to what extent they can go—beyond which they must not go unless they take the consequences?

Mr. WHITNEY. Yes; and I think inside of a year the whole thing will be straightened out. This is only made necessary by the disastrous effect of the use of Trona potash this year.

Mr. CANDLER. You say 2 pounds to be used in the drill is the limit, and 5 pounds to be used broadcast?

Mr. WHITNEY. Ten pounds broadcast.

Mr. McLAUGHLIN of Michigan. Per acre?

Mr. WHITNEY. Yes.

The CHAIRMAN. There is a way that the borax can be extracted from the potash?

Mr. WHITNEY. Oh, yes; and the companies that are responsible for this are purifying their product now.

The CHAIRMAN. Is the process expensive?

Mr. WHITNEY. Not particularly; no. It is the way they extract it. Instead of evaporating it all down they have got to crystalize it out, preferably by refrigeration—that is, by cooling down suddenly—and your potash separates out, and your borax stays in the mother liquor. Then if you take that out as you do sugar, in a centrifugal machine, it flings off the mother liquor. The borax is in the mother liquor. You have got to keep that away from your valuable salts.

The CHAIRMAN. It can all be treated so as to make it serviceable or valuable?

Mr. WHITNEY. Yes, sir; and they are going to do it.

The CHAIRMAN. Will it be necessary to standardize fertilizers from now on to protect the consumer?

Mr. WHITNEY. It ought to be done.

Mr. McLAUGHLIN of Michigan. There are several sources of potash, including Germany, and we are getting some from the cement factories, some from Nebraska, some from California, and some from kelp?

Mr. WHITNEY. And some from Chile; and that is one of the largest sources we know of, one of the largest that has been developed.

Mr. McLAUGHLIN of Michigan. How much are we getting from other sources? In what proportion is the supply from other sources to Chile?

Mr. WHITNEY. I haven't the figures just now. As I tell you, it has been a very unsettled condition. For a time the kelp plant closed down, the Nebraska plants all closed down, the cement mills closed down. All were afraid of a sudden dumping of this material from Europe. It almost appeared as if they thought that there were millions of tons afloat at the time of the signing of the armistice, and just as soon as the word was given that the bars were down these would be dumped right over into New York. Nothing of the kind happened.

Mr. McLAUGHLIN of Michigan. So that the local production ceased?

Mr. WHITNEY. It ceased, yes, for fear of this European competition. Now they have started up again, but the quantity produced has been very materially cut down by that period of uncertainty.

Mr. McLAUGHLIN of Michigan. Was the amount being produced at the cement factories increasing satisfactorily up to that time?

Mr. WHITNEY. Yes; everything was proceeding satisfactorily.

Mr. HUTCHINSON. Doctor, have you made any inquiry in South America? I understand that there is more potash there than there is in any other country in the world—more than there is in Germany.

Mr. WHITNEY. Yes; in connection with the nitrate of soda deposits.

Mr. HUTCHINSON. You are making investigations there?

Mr. WHITNEY. Yes.

Mr. McLAUGHLIN of Michigan. And from Chile?

Mr. WHITNEY. Yes. Mr. Chairman, we have Dr. Turrentine here, who has charge of the kelp plant and who has developed that work. I would like to have him speak, but I would like first to take up the increase requested for the soil survey.

The CHAIRMAN. Very well.

Mr. WHITNEY. We have asked for an increase of \$33,200 for the soil survey, to provide additional funds to meet the funds that are being appropriated by the States.

Mr. ANDERSON. What States are cooperating with you now, Doctor?

Mr. WHITNEY. Would you like to have me read the list of States?

Mr. ANDERSON. I would like to know what States are cooperating.

Mr. WHITNEY. In 1918 they were Alabama, California, Georgia, Idaho, Indiana, Iowa, Kentucky, Maryland, Minnesota, Mississippi, Missouri, Nebraska, New Jersey, New York, North Carolina, North Dakota, Ohio, Oregon, Pennsylvania, Tennessee, Virginia, Washington, West Virginia, Wisconsin, and Texas.

Mr. McLAUGHLIN of Michigan. Do you have there the amount that that each State contributes?

Mr. WHITNEY. Yes.

Mr. McLAUGHLIN of Michigan. You had better read that and let it go into the record.

Mr. WHITNEY. These figures are correct so far as I am informed. Of course, we have nothing to do with the actual appropriations, the actual expenditure of State funds. They meet the expense of their cooperation and we meet our own. Now, this is a statement that I have received from the States, or where they have not furnished a statement the amount that I have estimated the expenditures on soil-survey work.

Mr. CANDLER. On what ground do you cooperate?

Mr. WHITNEY. We pay our own expenses and they pay theirs, but as nearly as possible we provide an equal number of men and an equal amount of money.

Mr. McLAUGHLIN of Michigan. That was 1918?

Mr. WHITNEY. Yes.

Mr. McLAUGHLIN of Michigan. Have you that for 1919?

Mr. WHITNEY. Yes, sir.

Mr. McLAUGHLIN of Michigan. Wouldn't it be well to put into the record each year?

Mr. WHITNEY. I have also the approximate amount of money spent by the cooperating States since 1900, if you would like it. That is the amount of money that they have spent each year, so far as we are informed, in actual cooperation with the bureau.

Mr. McLAUGHLIN of Michigan. That is all part of the same table?

Mr. WHITNEY. Yes, sir.

Mr. McLAUGHLIN of Michigan. Could it all go in together?

Mr. WHITNEY. If you would care to have it.

The CHAIRMAN. You had better insert the full table. Without objection, it will be done.

(The paper referred to follows:)

Approximate total amount spent by cooperating States for soil surveys, 1900 to 1919, inclusive.

1900.....	\$3,500.00	1911.....	\$34,967.53
1901.....	1,500.00	1912.....	46,631.43
1902.....	1,839.15	1913.....	61,705.57
1903.....	1,748.35	1914.....	60,692.81
1904.....	2,377.57	1915.....	72,068.14
1905.....	422.22	1916.....	47,687.41
1906.....	699.47	1917.....	63,907.68
1907.....	2,010.60	1918.....	96,780.95
1908.....	7,517.94	1919.....	103,314.33
1909.....	10,837.28		
1910.....	24,919.26	Total.....	645,127.69

Funds expended by cooperating States for soil survey work for the years 1918 and 1919.

1918.		1919.	
Alabama.....	\$1, 290. 68	California.....	\$2, 706. 97

Total.....	94, 028. 90		

Mr. ANDERSON. Doctor, I gather from your report that most of the soil survey work is done in the South. What is the reason for that?

Mr. WHITNEY. No. The organization of the soil survey field force is this: The men are working out in the field all the time; many of them have not been in Washington headquarters for years; and as this is all outside work and all surveying work they have to be moved during the cold season into the South; and the only time they can work in the North is during the warm season. So we aim to keep the parties in the Southern States for about four months of the year. If we haven't finished we may keep them a little longer. Now, of course, the area of the Southern States is very much smaller than the area of all the rest of the country, and during these four months we concentrate our people in this area in which work can be done practically every day during the winter months; and as soon as that period is passed and the weather becomes settled in the North, we scatter them to all parts of the United States.

Mr. ANDERSON. That is probably the explanation for the situation which seems to be indicated by your report of the acreage covered in the different States, and I notice—calculating it roughly—it struck me that about one-half of the total acreage that you have already surveyed was in the Southern States, as you have indicated.

Mr. WHITNEY. In the case of Alabama, we have kept the party there—they appropriated \$10,000 a year for six years—and we are just winding up there. We have kept a party there throughout the year to meet their cooperation; but in other cases we are sending men to the North and we use them in the South during that period when they can not work in the North—or, rather, it is the period

when they can't work in the North that we send them south, so that they can continue their work.

Mr. CANDLER. They take advantage of the sunny South to do the work there when they can't work in the North?

The CHAIRMAN. Is preference given to the States that are cooperating with you?

Mr. WHITNEY. Yes; we give them preference.

The CHAIRMAN. I notice you are asking for an addition of \$3,000 each for certain States that cooperate and an additional \$9,000 to encourage work in States where they do not cooperate.

Mr. WHITNEY. Yes. Practically all of the work that we do in the summer time is done in cooperating States.

The CHAIRMAN. Do you not think that States which profit by the work of the department should be made to cooperate or go without the service?

Mr. WHITNEY. That is a question. It would seem to be unwise, because the soil boundaries do not follow State boundaries, and this is a national problem. But you will see that a great many of the States are cooperating.

Mr. CANDLER. That is growing more and more every year, isn't it? States are coming in that haven't cooperated heretofore?

Mr. WHITNEY. Yes. Now, Mr. Chairman, if there are no other questions, I would be glad if you would hear Dr. Turrentine.

The CHAIRMAN. You do not care to comment on the other items?

Mr. WHITNEY. No.

The CHAIRMAN. There is no increase?

Mr. WHITNEY. No.

Mr. McLAUGHLIN of Michigan. If the doctor's statement would consume more than the time remaining until 6 o'clock, hadn't we better take it up to-morrow morning?

Mr. TURRENTINE. My statement will be very short.

The CHAIRMAN. We will hear you now, then.

**STATEMENT OF MR. J. W. TURRENTINE, BUREAU OF SOILS,
IN CHARGE OF THE EXPERIMENTAL KELP-POTASH PLANT
AT SUMMERLAND, CALIF.**

Mr. TURRENTINE. Mr. Chairman, as Prof. Whitney has directed his statement to the general potash situation, I will proceed to the discussion of the situation in regard to the kelp-potash industry.

The American potash situation is still acute. At the time of the original appropriation by Congress for a survey of American potash resources, American farmers were receiving from Germany all the potash that was required and at the very low price of 60 cents per unit, delivered at Atlantic seaports. But on account of the absolute dependence on this foreign source, the American farmer being at the mercy of the foreign producer, it was highly desirable that America produce at least a portion of this potash and to an equivalent degree achieve independence in this respect. The beginning of the European war found us with potash resources surveyed but none developed. But promptly, under the stress of the urgent demands here created, all established sources were developed, the price obtainable sweeping aside all economic considerations. The development reached 25 per cent of normal prewar consumption of potash. The

signing of the armistice and the promise of cheap potash from abroad, and the threat that accumulated stores of foreign potash would be dumped on the American market, prompted all American producers not on a logical economic basis to cease operations and to close down their plants. Then it developed that there would be no heavy importations from Europe, that there was no accumulated supply to be disposed of at bargain prices, and that conditions surrounding foreign production were so changed that potash at prewar cheapness would not be again available, and that the increase in price would be over 100 per cent.

The potash situation in America, therefore, now more than one year after the ending of the war, is by far worse than it was before the war started, with but few American sources operable and but little of the foreign product available. The work done in America is creditable but can not in any sense be regarded as the solution of the American potash problem. Potash sold during the war as high as \$6 per unit, the major part selling at \$4.50 to \$5 per unit.¹ Following the armistice it sold at \$2.25 per unit and now brings \$2.75. The American sources that have survived these fluctuations are, roughly, only the Searles Lake and the Nebraska lakes industries. The former of these, while producing continuously, has suffered grievously through the prejudice arising on account of certain early sales of product which carried injurious quantities of impurities; and the latter lost months of production through months of idleness.

The kelp-potash plants operating profitably at war-time prices could not do so at postwar prices. Not one had developed any by-products or taken any special measures to enhance the economy of production. The maximum tonnage possible was the chief consideration. It was early considered, as had already been predicted, that for normal conditions potash alone could not be gotten profitably from kelp. The acetone plant of the Hercules Powder Co., wherein acetone and various other chemicals were manufactured, likewise closed down with the termination of the war-time demand for acetone. Frequently the Hercules Powder plant is regarded as a potash plant, but it was not a potash plant. Potash was a by-product there. It was an acetone plant.

It was hoped that the results of the work in this experimental plant would be available for use by the various privately owned plants and would enable them to install by-products equipment in accordance with demonstrated plans, and that they would be able to keep going. Unfortunately, this work had not progressed to the point where at that time this was possible. Therefore all of them closed their plants, without the feasibility of the kelp by-products proposed ever having been tested commercially.

The problem which we were to solve resolved itself into three phases: (1) The establishment of the facts relative to the products and by-products which are obtainable from kelp; (2) the development of processes and the design of apparatus for the production of the various products and its assemblage into a plant; and (3) the

¹ Since potash salts as "carriers" vary widely in their respective potash contents, sales are made on the basis of analysis and the price per ton is determined by the amount of actual potash present. Thus a standard basis of comparison and sales is established. For each percentage of potash present the price of so much per ton is asked. Each percentage per ton is spoken of as a "unit," and the price per ton is determined by multiplying the price per "unit" by the number of units present, or the percentage. For example, potash salts quoted at \$3 per unit and analyzing 20 per cent would be sold for \$60 per ton.

production and sale of product. Our plan of procedure prescribed the establishment of a product, the design of apparatus for its production, and its production on the plant scale. That is to say, as soon as it was established that a material was obtainable, apparatus was installed for its production and it was turned out in commercial quantities. The first product was dry kelp, which was followed by kelp char and then by kelp ash, and finally by potash salts of a high grade. These products represented stages in the development of the processes. Each stage has represented a decrease in production costs of the product. Muriate of potash is now being produced at a cost which, with refinements in operation, should show a profit even at the present price of \$2.50 a unit.

That was the price prevailing a short time ago. The last we sold was sold at \$2.70 per unit, and we are now quoting \$2.85 for pure muriate.

Mr. CANDLER. How much is a unit?

Mr. TURRENTINE. A unit is a per cent on a ton basis. It represents 20 pounds of pure potash.

Subsequently the residue or by-product, kelp charcoal, was shown to be a valuable material, and steps were taken immediately to design a process and apparatus and to turn it out in commercial quantities. The output of the plant in this material is yet small, but we have every assurance that the apparatus now being installed will yield this in large quantities. A market for it has already been established at a very advantageous price, indeed. With its aid the cost of production of potash will have been reduced to about \$1 per unit provided the kelp char is sold at 25 cents a pound, a price now quoted for it. This will leave a profit of about \$48 per ton on the carbon itself. That is to say, if the cost of manufacture is placed on the by-product up to the point where its course through the plant is separated from that of the other products, it is able to pay all of those operating expenses and leave a margin of profit besides. The idea being to develop by-products to pay the cost of production of potash, it may be said that this apparently is now accomplished with the one by-product, kelp char, alone, without considering iodine, ammonia, and other things. However, it will be obvious to anyone that to stop the investigation at this point with any number of other important results just within reach would be the height of folly.

I say that because, while it might be possible to produce potash and bleaching carbon (charcoal) at a profit, at present we do not expect the price of potash to stay at \$2.75 or \$3. What we want to do is to get enough by-products to enable us to sell potash under any conditions. It behooves us from every point of view to proceed with the work until we have put ammonia, common salt, and iodine on a production basis and brought that production to the point where they are yielded in salable quantities and a market established for them. When we have done that, we can then present our results to the public and present them in a form which will be a credit to the Government. In their present form they would not carry conviction anywhere and would only reflect discredit upon our organization.

The present year may see production brought to the point illustrated by attached table entitled, "Estimated production of the experimental kelp-potash plant for the year ending June 30, 1920."

TABLE 1.—*Estimated proceeds from sale of products from the experimental kelp-potash plant for the fiscal year ending June 30, 1920.*

Potash, 100 units K ₂ O, at \$2, \$200 per day, for the year of 300 days.....	\$60, 000
Carbon, ¼ ton per day, October to January; ½ ton per day, January to April; 1 ton per day, April to July; average, ½ ton per day for 9 months, at \$500 per ton.....	50, 000
Iodine, 20 pounds per day for 6 months, 3,000 pounds, at \$4.....	12, 000
Total for year.....	122, 000

TABLE 2.—*Estimate of costs, proceeds, and profits obtainable for period, Jan. 1, 1920, to June 30, 1920.*

	Operation costs.			
	Per month.	Tons.	Per ton.	Per unit K ₂ O.
Harvesting and unloading.....	\$1, 267. 50	1, 950	\$0. 65	\$0. 48
Drying.....	3, 070. 39	216	14. 23	1. 16

In drawing up the estimate presented in Table 2, "Estimates of costs, proceeds, and profits obtainable for period January 1, 1920, to June 30, 1920," the cost of manufacture has been placed on the by-product carbon through those processes where potash and carbon are treated simultaneously. From the point where the two are treated separately each is made to carry its own costs of manufacture.

Mr. ANDERSON. That is somewhat higher than you estimated previously, I think?

Mr. TURRENTINE. Yes; because at that time I was estimating carbon at 15 cents a pound; now we find we can sell it at 25 cents.

I have also given a table here showing what we anticipate will be the results from the next six months of operation—that is from January 1 to July 1, showing what the cost of manufacture will be of those two products, potash and carbon, and what profit we anticipate from them.

Mr. WHITNEY. I would like to say a word of commendation here. During this period of experimentation when we have had to devise everything, all kinds of apparatus, have had to test them and rebuild them, we have actually sold during this period approximately \$80,000 worth of potash. We have turned the money into the Treasury, less the freight charges.

The CHAIRMAN. \$80,000 out of how much of an appropriation?

Mr. WHITNEY. I do not recall the total amount that has been appropriated.

The CHAIRMAN. The net cost, then, was only \$40,000? You say you turned into the Treasury \$80,000, and the expenditure was \$120,000?

Mr. WHITNEY. That runs over two or three years, you understand. It covers all the period of our experimental work. I mean that, during the period when we were experimenting we were actually turning out materials to the value of \$80,000 gross.

Mr. CANDLER. I notice in the note here it says it is estimated that \$100,000 will be realized from the sale of products at this plant for the current fiscal year. For the fiscal year 1921 it is believed that the receipts will more than cover all expenditures, including the heavy overhead now entailed by a large force of chemists, and construction and repair men.

Mr. WHITNEY. That means that we are now on a production basis, but during the time when we were experimenting the expense of course was heavier.

Mr. TURRENTINE. It may be impossible to carry this program to completion on account of the fact that we are now facing a serious lack of funds.

I may explain that the lack of funds is due to the fact that the war-time appropriation—we are still working under the war-time appropriation—makes no provision for the increased cost of labor and materials.

Mr. McLAUGHLIN of Michigan. How much of the war funds did you have?

Mr. HARRISON. Mr. McLaughlin, no allotment was made for this work under the food production act, if that is what you have in mind.

Mr. McLAUGHLIN of Michigan. There was a fund, though, from which this work was supplied.

Mr. HARRISON. An appropriation has been carried in the regular bill for the past two or three years. That is the only fund available for this purpose, so far as I know. I imagine Dr. Turrentine has in mind the fact that the sum provided for the operation of the plant was fixed during the early period of the war and that there has been no addition to it to take care of the increased cost of labor and materials. Is that correct, Doctor?

Mr. TURRENTINE. Yes. To continue operating on our present basis, without any development or enlargement, would leave us a margin of only \$11,000 for miscellaneous supplies and new apparatus. We shall of necessity exceed \$11,000 for new apparatus, which means that we must decrease our operating force materially and correspondingly our results. The wage scale is still going up. We are lagging behind the community right along in the matter of wages, and we are persuading the men to stay in consideration of the

things which go along with a government appointment as part payment. For example, our chief carpenter is being paid only \$5 a day, while other carpenters in the neighborhood are getting \$7 and \$8. The same is true of our mechanics.

We have a serious problem confronting us, and we are now at work on it in order to determine the best policy to pursue which will yield maximum results with minimum expenditures. This handicap will operate to cut down decidedly the show of results which otherwise could be expected from the year's work, and constitutes an important reason why the end of the year will not show results of such a character as to justify the termination of the work.

A prospectus based on results as they stood a month ago is inserted here as illustrating what is now expected as the results to be attained as the outcome of the present stage of these experiments. The conservativeness of the estimates should counterbalance the prophetic nature of the statement. This prospectus may be taken to represent the results expected to be attained during the fiscal year 1920-21. It is confidently believed that by the end of that year, that is by June 30, 1921, results substantially as represented here will have been obtained.

This estimate contemplates the production of only the by-products—salt, iodine, ammonia, and bleaching carbon. In addition, there are combustible gas, kelp oils, pitch, and creosote, which are simultaneously obtainable. Some of these are of demonstrated and all are of potential commercial value.

TABLE 3.—*Prospectus, value of products obtainable from 100 tons per day raw kelp.*

Potassium chloride, 95 per cent:	
2.5 tons=150 units at \$2.....	\$300
(Or 150 units at \$2.50=\$375.)

Mr. TURRENTINE. By way of résumé:

(1) Results to date show definitely that the successful outcome of experiments is assured, that by-products will be developed which will more than carry the production cost of potash. This will enable kelp potash, then, to come into the market, where freight rates are not prohibitive, in competition with potash from any other source.

(2) With a successful outcome assured, it would be unwise to discontinue the work and lose the credit which is bound to accrue to the Government through the successful prosecution of a problem undertaken in the face of so much criticism and one advertised so widely by its opponents as illogical and uneconomical.

(3) Its continuation from now on will be at a very slight and decreasing expense to the public, the proceeds from this year's production probably being about enough to equal expenditures and those from next year's operation probably more than equaling expenditures. That the enterprise will be self-sustaining within a short period seems assured.

Mr. ANDERSON. You say you have sold this year \$22,000 worth?

Mr. TURRENTINE. Yes.

Mr. ANDERSON. You expect to increase the sales sufficiently in the next six months of the fiscal year to make up the entire cost of your operations for the year?

Mr. TURRENTINE. We have sold only small amounts of carbon up to this time. From now on we expect to be selling carbon in larger quantities, and carbon is worth more than potash.

(4) It should be borne in mind, that at the completion of the work, with the results anticipated, the plant will be on a profitable basis and could be put on the market as a going concern earning a profit, and would yield a price accordingly. If it is sold before all the facts are demonstrated, it would have to be sold as junk, and as such would yield only about a third of what it would yield otherwise. If sold as a going concern, however, it would yield not less than \$100,000.

It is easy to see, therefore, that if we keep going until the work is completed, the net profit to the Government will be greater than if the work were discontinued at the end of the present year.

(5) Since it has been demonstrated that not less than 500,000 tons per annum of raw kelp are available in the vicinity of Summerland, it is to be assumed that when it is demonstrated what profits are obtainable from the treatment of kelp by the process developed here, plants will be established sufficient in capacity to utilize the raw material available. We may with confidence, therefore, look forward to the establishment ultimately of an industry in this part of the State of California which will yield the products obtainable from this quantity of kelp and of an annual value of over \$7,000,000. This estimate does not take into consideration the equally large industry which may be founded additionally on the kelps of Puget Sound and Alaska. The profit to the public, therefore, from the successful outcome of these experiments seems to be beyond question, and certainly would seem to justify a continuation of the slight net expense to the public now being incurred in this work.

Mr. HUTCHINSON. Doctor, you spoke about the prospects of the future. Kelp is grown along the coast, isn't it?

Mr. TURRENTINE. Yes, sir.

Mr. HUTCHINSON. About how deep in the water?

Mr. TURRENTINE. Kelp grows in about 40 feet of water, but it grows to a length of 150 feet. It grows up to the surface and then it is held up in the water and lies on the surface in large tangled masses.

Mr. HUTCHINSON. You mean it grows from the shore out to 40 feet of water?

Mr. TURRENTINE. No; it grows on the water in 40 feet of water.

Mr. HUTCHINSON. It grows where the water is 10 feet deep, does it?

Mr. TURRENTINE. A little of it grows in 10 feet of water, but the tide, you see, would uncover it.

Mr. HUTCHINSON. How far out in the ocean does it grow?

Mr. TURRENTINE. It varies from half a mile to 3 miles. The position of the kelp is determined by the bottom of the ocean. Where you have rocks, a rocky bottom, or bowlders, something for the kelp to fasten to, you will find it growing; otherwise you do not.

Mr. HUTCHINSON. How deep is the deepest part where it grows? Is it over 40 feet?

Mr. TURRENTINE. Yes, considerably over 40 feet. Kelp has been observed under water 100 feet deep.

Mr. HUTCHINSON. And you think it is unlimited?

Mr. TURRENTINE. No; it is not unlimited, but it is inexhaustible in the sense that it grows right back after you cut it.

Mr. HUTCHINSON. If you cut it down, how long does it take before it grows up again?

Mr. TURRENTINE. We expect a crop every three months; four harvest seasons.

Mr. HUTCHINSON. Haven't the fertilizer manufacturers now abandoned their manufactories out there?

Mr. TURRENTINE. Yes; the Government plant is the only one running.

Mr. HUTCHINSON. That is what I thought. In other words, you can't compete with German potash now, can you? You say you are selling it at \$3?

Mr. TURRENTINE. Yes.

Mr. HUTCHINSON. And we are buying German potash for \$1.80.

Mr. TURRENTINE. Are we?

Mr. HUTCHINSON. I bought a lot of it.

Mr. TURRENTINE. We got \$2.75 for our product all last fall. I haven't any doubt at all but that we can compete with Germany.

Mr. HUTCHINSON. You have no doubt about it?

Mr. TURRENTINE. No.

Mr. HUTCHINSON. Not when it gets down to 70 cents a unit?

Mr. TURRENTINE. I don't think it will ever go to 70 cents.

Mr. HUTCHINSON. Do you suppose you can compete at \$1?

Mr. TURRENTINE. Yes.

Mr. HUTCHINSON. You think you can?

Mr. TURRENTINE. Yes; figuring it as I have indicated here in this statement, our production cost is now \$1, that is, \$1 laid down in the market for potash.

McLAUGHLIN of Michigan. \$1 in California?

Mr. TURRENTINE. No; in Baltimore.

Mr. McLAUGHLIN of Michigan. You can lay it down in Baltimore for \$1?

Mr. TURRENTINE. Yes; figuring it the way we have—figuring the cost of production on the by-products.

Mr. CANDLER. You pay the expenses with the by-products, and your potash is largely profit?

Mr. TURRENTINE. Yes.

Mr. CANDLER. Whatever you get out of that is profit?

Mr. TURRENTINE. Yes.

Mr. McLAUGHLIN of Michigan. What is the freight from your factory to Baltimore?

Mr. TURRENTINE. \$15 a ton in carload lots.

Mr. HARRISON. Doctor, the commercial plants on the coast, I understood, were erected under war conditions and they had a special object in view, namely, to secure products which were urgently needed for war purposes.

Mr. TURRENTINE. Yes.

The CHAIRMAN. How many tons of kelp does it take to product a unit of potash?

Mr. TURRENTINE. A ton of kelp will produce a unit and a half.

The CHAIRMAN. One ton of kelp will?

Mr. TURRENTINE. Yes.

Mr. HUTCHINSON. How many units does a ton of kelp run?

Mr. TURRENTINE. One and a half on the wet basis.

The CHAIRMAN. A unit is 20 pounds?

Mr. TURRENTINE. Yes, sir.

Mr. CANDLER. You cut it and gather it on the surface of the water?

Mr. TURRENTINE. Yes, sir.

Mr. CANDLER. You don't cut it below the water?

Mr. TURRENTINE. We cut it about 5 or 6 feet below the surface of the water.

Mr. CANDLER. And then it grows out and you cut it four times a year?

Mr. TURRENTINE. Yes, sir.

Mr. CANDLER. Cutting doesn't injure the plant at all? It comes right back?

Mr. TURRENTINE. Yes, sir.

Mr. HUTCHINSON. After you prepare this potash, what does it run?

Mr. TURRENTINE. Fifty-five per cent K_2O .

Mr. HUTCHINSON. That is actual potash?

Mr. TURRENTINE. Yes, sir.

The CHAIRMAN. We are very much obliged to you.

(Thereupon, at 5.45 o'clock p. m., the committee adjourned.)

Activities under lump-fund items, Bureau of Soils.

Project.	Allotment, 1920.	Estimate, 1921.	Increase.
Soil chemical investigations:

¹ Includes \$1,800 transferred to statutory roll.

² Includes \$2,100 transferred to statutory roll.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Friday, December 19, 1919.

AFTERNOON SESSION.

The committee met pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

BUREAU OF ENTOMOLOGY.

The CHAIRMAN. The committee will come to order.

Mr. HARRISON. Dr. Howard, Chief of the Bureau of Entomology, is present and is ready to take up the estimates of his bureau.

The CHAIRMAN. We will be pleased to hear you, Dr. Howard.

STATEMENT BY DR. L. O. HOWARD, CHIEF OF THE BUREAU OF ENTOMOLOGY, DEPARTMENT OF AGRICULTURE.

Dr. HOWARD. Under the statutory provisions, Mr. Chairman, there are no changes, except that we are asking for two new clerks of class 4 and two clerks of class 3, and also for an executive clerk, at \$1,980. That is explained in the note under item No. 5. It seems that some time ago the committee was asked to give us some more clerks at the top of the list, and to drop off certain clerks at the bottom of the list, and they responded by dropping off the clerks of the bottom of the list and not putting on those at the top of the list, which left us shorthanded. We are shorthanded now and need the additional clerks here requested.

The CHAIRMAN. You have found it necessary to increase these salaries?

Dr. HOWARD. It is not an increase in salaries; we want to get five more clerks, appointed from the outside if necessary.

The CHAIRMAN. Two more clerks of class 4—

Dr. HOWARD. Two of class 4 and two of class 3.

Mr. ANDERSON. And you ask for one executive assistant, under item 5, do you not, Doctor?

Dr. HOWARD. Yes, sir.

The CHAIRMAN. Under item 2 you are asking to have one chief clerk and an executive assistant at \$2,250 changed to one clerk at \$2,250. That is simply a change in title?

Dr. HOWARD. Yes, sir.

This statutory roll, as explained, is increased by \$8,780, by the addition of new places, and is decreased by \$4,200 by dropping seven

entomological assistants at \$600 each, as indicated in the note under item 21. There is an actual increase of \$4,600 over the amount allowed for 1920, but, as our statutory roll for 1920 was reduced by this sum, there will be no increase. This is explained in the note under item 5.

Mr. Chairman, I will discuss the general expense items, if I may.

Item No. 32, "For investigations of insects affecting deciduous fruits, orchards, vineyards, and nuts, \$103,500."

Mr. McLAUGHLIN of Michigan. There is a proviso that \$9,600 of this sum shall be available for the investigation of pecan insects.

The CHAIRMAN. This is the item on the general investigation of insects affecting deciduous fruits which includes the Japanese beetle?

Mr. HARRISON. Yes, Mr. Chairman; and with your permission we would like to have inserted in the record the supplemental estimate which has been submitted.

The CHAIRMAN. Yes.

Dr. HOWARD. I have a copy of it here so that it will be available in this discussion.

The CHAIRMAN. That goes to the Secretary of the Treasury?

Mr. HARRISON. Yes; to the Secretary of the Treasury and then to the Speaker of the House.

The CHAIRMAN. We will have it inserted.

(The letter of the Secretary, transmitting the supplemental estimate for the control of the Japanese beetle follows:)

DEPARTMENT OF AGRICULTURE,
Washington, December 19, 1919.

THE SECRETARY OF THE TREASURY.

SIR: I have the honor to transmit herewith, for inclusion in the agricultural appropriation bill for the fiscal year 1921, an estimate of an additional appropriation of \$105,000 under the heading "General expenses, Bureau of Entomology," required by this department to meet the emergency caused by the unexpected spread in New Jersey of the Japanese beetle. The current appropriation act carries an item of \$105,780 for the investigation of deciduous fruit insects, of which \$25,000 has been allotted for the purpose of controlling the spread of the Japanese beetle. It is recommended that the latter amount be eliminated from this item (p. 167, item 32, committee print of estimates) and be included in a new paragraph making specific provision for the Japanese beetle control work. For this paragraph the following wording is suggested:

"To meet the emergency caused by the recent and sudden spread of the Japanese beetle in the State of New Jersey, and to provide means for the control and prevention of spread of this insect in that State and to other States, in cooperation with the Federal Horticultural Board, the State of New Jersey and other States concerned and with individuals affected, including the employment of persons and means in the city of Washington and elsewhere, and all other necessary expenses, \$130,000, of which \$30,000 shall be immediately available."

Investigations during the fall of 1918 and the spring of 1919 showed that the Japanese beetle had reproduced itself in enormous numbers and spread over much additional territory in spite of the repressive measures undertaken by the department and the New Jersey authorities. In order to cope with the situation, a supplemental estimate calling for an emergency appropriation of \$70,000 was transmitted to the Congress on August 19, 1919. Only \$45,000 of this amount, however, was made available in the first deficiency bill (Public 73, 66th Cong.), which was approved on November 4, 1919, making a total of \$70,000 for the Japanese beetle suppression work during the fiscal year 1920, a sum insufficient to carry out an adequate program of suppression.

The Japanese beetle, introduced from Japan, has become in this country a serious enemy of many kinds of plants, including orchards, vineyards, truck crops, ornamental plants, various weeds, shade trees, etc. It is now established

in Burlington and Camden counties, N. J., and covers an area, according to present surveys, of about 15,000 acres. Since during most of its life the insect lives as a grub in the ground, and in the adult stage is a very active flying beetle, it is now realized for these and other reasons that its eradication is impracticable. It is extremely important, however, that everything feasible be done to prevent its further spread, and money expended in this work will be a very profitable investment because it will protect other parts of the country from the ravages of the insect and obviate the necessity for considerably larger expenditures in connection with control measures over much greater areas.

It is estimated that, aside from the \$25,000 at present included in the item for deciduous fruit insect investigations, \$105,000 will be required to carry out an effective program of control during the fiscal year 1921 and to conduct the work on an adequate scale during the remainder of the current year. There is much to be done if the beetle is to be held within its present limits. The territory bordering the infested area should be thoroughly scouted to establish its distribution. Food plants of little or no economic importance along roadways and elsewhere should be removed and other plants kept coated with poison. A large barrier band of sprayed or dusted food plants outside the infested area should be maintained and all noneconomic plants in the area destroyed.

The Federal Horticultural Board will establish an adequate quarantine which will provide for the inspection and certification of crops of all kinds in the infested area, and the control work is being, and will continue to be, carried out in cooperation with the New Jersey State Department of Agriculture and with representative citizens of the infested territory.

Respectfully,

D. F. HOUSTON, *Secretary.*

DR. HOWARD. I would like to have Dr. A. L. Quaintance tell you about this work.

THE CHAIRMAN. Very well, Dr. Howard, we will hear Dr. Quaintance.

STATEMENT OF DR. A. L. QUAINANCE, IN CHARGE OF DECIDUOUS FRUIT INSECT INVESTIGATIONS, BUREAU OF ENTOMOLOGY, DEPARTMENT OF AGRICULTURE.

DR. QUAINANCE. Mr. Chairman, I shall be glad to answer any questions that may be asked me.

THE CHAIRMAN. Your statement will be in reference to the estimates submitted for the investigation of deciduous fruit insects and also in reference to the special estimate for the Japanese beetle work?

DR. QUAINANCE. Yes.

MR. HARRISON. I may explain, Mr. Chairman, that a portion of this appropriation is now expended for the Japanese beetle work. Several other lines of activity also are conducted under it.

DR. QUAINANCE. This work covers insect enemies of orchards and small fruits, like the gooseberry, the cranberry, and the currant. Our plan of work is to maintain laboratories in the various fruit regions of the country. The office has laboratories in Connecticut, Delaware, Virginia, Georgia, Florida, Texas, Colorado, California, and Washington State, and in one or two more States.

We have brought to our attention almost every year emergency situations in regard to orchard insects, and we change these laboratories about so as to meet conditions and follow the general principle of putting the work where the principal emergency is.

If there are any questions about any particular investigation or project, I shall be very glad to answer them. Perhaps, if I shall read

some of the investigations which are under way it will be suggestive to the committee.

One of our large projects is the investigation of apple insects, and this is distributed through considerable territory. Wherever the apple is grown to a large extent we have a laboratory, or we have had. We shift these laboratories around from time to time.

In our grape insect investigation we have one laboratory in California, now in Fresno, and one in the northern Ohio grape belt, at Sandusky. In years past we have maintained laboratories in the Chautauqua-Erie grape belt.

Mr. ANDERSON. It strikes me that a year or two ago there was some grape work done in Ohio. I do not remember much about it, but it seems to me we made an appropriation or carried an item a year or two ago on that. Do you remember about that?

Dr. QUAINANCE. That was for an investigation of the grape-berry moth, which, due to a combination of circumstances, was very destructive in northern Ohio. This work is still in progress and has been very successful. We are showing the growers how to use the information that we have obtained so that it will be most effective. The method of treatment is by spraying. We have improved the spraying apparatus and have improved spraying liquids. There has been also a good deal of educational work in connection with the investigation.

Another project is the investigation of nut insects, which is subdivided. Part of the work is done under a special appropriation for pecan insects. That work has headquarters in Florida and in Texas. Work on Northern nut insects has headquarters in West Virginia.

We have a project on orchard insecticides and spraying machinery. There are constantly investigations to be made in regard to insecticides.

Mr. McLAUGHLIN of Michigan. Before you leave the nut proposition: A few days ago there were some gentlemen before us representing the nut industry who recommended a large increase in the appropriation, a part of which was to be used by the Bureau of Plant Industry. Has your work been done in connection with and in cooperation with the Bureau of Plant Industry? This is about the nut business.

Dr. QUAINANCE. Do you refer to the pecan?

Mr. McLAUGHLIN of Michigan. Yes.

Dr. QUAINANCE. Yes; we have been cooperating with the Bureau of Plant Industry. They use our laboratory facilities to some extent, and we use theirs where the work brings us together in the same locality. This work must be taken where the particular troubles appear and where they can be worked out to the best advantage. The Bureau of Plant Industry has been particularly interested in cultural questions and disease questions, and it has been possible to combine our forces in some places.

Mr. McLAUGHLIN of Michigan. What progress are you making?

Dr. QUAINANCE. We have made very good progress. We have worked up the life histories of the principal pecan insects and have published one bulletin on the subject.

We are now testing out insecticides in the Southeast, in Georgia and Florida. We find, I might say, that pecan foliage is very tender,

and we have certain conditions to meet in spraying not usual with orchard trees.

Our work in Texas is of a somewhat different type. The pecan industry there is confined largely to the wild pecan trees in the river bottoms. The trees are often quite large, and we have to develop special means of control. We have not made so much progress on the pecan situation in Texas as in the Southeast, but we are making progress. The item, I think, should be continued. It is useful work and it is appreciated by a growing industry.

Mr. McLAUGHLIN of Michigan. Is there any reason for continuing that pecan appropriation as a separate appropriation? The general wording of that paragraph includes nuts. Why can not the investigations be made as to pecans and all other nuts out of the same money?

Dr. QUAINANCE. That would be advantageous from the administrative standpoint. The present wording necessitates the keeping of separate accounts.

The CHAIRMAN. You keep separate accounts?

Dr. QUAINANCE. Yes, sir.

The CHAIRMAN. You say it would be advantageous—

Dr. QUAINANCE. To eliminate the necessity of keeping separate accounts—bookkeeping accounts.

Mr. McLAUGHLIN of Michigan. Would you spend quite a considerable amount on the pecans if we eliminated that language?

Dr. QUAINANCE. We are spending all that money on pecan insects now, since it is a specific appropriation.

Mr. McLAUGHLIN of Michigan. Would you continue to do that if we combined them?

Dr. QUAINANCE. We would continue that. Our nut insect work in the North is being done under another item.

Mr. McLAUGHLIN of Michigan. Why should there be two items as to nuts? Under which item is it? Which is the other one?

Dr. QUAINANCE. It is being done in connection with the fruit-tree borer work, under a subproject on apple insects, under the general subappropriation for deciduous fruit insects.

Mr. McLAUGHLIN of Michigan. What is the number of it?

Mr. QUAINANCE. The subprojects are not shown in the Book of Estimates. If you have the department "Program of Work," the item will appear there.

Mr. McLAUGHLIN of Michigan. A considerable increase in the appropriation for nuts has been requested, and evidently money is being spent from several different appropriations, or at least from more than one. We would like to know how much money is being spent for this nut business and where and how it is carried.

Mr. HARRISON. There are three items, as I recall it. Two are in the Bureau of Plant Industry, and the other is in the Bureau of Entomology—the one we are now discussing.

The CHAIRMAN. Two in the Bureau of Plant Industry?

Mr. HARRISON. Yes, sir.

Mr. McLAUGHLIN of Michigan. This gentleman says they are using money from another item.

Dr. QUAINANCE. The gentlemen who are working on fruit-tree borers, carried under our apple-tree work, have by reason of their location, opportunity to study hickory nuts and chestnuts, and as

they have occasion they make investigations in near-by States as to imported walnuts, such as English walnuts.

Mr. McLAUGHLIN of Michigan. That is done under this item No. 32?

Dr. QUAINANCE. It is all carried under the subappropriation for deciduous fruit insects, but it is not shown specifically in the Book of Estimates.

Mr. HARRISON. Another item which appears on page 70, item 80, under the Bureau of Plant Industry, relates to the diseases of pecans; and the third provision occurs in item 101, on page 95, for nut culture. You will recall that one proviso under the Bureau of Plant Industry was eliminated last year, when a specific paragraph relating to the improvement of nuts was inserted.

The CHAIRMAN. Why should you have an appropriation in one place for the diseases and one in another place for the culture of the nuts?

Mr. HARRISON. The item in the Bureau of Entomology relates to insects affecting pecans.

Mr. McLAUGHLIN of Michigan. The one in the Bureau of Plant Industry relates to the cultivation.

Mr. HARRISON. The first relates to the diseases of the pecan; that is, the tree diseases, the fungus diseases; and the second to the cultural practices—the cultural work. There were originally three separate provisos in the bill covering the pecan work. One of the provisos was eliminated last year because a new paragraph making specific provisions for work relating to nuts was inserted in the bill.

Mr. McLAUGHLIN of Michigan. What is the number of the item which was inserted last year?

Mr. HARRISON. It is on page 95, item 101.

Mr. McLAUGHLIN of Michigan. Yes; I have that. Where is the other one found?

Mr. HARRISON. On page 70, item 80. Then there is the item we are discussing under the Bureau of Entomology, item 32, on page 167.

Mr. McLAUGHLIN of Michigan. All right.

Mr. RUBEY. While there is a lull, I want to ask a question for information. When I was at home last spring some sort of a bug or animal got on my gooseberry bushes and cleaned them up, and it interfered materially with my gooseberry pie. I am wondering what kind of a bug he was. He was from half an inch to an inch long.

Dr. QUAINANCE. Yes; another imported insect, probably.

Mr. RUBEY. It fed on the leaves and cleaned up the bushes; and it seemed to go all over the community. Every gooseberry bush in the whole community was effected the same way. When the berries got to a certain size they stopped growing and did not mature.

Dr. QUAINANCE. That was the imported currant worm. It is rather easily controlled, if you treat it early in the season, with an arsenical. As the fruit ripens, hellebore is used in order to avoid danger of poisoning the fruit.

The other principal project I wish to mention is that in regard to the Japanese beetle. About 1911, I think, we had introduced into New Jersey what we call the Japanese beetle. The insect in its immature stage is a grub living in the soil. It probably came into this country on soil attached to the roots of some iris

plants imported from Japan. It has spread rapidly and now occupies about 15,000 acres in the counties of Burlington and Camden, N. J. Its injures have established its serious character, and, while we have been working with certain appropriations for its suppression and prevention of spread, it would appear that our appropriation of the present fiscal year is not adequate. Hence an increase is requested in the supplemental estimate to which reference has been made.

Mr. McLAUGHLIN of Michigan. Is that under item 32, on page 167?

Dr. QUAINANCE. It is submitted in the form of a separate special appropriation.

Mr. McLAUGHLIN of Michigan. That special appropriation is for an increase in this appropriation, is it not, No. 32?

Mr. HARRISON. \$25,000 of this appropriation (item 32) now is use for the Japanese beetle work. We are suggesting that that be eliminated and that a special appropriation be made for the Japanese beetle work. The total amount of the estimate is \$105,000. Adding to that \$25,000 of the item for deciduous fruit insects now used for the Japanese beetle work, will make \$130,000 we are asking for the work next year; and we are asking that \$30,000 of the total amount be made available immediately upon the passage of the appropriation bill. For the current fiscal year we have for this work \$25,000 under this item 32, on page 167, together with \$45,000 which became available in the first general deficiency bill, November 4, making \$70,000; and, if you give us the \$30,000 of the amount we are now suggesting, immediately upon the passage of the appropriation bill, we will have a total of \$100,000 this year and an equal amount next year for the Japanese beetle work.

Mr. McLAUGHLIN of Michigan. This suggestion involves the setting up of a new item?

Mr. HARRISON. We are suggesting that you eliminate the \$25,000 now included in the total of \$103,000 in item 32, and transfer that amount to a separate item immediately following the deciduous fruit insect paragraph. The language for the new item is set out in the supplemental estimate.

The CHAIRMAN. You deduct \$25,000 from this \$103,000?

Mr. HARRISON. Yes, sir.

The CHAIRMAN. You add a new item; you add how much?

Mr. HARRISON. We add a new item. I have the language here, Mr. Chairman; shall I read it?

The CHAIRMAN. Yes.

Mr. HARRISON. The language suggested is as follows:

To meet the emergency caused by the recent and sudden spread of the Japanese beetle in the State of New Jersey, and to provide means for the control and prevention of spread of this insect in that State and to other States, in cooperation with the Federal Horticultural Board, the State of New Jersey and other States concerned, and with individuals affected, including the employment of persons and means in the city of Washington and elsewhere, and all other necessary expenses, \$130,000, of which \$30,000 shall be immediately available.

Mr. ANDERSON. Is that a reduction of \$32,000 or \$30,000?

Mr. HARRISON. \$25,000 has been deducted from item 32 and is included in the proposed new item, carrying a total of \$130,000.

This represents an increase of \$105,000 over the estimates, and of \$35,000 over the amount at present available for the Japanese beetle work, \$70,000 having been provided in the first deficiency bill.

The CHAIRMAN. What is the object of the \$130,000?

Mr. HARRISON. For controlling the Japanese beetle. Is that clear to you, Mr. McLaughlin?

Mr. McLAUGHLIN of Michigan. Yes. There are some of the other items, though, that are broad enough to cover the same work.

Mr. HARRISON. Of course, it would be entirely satisfactory to the department if the total amount of item 32 were increased by \$105,000, making \$35,000 of it immediately available. The money would be expended in exactly the same manner.

Mr. ANDERSON. It would be, would it not?

Mr. HARRISON. It would be. We thought the committee would prefer to make provision for the Japanese beetle work in a separate paragraph, but it would be entirely satisfactory to us to have the necessary additional funds included under item 32.

The CHAIRMAN. All right; go on.

Dr. QUAINANCE. This Japanese beetle bids fair to be a pest of importance, and our program is one of repression. Owing to the peculiar life history of the pest, we do not believe it can be eradicated, even though it occurs over only 15,000 acres at this time. It lives for nearly 10 months of the year in the ground, and it would be quite impossible to get the last grub destroyed without destroying all vegetation in the territory. It is a pest of very general feeding habits, attacking weeds, orchard and shade trees, vineyards, truck crops, and especially ornamental plants. We are doing a great deal of clean-up work, cutting back from the roads all food plants which will be attractive to it. We are treating the soil with insecticides in the worst-infested areas. We are using for that, largely, sodium cyanide in water, which kills a large percentage of the grubs. We are catching many of the insects by hand-picking—that is, by the use of nets. We have taken in that way two or three million beetles in the last year. We are maintaining a band of poisoned foliage completely around the area and are trying all methods that we think are likely to hold it in check. I think that indicates, in brief, the status of the work and the importance of the pest.

Mr. McLAUGHLIN of Michigan. Are you doing this work alone or in cooperation?

Dr. QUAINANCE. We are cooperating with the New Jersey authorities, with the New Jersey Department of Agriculture. They are appropriating funds to assist us in the work. The cooperation is very active. We are cooperating with the Federal Horticultural Board in a quarantine of green sweet corn, as to interstate traffic, and with the office of the State entomologist as to intrastate traffic. We hope to hold the pest back until we can find out more about it, develop effective control measures, get its parasites to working, and thus reduce its severity.

Mr. HUTCHINSON. You are cutting down trees, are you not, all the way around it?

Dr. QUAINANCE. Yes; we are cutting out at certain places food plants that are attractive to the beetle.

Mr. HUTCHINSON. Does your method of control leave the farm in a different condition; does it leave the farm in a productive condition?

Mr. QUAINANCE. Oh, yes; we are getting the cooperation of farmers, and they are cleaning up their own places to a large extent.

Mr. HUTCHINSON. These beetles destroy everything in sight, do they not?

Dr. QUAINANCE. They are very destructive to a large list of plants. They get into the tips of the ears of corn especially and are thus likely to be moved out with the corn to market and be distributed. We have special machinery to inspect this corn and certify it.

The CHAIRMAN. How much have you spent, and how much do you want for that?

Dr. QUAINANCE. We have had \$25,000 in our regular appropriation this year. We had an emergency appropriation of \$45,000. We are asking in the supplemental estimate for \$130,000, with \$30,000 of that amount immediately available. Our work is planned on a \$100,000-a-year program. Our present allotment is \$70,000, and we wish \$30,000 immediately available out of the bill under consideration, which will furnish funds needed for the balance of the present fiscal year, and which will leave us \$100,000 for the next fiscal year.

Mr. McLAUGHLIN of Michigan. How long has this pest been known?

Dr. QUAINANCE. Since about 1915. It was discovered in the nursery where it was probably introduced.

Mr. McLAUGHLIN of Michigan. It does not seem to spread very fast.

Dr. QUAINANCE. It has spread rather quickly. It is rapid spreading for an insect like this one to develop from a few individuals that came over to its present abundance and infest some 15,000 acres.

Mr. McLAUGHLIN of Michigan. It has not yet gotten into other States?

Dr. QUAINANCE. It is not in Pennsylvania at this time. It is just across the river from Pennsylvania.

Mr. McLAUGHLIN of Michigan. It has not gotten there?

Dr. QUAINANCE. No; it has not gotten into Pennsylvania yet. It is just across the Delaware River from Pennsylvania. Most of the crops grown in this area are moved into Pennsylvania; to Philadelphia, Pa., and to Camden, N. J.

The CHAIRMAN. What is next?

Dr. QUAINANCE. I have nothing more, sir, I think, to call to your attention.

The CHAIRMAN. Thank you, Dr. Quaintance. You may proceed, Dr. Howard.

Dr. HOWARD. Mr. Chairman, I do not wish to take up the time of the committee with the general work done, but I should like to discuss the increases we have asked for.

Mr. RUBEY. What is the next item where you have no increase?

Dr. HOWARD. The next is item 33, "For investigations of insects affecting cereal and forage crops," for which we ask an increase of \$10,000. That amount is requested in order to further the work

with the alfalfa weevil. Mr. Walton, of my force, is just back from Utah, from the region where the alfalfa weevil occurs, and I will ask him to give the reasons for this increase of \$10,000 for that project.

The CHAIRMAN. We will hear Mr. Walton.

STATEMENT OF MR. W. R. WALTON, IN CHARGE OF CEREAL AND FORAGE INSECT INVESTIGATIONS, BUREAU OF ENTOMOLOGY, DEPARTMENT OF AGRICULTURE.

Mr. WALTON. The alfalfa weevil, Mr. Chairman, is also an introduced or imported pest.

Mr. RUBEY. How long have you had him?

Mr. WALTON. Since about 1904 or 1905.

The CHAIRMAN. How much of an increase do you ask?

Mr. WALTON. \$10,000, for the purpose of extending the work.

More or less efficient means have been evolved for controlling this insect in Utah, southern Idaho, and southwestern Wyoming, and the increase is asked for the especial purpose of perfecting the methods which have been discovered.

Mr. RUBEY. Did he come in through New Jersey?

Mr. WALTON. It is difficult to say through what State he came. He was not discovered until he got to Utah.

Mr. McLAUGHLIN of Michigan. All bugs originate there.

Mr. WALTON. No; some come through Boston occasionally.

It is proposed to use a considerable portion of this increase in appropriation for the purpose of ascertaining more accurately the distribution of this insect. Last year a new infestation was discovered in western Colorado. The weevil had not been known in Colorado before that time. We also have reason to believe that it may be present in southeastern Oregon.

Mr. RUBEY. Does this insect affect the growing crop or the crop after it is cut?

Mr. WALTON. The growing crop.

Mr. RUBEY. Tell us how much damage it does to that. Does it go into a field and destroy the entire field or just part of it, and is its prevalence general over a community?

Mr. WALTON. It never destroys all the alfalfa in a field, but it injures it very seriously—possibly as much as 50 or 75 per cent of the stand in the field. It is a very serious insect pest, indeed.

Mr. ANDERSON. What are the methods of control?

Mr. WALTON. The original methods of control, those which were used first, consisted of the formation of a dust mulch by dragging the field with a brush drag during the hot portion of the year. This dislodged the insects from the alfalfa and ground them into the dust; it cleaned up the bugs, but it often hurt the alfalfa.

The improved method consists of spraying the alfalfa with poisons early in the spring, and this has been found to be a very excellent means of control.

Mr. RUBEY. That does not injure the alfalfa?

Mr. WALTON. Not at all. The method consists of spraying the alfalfa with a diluted solution of arsenate of lead, which is not poisonous to cattle to any extent and will kill the insect.

A portion of the appropriation is for the purpose of conducting, on a larger scale than has been possible heretofore, experiments to

demonstrate thoroughly the effectiveness of this method, and the remainder is for survey work.

Mr. McLAUGHLIN of Michigan. Is the infested area increasing?

Mr. WALTON. It has increased considerably in the past four or five years. As I say, there was a new infestation found in Colorado last year. There are reasons for believing that a large portion of Idaho is involved in this infestation.

Mr. McLAUGHLIN of Michigan. A large portion of the entire State?

Mr. WALTON. A considerable portion of the entire State; yes, sir. The insect has not yet reached the vicinity of the important Snake River irrigation project, where there are very rich alfalfa lands; the State authorities and Federal authorities are cooperating in an effort to keep it away from there.

Mr. ANDERSON. You have no hope of destroying it altogether?

Mr. WALTON. Not altogether.

Mr. ANDERSON. It is simply a question of controlling it?

Mr. WALTON. Exactly.

Mr. McLAUGHLIN of Michigan. Can you give an estimate of the amount of damage it does in each of those States?

Mr. WALTON. That would be a difficult matter to do in dollars and cents.

Mr. McLAUGHLIN of Michigan. You say it sometimes destroys 75 per cent of the crop?

Mr. WALTON. Where no specific treatment is given to the crop.

Mr. McLAUGHLIN of Michigan. To what extent are you able to reduce the loss by the treatment?

Mr. WALTON. Where proper methods are used, the loss is entirely eliminated. We get excellent results and get good crops of alfalfa; as good as or better than before infestation occurred.

Mr. ANDERSON. How expensive is the treatment?

Mr. WALTON. The improved method costs about a dollar an acre.

Mr. McLAUGHLIN of Michigan. Are the States making appropriations for this work?

Mr. WALTON. I believe the State of Idaho is making some appropriation for this work.

Dr. HOWARD. Colorado is about to do so.

Mr. McLAUGHLIN of Michigan. It was first discovered in Utah, and has been there longest, you say? Has not Utah made any contribution to the work?

Dr. HOWARD. The State agricultural experiment station has made some, I know, but I believe they have made no specific appropriation to fight this insect. This is one of the investigations that this committee has authorized which has turned out very successfully. It was a new imported insect and caused a great scare at the time it was discovered. We have gone through all sorts of things and have found remedies that seemed to be good and those that seemed to be better, until we have got hold of a system now which we think will keep the pest in control at a very moderate cost. Our idea is to carry out the experimentation on a larger scale and see whether it will work, and to send men over into Colorado, where it is new, and show them how they can handle it.

The CHAIRMAN. Thank you, Mr. Walton.

STATEMENT OF DR. L. O. HOWARD, CHIEF OF THE BUREAU OF ENTOMOLOGY, DEPARTMENT OF AGRICULTURE—Continued.

Dr. HOWARD. The Secretary of Agriculture has sent through the Treasury Department to you a supplemental estimate for \$500,000 to be used in investigating the newly imported corn borer, about which I think we had hearings last year. We had previously sent in an estimate of \$500,000, but, on account of the adjournment of Congress before action upon the bill, the appropriation, of course, was left out. Then, when the special session convened you put in \$250,000 instead of \$500,000.

The CHAIRMAN. The Senate committee reported \$500,000, but it was not passed on by the Senate.

Dr. HOWARD. An appropriation of \$250,000 was made, but investigation showed that the operations of the corn borer were becoming more dangerous, and the Senate committee was asked to add \$250,000.

The CHAIRMAN. As I recall it, the estimates were originally for much less.

Dr. HOWARD. Originally; yes. Later we asked for the sum of \$500,000 in addition to the appropriation of \$250,000. The Senate, as I say, had the bill then. It passed at the special session of Congress, but, instead of giving us \$500,000, as was provided for in the previous will, which had not passed, we were given \$250,000, and on that appropriation we are working at the present time.

There has been still a further spread of the insect, so we appeared before the Appropriations Committee of the Senate and asked them for an appropriation of \$250,000, to be made immediately available. Before they decided on that, the estimates of the Secretary were put in, and, thinking that that might be added in the general deficiency bill, he made no additional requests of this committee.

Since the Appropriations Committee declined to provide for the corn borer in the deficiency bill, the Secretary now asks for this amount in a supplemental estimate.

The CHAIRMAN. In your opinion, will \$500,000 be sufficient?

Dr. HOWARD. I think it will for the next year's work.

The CHAIRMAN. You are getting along fairly well with the work?

Dr. HOWARD. We can't tell how much we are accomplishing just yet, but we need \$250,000 to be made available for next spring's work.

The CHAIRMAN. \$250,000 of the \$500,000—

Dr. HOWARD. Should be made immediately available in order that we may continue the work. We will have expended practically all of the \$250,000 this year, before the 1st of January, within \$20,000 or \$30,000 of the entire amount.

The CHAIRMAN. You say that \$250,000 will be spent by what time?

Dr. HOWARD. By the 1st of January.

The CHAIRMAN. Of this year?

Dr. HOWARD. This fiscal year.

The CHAIRMAN. It is practically expended now?

Dr. HOWARD. It is practically expended now; yes, sir.

Mr. McLAUGHLIN of Michigan. This corn borer was found first in a very limited area, first in Massachusetts?

Dr. HOWARD. Yes, sir.

Mr. McLAUGHLIN of Michigan. You were not able to confine it to that area, and it spread in all direction; to what extent?

Dr. HOWARD. It spread from southern Massachusetts northward and westward. Owing to the failure of our appropriations last spring, the borer got a start, and it spread during the early summer; and it now extends over an area in eastern Massachusetts of about 1,800 square miles. It has also gone across into New Hampshire and has made its appearance in New York, near Schenectady. It is estimated that it covers an area of 500 or 600 square miles in that locality.

It has been discovered quite recently in two or three other places. It has been discovered in Erie County, N. Y., and Erie County, Pa.

Mr. McLAUGHLIN of Michigan. Are those two counties, in those two States, near together?

Dr. HOWARD. The counties, I believe, are near together but do not adjoin each other across the State line.

The CHAIRMAN. How large an area is infested?

Dr. HOWARD. The area in western New York is approximately 500 square miles, but the infestation is not as serious in that part of the country as it is in Massachusetts.

The CHAIRMAN. How large is the area of infestation in Massachusetts?

Dr. HOWARD. Something over 1,800 square miles.

Mr. McLAUGHLIN of Michigan. That is in addition to the 300 square miles in which it was first found?

Dr. HOWARD. That includes the 300 square miles; that is the entire area of infestation in Massachusetts.

Mr. ANDERSON. Has there been any investigation of this infestation by county and State authorities?

Dr. HOWARD. Yes, sir; there has been a meeting of the commissioners of agriculture of the different States. They have an association, and they held a meeting at Albany last August, and then adjourned to Boston, and had a meeting there also. They looked over the matter and were very much impressed with the seriousness of the situation, and urged an appropriation of \$2,000,000 for the extermination of the corn borer. They believed it could be exterminated with \$2,000,000.

Mr. ANDERSON. I read an article by some commissioner, or member of a committee, or whatever it was, and my impression now is that he thought it was not possible to exterminate the insect. He also thought that possibly the damage done by the insect was not as serious as had been indicated.

Dr. HOWARD. You refer to the article by Mr. Woodbury, of Indiana, who visited the region a month later than this commission. He looked over the matter, and he was rather of the opinion of the experts of the department, that it would be practically impossible to exterminate the insect at this stage of the game and that it would be much better for the Government to find out the exact extent of the outbreak, to make smaller appropriations, and the secretary has asked for \$500,000.

I told the committee last year that it was supposed that this insect had been imported into the southern part of Massachusetts in hemp,

but it has been discovered that it is much more probable that it came in with large shipments of broom corn from Hungary. These shipments of broom corn went to many places, including Massachusetts and New York, and also Kentucky, Illinois, Indiana, Iowa, and some other Western States. We have had no reports of the insect's occurrence in those latter States. It has not yet shown up at every place where the broom corn was sent.

Mr. McLAUGHLIN of Michigan. In what form was that broom corn imported?

Dr. HOWARD. Baled in long stalks, for the purpose of making brooms; and the insect, in all probability in the caterpillar form, was inside of the stalk, where it wasn't noticed.

Mr. McLAUGHLIN of Michigan. Have you learned how it spreads?

Dr. HOWARD. It spreads rapidly, by flight mostly; it also spreads by lighting on vehicles and carriages and being carried from one place to another in that way; it also spreads in seed corn on the cob.

Mr. McLAUGHLIN of Michigan. At what time of the year does it move by flight?

Dr. HOWARD. It moves in Massachusetts twice a year. It moves in June and again in late July and early August. There are two generations in Massachusetts. This year there was only one generation in New York, which was pointed out by Mr. Woodbury in the article to which Mr. Anderson refers.

Mr. McLAUGHLIN of Michigan. What kind of work are you doing?

Dr. HOWARD. We are spending that money as follows:

We are inspecting the corn areas wherever this broom corn was sent—all of the areas in regions to which this original shipment of broom corn was introduced. We are doing very elaborate scouting work for the insect, in order to determine as accurately as possible where it is to be found. In addition to that, we have a selected area of the densest population where it is to be found, making it difficult to combat, and we have chosen 25,000 acres of this to try and see whether it is possible to exterminate it. In some localities it occurs in almost every garden, not only on corn but vegetables of different kinds.

Mr. HARRISON. I have here the supplemental estimate which I can insert in the record, if you desire. It has been transmitted to the House through the Secretary of the Treasury, and is now on the Speaker's table, but it has not yet come to this committee.

The CHAIRMAN. We will be glad to have it.

(The paper referred to follows:)

DEPARTMENT OF AGRICULTURE,
OFFICE OF THE SECRETARY,
Washington, December 12, 1919.

The Honorable the SECRETARY OF THE TREASURY.

SIR: I have the honor to submit herewith an estimate of an additional appropriation required by this department to meet the emergency caused by the unexpected spread of the European corn borer. For this item the following wording is suggested:

"To enable the Secretary of Agriculture to meet the emergency caused by the spread of the European corn borer, and to provide means for the control and prevention of spread of this insect throughout the United States, in cooperation with the States concerned, including employment of persons and means in the city of Washington and elsewhere, and all other necessary expenses, \$500,000, which shall be immediately available."

It is proposed to use this sum for the continuation of the work now under way relating to the investigation and control of the corn borer.

As a result of the studies of the past season, it is believed that the European corn borer was brought into this country in 1908-9 with importation of approximately 10,000 tons of broom corn, chiefly from Hungary. Some hundreds of tons of this imported broom corn were utilized near Boston, and like quantities went to the region in New York where the insect was first discovered in that State, but the bulk of the importations were shipped to St. Louis, Chicago, and New Orleans and other western and southern towns and from these points was widely distributed to local broom factories throughout the Middle West. Some of these shipments have been traced to their destinations but they should all be followed up and located and the districts involved should be given, next season, an intensive inspection to determine possible infestation from such broom corn.

In view of the large number of food plants of the corn borer, of its spread as now known in this country, and of the likelihood that, as a result of surveys which should be made next year, it will prove to be even more widely distributed, it is realized that extermination is probably out of the question. The problem, therefore, is one of determining the area infested and the possibilities of practical control. The funds appropriated by the last Congress are being utilized for these purposes, including the carrying out of experimental control measures over areas sufficiently large to demonstrate the possibilities of practical repression or extermination. The bulk of this work must be done in the late fall and early spring. As now planned and in progress, it will call for the expenditure of all the original appropriation by the end of this calendar year.

It is estimated that at least \$500,000 will be required for the effective prosecution of the work outlined. At least half of this sum should be made immediately available in order to provide for the necessary surveys and the completion, without interruption, of the large control experiments now in progress.

The European corn borer is now known to occur over the entire coastal region of Massachusetts, including Cape Cod and adjacent islands, and in the vicinity of several towns in southern New Hampshire, involving approximately 1,800 square miles. In New York State an infested area of about 800 square miles exists in the Mohawk Valley between Amsterdam and Albany. In western New York an area was recently discovered which now extends over 500 square miles, and this area is being extended as the survey proceeds. The insect also has been discovered in a limited area in Erie County in north-western Pennsylvania.

While the insect is called the corn borer, it infests most annuals, including ornamental plants, common grasses, small grains, and most garden vegetables and weeds—in fact, almost any plant which is not of a hard or woody nature. Corn is its favorite food, however, and in Massachusetts it has been a source of marked injury to sweet and flint corn. The possibilities of damage to the coarser field corns of the West and South remain to be determined.

The fears which have been aroused throughout the United States on account of this pest have led to a wide demand for thoroughgoing control efforts by the Federal Government, in cooperation with the States already invaded by the insect. This demand was emphasized at the meeting of the National Association of Commissioners of Agriculture, held at Albany and Boston on August 28 and 29, when resolutions were passed urging Congress to appropriate \$2,000,000 to carry on the work against the corn borer, the money to be made available for use as rapidly as an effective organization could be developed. In view of the possibilities of damage by the pest and in response to the wide public demand, it seems proper that an appropriation should be made which will enable the department, working in close cooperation with the States concerned, fully to determine the status of the insect as an enemy to corn and other crops, its present distribution, and the possibility of control.

Respectfully,

D. F. HOUSTON, *Secretary*.

MR. McLAUGHLIN of Michigan. Can you tell as to how destructive the insect is?

DR. HOWARD. It has not been observed closely except in Massachusetts and in New York. It is a very serious insect. We have not yet been able to determine whether it will be as bad on the field of corn in the West as it is on the sweet corn in the East.

Mr. PURNELL. What action does it have on the corn?

Dr. HOWARD. It bores into the stalks; also into the ears; it weakens the cornstalks and destroys the ears.

Mr. PURNELL. Does it attack when the stalks are young or after the corn matures?

Dr. HOWARD. The caterpillar passes the winter in the old stalks, and when the moth comes out it lays its eggs on the leaves of the corn, before the corn tassels or just about the time that it tassels; it also lays its eggs in the tassels of the corn and on the leaves. The caterpillars hatch out in the tassels and later attack the forming ear; they grow, turn into the chrysalis condition, and then the moth comes out.

Mr. ANDERSON. I would like to call your attention to an article appearing in "The National Grange Monthly," showing how the experts are doing this work. Have you read it?

Dr. HOWARD. No, sir.

Mr. ANDERSON. I should think you would be very much interested.

Dr. HOWARD. I would like to hear it.

Mr. ANDERSON. This is an article appearing in the December, 1919, issue of The National Grange Monthly, and it is headed "The way 'experts' work." It says:

In speaking of the comparative efficiency of Government and private management, Edgar J. Rich cited an instance where, during the corn-borer work of the past year on his own land in Massachusetts, four Government "experts" were sent out, with instructions to destroy all the hollow-stalk weeds, as the latter are supposed to be the nesting places of the pest. It was only a small piece of ground, and the men remained so long that he went out to investigate what was keeping them, only to find that four men armed with small nippers were carefully picking out the hollow-stem weeds and cutting them, making an exceedingly slow process. He remonstrated with them, and asked why they did not take a scythe and cut all the weeds, as there was nothing of value on the piece of ground. The Government "experts" appeared very much shocked at such a proposal, and explained by saying, "If we did that we should destroy a lot of weeds which do not have hollow stems, and our instructions are to destroy only hollow-stem weeds." Mr. Rich figured that one man with a scythe, in less than half a day, could have cleared the entire piece, on which the Government with its "expert" labor expended fully \$50.

Dr. HOWARD. That is not the way the work is done at all. And they have a way of calling laborers which the Government sends out "experts." It is very difficult to get the best class of labor to do the work, but the work is not done in that way at all, Mr. Anderson.

Mr. ANDERSON. I had no idea it was. I simply wanted to call your attention to the article. It is a good story, whether it is true or not.

Dr. HOWARD. Ever since I have been engaged in this work the newspapers have made fun of entomology, not because I happened to be an entomologist, but they have always pictured the entomologist as a queer person with a butterfly net and insects pinned to his hat.

The CHAIRMAN. You might go a little more into detail about the corn borer. This is quite interesting. Do you have hope of ever exterminating it?

Dr. HOWARD. I fear not.

The CHAIRMAN. You think you can restrict it?

Dr. HOWARD. Yes, sir.

The CHAIRMAN. Your activities are being confined to the restricting it?

Dr. HOWARD. In addition to this scouting work, to determine exactly where it is, we have got this large experimental control area of over 25,000 acres of land to see what we can do toward extermination.

The CHAIRMAN. Has it been suggested that the other States quarantine against these States in which the borer prevails?

Dr. HOWARD. A number of States are about to quarantine against the infested sections.

The CHAIRMAN. You say, about; have they taken any action?

Dr. HOWARD. Yes, sir.

Mr. WALTON. New York, Massachusetts, New Hampshire, Illinois, Vermont, the Dominion of Canada, and Florida have all issued quarantines against them. Other States are about to do so. Our State entomologists and State commissioners are greatly exercised about it and are bringing pressure on the legislatures now to establish quarantines against the infested regions.

The CHAIRMAN. Would not that be the proper way of doing it?

Dr. HOWARD. That would be an admirable thing.

The CHAIRMAN. That ought to be impressed upon the State authorities.

Dr. HOWARD. They feel the responsibility very much.

The CHAIRMAN. You have taken it up with the States?

Dr. HOWARD. They have taken it up themselves, and they know it is a serious problem.

Mr. LESHER. In what way does it affect the corn?

Dr. HOWARD. It destroys the ear and it reduces the bearing capacity of the stalk. Those ears that escape the borer in the early summer afterwards may be infested by the second generation of moths. They reduce the corn crop to a very serious extent. We have been advised by European entomologists, for example, that some years ago in portions of Hungary the corn crop was reduced 75 per cent in one year.

Mr. McLAUGHLIN of Michigan. If the corn is shipped in the ear, is the insect easily hidden?

Dr. HOWARD. It may be quite concealed. It may be in the interior, in the stalk, or in the cob, between the grains.

The CHAIRMAN. To what extent are the crops destroyed in the areas which are infested in New York and Massachusetts?

Dr. HOWARD. The different kinds of corn seem to be differently affected.

We have seen some crops of sweet corn, in limited areas in Massachusetts, which were almost totally destroyed. We have seen no destruction of field corn of more than 10 per cent as yet.

The CHAIRMAN. Do they just damage the corn or destroy it entirely?

Dr. HOWARD. They reduce the general yield of corn from 5 to 10 per cent.

Mr. McLAUGHLIN of Michigan. There isn't much shipment of corn-stalks from one locality to another, is there?

Dr. HOWARD. Not much; no, sir.

The CHAIRMAN. How many acres of sweet corn were destroyed?

Dr. HOWARD. In the regions which are most infested they have appeared in small garden patches, as a rule, but in some truck regions possibly three-fourths of an acre.

The CHAIRMAN. Does it operate something like the chinch bug in destroying the crops?

Dr. HOWARD. No; it goes through the field. There may be here and there stalks that are not attacked, and then again it may be that every stalk is attacked.

Mr. HUTCHINSON. Is it anything like the wheat moth?

Dr. HOWARD. No, sir; it is a different insect. It works only on the stalk and in the ear. It does not feed in the grain like the wheat moth.

The CHAIRMAN. Are we to understand that \$500,000 will be adequate?

Dr. HOWARD. That is the best judgment of the experts of the department at the present time.

The CHAIRMAN. That is the lowest amount that you could get along with?

Dr. HOWARD. I don't see how we can do with any less.

Mr. McLAUGHLIN of Michigan. You say a part of the money should be made available before the close of the present fiscal year?

Mr. HARRISON. At least half of it.

Mr. McLAUGHLIN of Michigan. That will leave \$250,000 for the rest of the fiscal year.

Dr. HOWARD. That will leave \$250,000 for the rest of the year. We do this work in the spring and in the autumn. That is the reason we have to have the money before the first of the next fiscal year.

The CHAIRMAN. But you say that the \$250,000 that you now have appropriated has practically been exhausted. This bill will probably not pass and become a law before March. During what time of the year do you do this work?

Dr. HOWARD. There is nothing to be done just at present but to continue our investigations and our scouting work, and we will have enough money left for that.

Mr. McLAUGHLIN of Michigan. Have the States made any appropriations for work along this line in cooperation with you?

Dr. HOWARD. Yes, sir. The State of Massachusetts, when they found our bill could not pass last March, made an appropriation of \$100,000 and turned it over to the bureau, and we worked with Massachusetts. Finally, the State of New York made an appropriation of \$100,000.

Mr. McLAUGHLIN of Michigan. The States did that when they learned that the bill was not going to pass. If the money had come forward from the Government they would not have done anything.

Dr. HOWARD. Mr. McLaughlin, I should have explained that their bills for appropriations were introduced for days before it became evident that our appropriation would fail. They would have passed their bills anyway. I did not mean to create that impression.

Mr. McLAUGHLIN of Michigan. There was \$100,000 appropriated by the State of New York?

Dr. HOWARD. The Massachusetts appropriation was expended absolutely by us. New York expended hers under the direction of the State in consultation with us. They did a tremendous amount of work. They had a pay roll as high as \$12,000 a week at one time.

Mr. McLAUGHLIN of Michigan. How about the outbreak in Indiana?

Dr. HOWARD. There isn't any outbreak in Indiana.

Mr. McLAUGHLIN of Michigan. Did you not make some investigations out there when the scare first started?

Dr. HOWARD. We have investigated the matter in every locality where this shipment of broom corn was supposed to have reached, but in many places no infestation has been discovered. In Massachusetts and New York are the original outbreaks.

Mr. McLAUGHLIN of Michigan. How far do these moths fly?

Dr. HOWARD. They fly at night, and I do not know the exact distance.

Mr. WALTON. The longest single flight observed was about 600 yards at a time, but they make repeated flights, of course.

Dr. HOWARD. Of course, they light on vehicles, and in that way they will be carried a considerable distance. They would be attracted by the light in trains and be carried by the train for some distance.

Mr. RUBEY. I thought we had some means of protecting the Government from importations of infested trees and plants. How were these things brought in?

Dr. HOWARD. We have a Federal law which is being very carefully enforced.

Mr. RUBEY. How did that shipment get past it?

Dr. HOWARD. It was made in 1910, two years before the quarantine law was passed. The quarantine law was passed in 1912.

Mr. LESHER. Is the quarantine law such now as to prevent any other bugs or insects from getting into the United States which will cause us to spend so much money?

Dr. HOWARD. They issue quarantines from time to time, if a European pest is found attacking the crops, which provides that those crops shall not be shipped to this country. We have done that a number of times. I think this country is better protected than almost any other country in the world. At the same time, things will slip in.

Mr. McLAUGHLIN of Michigan. What means do you use to learn of the bugs that are prevalent, so that you may be prepared to protect the United States from them, from any other countries?

Dr. HOWARD. There are economic entomologists all over the world who study these things. We correspond with those people constantly. The economic entomologists are the most mutually helpful men that you can imagine. They forward their publications to one another, and whenever they find a new pest we know about it, and in that way we get the information.

Mr. McLAUGHLIN of Michigan. What success have they had with fighting this corn borer in Europe?

Dr. HOWARD. They have had comparatively little success. The point is this, Mr. McLaughlin, that they grow corn to a relatively slight extent over there. Corn is grown in some few places. It is used for cattle food, but only to a comparatively slight extent as human food. They raise some in southern France, in Italy, and in Hungary. In Transylvania there is a considerable area of corn, and there is some produced in the southeastern part of Russia. It is not so important a crop as in America, and the corn borer hasn't made as much of a stir over there as here, where we grow such an enormous acreage of corn and where we use it to such an extent.

They have studied the insect to some extent in Russia. They studied it there before the war. The remedies which they advised are the ones that we are trying in Massachusetts, upon which we have greatly elaborated.

Mr. McLAUGHLIN of Michigan. Does the insect prevail in each area where corn is grown in Europe?

Dr. HOWARD. Wherever corn is grown this insect usually is found; but, again, the insect is found in regions where no corn is grown. For example, a report has just come from Brussels. Some entomologists began to look around in the field and found this insect in weeds near Brussels. It had not been known to exist there before, but probably has been there all the time.

The next item under which we ask an increase is item 35, "For investigations of insects affecting southern field crops, including insects affecting cotton, tobacco, rice, sugar cane, etc." The increase here is \$78,000, of which \$70,000 is to be applied to experimental work with our recently discovered system of destroying the boll weevil. In 1915 experiments on a small scale in the Delta region of Louisiana showed that there is undoubtedly a good method of poisoning the boll weevil at a comparatively small price which will work in that region. We did not make public the results of that work at once, but continued to increase the size of our experiments until now we find that it can be successfully used at a great saving of cotton on a large scale. The conditions of growing cotton in the Delta region of Mississippi and Louisiana are different from the conditions that exist in other parts of the cotton belt, however, and, encouraged by what we have given out this year about the success in this particular region, planters have already contracted for over 20,000,000 pounds of arsenate of lime and are going to work, probably to the disappointment of some, in applying the same methods under different conditions in other parts of the cotton belt.

We desire now to experiment in parts of the cotton belt where conditions differ from those in the Mississippi Delta. At each of those points we want to spend about \$5,000 in experiments on variations of the methods of this poisoning that will be necessary. The method consists of dusting the cotton, under conditions of moisture where possible with arsenate of lime, which is a very dry and very flocculent arsenical poison, which adheres to the leaves, and catches the weevils when they come to suck up the moisture on the leaves. Although our success has been very great in the Mississippi Delta, we fear that it will not be as great a success elsewhere if done in the same way. We want to study the different conditions and contrast the methods in other parts of the cotton belt. Only this last summer the State Entomologist of Alabama, one of our former assistants, has tried it out experimentally on a cotton plantation of 210 acres near Montgomery, Ala. He kept 60 acres untouched and poisoned 150 acres, and the result was a saving to the amount of over \$9,000, which shows that a trained man can apply this remedy successfully in an adjoining State, although under somewhat similar conditions, because it was also there in a river bottom. We wish to perfect this method to such an extent that the average planter can follow directions, wherever he may be, and get equally good results.

Mr. McLAUGHLIN of Michigan. That was not a very good result, was it; a saving of only \$9,000?

Dr. HOWARD. That was the result of the first attempt. Of course, we can do much better than that.

Mr. McLAUGHLIN of Michigan. How large an area was it, 150 acres?

Dr. HOWARD. Yes; 150 acres.

Better results have been obtained under the direction of our own men in the Mississippi bottom lands. For instance, on Senator Ransdell's plantation he has successfully used this method, with a very great saving. The method of applying the poison is something we have got to do more work on. We are perfecting dusting machines, in cooperation with the engineers of the Bureau of Public Roads, and we expect to use probably \$16,000 this coming year on the perfecting of those machines.

Mr. McLAUGHLIN of Michigan. Why are you cooperating with the Bureau of Public Roads?

Dr. HOWARD. Because there are mechanical engineers connected with that bureau who can be used for that purpose without additional expense. This is the easiest way for us to get the services of mechanical engineers to help us, and one of their men, Mr. Taylor, has made suggestions in reference to the improvement of these machines that are very valuable indeed.

The CHAIRMAN. Is there some prospect of exterminating the boll weevil?

Dr. HOWARD. No; I do not think there is any prospect of exterminating them, but there is the possibility of killing so many of them that all that are left will be able to do very little damage.

The CHAIRMAN. Will this new method eventually exterminate all of them?

Dr. HOWARD. I doubt it very much. It might possibly do so.

Mr. HUTCHINSON. What is the difference between the pink bollworm and the boll weevil?

Dr. HOWARD. The boll weevil is an insect that came to us through importations of cotton from Mexico more than 20 years ago. It is a hard-backed weevil. The pink bollworm is an insect which has spread all over the world from importations of Egyptian cotton, and is the larva of a moth.

Mr. HUTCHINSON. That is what I thought. The pink bollworm is an entirely different insect.

Mr. McLAUGHLIN of Michigan. The boll weevil and the pink bollworm are two different things.

Mr. HUTCHINSON. The pink bollworm develops into an insect that flies, does it?

Dr. HOWARD. Yes, it flies; it becomes a little moth.

Mr. HUTCHINSON. Where did that come from?

Dr. HOWARD. That insect was brought into Mexico on Egyptian cotton a number of years ago. We have tried to keep it out of this country; some got in, but we have practically annihilated it under the work of the Federal Horticultural Board.

Fifty thousand dollars of this \$78,000 asked for will be used for further experimentation as to the different conditions of the uses of the recently discovered cotton boll weevil remedy. We expect to spend \$16,000 in the further perfection of machinery. That makes \$66,000. The other \$4,000 will be spent for the compensation of traveling inspectors, and so on.

The remaining \$8,000 we wish to devote to further perfection of our field experimentation work on tobacco insects. Members of Congress from the tobacco regions have repeatedly urged an increase of this appropriation for demonstration work and for experimental work on a larger scale.

Mr. McLAUGHLIN of Michigan. That spraying of cotton, I suppose, will reach the point that has been reached in the spraying of fruit trees, and so on, in other States where the people do it themselves.

Dr. HOWARD. They will be obliged to do it if they wish to raise cotton.

Mr. McLAUGHLIN of Michigan. Unless the Government does it for them.

Dr. HOWARD. The Government is not going to do it for them, but to tell them how to do it; that is all.

There are no increases asked for under item 36, "For investigations of insects affecting forests."

The CHAIRMAN. You might state the character of the work done under that.

Dr. HOWARD. That is the general study of insects affecting forests. A large part of this sum is devoted to the study of insects affecting the great pine forests of the West. We are now able to give advice to timber growers, and we are consulted by the Forest Service all the time on these questions.

Mr. RUBEY. The Forest Service has requested an appropriation to combat insect infestations in the forests. Your work is to find the insects, and then they go to work to destroy them; is that it?

Dr. HOWARD. They follow our methods. We tell them how to do it; that is all, sir.

Under the next item, 37, "For investigations of insects affecting truck crops," etc., and "insects affecting stored products," there is a large sum of money being expended for the sweet potato weevil, which has been discussed before this committee before. No increase is asked for this item, but I would like to show to the members of the committee a map of the present distribution of the sweet potato weevil and to give a brief report of progress.

Mr. McLAUGHLIN of Michigan. How much of this money was spent for this sweet potato weevil?

Dr. HOWARD. \$70,000; and we wish to spend \$70,000 more. The sweet potato weevil is an insect which in recent years has been very much on the increase.

Mr. RUBEY. Does this map indicate where you have done the work?

Dr. HOWARD. This shows where the insect occurred.

Mr. RUBEY. Have you been able to eliminate it from that territory?

Dr. HOWARD. From certain parts of it. It is not a difficult insect to handle, now that we have studied its life history and understand it pretty well. It is spread through the slips and draws which are used for propagation, and the States of Florida, Alabama, Georgia, and Mississippi have passed legislation preventing the introduction of slips or draws from infested regions. These slips and draws carry the weevil, and these things have been brought from regions where the insect occurred to regions where it should not occur.

Louisiana has also passed a law, which has not been effective because it has not been enforced; but Texas has passed no legislation whatever.

Mr. McLAUGHLIN of Michigan. How long ago did you make this request for legislation on the matter?

Dr. HOWARD. Of the States?

Mr. McLAUGHLIN of Michigan. Yes.

Dr. HOWARD. Two years ago, I think.

Mr. McLAUGHLIN of Michigan. Louisiana is the only one that complied?

Dr. HOWARD. No; Florida, Alabama, Georgia, and Mississippi have passed laws and are enforcing the laws. Louisiana has passed a law but is not enforcing it. Texas has not yet passed such a law. Our men have been scouting all this territory to find where the insect occurs. They have located all these points that you see on that map, and now they are going into each individual place and getting the farmers to destroy the infested sweet potatoes in the fields, and to destroy all of the plants, and then to get their new slips and cuttings for the next crop from regions where the insect does not occur.

Some experiments with poisons have been made in Texas, but they have not proved perfectly effective. In all these regions in the territory where the sweet potato is the only food plant, we have been able to greatly reduce the area and to wipe out the insect on farm after farm.

In Florida the problem is complicated, because there are wild food plants of the insect there on which it feeds. There is nothing to do there but get the people to destroy these wild food plants.

Mr. McLAUGHLIN of Michigan. How is the weevil carried?

Dr. HOWARD. It is carried on slips and draws that are used for planting in the spring; and it also flies. It is a small beetle; it looks more like an ant than a beetle, but, as a matter of fact, it will fly for a mile or two.

Mr. McLAUGHLIN of Michigan. If Texas is not doing anything, it had better be left to itself, had it not?

Dr. HOWARD. I think so.

Mr. HUTCHINSON. Doctor, I want to ask you about the wheat moths and weevils.

Dr. HOWARD. That matter is pretty well understood, Mr. Hutchinson. We haven't gone into that ourselves for the reason that there are only two States that seem to be suffering any damage, New Jersey and Pennsylvania, and each of those States have very competent entomologists, Dr. Headlee, in your State, and Prof. Sanders.

Mr. HUTCHINSON. But they are going farther West all of the time; they are spreading. If they keep spreading, they might threaten the entire United States?

Dr. HOWARD. Isn't it possible for the farmers to thrash their wheat earlier up there?

Mr. HUTCHINSON. Everybody can't thrash their wheat earlier. Here is a sample of wheat that has been affected, and here is another sample of good wheat. When this wheat was brought in, this infested wheat was just as good in appearance as this other wheat. This wheat is coming in now, and we do not buy it. We can not use it for making flour. We can use it only for chicken feed and

things of that kind. It does seem to me that the Government ought to do something to check its spread. I do not know whether anything can be done, but it seems to me that something might be done. This weevil looks a little bit like the pink boll weevil.

Mr. HOWARD. It belongs to the same family as the pink bollworm belongs to.

Mr. HUTCHINSON. It is very seriously affecting the wheat growers in New Jersey, and it is liable to get all over the country. I think it is one of the most important things to be considered.

Dr. HOWARD. We are not estimating for investigations of this insect. The men in New Jersey are perfectly competent to handle it, and, after all, this is simply a question as to whether the farmers can trash their wheat before it is stored.

Mr. McLAUGHLIN of Michigan. Before?

Dr. HOWARD. In most of this section, after the wheat is harvested it is stored. I will ask Mr. Back to discuss that.

The CHAIRMAN. We will be pleased to hear Mr. Back.

STATEMENT OF MR. E. A. BACK, IN CHARGE OF STORED PRODUCT INSECT INVESTIGATIONS, BUREAU OF ENTOMOLOGY, DEPARTMENT OF AGRICULTURE.

Mr. BACK. Just as soon as the wheat is cut and shocked, sometimes a little earlier, the eggs are laid in the wheat in the shocks, and then the moths hatch and eat into the grain and do damage by devouring the interior of the kernel.

Mr. McLAUGHLIN of Michigan. Then the wheat isn't ruined at the time it is cut?

Mr. BACK. Sometimes the moth will attack the ripened wheat standing in the field, but the great damage comes, of course, after the wheat has been cut and stacked in the barn, provided it is not thrashed at once. This insect will breed in the bins in the barns. Storing in the barns without threshing make it possible for the moths to get into the wheat much more easily.

The CHAIRMAN. You know of no way of exterminating it?

Mr. BACK. Yes, sir; if wheat is threshed immediately, or very soon after it is harvested, there is very little danger.

The CHAIRMAN. That does not exterminate the flies.

Mr. BACK. Threshing and storing in bins does not exterminate the flies, because usually a few moths will be found feeding on top kernels of the granaries after the wheat has been stored.

The CHAIRMAN. In time, they will starve?

Mr. BACK. Probably not entirely, because they are able to feed on a few grains that are to be found here and there, and very few farmers ever clean out their bins entirely.

The CHAIRMAN. Can you suggest anything?

Mr. BACK. As Dr. Howard says, they may thresh their grain and store it in bins. Grain so stored can be fumigated to prevent loss.

The CHAIRMAN. Would an appropriation be necessary for that?

Mr. BACK. No, sir.

Mr. HUTCHINSON. You can fill that box up with wheat and close it tight, and they will hatch out?

Mr. BACK. Yes, sir; that is because the eggs were in the kernels when the wheat was put in the box.

Mr. HUTCHINSON. Don't you think that the eggs were laid at some time after the wheat was put in the box?

Mr. BACK. No, sir; not the eggs causing the original infestation.

Mr. HUTCHINSON. How did they get inside of the kernels?

Mr. BACK. Suppose you put a handful of wheat in that box [indicating]. There may be one kernel in there that is infested.

Mr. McLAUGHLIN of Michigan. With eggs?

Mr. BACK. With eggs, yes, sir; the others may be all right when they are put in the box. Then, after those eggs hatch out and the insect goes through its life cycle, the moths will lay new eggs on the other kernels, so that by spring, when you open the box and expect to find a perfect lot of grain, you will find that the original insects have multiplied in the dry grain to such an extent that they have practically destroyed every kernel.

Mr. HUTCHINSON. Do you mean to say that the eggs are laid on the outside and get in the grain?

Mr. BACK. Yes, sir; every time.

Mr. HUTCHINSON. You say that the eggs are laid on the outside and get in the grain?

Mr. BACK. No; the eggs hatch first.

The CHAIRMAN. Thank you Mr. Back.

STATEMENT OF DR. L. O. HOWARD, CHIEF OF THE BUREAU OF ENTOMOLOGY, DEPARTMENT OF AGRICULTURE—Continued.

Dr. HOWARD. Mr. Hutchinson, this insect has been known in this country for 120 years. It must have been introduced by some of the colonists before the Revolutionary War. It has been known over a considerable section of the country, over the eastern section, but it has been only during the past few years that it has damaged wheat to any considerable extent in these two States. I do not think there is any great danger of it spreading.

Mr. HUTCHINSON. It is spreading all the time. It is going farther and farther. It is over in Pennsylvania, and is getting up around Lancaster, away up there. We don't buy this wheat. We have absolutely abandoned the use of it for flour and use it only for chicken feed.

Dr. HOWARD. It seems as if the farmers could thrash their wheat a little earlier.

Mr. HUTCHINSON. All of them can not get their wheat thrashed at once; it is impossible.

Dr. HOWARD. I took a trip over your State last summer with Dr. Headlee. He told me he had issued publications telling the farmers of New Jersey how to handle it.

Mr. McLAUGHLIN of Michigan. You have seen the way that the bugs attack the field peas, haven't you? Dr. Howard, of course, knows a great deal better than I do, but it seems to me that the fly stings the pea and lays its eggs on the inside, and then the little flies develop in there, and they grow inside of the field pea to be about the size of the head of that wooden pin [illustrating]. If you will take the pea and break it open, on the inside you will find the fly.

Mr. HUTCHINSON. That is the same way with the wheat.

Mr. McLAUGHLIN of Michigan. Except that the gentleman says that the eggs are laid on the outside of the wheat and hatch on the

outside, and that the insect then develops and digs into the wheat—digs its way in.

The CHAIRMAN. What progress are you making under item 38, "for investigations and demonstrations in bee culture"?

Dr. HOWARD. That is very well covered in my annual report. I had expected to have Dr. Phillips here to speak to you on that.

The CHAIRMAN. You are making progress?

Dr. HOWARD. Very good. There has been an enormous increase in the exportation of honey from this country, an enormous increase in the production of honey, as a substitute for sugar, largely stimulated by the department as a war measure.

The CHAIRMAN. Your present appropriation will be enough?

Dr. HOWARD. I think so. The Secretary of Agriculture has made no request for anything further.

There are no more increases, Mr. Chairman, until we come to item 39, page 174, "for investigations of insects affecting tropical and subtropical fruits," and I shall be very glad to leave the discussion of those increases to Mr. Marlatt, who has charge of that branch, and who at the same time will come before you for the appropriations for the Federal Horticultural Board, of which he is chairman. I think it would be better to leave those propositions to him.

Mr. McLAUGHLIN of Michigan. Have not requests been made of him, and perhaps they have come to you also, from some of the people of Texas to change the regulation by which you demand that local people interested shall pay for fumigating the cars in connection with shipments across the Mexican border?

Dr. HOWARD. Yes.

Mr. McLAUGHLIN of Michigan. They want the Government to bear that expense?

Dr. HOWARD. Yes.

Mr. McLAUGHLIN of Michigan. Have you considered that?

Dr. HOWARD. That does not come under me, but under the Federal Horticultural Board.

That finishes the matters for the bureau, Mr. Chairman.

The CHAIRMAN. Thank you, very much, Dr. Howard.

MORNING SESSION.

THURSDAY, JANUARY 8, 1920.

Mr. HARRISON. Mr. Chairman, when Dr. Howard was before the committee he suggested that the consideration of item No. 39, on page 174, and item No. 40, on page 175, be deferred until Mr. Marlatt could be here. Mr. Marlatt is here, and would be glad to discuss those items so that the hearings on the Bureau of Entomology can be printed.

STATEMENT OF MR. C. L. MARLATT, ASSISTANT CHIEF OF THE BUREAU OF ENTOMOLOGY, DEPARTMENT OF AGRICULTURE.

Mr. MARLATT. Mr. Chairman, these items relate to the work that the Department of Agriculture is doing with respect to citrus and subtropical-fruit insects.

Item No. 39, on page 174, is "for investigation of insects affecting tropical and subtropical fruits including the orange, lemon, grape fruit, mango," and so forth. The amount of the estimate is \$24,500.

Item No. 40, on page 175, is "for investigations and control, in cooperation with the Federal Horticultural Board of the Mediterranean and other fruit flies." The amount of the estimate is \$32,000.

Item No. 39 covers the insect work in relation to the big citrus industry of Florida and California. There has not been an increase in that amount for some 8 or 10 years. The amount has been \$16,500, and that amount has been practically a continuous one without an increase for that period.

It began with \$21,500, and the reduction is due to transfer to the statutory roll.

The CHAIRMAN. You are asking for an increase?

Mr. MARLATT. We are asking for an increase of \$8,000, to be divided \$5,000 to the work in California and \$3,000 to the work in Florida.

While this is one of the smallest appropriations made for the department it covers a very important field of fruit production, namely, that of all tropical and subtropical fruits. We have been going along for a number of years with a very small appropriation, but there is now a very large need for an increase in the work, and it has not been possible to undertake important and necessary work on account of shortage of funds. I can, perhaps, best explain the needs by enumerating the types of work that are being conducted under this appropriation.

The subtropical cultures in California covered by this appropriation include all citrus fruits, such as the orange, lemon, and grapefruit, and also the fig, olive, and guava, and the rapidly developing date industry in the Coachella Valley.

In connection with the citrus work, one of the important continuing items is the investigation of orchard fumigation with hydrocyanic acid gas. Within the last two years there has been an entirely new development in this process, namely, in the employment of the liquefied gas in lieu of the old method of generating the gas in jars under the tented trees. The gas is now being produced in plants and liquefied and carried to the orchard in suitable containers, and this new form of use has resulted in much simplifying the method of fumigation. The manufacture, handling, and utilization of this liquefied gas introduces certain new risks to the persons engaged in its use and has involved the working out of new tables of dosage with respect to the effect on the insects concerned and on the trees and fruit. The working out of these needs is now under way and the citrus interests of California are looking to this department to standardize the method and to develop proper safeguards both with respect to the operators and to the orchards treated.

Another important phase of the California citrus work is the study and demonstration work which is being conducted with respect to certain mealy bugs. This work involves also a study of the Argentine, and which has now thoroughly invaded all the California citrus

districts. This ant is only indirectly of importance to the citrus industry, but the food relations which it maintains with these mealy bugs has resulted in the enormous increase of the mealy bugs in citrus orchards and the control of these citrus pests is dependent entirely on the control of the ant. This work already has resulted in clearing the ant and correspondingly the mealy bugs from large citrus areas in which the profitable production of oranges had been largely destroyed by the combined work of the ants and mealy bugs. It is desirable to continue this work and to extend it until the mealy bug and ant have been fully brought under control with respect to the areas invaded in southern California.

The rapidly developing date industry in the Coachella Valley is retarded for the present by two important scale insects. Funds have never been available to properly investigate these insects as a basis for control measures. It is apparent that such control measures are possible and the date industry may even be freed entirely from the presence of these insects. This is an important phase of the California work. It has been begun in a very limited way and this work has shown what undoubtedly can be accomplished if we have funds to properly develop investigation and control features.

The work in Florida similarly covers all the subtropical cultures developed or being developed in that State. A new station has been recently established near Miami to especially study the insect enemies of the avocado, mango, and guava. The avocado industry is one of the new promising fruit developments in that State and there are several insect problems of importance which should be worked out in relation to this fruit. The laboratory which has already been established for this work is very much restricted in its possibilities of usefulness by lack of funds.

The citrus work in Florida with laboratory headquarters at Orlando has been in operation for a considerable period. It is recognized as being of tremendous value to the State and is on both an investigational and demonstrational basis. The indorsement of the work of this laboratory has been widespread and emphatic. It has had no enlargement for a considerable period of years and should be strengthened by the addition at least of another agent with funds for enlarging the extent and usefulness of the project.

As an associated and related piece of work of very considerable importance, we are attempting to carry out under this appropriation also an investigation of the insects which commonly are found in greenhouse and hothouse cultures—plants most of which are tropical or subtropical in nature. This really involves the entire ornamental growth of plants under glass throughout the United States, an industry scarcely second even to the outdoor growth of ornamentals. No systematic effort has hitherto been made to study the insect enemies of such cultures of ornamentals under glass, and there is here a field of tremendous usefulness and one for which there is a wide demand for work and information.

We are attempting to do all of this work on an appropriation of \$16,500, and have not asked for an increase up to now. I think this is almost a unique case in the Department of Agriculture, where an appropriation of this kind has thus run along without an increase,

and I hope, therefore, that your committee will see fit to grant the small increase that is requested.

The CHAIRMAN. What do you propose to do to standardize the methods of fumigating orange orchards?

Mr. MARLATT. We have been cooperating with the makers of this gas to determine the reasons for its occasional explosive qualities, and to eliminate this risk. That is really a matter of production, purity, and proper containers, and that phase of the work has been largely completed. I think we have the gas now on a fairly safe basis in these respects. What we are now attempting to standardize is the use side—the orchard side.

The CHAIRMAN. You are investigating its use?

Mr. MARLATT. We are now working on the orchard side, to determine the best method of using the gas, the strengths to use, and working out tables which can be put into the hands of the fumigators for practical work.

This increase, therefore, of \$5,000 for California, and \$3,000 for Florida, will enable us to go on with the work which we are now doing, and which we have undertaken during the last two years. It, however, is a very modest increase, considering the importance of the tropical and subtropical fruit subject.

The next item, No. 40, is "For investigation and control, in connection with the Federal Horticultural Board, of the Mediterranean and other fruit flies." The amount estimated is \$32,000.

This appropriation has been running along for eight years or more without an increase, and no increase is now asked. This appropriation is in large part for the administration of the fruit-fly quarantine. A quarantine is in force against certain fruits from the Hawaiian Islands prohibiting the importation of such fruit into the United States as is affected by the Mediterranean fruit fly and by the melon fly, thus guarding against the spread of these pests. These insects are widespread throughout the islands, but as yet have not gotten a foothold in North America, so far as we know. This fund is used for the administration of this quarantine and the inspecting of certain fruits the exportation of which to the United States is permitted. These are chiefly pineapples and coconuts. This appropriation also covers research and control work which is done in the Hawaiian Islands with respect to these insects. In addition it supports the investigations and inspections of fruit imported into the United States from other countries where the fruit fly is known to exist. It covers also the fruit-fly investigations which we are conducting in the countries more immediately contiguous to the United States; i. e., in the West Indies and in Central and South American countries, including the Canal Zone. The information thus obtained is needed to determine what measures are necessary to prevent the entry of these pests or other similar fruit flies into this country.

No increase is asked for this work. The appropriation is now fully used and should be continued.

Item No. 41 is "for conducting investigations and study of the nature and habits of the pest known as the camphor thrips, for the purpose of discovering methods of control and applying methods of

eradication or control already discovered." The amount estimated is \$5,000.

This work was provided for under a special appropriation inserted in the bill carrying the current appropriations for the department. It is for work which was specially requested by the interests connected with the development of the camphor industry in Florida. Camphor is a very essential drug and there has been a great shortage of it, and the development of the industry in Florida was being seriously threatened by an insect—a species of thrip—

The CHAIRMAN. Is the camphor thrip a new pest?

Mr. MARLATT. It may be a new pest, but it is more probable that it is a native insect of Florida which has found camphor a favorable and likable food.

We have, with this small appropriation of \$5,000, started to investigate this insect and the means of controlling it. This work is only beginning. This appropriation was not available until last July. We are not asking for any increase in this appropriation.

The CHAIRMAN. Could not that item be merged with some of these other items?

Mr. MARLATT. There is no objection to merging it with the first item; for the investigation of insects affecting tropical and subtropical fruit.

Mr. HARRISON. You mean to combine items 41 and 39?

The CHAIRMAN. Yes.

Mr. MARLATT. The only advantage of having a separate item is that it indicates a definite allowance of \$5,000 for that work.

The CHAIRMAN. I take it that that would be the point of view of the people particularly interested in this work.

Mr. MARLATT. And they know that they have got so much money to do that work. It would not affect the work at all to consolidate the items.

The CHAIRMAN. I think with that statement showing that the money is to be used for that purpose it would be satisfactory. As I recall, this was put in by the Senate or by the conferees last year.

Mr. MARLATT. It was put in by the Senate, I think.

The CHAIRMAN. If they were assured that the money would be spent for that purpose, I think it would be satisfactory. Would that be satisfactory to the department?

Mr. MARLATT. Quite so.

The CHAIRMAN. It amounts to the same thing?

Mr. MARLATT. It amounts to the same thing.

The CHAIRMAN. Is there anything else, Doctor?

Mr. MARLATT. That concludes the subject of these items belonging to the Bureau of Entomology, Mr. Chairman.

The CHAIRMAN. We are very much obliged to you, Dr. Marlatt.

Mr. MARLATT. I have the Federal Horticultural Board work, which covers a good deal more ground.

The Chairman. We can take that up after recess.

(Thereupon, at 12.50 o'clock p. m., the committee took a recess until 2.15 p. m.)

MORNING SESSION.

FRIDAY, JANUARY 9, 1920.

The CHAIRMAN. We will be pleased to hear you on the item for the eradication of the screw worm, Mr. Hudspeth.

STATEMENT OF HON. C. B. HUDSPETH, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF TEXAS.

Mr. HUDSPETH. I want to take up another matter from the live-stock standpoint which I did not get to present to the House Agricultural Committee at the last session but did present to the Senate Committee. I am executive committeeman and also attorney of one of the cattle raisers' associations in Texas. Texas is a great cattle-producing country. I do not know whether or not they have in other States what is known as the screw worm. Do you have the screw worm in Alabama, Mr. Heflin?

Mr. HEFLIN. I do not believe I have ever heard of it.

Mr. HUDSPETH. We have in Texas, the agricultural reports there show, what is called the screw worm, and last year it destroyed a million dollars' worth of live stock.

I will explain to you what it is as a cow man. If any kind of a little sore appears on the cow, a fly known as the blow fly lays its eggs in that sore and hatches a worm, and that worm bores into the very vitals of that animal, and does it very quickly.

We are raising now in Texas the high-grade Hereford and Durham cattle. This worm, as I stated, kills \$1,000,000 worth of live stock. The Agricultural Department made an investigation and put a man at Dallas, Tex., last year. He went over the country and discovered a method of destroying the fly. The fly hibernates in a carcass and stays there, and millions of maggots are produced from one fly. You made an appropriation which the Agricultural Department expended last year with the aid of this one man, amounting to \$40,000, which, of course, is a very small sum; but he educated the ranchman and the cowman to destroy this fly by burning up these carcasses and also by scattering medicine over the range that kills the fly. Senator Kendrick, of Wyoming, thoroughly understands the proposition. I explained it to him and he said, "Yes; I know what they are doing because I have seen them do it."

Gentlemen, Texas is a small part of this country, but, I take it, similar conditions would prevail in the southern part of Florida and Arkansas. Texas produces more cattle than any other State in the Union and, of course, we are only asking our portion.

It has been a great work. The man whom they sent there has done a great work toward the eradication of this blowfly that produces this screw worm.

Mr. TICINER. How does he eradicate the blowfly?

Mr. HUDSPETH. As I understand it, they sprinkle over the range a certain kind of poison, and when the fly alights on it, it kills him. They put it on possibly in little pots or something of the kind. They also put it in the carcass of a dead animal, where cattle will congregate.

Mr. TINCHER. We have got not only the blowfly but also the screw worm.

Mr. HUDSPETH. The blowfly produces the screw worm.

Mr. TINCHER. We have only got the screw worm where we dehorn.

Mr. HUDSPETH. Where there is a little spot of blood the fly will alight. In the old days the cow punchers carried a medicine bottle and wherever we saw one of those animals had worms we lassoed him and threw him down and doctored him. But that is very dangerous to the men and it is also very detrimental to these high-grade cattle we are raising down there. Hence, if a method can be established (and the Agricultural Department claims they can eradicate this blowfly and saved \$1,000,000 worth of property to the State with the small expenditure of \$25,000 or \$30,000), it strikes me, gentlemen, that it is the part of good business and economy on the part of this committee to make an appropriation of that kind.

The CHAIRMAN. The department is doing some of that work now, is it not?

Mr. HUDSPETH. Yes, sir; the Senate Committee gave us last year \$25,000, but, of course, everything was compromised and it was cut down to \$10,000, which was wholly insufficient to do very much work. As the representative of those people down there, I am just presenting these matters to you for your consideration. I represent the entire western part of the State, which is this live stock growing section.

Mr. McLAUGHLIN of Michigan. That has been going on for a long time?

Mr. HUDSPETH. The old specific method of chloroforming was the only way in the brush country. If the worms were discovered very early you could save the animal, but generally they were discovered too late. This worm will bore into the vitals in a few days. It will screw into the vitals of the animal and stay there and kill the animal in a very short time.

Mr. McLAUGHLIN of Michigan. That has been the trouble for a considerable length of time?

The CHAIRMAN. The State legislature has taken no notice of it?

Mr. HUDSPETH. I do not think the State legislature has done anything, sir.

Mr. TINCHER. As a matter of fact, I never heard until just now that there was any way of treating the cattle to kill the screw worm or any way, other than the killing of the blowfly.

Mr. HUDSPETH. Yes; they started this work last year and they did a great deal of good.

Mr. TINCHER. Every man in the cattle business realizes the seriousness of the menace due to the blowfly.

Mr. HUDSPETH. The difficulty has been that the State will not do anything unless the Federal Government does something.

Mr. McLAUGHLIN of Michigan. I know that.

Mr. HUDSPETH. If the Federal Government made an appropriation to be matched by the State, I believe the State would raise it, but the State usually relies on the Federal Government and the Federal Government has done most of it up to the present time in the live-stock line toward improving the live stock.

Mr. McLAUGHLIN of Michigan. What you say is very interesting in regard to this man.

Mr. HUDSPETH. Yes, sir.

Mr. McLAUGHLIN of Michigan. He is a highly scientific man. He has been working for the State for years and has accomplished nothing, but when employed by the Federal Government for one year he has done wonders.

Mr. HUDSPETH. I do not know what he has been doing for the State, but I do know what he did under the Federal appropriation.

Mr. HEFLIN. Possibly, that was because he had something to work with.

Mr. HUDSPETH. I do not think the State gave him anything to work with.

Mr. McLAUGHLIN of Michigan. I have a very high opinion of Texas, gained largely from the character of the representatives which they have sent here during my experience here.

Mr. HUDSPETH. Thank you, sir.

Mr. McLAUGHLIN of Michigan. But it is rather surprising to hear that this test is so well known and that the State has seen fit to do nothing; also that one man working along the same lines for a long time for the State authorities accomplished practically nothing, whereas, working one year for the Federal Government, he did a great deal.

Mr. HUDSPETH. Let me give you another illustration. As a member of the Texas senate we made an appropriation of \$250,000 for the eradication of the wolf. That \$250,000 was expended and the wolf was not eradicated. You men here in Congress got another appropriation and employed Government-paid trappers and you put them in Texas and the wolf is to-day eradicated in Texas. To-day the lands that were only worth \$1.50 an acre, before the ranchman could turn his goats loose, under Government supervision, they are renting for \$10 an acre, and you and I and every man in the United States is getting the benefit of those taxes.

Mr. McLAUGHLIN of Michigan. I never thought that about the State of Texas.

Mr. HUDSPETH. I do not hesitate to tell the truth; those are facts, and that has been done.

Mr. HEFLIN. The State was employing a method that was not thought effective?

Mr. HUDSPETH. Yes.

Mr. HEFLIN. The Government, of course, worked directly.

Mr. HUDSPETH. Yes; that is it.

Mr. LEE. That is true.

Mr. HUDSPETH. Many States throughout this Union have adopted prohibition; yet they did not enforce it to the letter, but in my opinion national prohibition will be enforced all over the country. I am giving you facts in regard to Texas. We are simply asking for an appropriation, which I believe every other citizen in the country is interested in where you have the growing of these things and the live stock. Those are facts. For 10 years Texas attempted to eradicate the wolf and made these appropriations, but let me explain why they did not eradicate the wolf: They placed a bounty of so much on every scalp turned in. Trappers went out into that country on the State bounty and they trapped the wolf, but they would let the she-wolf go; but when the Federal Government put men in that country to trap the wolf they paid them by the month

and they had to make reports every night on the number of wolves killed. The men had to make their reports daily to some man in the Agricultural Department, and there was no incentive to turn the she-wolf loose, because they were paid by the month. There was no incentive for the Government man as was the case with the man trapping wolves for bounties. That is the reason why the State could not eradicate the wolf.

The CHAIRMAN. The question of the blow fly or screw worm is largely educational?

Mr. HUDSPETH. That is largely educational. Of course, as I said, the old method we had, Mr. Haugen, was mercurial ointment and chloroform. The Federal Government has discovered poison that kills the blow fly, and they are educating the ranchmen to put it out. This, as you see, is a matter of education.

The CHAIRMAN. I take it that the county agents do a great deal of that work, too.

Mr. TINCHER. I wonder if there has been a bulletin on that?

Mr. HUDSPETH. Yes; a man by the name of Webb is in charge of that.

The CHAIRMAN. A man by the name of Webb is in charge of it?

Mr. HUDSPETH. Yes, sir.

Mr. HEFLIN. How long is the worm?

Mr. HUDSPETH. Just about 1 inch long.

Mr. YOUNG. Does it confine its operations to cattle?

Mr. HUDSPETH. Hogs, sheep, and all kinds of live stock; it even kills chickens and turkeys—anything where there is a spot of blood or a little sore. This appropriation for work on the screw worm is very important, gentlemen, I think, not only for Texas but for every other State. I would ask that an appropriation of at least \$30,000 be made to continue this educational work along with the eradication of the screw worm.

The CHAIRMAN. You mean the eradication of the blow fly?

Mr. HUDSPETH. I mean both.

Mr. TINCHER. The Department of Agriculture has a method of eradicating the blow fly, but for doing this work \$30,000 would not be a drop in the bucket.

Mr. HUDSPETH. I do not think so.

Mr. TINCHER. There is not a township in the cattle country that does not sustain that much loss. I think it is a matter of education.

The CHAIRMAN. What is the Federal Government doing at present?

Mr. HUDSPETH. Since it is raising these high-grade cattle, as you know, only a few need be lost by that worm to run the amount up to several thousand dollars.

Mr. VOIGT. What is the size of this fly?

Mr. HUDSPETH. It is a big, blue fly; it is twice or three times as large as the common house fly.

Mr. VOIGT. This fly deposits eggs which hatch out these worms?

Mr. HUDSPETH. It will alight on any kind of a spot of blood and lay eggs—thousands and thousands of eggs—and every one of those eggs makes a worm.

Mr. TINCHER. It depends on the steer. If you put the dope on one side of his head and leave it off the other side for five days, in the months of May or June, the other side of his head will be working out. The fly put that worm in there, and that sore is growing, getting larger and larger.

Mr. HUTCHINSON. Do the flies kill the animal?

Mr. HUDSPETH. The worm bores right in. The maggot produced from this egg bores right into the vitals.

Mr. TINCHER. I did not suppose that it was any more possible to eradicate the blow fly than to eradicate the house fly.

Mr. HUDSPETH. I did not think so until last year. I had no idea that you could eradicate the fly. The only way I thought you could treat the proposition was to kill the worm after it developed with medicine, and, of course, it is only possible to do that at very great cost.

Mr. VOIGT. Any county in your State that has cattle would spend more than \$30,000 for medicine to eradicate this worm.

Mr. HUDSPETH. Surely; and this appropriation is just a matter of education to the live-stock growers as to how to eradicate this fly. The Government has given us, of course, many ideas that we never thought of before. They have studied these matters out; that is what they are there for.

Activities under lump-fund items, Bureau of Entomology.

Projects.	Allotment, 1920.	Estimate, 1921.	Increase.
Deciduous-fruit insect investigations:

³ Includes \$1,600 transferred to statutory roll of Division of Publications.

⁴ Includes \$1,400 transferred to statutory roll.

The CHAIRMAN. We are very grateful to you, Congressman Hudspeth.

(Thereupon the committee proceeded to consider estimates for another bureau.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Saturday, December 13, 1919.

AFTER RECESS.

The committee reassembled at 2 o'clock p. m., pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. Mr. Nelson, we will hear you next, if you are ready. Do you prefer to make a general statement, and then take up the items, item by item?

BUREAU OF BIOLOGICAL SURVEY.

STATEMENT OF MR. E. W. NELSON, CHIEF OF THE BUREAU OF
BIOLOGICAL SURVEY, DEPARTMENT OF AGRICULTURE.

Mr. NELSON. Mr. Chairman, I think perhaps I better clear up the first item—the statutory roll—and have that out of the way, and then go on with the general work of the bureau.

The CHAIRMAN. Very well.

Mr. NELSON. There are no changes in the statutory roll except transfers to it of clerks from the lump-sum appropriation, according to the requirements of the law.

The CHAIRMAN. Item 2, one chief clerk and executive assistant at \$1,800, changed to one chief clerk at \$1,800.

Mr. NELSON. That is merely a change in order to shorten the title and make it conform with the designation of similar officers in other bureaus.

The CHAIRMAN. To conform with the designation of similar offices in other bureaus?

Mr. NELSON. Yes, sir. There are two changes of this character.

The CHAIRMAN. They are all carrying the same salary?

Mr. NELSON. At the same salary; there is no change in pay. The entire increase in the statutory roll of \$12,900 is due to the transfer of clerks from lump-sum appropriations.

The CHAIRMAN. I think we had better take up the items one by one.

Mr. NELSON. One clerk each was transferred from the lump-sum funds for food habits of birds and mammals, and for the protection of migratory birds, at \$1,800; one clerk from game protection, at \$1,500; two clerks from food habits, at \$1,400 each; one clerk from control of rabies, at \$1,400; two clerks from food habits, at \$1,200 each; one clerk from migratory-bird appropriations, at \$1,200, a total of \$12,900. There are no increases in salaries.

The CHAIRMAN. They are transferred at the same salary?

Mr. NELSON. They are transferred at the same salary and deduction is made from the lump-sum appropriations in corresponding amounts

The CHAIRMAN. There is no increase or change except by transfer?

Mr. NELSON. No change except transfers and changes in titles of two clerks.

The CHAIRMAN. I think that will cover it.

Mr. NELSON. The next item is No. 29, on page 182, "for the maintenance of the Montana National Bison Range and other reservations." There is no need for reading all of this?

The CHAIRMAN. No, just so you give the first line so that we can refer to it readily in the hearings.

Mr. NELSON. For the maintenance of the Montana National Bison Range and other reservations, etc. There are 74 of these reservations under the jurisdiction of the Biological Survey—69 bird reservations, 1 combination bird and game, and 4 big-game reservations.

The CHAIRMAN. How many?

Mr. NELSON. Sixty-nine bird reservations and 5 game reservations; that is, 4 big-game reservations and 1 combination bird and game reservation.

The CHAIRMAN. Five bird and game reservations?

Mr. NELSON. Bird and game reservations combined. We now have on these reservations 356 buffalo, 324 elk, 21 deer, and 57 antelopes. The animals are all in good condition and are increasing rapidly.

The bird and game reservations are scattered all over the country, as indicated by the red spots on this map (indicating).

The CHAIRMAN. I think you better indicate by States, as the map does not go into the record.

Mr. NELSON. Federal bird and game refuges are located in 19 States and 3 Territories, as follows: Arizona, California, Florida, Idaho, Louisiana, Michigan, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oregon, South Dakota, Texas, Utah, Washington, Wyoming, Alaska, Hawaiian Islands, and Porto Rico.

Mr. McLAUGHLIN of Michigan. I note you are asking for \$2,200 increase to provide a warden service for bird reservations in Alaska, and further you say that this service is needed in order to promote the development of grazing and other interests where possible. What does your work have to do with the grazing?

Mr. NELSON. Under the law the bird reservations are under the jurisdiction of the Department of Agriculture; but an Alaska bird reservation, which includes the Aleutian Islands is under the joint jurisdiction of the Department of Commerce and the Department of Agriculture; on account of the fisheries interest there, the part relating to fisheries being under the Department of Commerce, and the part relating to the protection of birds and land mammals being under the Department of Agriculture.

Mr. McLAUGHLIN of Michigan. The connection between birds and grazing is what I can't understand.

Mr. NELSON. These islands are parts of a bird reservation and the control of grazing is necessary to protect the welfare of the bird life on them. They are Arctic in character and have no trees, but there

is grass and other vegetation. Heretofore they have been considered of no economic value, but some people in Oregon got the idea that they could develop a grazing industry on the islands and asked for permits to be issued by the Secretary of Agriculture and Secretary of Commerce giving them the grazing privileges on these islands. They are now experimenting as to whether or not they can develop successfully sheep and cattle growing there. We gave those people the permits, and I understand they have spent more than \$150,000 in the experiment. It appears as though they may possibly be successful. There appears to be a real chance to make something out of these otherwise desert islands, while at the same time safeguarding the bird life. Grazing permits have been issued, I think, to two, perhaps, three individuals, and within the next two or three years the question will be definitely determined. If the first company makes a success, there is no doubt that considerable development will follow. I think this experiment ought to be encouraged so far as can be done without serious detriment to the bird life of the islands. The Department of Commerce is encouraging the development of fisheries and issuing permits for the establishment of fishing stations, so that between the departments, we do what we can to foster the development of grazing and of fishing in that territory while conserving its wild life resources.

It is the duty of the Secretary of Agriculture to safeguard the bird life there, and the permits for grazing he issues with the proviso that the permittees will refrain from destroying bird life or otherwise interfering with the birds.

Mr. McLAUGHLIN of Michigan. In that connection, I have been told that permits have been issued for the establishment of canning industries, I believe, it is said, at the mouth of the Yukon River.

Mr. NELSON. That is on the mainland.

Mr. McLAUGHLIN of Michigan. Yes; and the result has been that the fish do not go up the river as they formerly did, and that the inhabitants up the river have been sadly in need of food, being deprived of it on account of it being taken at the canneries at the mouth of the river, and they do not go up.

Mr. NELSON. I have heard something about that. I once lived four years near the mouth of the Yukon. One year the salmon ran up the river a month earlier than usual and the natives entirely missed the run. The result was that the natives caught only a few fish and were so short of food the following winter that, if it had not been for the fur traders they would have starved to death. It does not necessarily follow that because they failed to catch salmon this year that it was due to the cannery at the mouth of the Yukon. I understand there is but one cannery there.

Mr. McLAUGHLIN of Michigan. The cannery has been there for a number of years?

Mr. NELSON. I think it has been there about two years.

Mr. LEE. Do they completely control the mouth of the river with nets?

Mr. NELSON. I doubt if one cannery could. In its lower course the Yukon is about a mile wide and empties through various channels in a delta about 60 miles broad at its mouth. The main channel of the river is on the left-hand side of the delta. The cannery was originally at Andreafski, a short distance above the delta, but has

been moved down near the mouth of one of the main channels in the delta.

Mr. McLAUGHLIN of Michigan. What is the width of the river up where this fishing cannery is?

Mr. NELSON. About a mile at Andraefski and probably less at its present location.

Mr. McLAUGHLIN of Michigan. Then you are of the opinion that the failure of the fish to go up the river is not due to the establishment of the cannery?

Mr. NELSON. Yes, sir; I should doubt that very much. The single cannery would not be likely to have such a result in so brief a time. Such a report would need careful investigation before being accepted.

Mr. McLAUGHLIN of Michigan. You say this could not be established without investigation; has some investigation been made to determine that?

Mr. NELSON. I do not know as to that; that comes under the activities of the Bureau of Fisheries, in the Department of Commerce, and my information is merely of a general character.

Mr. McLAUGHLIN of Michigan. It is your opinion, then, that the fish can not be stopped by the canneries?

Mr. NELSON. They may be stopped by very extensive netting. They might be depleted so that the run in the Yukon would in a few years amount to little or nothing. That ought to be safeguarded; but by ordinary fishing they could not be stopped in a great river like the Yukon. Of course, if they overdid it they could cut down the supply of salmon for the upper Yukon.

Mr. LEE. How long is the Yukon?

Mr. NELSON. Approximately 2,000 miles.

Mr. McLAUGHLIN of Michigan. When the fish are stopped by nets, at what depth do they place the nets?

Mr. NELSON. They use gill nets extending several yards below the surface, or make pound traps with a fence that runs out into the river from shore.

Mr. LEE. They do pound netting?

Mr. NELSON. Pound netting and gill netting—just how they fish at this particular place I do not know. I have not been up there since the cannery was established.

Mr. McLAUGHLIN of Michigan. Gill nets could cover quite an extent of the river?

Mr. NELSON. They could, but so far as I have heard they have not yet developed the industry there to the extent of covering the entire river.

Mr. LEE. They can't use gill nets in swift water.

The CHAIRMAN. Are you through with this item?

Mr. NELSON. We need \$2,200 to provide a warden service for bird reservations in Alaska, adequate provision for which is impossible under present limited appropriations. We need this warden in the Aleutian Islands to make an investigation and report on their usability for grazing as no definite information on the subject is available. When people appeal to us for information we are now able to give but little and we ought to be in possession of definite information of conditions on those islands both as to its wild life and of the grazing conditions in order to properly safeguard the birds, and at the

same time foster any use of the islands which may be practicable. The natives on these islands have to make a living there and their welfare must be considered in administering this reservation.

The CHAIRMAN. Are we to understand that it is more of a grazing than of a bird and game proposition?

Mr. NELSON. No, sir; the grazing may develop later. At the present time it is merely an experiment.

The CHAIRMAN. What is an experiment; grazing?

Mr. NELSON. Grazing on the Aleutian Island bird reservation; yes, sir.

The CHAIRMAN. That comes under some other bureau?

Mr. NELSON. No, sir. Under the Secretary of Agriculture the Biological Survey administers all of the Federal bird reservations and any activity to be established within such reservations must have a permit from the Secretary.

The CHAIRMAN. What bureau issues the permits?

Mr. NELSON. The Secretary of Agriculture issues the permits on recommendation of the Biological Survey. It is necessary to control activities on the Aleutian Island reservation and other bird reservations by permits in order to carry out the purpose for which the reservations were established. I might add that a number of the islands on this reservation are now being used for fox farming under permits. These fox farms are owned by natives and a few others.

Mr. LEE. You protect game birds?

Mr. NELSON. We protect the birds.

Mr. McLAUGHLIN of Michigan. Isn't it a better way to determine whether or not these islands are suitable for grazing, to let the private interests go ahead and try it out as they have been doing instead of the Government going to that expense?

Mr. NELSON. We do not expect the Government to go up there and develop the islands. We want to have a representative up there to see what is going on, and to give us information which will tell us whether the birds are being destroyed, and whether it is better for certain islands to be given over to grazing without reference to bird reservations. In other words, properly to administer the reserve.

The remaining increase asked for under this item is to pay for warden service and for the expense of maintaining certain patrol boats that heretofore have been paid by the National Association of Audubon Societies. Under the present law we are now prohibited from accepting such assistance from outside individuals and organizations. The assistance of that society has been eliminated, and we have had to take over the work which they had been helping us to maintain.

Mr. McLAUGHLIN of Michigan. How many men?

Mr. NELSON. A warden's salary on Breton Island and an assistant on Breton Island, and one at Key West. They were helping pay the salaries of three others, and they were contributing the running expenses of three boats.

The CHAIRMAN. My attention has been called to the reindeer in Alaska. Have you anything in this bill for that work?

Mr. NELSON. There is nothing in this bill about it, but that is a thing which interests me very much.

The CHAIRMAN. You have been in Alaska and are familiar with it?

Mr. NELSON. I once lived more than four years in Alaska. I consider that there is a great future for the reindeer industry in that Territory. There are now about 160,000 reindeer up there as a result of importations made by the Bureau of Education. These reindeer were introduced from Siberia and from Lapland to assist the natives on the coast of Bering Sea and the Arctic Ocean to become self-supporting.

The reindeer have remained in the hands of the natives except some of them that were given the Laplanders, who were brought over to help teach the natives to care for them. Some of these reindeer have been sold to white men and they have some large herds, belonging mainly to a Mr. Lindaberg and the Lomen brothers. Reindeer increase rapidly, and the arctic grazing area suitable for them in Alaska is estimated to be sufficient to take care of 10,000,000 of them. That number of these animals may be maintained on these arctic treeless plains bordering the Arctic Ocean and Bering Sea in Alaska.

The CHAIRMAN. How many?

Mr. NELSON. Ten million. This is a new industry that it appears to me should be fostered and its development encouraged by the Department of Agriculture.

Mr. Lomen, one of the present herd owners, was down here last winter and expressed a great desire to have the benefit of the expert assistance of this department in building up the industry and improving the herds. He said that the most of the reindeer herds being in the hands of the Eskimos, they were not handled along proper lines to maintain the herds and improve the quality of the stock. He reported much inbreeding and much scrubby stock, with a lack of any expert advice on controlling the diseases and parasites of the reindeer. In other words, he thought the time ripe for the Department to help the reindeer industry as it now helps the sheep and cattle industry. There is one very effectual way in which the breed can be improved, and that is by capturing some young wild caribou bulls from the Alaskan herds and turning them with the reindeer. The caribou are larger than the reindeer, and interbreeding them is perfectly feasible and would undoubtedly result in increasing the size and hardihood of the reindeer. Reindeer are merely domesticated old world caribou.

The reindeer are badly bothered with flies, which produce "warbles" or grubs in the skin on their backs. One skin sent me has a solid mass of warble scars over the entire back. The reindeer have numerous parasites and diseases, but with the industry trying to get on its feet in Alaska, there is no available help for trying to limit losses from such sources.

The CHAIRMAN. How much money is being expended by the Bureau of Education?

Mr. NELSON. I do not know.

The CHAIRMAN. You said nobody was paying attention to it?

Mr. NELSON. According to my last information, no expert veterinarian or other person skilled in such work is available for helping build up the industry on modern lines.

The CHAIRMAN. Have you knowledge as to the activities of the Bureau of Education?

Mr. NELSON. I know they are promoting education among the natives, and that they are promoting the ownership of reindeer herds among the Eskimos. The reindeer were introduced into Alaska by the Bureau of Education, but so far as I am informed, no one has ever

been sent up there to look after the development of the industry in a scientific way, as is now universal among the stock industries of the United States.

The CHAIRMAN. It might be advisable to have this work transferred to the Department of Agriculture?

Mr. NELSON. There is no question that if the department would take a hand in developing this industry the results would be notable.

The CHAIRMAN. In your opinion, what should be done?

Mr. NELSON. I think that the reindeer industry, as connected with the natives, could properly remain with the Bureau of Education; but it appears to me that the Department of Agriculture should be given a hand in developing it among the people outside of the natives.

The CHAIRMAN. Your contention is that the reindeer should come under the supervision of the Department of Agriculture?

Mr. NELSON. Yes; for the development of the industry among the people aside from the natives. Of course, the natives would get the benefit of whatever was done to improve the herds.

The CHAIRMAN. Why do you divide it?

Mr. NELSON. There would be no division. The Bureau of Education, as I understand it, is merely promoting the ownership of reindeer among the Eskimos. Meanwhile a considerable number of these animals, more than 20,000, I am told, are owned by white citizens of Alaska who desire to develop the industry which promises great things for that region but are handicapped by lack of the expert scientific help such as other stock industries are receiving.

By establishing a reindeer experiment station at a suitable point in Alaska with a skilled veterinarian and animal husbandman, supplied with proper laboratory conveniences, and by other scientific expert assistance the reindeer industry could be given a great impetus at a trifling cost compared with the benefits. This would not in any way duplicate or interfere with the efforts of the Bureau of Education to promote ownership of reindeer among the Eskimos.

Mr. McLAUGHLIN of Michigan. I have the same idea as Mr. Haugen has. As the Bureau of Education is doing a part of that work it might be better to let them extend the work, and not have a part of it done by them and a part of it done under your department.

Mr. NELSON. The work of the Bureau of Education in Alaska has to do only with the welfare of the natives. For it to branch out and establish the kind of an experiment station I have mentioned would be entirely outside their present activities and would be a duplication of the kind of work being done by the Department of Agriculture. In this department we have the corps of scientific veterinarians and others needed in the development of the reindeer industry, which is merely another phase of stock growing based on the domesticated members of a kind of deer. It is purely a Department of Agriculture problem.

Mr. McLAUGHLIN of Michigan. The Bureau of Education, no doubt, could have the same kind of men?

Mr. NELSON. Yes; by building up a new line of work such as this department is now doing.

The CHAIRMAN. In looking up an outside appropriation of \$7,500, I find that an increase of \$1,500 is asked by the Bureau of Education, so a considerable amount is being expended. It seems to me that that amount could be expended to greater advantage through the department that has a force there at present.

Mr. NELSON. That appropriation is, I think, merely for the purpose of administration in promoting the ownership of herds by the Eskimos, keeping records and otherwise helping the natives adapt themselves to this phase of stock growing, and not at all for such a purpose as I have in mind should the department take up the matter. The Bureau of Education would still need that appropriation even though the Department of Agriculture should establish an experiment station up there.

The CHAIRMAN. Give us an outline of what you think should be done. I take it that you are better informed as to that than anyone we could hear.

Mr. NELSON. I think there should be established up there a reindeer experiment station which should have on its staff a competent, experienced veterinarian, a man who has had experience and has good judgment, and an animal husbandman with several other experts who would devote their time to the study of the reindeer, its diseases and parasites; to locate the best source of supply of young caribou to increase the size of the tame animals; to study the forage plants used by these animals and determine the areas suitable for pasturing the herds and what effect reindeer have on the supply of forage and its reproduction. Here is a new industry destined to supply Alaska with all the meat it needs and to supply great quantities to the United States. It will be developed on an area hitherto considered absolutely worthless as a food-producing area. A little money wisely spent now will be repaid in an amazing development. The meat is excellent and small quantities of it have already been marketed at high prices in Seattle, San Francisco, Minneapolis, and New York.

Mr. LEE. The meat is something like the red deer.

Mr. NELSON. A little; yes, sir.

The CHAIRMAN. What do you suggest in the way of development?

Mr. NELSON. I think that the Alaskans ought to be encouraged and helped to develop the reindeer industry, and that one of the first things would be to get some of the native young bull caribou to put in with the reindeer to increase their size, weight, and hardiness.

The CHAIRMAN. You say they would have to be transported?

Mr. NELSON. There are wild caribou on the Peninsula of Alaska. This is about five or six hundred miles by water. They would have to be shipped if taken there; but the largest wild caribou are in the interior of Alaska and could be brought down the Yukon or Kuskokwim River and landed wherever needed.

The CHAIRMAN. They would have to ship them five or six hundred miles or more by boat?

Mr. NELSON. Yes, sir; it is from the Peninsula of Alaska, or from the Tanana River or elsewhere in the interior.

The CHAIRMAN. The first thing would be to catch them.

Mr. NELSON. They should be caught while they were young, in the summer or fall.

The CHAIRMAN. Are there many of them?

Mr. NELSON. Yes, sir; it is estimated that the herd between the Tanana and the Yukon contains about 100,000 animals.

The CHAIRMAN. What would be the expense?

Mr. NELSON. That would be rather difficult to estimate. They would probably cost at least \$100, perhaps \$150, each.

The CHAIRMAN. Would 100 be sufficient to build up the reindeer in Alaska?

Mr. NELSON. That would not be enough for entirely building up the reindeer in Alaska, but that would be a good start, and it would be enough to make a demonstration of the benefits to be derived from such a cross-breeding.

The CHAIRMAN. What would you do with the native stock; destroy them?

Mr. NELSON. No; the herdsmen could continue to raise them as they are now, but they could build up their herds into graded or improved stock.

The CHAIRMAN. I mean the bulls?

Mr. NELSON. Those ought to be made into steers as fast as they could be replaced with better bulls, and when they got to be of a marketable age, kill them for meat just as you would handle cattle by eliminating the poor stock. I have a correspondent who has a reindeer herd on Kuskokwim River. He wrote me that several caribou bulls have come into his herd and lived there for some time, moving around with the herd of reindeer, and then drifting back with the wild caribou again. That indicates how simple it will be to make the cross suggested.

Mr. McLAUGHLIN of Michigan. Does that increase the size of the get very much?

Mr. NELSON. We have no record of what happened where those caribou bulls have served those tame reindeer, as yet.

Mr. McLAUGHLIN of Michigan. In your experience, do those caribou bulls increase the size of the get very much?

Mr. NELSON. No one in Alaska has recorded any experience of that kind. It appears evident, however, if you have a bull reindeer that will dress 200 pounds, and the bull caribou will dress 300 pounds, you are bound to get a larger offspring from the bull that dresses 300 pounds. That is common sense. And, furthermore, it would improve the reindeer stock, stopping the inbreeding of those 160,000 reindeer that are now in Alaska. They are the descendants of about 1,200 imported animals and they are in serious need of new blood.

The CHAIRMAN. How long ago?

Mr. NELSON. More than 25 years ago.

Mr. LEE. You have to feed those animals?

Mr. NELSON. No; they feed themselves. Reindeer and caribou can live under the severest climatic conditions without feeding. They live in the summer time on the moss and other vegetation on the Arctic plains and in winter paw through the snow. The snowfall is not very deep on the Arctic coast plains, rarely ever more than from 1 to 2 feet, and the wind blows it off great areas, so that the vegetation is exposed.

I am convinced that there is a bright future for the reindeer industry in Alaska. The Canadian Government is so convinced of the same thing for the development of the industry in their territory that they have appointed a commission to study the situation, and they are now conducting an investigation. They have employed the explorer Stefansson and he is preparing a full report on the reindeer industry, including that of northern Europe and Siberia.

The Canadian Government, of course, has millions of acres of these Arctic lands which have heretofore been waste. The progress made in Alaska has greatly impressed the Canadians. In this con-

nection it may be added that the newspapers recently announced the formation of a company in Indiana which has applied to the Canadian Government for the privilege of grazing reindeer on a large area on the west coast of Hudson Bay for a period of 30 years. The Council for the Canadian Government has approved of that application.

The CHAIRMAN. Are the tame reindeer that run at large in Alaska owned in common; and is there any restriction on killing them for food?

Mr. NELSON. The tame ones are owned by individual Eskimos, or by individual white men, just like cattle or sheep are in this country. The owners care for their herds and look after them as they would for sheep.

The CHAIRMAN. There is need for this meat in Alaska, is there not?

Mr. NELSON. Yes; meat is needed throughout the Territory and the reindeer herds of the future will supply it in abundance.

The CHAIRMAN. There is a scarcity in Alaska?

Mr. NELSON. Yes; the cattle and sheep industry of Alaska are wholly undeveloped, but once the reindeer industry is well established the Territory will become self-supporting so far as meat is concerned and will export a large surplus.

The CHAIRMAN. I would like information as to the importance of the proposition. The condition was called to my attention by Mr. Lomen, when he was here last year.

Mr. NELSON. It is highly worthy of development, as is indicated by the interest the Canadian Government is taking in it. The Canadian Government has millions of acres of this Arctic land like that in Alaska, which is absolutely worthless for anything else. Now, here, we have an animal that will live on these Arctic plains and stay in good condition the year round, and produces good meat, and good tallow, and produces splendid hides, and is readily domesticated, just as domestic an animal as the sheep.

The CHAIRMAN. How many people has the department in Alaska?

Mr. NELSON. The department has not very many. It has an agricultural experiment station, but I do not know the number of employees.

The CHAIRMAN. This question could be taken up in cooperation with others to advantage?

Mr. NELSON. It could be done in cooperation with the Bureau of Animal Industry.

The CHAIRMAN. I mean with the department as a whole?

Mr. NELSON. Yes; the thing could be handled by the Department of Agriculture perfectly, because it has all of the men and organization for the work. It is merely a matter of having money to conduct the work up there.

The CHAIRMAN. It appears to me that it could be handled to a better advantage through your department than through the Bureau of Education. If it is of sufficient importance, we can take it up with the chairman of the other committee and possibly have it adjusted.

Mr. NELSON. It seems to me, without reflecting any discredit on the Bureau of Education, that the Department of Agriculture could get results which are infinitely better than any results which the Bureau of Education has heretofore been able to obtain.

The CHAIRMAN. This discussion is not intended to reflect on anybody.

Mr. NELSON. No, sir; it is merely a fact that the Department of Agriculture is in the best position to develop any phase of the livestock industry.

The CHAIRMAN. Can you give us an estimate as to what would be required to encourage this development?

Mr. NELSON. As a rough estimate I think that approximately \$25,000 would be needed to establish and support a reindeer experiment station the first year.

The CHAIRMAN. Has the department any buildings there?

Mr. NELSON. Near Nome is a more or less abandoned military post with good buildings, and rents are cheap in Nome.

The CHAIRMAN. Have you any stations in this vicinity?

Mr. NELSON. No.

The CHAIRMAN. How many houses would they need.

Mr. NELSON. Not very extensive quarters to house and afford laboratory accommodations; also small corrals and sheds as hospital quarters for animals being studied.

The CHAIRMAN. Can you give a rough estimate?

Mr. NELSON. I should say that \$25,000 ought to start the thing.

The CHAIRMAN. Have you any plans?

Mr. HARRISON. Would it not be better to let Mr. Nelson think the matter over and submit a statement later?

Mr. NELSON. I will be glad to do that.

The CHAIRMAN. This is outside of the estimates. My attention has been called to it. It is very interesting and I would like to know what to do in the matter.

Mr. NELSON. Mr. Lomen's greatest desire was to have somebody study the business and help it develop. That is what is needed more than anything else. This can be done by trained men located up there.

The CHAIRMAN. And to improve the herds?

Mr. NELSON. Yes, sir.

The CHAIRMAN. My understanding that inbreeding is the greatest trouble.

Mr. NELSON. That is the greatest trouble. Then, too, my correspondent up there complains that he is losing animals from parasites.

The CHAIRMAN. Would you suggest importing animals or improving the herds you have now?

Mr. NELSON. I would improve the herds of animals that we have in Alaska. We have an abundance of tame animals and can grade them up by crossing with our wild caribou.

The CHAIRMAN. We thank you very much. After you have given this further consideration we will be pleased to have you furnish a statement?

Mr. McLAUGHLIN of Michigan. Mr. Nelson, can you furnish a statement showing what it would take the first year of operations?

The CHAIRMAN. Yes, in connection with these remarks—in connection with this discussion.

Mr. NELSON. I shall be glad to do so. In speaking of transfers of activities to this department I wish to refer to another matter. Some years ago Congress gave to the Department of Commerce, Bureau of Fisheries, jurisdiction over the land fur-bearing animals in Alaska. Neither the Department of Commerce nor the Bureau of Fisheries wishes to have this work, and the recent annual reports of the Secretary of Commerce and of the Commissioner of Fisheries repeat their desire to have the work transferred elsewhere, the Com-

missioner of Fisheries recommending that it be transferred to the Biological Survey, where I think it belongs. I saw Dr. Smith, Commissioner of Fisheries, recently, and he inquired when we planned to take that off of their hands. He said it was a burden to them and that they were not interested in it, as it was entirely outside their interests.

Mr. HARRISON. The transfer of the work was recommended in the report of the Secretary two or three years ago.

Mr. NELSON. There was a bill introduced in Congress two years ago to bring about this transfer but no action was taken. It is a line of work such as the Biological Survey is already doing and its transfer would result in greater efficiency.

The CHAIRMAN. If you will submit a draft of what you want done, the committee will see what it can do.

Mr. LEE. That would have to be done by a special bill.

The CHAIRMAN. It could be done by an agreement in this bill.

Mr. HARRISON. We will prepare a section to accomplish the purpose and submit it in any form you desire if the committee wishes us to do so.

The CHAIRMAN. I believe that would be proper. Of course, we will have to confer with the other committee. If the two committees agree, I think it can be done.

Mr. HARRISON. This is a matter on which the two departments are in complete agreement and both have recommended it in their annual reports.

The CHAIRMAN. Very well; what is the next item?

Mr. NELSON. The next is No. 30, "For the improvement and maintenance of the game preserve in Sullys Hill National Park, in the State of North Dakota." It is proposed to strike out the word "preserves" and insert instead the word "preserve." There is just one preserve and not two. The appropriation is for \$5,000. That is the amount that was appropriated last year, and there is no change.

The next is item No. 31, "For investigating the food habits of North American birds and mammals in relation to agriculture, horticulture, and forestry," etc.

The appropriation under this item covers four lines of work: (1) Investigation of the food habits of North American birds and mammals in relation to agriculture; (2) the destruction of predatory animals, such as wolves, coyotes, and others; (3) the destruction of injurious rodents, such as prairie dogs, pocket gophers, and others; and (4) experiments in rearing fur-bearing animals.

For the destruction or control of rodents injurious to agriculture we now have a complete organization in 16 of the Western States, where these pests are most numerous. Our experts in charge of the State organizations work in cooperation with the State extension service and through the county agents.

The losses of crops through depredations of rodents annually is estimated at more than \$150,000,000, and the losses of forage products from this source is an equal sum, or a total of about \$300,000,000 destroyed by these pests each year.

Since the Biological Survey developed improved and effective methods of destroying these pests, the farmers have become deeply interested and are joining in the campaign in rapidly increasing numbers. Last year more than 135,000 farmers cooperated in this work and a still larger number are doing so this year.

The demand for our participation in this work has grown more rapidly than our available funds will permit. We have requests for establishing a regular organization in three additional States which we have been unable to meet.

The rodent pests while present and injurious to agriculture in every State are most serious in the States from the western part of the Mississippi Valley to the Pacific coast. In the Mississippi Valley and the Eastern and Southern States various kinds of mice are the most generally distributed and serious pests. As a sample of their destructiveness I may mention the case in Winchester County, Va., where in two years small field mice about 3 inches long, known as the pine mouse, killed bearing apple trees valued at about \$250,000.

Mr. McLAUGHLIN of Michigan. There must have been a lot of mice.

Mr. NELSON. There were many of them, but they might readily have been destroyed and the trees saved, as we demonstrated to the orchard owners when we were called in to help protect the orchards.

These mice work underground and girdle the roots by gnawing off the bark. The tree dies suddenly and the owner is often unable to understand what has happened. These pests are found throughout the Eastern States as far as New Hampshire, and we are often asked to help stop their ravages.

The CHAIRMAN. How did you destroy these mice?

Mr. NELSON. We powder strychnia on small cubes of sweet potato or similar vegetable and put the baits in their runways or holes. The mice eat such baits readily and are killed.

Mr. McLAUGHLIN of Michigan. In this item 31—

Mr. NELSON (interposing). The extent of the rodent operations are indicated by the fact that our field men during the past year guided the farmers in the destruction of these pests on nearly 15,000,000 acres of farm lands, and through our own field parties destroyed most of the rodents on 1,500,000 acres of the public domain, largely in National Forests. Prairie dogs and ground squirrels have been nearly exterminated over enormous areas and have been absolutely exterminated on large tracts.

The CHAIRMAN. Will you kindly give the States from which they have been eliminated?

Mr. NELSON. They have been entirely eliminated from large areas in New Mexico, Arizona, Colorado, and North Dakota, but not from the entire States. The work is progressive and the areas to be covered are very great.

The CHAIRMAN. Doctor, we started in with a heavy appropriation and increased it last year. Congress will now want to know what progress you are making. We hoped that in view of your effective work possibly some of these appropriations might be cut down.

Mr. NELSON. Mr. Chairman, I think consideration of the magnitude of the task we have in hand is sufficient to show that it will require a number of years to complete it. Rodent pests infest hundreds of millions of acres of public and private lands and destroy more than \$300,000,000 worth of crops and forage each year. Predatory animals infest 18 Western States, where they destroy more than \$20,000,000 worth of live stock each year. We are guiding a campaign to destroy these pests and lessen the losses year by year until they are reduced to a nominal sum. Our work is demonstrating that this is practicable at a nominal cost compared with the increased returns to farmer and stock grower.

The best proof that our work is getting the desired results lies in the fact that when we began the work against injurious animal pests no funds were being put up by the States to help in the work. This year the States are putting into cooperation with us for the destruction of rodent pests more than \$900,000, and for destruction of predatory animals more than \$225,000. More than 135,000 farmers are actively cooperating in rodent campaigns, and thousands of stockmen in the predatory animal and rodent work. The legislatures of 13 States have made appropriations for this work, usually specifying that they are to be expended in cooperation with the Biological Survey. Other funds come from counties, local associations, and individuals. The interest of the people where the work is being done and the large funds they are putting into cooperation with us is proof not only that we are getting effective results, but also that the work is one of serious importance to the welfare of the farmer and stockman. In the end we expect to practically exterminate some of the most destructive of the animal pests and to control the others.

The CHAIRMAN. What do you mean by control?

Mr. NELSON. To reduce their numbers about cultivated areas.

The CHAIRMAN. Isn't it possible to destroy them?

Mr. NELSON. Some of the small rodents are so numerous over great sections of the country that to exterminate them completely would cost too much. The losses by such rodents can be controlled by destroying the animals about the farms from year to year. That rodent work is a profitable investment on the farm is indicated by the statements we have received from farmers that they profited from \$15 to \$20 for every dollar spent in the destruction of these pests.

The CHAIRMAN. Are cooperative funds available from all the States?

Mr. NELSON. From practically all of the States from the western border of the Mississippi Valley to the Pacific coast, which is the area in which occur the greatest losses from rodents and predatory animals. In that region we are conducting great campaigns and are seriously handicapped by being able this year to allot only \$102,000 for rodent work with which to meet and offset the \$901,000 being put up in the States. The States are constantly urging us to do more work on Government lands adjacent to cultivated areas on which they are destroying rodents and are having their lands reinfested from the rodents living on the Government lands. This brings in the need of keeping the rodent work going as a continuous operation. If the work stops, or is reduced for a single season, the areas in which we have exterminated the pests will be reoccupied by them from surrounding territory, and areas on which have been killed from 75 to 95 per cent of the pests will be restocked by the breeding survivors which would be destroyed by a follow-up treatment.

California is spending about \$335,000 this year in rodent destruction and has criticized the failure of the Government to meet them in this work by destroying the rodents on the adjacent public domain. This we would like to do, but it is an impossibility with our present funds.

Before the Biological Survey took up the work of destroying animal pests many millions of dollars had been spent in fighting these pests by sporadic campaigns, sometimes by the States, sometimes by communities or by individuals, but always without continuity of

organization and plan. The result was complete failure to accomplish any permanent result. The success of our endeavors has been due to two factors—first, the development of much more effective and economic methods, and second, by a definite plan for continuous community action until the pests are actually exterminated, wherever this result is practicable. I have already stated the evidences of local appreciation of our methods by the amount of money put into cooperation in addition to the work of many thousand farmers and others.

Mr. McLAUGHLIN of Michigan. You cooperate with the States in taking care of these lands and privately owned lands?

Mr. NELSON. Yes, sir. For instance, in North Dakota, where one of the largest campaigns against rodents is going on, we supply an expert who passes on his knowledge to the county agents and the farmers.

Mr. McLAUGHLIN of Michigan. I am glad to know that. I am glad to hear you say that, because almost every bureau that we have talked with says that the county agent is no good, and that it is necessary to have an expert from the bureau go around to do the work himself.

Mr. NELSON. The county agent organization has enabled us to greatly increase the usefulness of our work. Through the county agents we get the farmers organized and in a receptive mood to receive the necessary instructions, and the carrying out of the campaigns on such a great scale as at present would be impossible without their aid. At the same time it is necessary for us to keep our experts in the States to keep in touch with the work and to give demonstrations and otherwise maintain the efficiency of the work. While the county agents are very helpful, they have a multitude of duties and can not concentrate on rodent work or any other one subject except temporarily. This work calls for the continuous activity throughout the year of our expert as the chief center of education and organization in this campaign. Our results have been vastly increased by the help of the county agents.

Mr. LEE. You do this by simply poisoning oats?

Mr. NELSON. By mixing specially prepared poisons with oats, barley, or other vegetable food suited to the special kind of rodent to be destroyed.

Mr. McLAUGHLIN of Michigan. I can understand very well why you do this on Government lands, national forests, and so on, why you should eliminate them from such lands and from certain of those places where the land adjoining is infested, but I don't quite understand how the Government can go on this private land and do this work.

Mr. NELSON. We do not do the actual work on the private lands. We demonstrate methods and instruct the people how to prepare and distribute the poison, aid them in organizing themselves to make the work effective and results permanent, and they pay all operating costs on their holdings.

Mr. McLAUGHLIN of Michigan. I asked you, in my first question a moment ago, if the department did this on private land, and you said yes.

Mr. NELSON. I beg your pardon, I did not understand you. We cooperate with the States by having our experts supervise and direct

the whole campaign on Federal, State, and private land, correlating the entire operation, working through county agents in instructing and organizing the farmers, guiding them in the employment of the most efficient measures on the private holdings, the operating cost being borne by the landowners. On Government lands we usually hire men and do the work ourselves. In some places, however, the farmers are so desirous to keep their crops free from rodents that they volunteer to put out the poison on Government land adjoining their farms if we will supply the poisoned grain. We have had a lot of free work done for the Government in that way, and considerable areas of Government land has been cleaned by volunteer labor, because in doing that they guard against the reinvasion of their own lands.

Mr. McLAUGHLIN of Michigan. I think that kind of work should go on, but not on private lands. Teaching them how to do it is all right, but there is a growing tendency on the part of the people in many parts of the country to ask the Government agents, men from the different bureaus to come and actually do the physical work, besides bearing the expense, which I do not approve.

Mr. NELSON. The part we take with regard to private land is that of guiding the work and teaching the people the most effective methods of preparing and handling the poison.

Mr. McLAUGHLIN of Michigan. I would like to call your attention to item 31. It seems to me that there is no need of segregating this proposition. If you will read the different sections, the first one includes experiments and demonstrations in destroying wolves, coyotes, prairie dogs, gophers, and other animals injurious to agriculture. In the second item below is the provision for destroying wolves, coyotes, and other animals injurious to agriculture, and in the next paragraph is the provision for the protection of stock and other domestic animals, through the suppression of rabies and by the destruction of wolves, coyotes, and other predatory wild animals. The work there is practically all the same, and we divide it up, \$15,000 for one, \$125,000 for the other, and so on. The work is all the same. Why segregate it?

Mr. HARRISON. The appropriation should be provided in one sum instead of being divided into three. The present arrangement causes a lot of difficulty in administering the work.

Mr. McLAUGHLIN of Michigan. I think the present draft is inexcusable.

Mr. HARRISON. Mr. McLaughlin, nothing can be said about the present draft that would be too strong.

The CHAIRMAN. This language is, "that of this sum not less than \$123,800 shall be used on the public lands, national forests, and elsewhere in the Western and Northwestern States." So if you don't expend the \$123,800 they will send you to jail.

Mr. HARRISON. I suppose that is a possibility.

Mr. McLAUGHLIN of Michigan. The first paragraph is "public domain," and the next one is "public lands," which is public domain, and the next one "forests," which is just the same.

Mr. HARRISON. When you first mentioned the matter, I was talking to Mr. Haugen about it, and I told him that the paragraph is the most complicated in the whole bill.

Mr. McLAUGHLIN of Michigan. That is saying a good deal; I do not know about that.

Mr. HARRISON. That is true. We would be very glad, at your request, to submit a revision.

Mr. NELSON. It could be simplified.

Mr. HARRISON. And we would be glad to do it.

The CHAIRMAN. These States might want to have this language in the draft.

Mr. HARRISON. We could separate the three lines of work.

The CHAIRMAN. This matter was discussed in conference. The Senate conferees were determined to have this language in, to which we finally agreed. It is by no means the proper language.

Mr. HARRISON. We can set out the three different lines and show the amount that will be expended for each.

Mr. McLAUGHLIN of Michigan. You could indicate the amount that is to be expended for each one. Here is one place it says that 15,000 shall be used.

Mr. HARRISON. It says, in effect, that we "must" use that amount.

Mr. McLAUGHLIN of Michigan. In another place it is provided that you have got to spend \$123,800. You can't expend \$123,700; but you must get clean up to the \$800, and here is another place where it says that of this sum not more than \$125,000 shall be expended. You can spend \$10 and comply with that paragraph. So, if you can find another place that is worse than this one, Mr. Harrison, I think you are going some.

Mr. HARRISON. I think this is the worst.

Mr. McLAUGHLIN of Michigan. It is pretty bad.

Mr. HARRISON. It is undoubtedly the worst.

Mr. McLAUGHLIN of Michigan. I think it ought to be revised.

Mr. HARRISON. Is the committee willing to let us submit a new provision?

The CHAIRMAN. Yes; I believe it would be best to do so.

Mr. HARRISON. We can present three items providing separately for the three lines of work.

Mr. NELSON. There are four lines of work that have to be mentioned, but the wording of the lump sum could be so stated as to carry on those four lines of work.

Mr. HARRISON. There are only three, the investigational and experimental work, the rodent control work, and the predatory animal control work.

Mr. NELSON. There is fur farming.

Mr. HARRISON. That is investigational. That would come under the investigational item.

The CHAIRMAN. You could set out the amount of each item.

Mr. HARRISON. That would be entirely agreeable to us, wouldn't it, Mr. Nelson?

Mr. McLAUGHLIN of Michigan. If there are three kinds of work—

Mr. NELSON. The only point is that predatory animals and rabies are pretty bad in a largesection of the stock-growing country, and the stock growers might think that we were trying to leave something out.

Mr. HARRISON. That can be covered in the new language.

Mr. McLAUGHLIN of Michigan. Here in the same sentence you have included experiments, demonstrations, and also investigations and experiments.

Mr. HARRISON. Yes, sir; there is nothing you can say about the present arrangement of the paragraph that would be too bad, Mr. McLaughlin.

Mr. McLAUGHLIN of Michigan. We have taken notice that you have said a good word about the county agents, but the others that have come before the committee, when we ask them why the county agent can't do a certain thing they always say he does not know enough.

Mr. NELSON. It might interest you to know that in New Mexico the services of county agents were continued in several counties because of the success of the rodent work.

The CHAIRMAN. How about the extension of eradication work?

Mr. NELSON. We propose to extend it to Iowa, Minnesota, and Texas as soon as we have the funds.

Mr. McLAUGHLIN of Michigan. You say they are asking? How is it done?

Mr. NELSON. It is done through the extension service of the agricultural colleges.

Mr. McLAUGHLIN of Michigan. I do not know any reason why you should go in there and do that work in States where there is no public lands.

Mr. NELSON. In such States we merely conduct demonstrations and furnish expert guidance to insure the best results. The work itself is done by the people of the States and not by the Government.

Mr. McLAUGHLIN of Michigan. It is a simple matter; you have discovered the best kind of poison, and how to apply it to make it effective. Why can't they take it up and do it themselves?

Mr. NELSON. Because we find that most people are a little careless and often overlook some small but necessary detail. Furthermore we find conditions vary and the habits of the animals vary in a way that often tries the skill of our most experienced men to get good results. To depend on written instructions at times may give good results but practical field experience on a large scale in many States has shown conclusively the absolute need of expert leadership. When left to do the work wholly on their own guidance people often fail to get proper results.

Mr. McLAUGHLIN of Michigan. Who suffers as the result?

Mr. HARRISON. The country as a whole.

Mr. McLAUGHLIN of Michigan. No; I do not think it does.

Mr. NELSON. For instance we receive complaints that poison prepared according to our formula by certain farmers is worthless. We send a man to investigate and find that some small part of the formula was omitted or the poison had been kept too long or had been improperly distributed and the community had been discouraged. Our expert makes a demonstration in preparing and distributing the poison, gets good results, and the people at once go on with the campaign and make a good saving of crops.

Mr. McLAUGHLIN of Michigan. I do not see the reason.

Mr. NELSON. Our object is to carry on an educational campaign for the elimination of these rodents and with them the heavy losses to agriculture by them.

Mr. McLAUGHLIN of Michigan. It is hard for me to see the difference in teaching people how to kill these rodents, and in teaching them how to pull the weeds out of their corn.

Mr. NELSON. Another phase of the rodent work is the destruction of house rats. The annual losses caused in this country by house rats is about \$200,000,000.

The CHAIRMAN. You tell them how to destroy them?

Mr. NELSON. Yes; we advise as to the best method of destroying them by traps, poison, and better still to rat-proof buildings and all food storage places such as warehouses, corncribs, etc. A moderate expenditure in rat proofing is very effective in reducing losses from this source. In other words, safeguard the food so that the rats can't get it, and when you deprive the rats of food you will eliminate the rats.

If you build the granary so that the rats can not get in it, you eliminate the rats; if you build the granary so that the rats can get in it and have a free run, and plenty of food the rats will multiply right up to the available supply of food.

Mr. McLAUGHLIN of Michigan. How many men have you employed in that kind of work?

Mr. NELSON. We have one man who devotes a good part of his time to this kind of work. We have had calls for advice and help from many sources, and we have issued a bulletin on the subject. People appear to be more or less helpless when it comes to facing a problem presented by any kind of animal pest largely through lack of information as to their habits. For example, a large milling company of Louisville, Ky., reported serious losses from rats and asked our advice. We sent a man down there and he found that near the mill there were a lot of chaff and screenings, forming splendid homes for the rats, and that building was so constructed that the rats could get in without trouble. The owner said that it was costing him about \$3,000 a year to repair grain sacks, without reference to the amount of food that was destroyed by these rats.

Our expert pointed out how the building could be rat proofed for a few hundred dollars. The result was that the rats were practically eliminated from his mill and warehouse. That looks like a simple proposition, yet here was a man having losses amounting to thousands of dollars a year, but he had no practical idea how to stop them.

When the war came on the Army took over the Bush Terminal warehouses in New York, a series of buildings eleven blocks long, and from one to three blocks deep. They were to be used for the storing of supplies for the Army. The quartermaster in charge wrote us that the place was swarming with rats which must be destroyed before the supplies could be put in and asked for advice. We at once sent an expert who found that poison could not be used, and after examining the premises laid out a continuous trapping campaign on a large scale. The advice was followed promptly by the purchase of 1,200 traps of the kind suggested and four men set to trapping rats. That was the 1st of January, 1918; the 1st of January, 1919, I received a letter from the quartermaster in charge thanking us for our assistance and reporting that for some time after they began trapping they had taken a barrel full of rats day after day, and that at the end of the year they had trapped between thirty-five and fifty thousand rats. He added that their total losses from rats during the year had not exceeded \$50. In other words, the advice which the department gave, through one man spending a day up there, resulted in saving a very great sum to the Government.

The CHAIRMAN. Doctor, we have a number of very important items. Have you finished your statement?

Mr. NELSON. I haven't finished the statement. This is on the rodents. I think it may be well to give a few items showing what some rodents destroy.

Prof. Nabours, of the State College of Agriculture, estimated that last year the pocket gophers in Kansas destroyed 10 per cent of the alfalfa crop. The crop that year was valued at \$50,000,000. So that there was \$5,000,000 lost from that one kind of rodent in the State of Kansas in one year.

The effectiveness of the methods for destroying this pest was shown down at Hearne, Tex., when the quarantine against the pink cotton boll worm was put into effect. The farmers were advised by the Agricultural College to plant peanuts, but the pocket gophers ate them as fast as they were planted. On request we sent a man to help control the gophers. He soon demonstrated how to kill the gophers, a community campaign quickly eliminated the pests and a good crop of peanuts was the result.

A few months ago I received a telegram from an American firm in Mexico City saying that a swarm of field mice had suddenly attacked and was destroying a large area of wheat belonging to some Americans and asked advice by telegram. Our advice was followed and the crop saved. In the State of Vera Cruz, Mexico, some American owners of a sugar cane plantation after spending thousands of dollars fighting gophers unsuccessfully asked advice to save their plantation from complete destruction. Our suggestions enabled them to save their crop. The devastations of pocket gophers in the alfalfa fields are examples of the destructiveness of these pests.

Mr. McLAUGHLIN of Michigan. Why don't you telegraph to them as you did to Mexico?

Mr. NELSON. The destruction of these pests in alfalfa fields is not so simple or these losses would have been long ago eliminated. It will require an investigation to determine the best methods and then an educational campaign to teach the methods to the farmers.

Mr. McLAUGHLIN of Michigan. What is the use of them asking the Government to send a man in there to do something which they can do themselves?

Mr. NELSON. The object of our work will be to give the farmers the benefit of the expert knowledge we have secured in dealing with such problems through years of investigation and experience. The necessary information to control these losses will be passed on to the farmers through our cooperation with the county agents.

Mr. LEE. Mr. Chairman, before we take up the next item——

The CHAIRMAN. Are you through with this item?

Mr. NELSON. No; I wish to give something about the predatory animal work which is covered in this item. The plague of rabies among predatory animals existed in five States and was spreading when the first appropriation was made for its control. Before we could get the work well established it spread into the sixth State, Utah. Since then we have stopped its spread and held down its ravages to a great extent. Renewed outbreaks of it occur here and there as has been the case in Oregon, Nevada, and Utah within a few months but we soon suppress them. If this control should be removed the disease would spread all over the Western States.

In our predatory animal work, including rabies, we have taken the skins of over 95,000 predatory animals, which includes more than 2,200 big gray wolves. Single wolves are known to have killed anywhere from one thousand to five thousand dollars worth of live stock in a year.

The CHAIRMAN. How much money have you turned into the Treasury from these furs?

Mr. NELSON. We have turned into the Treasury to date more than \$209,000 from the furs from predatory animals taken by Government hunters.

The CHAIRMAN. And that is to be deducted from the appropriation?

Mr. NELSON. That would be deducted from the appropriation; as so much back to the Government from this work. That sum is not for one year but for the period since we began this work.

The CHAIRMAN. How much did you turn in last year?

Mr. NELSON. \$76,179.

Some of the predatory animal hunters, in occasional months, pay the Government a profit on their salary, getting skins worth more than their salary. In summer, however, the animal skins are worthless. The States are putting up cooperative money to work with us, but less than for the rodent work. They are putting up about \$225,000 for the predatory animal work, as against over \$900,000 for the rodent work.

Mr. McLAUGHLIN of Michigan. Is that on public lands out there where that work is being conducted?

Mr. NELSON. The predatory animal work is very largely on the public lands, because it is mainly on the national forests, and other wild public grazing land where the predatory animals breed and live. This work saves the lives of large numbers of stock which graze on the public domain.

It will interest the committee to know that we have several women trappers. Two women came up to Nevada from Arizona and asked to be employed as trappers. We tried them and they were found to be as effective as men, so these two women are on the rolls. They turn in, on an average, as many skins as the men trappers.

One of our trappers spent some time trying to get a notorious cattle-killing wolf, and during the period before capturing him found 23 freshly killed calves that had been destroyed by that wolf. We have record in another case where a mountain lion killed 50 calves and 3 colts before our men killed him.

In many cases it can be determined what individual wolf or other animal has done the killing from its having lost a foot or had it crippled in a trap so its track is easily distinguished.

Some of these animals have tremendous records, and are, of course, exceedingly difficult to get. A reasonable estimate of the saving of live stock through the predatory animals taken by our hunters last year amounts to more than \$5,000,000. The saving of crops through our rodent campaign based largely on estimates of farmers amounts to about \$15,000,000.

The next part is fur farming. We have an experimental fur farm in New York State. Fox farming has become an established industry, and we are running an experimental farm and working out methods of feeding and otherwise trying to develop this new industry. Fur farms are being established all along the northern tier of States. Fox farming is developing rapidly in Alaska and Canada as well. There appears to be a great future in the business due to the increasing value of furs as the wild fur animals are decreasing.

I merely want to call your attention to the fact that at the last sales the prices of muskrats were up to \$3.90, mink over \$20, and coyote more than \$20.

The final section of this appropriation is for the investigation of birds, to determine the useful species and to provide methods of increasing their number; also to determine the injurious species, and methods of destroying or controlling them.

Mr. Chairman, in connection with the rabies work, one item I omitted I would like to put in here. Up to 1918, 1,437 people had been bitten by rabid animals, and 47 had died from it, in the States where we are working to destroy the animals which spread this disease. That, Mr. Chairman, is all of this item.

The CHAIRMAN. It is very important work. There is no question about it.

Mr. NELSON. The next item is No. 32, "for biological investigations, including the relations, habits, geographic distribution, and migrations of animals and plants, and the preparation of maps of the life zones, \$24,400." That covers the scientific investigational activities of the bureau, and no increase is requested. It is the fundamental work of the Biological Survey upon which it was engaged before it took up the economical work. That is very necessary for the continuance of the effective economic activities of the bureau.

The next item, No. 33, "for all necessary expenses for enforcing the provisions of the migratory bird-treaty act of July 3, 1918, and for cooperation with the local authorities in the protection of migratory birds, and for necessary investigations connected therewith." The administration of this law is largely police work, done throughout the United States to enforce the provisions of the migratory bird treaty act. Under our present appropriation we are able to carry only about 38 full-time game wardens, less than one to a State. I think it will be admitted that one man or less than one man to each State is an inadequate number to enforce a Federal law throughout the country. The result of our inadequate force is that the violators of the law are beginning to take advantage of the situation in wholesale fashion in some sections of the country. It will be necessary to have more men if we are to have the treaty and the law properly respected.

Mr. McLAUGHLIN of Michigan. You have 37 now? How many men will be employed?

Mr. NELSON. Under the new appropriation, I think it gives us 55 paid wardens, and on part salary, we will have 100 deputies, and that would enable us to police the country in a far more satisfactory way than at present. We need enough wardens so that we can be represented in each State. That appears to me to be obvious. Our wardens are all acting in cooperation with the State game wardens, and in that connection I might say that the State game service, and the State game commissioners, are expressing more and more their appreciation of this Federal law, and the assistance it is in helping make more effective the protection of game in the States.

Mr. McLAUGHLIN of Michigan. Is that so in all States? Do all of the States feel the same way about it?

Mr. NELSON. With the exception of one or two States, we are having the most friendly relations. In general throughout the country we have the most cordial cooperation and have many expressions of appreciation for the cooperation we give in return. With the migratory bird work is combined the administration of the Lacey Act. Through this we can help the State game officials in controlling illegal shipments of game.

Mr. McLAUGHLIN of Michigan. I asked that question because I thought some of the States were opposed altogether to the migratory bird law.

Mr. NELSON. In the beginning, there was some suspicion among some State game officials as to the effect the law would have on the State game laws, but this has passed. There was a strong fight put up by many men who desired a continuance of spring shooting. Most of this antagonistic feeling has disappeared, and the better element of sportsmen throughout the country are strongly in favor of the law. In common with the State game commissions they report a great increase of migratory game as a direct result of the Federal law and especially to the abolition of spring shooting.

The reports coming in this season agree that there are far more migratory game birds than for many years. The result of this law has been astounding, and many people who were strongly for spring shooting have become changed to favor the law. One sportsman in Illinois recently remarked: "I have always been in favor of spring shooting, but from what I have seen this fall in the increase of game birds, undoubtedly from the results of this law, we are whipped. I am through." He says, "I think the law is a good thing." And that is a sample of the change in sentiment among many in various parts of the country who opposed it in the beginning. They feel now that the migratory-bird law is a good thing.

The CHAIRMAN. How much money has been appropriated for the enforcement of the Lacey Act?

Mr. NELSON. Twenty-two thousand dollars. That is an item which is combined with this appropriation.

The CHAIRMAN. You are cutting that down by \$1,500? The appropriation last year was \$22,000, and this year you are asking for \$20,500.

Mr. NELSON. That is on account of transfer of a clerk.

The CHAIRMAN. What is the next item?

Mr. NELSON. The next item is No. 34, "For general administrative expenses connected with the above-mentioned lines of work, including cooperation with other Federal bureaus, departments, boards, and commissions, on requests from them."

We are asking for a small increase here to meet the increased demands on the part of other bureaus for cooperation, and also due to the addition of one clerk to our administrative office.

Mr. CHAIRMAN. The increase is \$4,240?

Mr. NELSON. Yes, sir; \$1,800 of which goes to a clerk, and the rest is for general expenses, mostly traveling expenses, when men are sent out on request.

That is all, I believe.

The CHAIRMAN. You say your total increase is about \$80,000?

Mr. McLAUGHLIN of Michigan. No; it is only about \$23,000.

The CHAIRMAN. The total for the Biological Survey.

Mr. McLAUGHLIN of Michigan. That would be about \$36,000.

Mr. NELSON. The total increase asked for the bureau amounts to \$235,835, under the following items: Maintenance of reservations, \$5,135; food habits of North American birds and mammals, etc., covering the rodent and predatory-animal work, \$118,960; enforcement of migratory-bird treaty act, \$107,500; administration, \$4,240.

Mr. HARRISON. Mr. Chairman, there is another matter in which the Biological Survey is interested. I refer to item No. 24, on page 289, and Mr. Nelson will explain it briefly.

The CHAIRMAN. Has the migratory-bird treaty act been tested in the district courts?

Mr. NELSON. Six district courts have declared in favor of the constitutionality of it. No district judge has declared against it.

The CHAIRMAN. Has it come to the Supreme Court?

Mr. NELSON. Yes; it is before the Supreme Court. The attorney general of Missouri, when the law was passed, declared that he considered the law was unconstitutional, and he didn't propose to obey it. He proceeded to take a gun and go hunting out of season, and one of our wardens promptly arrested him and brought him into court. He retaliated by trying to get an injunction against the enforcement of the law in Missouri, on the ground that the law was unconstitutional. He was overruled and has appealed the case to the United States Supreme Court, where it is now on the calendar.

Mr. McLAUGHLIN of Michigan. What action did the district court take on the case when he was first arrested?

Mr. NELSON. I think the injunction was denied, and so he appealed. Six district judges in various parts of the country have declared the law constitutional.

The CHAIRMAN. You mean Federal courts?

Mr. NELSON. Yes, sir.

PROTECTION OF EMPLOYEES OF FOREST SERVICE AND BIOLOGICAL SURVEY.

Item No. 24, on page 289, for the protection of employees of the Forest Service and the Biological Survey in the performance of their duties. The duty of enforcing Federal laws or regulations falls, in some cases, upon employees of the Forestry Service and in some cases upon those of the Biological Survey. In doing this necessary police work our men often deal with desperate characters who are vicious and resist interference. One of our wardens was assaulted by a man in a hotel office in Maryland. This man resented the migratory-bird law, and without any provocation suddenly struck and knocked down and beat up one of our men because he was a Federal game warden. We have wardens whose duties are to protect Federal bird and game reservations. In many cases these men have been threatened and abused in performance of their duties and have no protection under any Federal law. It is a matter of common knowledge that game wardens are being killed at intervals all over the country by lawless characters who resent any control. And as it stands now our men have no protection. We send a man out to do police duty for us and do not give him any Government protection. He is at the mercy of any ruffian who wishes to attack him.

Mr. McLAUGHLIN of Michigan. You are right, Doctor, but you name the men employed in the Bureau of Animal Industry, you name the men employed in the Forest Service, and in the Bureau of Biological Survey. Are there not other bureaus that should have this same protection? Why do you pick out those in particular, Mr. Harrison?

Mr. HARRISON. The law now protects employees of the Bureau of Animal Industry, and it is proposed to extend it to the employees of the Forest Service and the Biological Survey. The proposed amendment is confined to the two latter bureaus because they are

the only cases that have been presented to the Secretary's office. Personally, I think it would be better to adopt a provision protecting all employees of the department while engaged in the prosecution of their duties under laws passed by the Congress of the United States. The Bureau of Chemistry is engaged in regulatory activity, but its inspectors do not have the power of arrest.

Mr. McLAUGHLIN of Michigan. Is it your idea only to have it apply to those that have the power of making arrests?

Mr. HARRISON. Not necessarily. The wardens of the Biological Survey and under certain conditions the rangers of the Forest Service have the power of arrest. The employees of the Bureau of Animal Industry are engaged in the enforcement of quarantine regulations and in the execution of meat-inspection law, and the present law was adopted to protect them against interference in the performance of their functions.

Mr. McLAUGHLIN of Michigan. If there are other bureaus, would it not be well to have them all included in the law, or have they broad ones such as you speak of?

Mr. HARRISON. I think it would be, and I shall be glad to take up the matter with the other bureaus and canvass the situation with them.

Mr. McLAUGHLIN of Michigan. This will be subject to a point of order.

Mr. HARRISON. Yes; I assume so.

Mr. NELSON. It would undoubtedly be useful to have such a law, because every now and then there is a case where employees are trying to enforce regulations and get into trouble with some viciously minded person.

Mr. McLAUGHLIN of Michigan. You are right, but it is a question of how to do it.

Mr. HARRISON. The Bureau of Chemistry probably would be the only other bureau involved. Their inspectors are required to take samples.

Mr. McLAUGHLIN of Michigan. They do not do this by force?

Mr. HARRISON. No; nor have they the power to go into an establishment and inspect it against the owner's will. There is no authority under the law for that.

Mr. McLAUGHLIN of Michigan. So these may be the only ones after all?

Mr. HARRISON. These may be, but I have not canvassed the situation thoroughly with that thought in mind. I shall be glad to do it, Mr. McLaughlin, and I will let you know the result.

Mr. LEE. Are you through for this evening?

Mr. NELSON. Yes, sir.

The CHAIRMAN. We are very much obliged to you.

Mr. NELSON. Unless you think there is something else, Mr. Harrison.

PER DIEM ALLOWANCE FOR TRAVELING EXPENSES.

Mr. HARRISON. There are other matters in the miscellaneous section which are of interest to all bureaus. We are suggesting that the committee include a provision in the bill increasing the per diem that may be paid to employees when they are traveling on official business. The limit now is \$4 in the case of per diem in lieu of sub-

sistence and \$5 in the case of actual traveling expenses. You know, gentlemen, that nobody can travel these days for any such sums.

The CHAIRMAN. You have it up to \$7?

Mr. NELSON. Seven dollars for actual traveling expenses and \$6 for per diem. The present rates are \$5 for actual traveling expenses and \$4 per diem. To give you a practical illustration, I expect to go to New York in connection with our work next week. I telegraphed to the Hotel Pennsylvania to ask for a reservation of a room because the last time I was in New York I spent two hours in a taxicab trying to find one. They replied that they would make a reservation for \$5. So if I eat I will have to do so at my own expense and not on Government account. We are up against that sort of thing all the time.

Mr. HENDERSON (Assistant Chief of the Bureau of Biological Survey). I tried eight hotels and got one for \$3.50.

Mr. LEE. Are we through, Mr. Chairman?

The CHAIRMAN. That is all, I believe.

(Thereupon, at 4.05 o'clock p. m., the committee adjourned subject to the call of the chairman.)

Activities under lump fund items, Bureau of Biological Survey.

Projects.	Allotment, 1920.	Estimate, 1921.	Increase.
Maintenance of mammal and bird reservations:			
(a) Supervision.....	\$5,000	\$5,000	
(b) General maintenance of reservations and refuges.....	15,900	21,035	\$5,135
(c) Montana National Bison Range.....	4,000	4,000	
(d) Wind Cave National Game Preserve.....	2,000	2,000	
(e) Winter elk refuge.....	5,200	5,200	
(f) Restocking reservations.....	2,500	2,500	
	34,600	39,735	5,135
Sullys Hill national game preserve.....	5,000	5,000	
Economic investigations:			
(a) Supervision.....	10,979	15,870	4,891
(b) Destruction of injurious mammals.....	87,281	165,450	78,169
(c) Relation of native and introduced birds to agriculture.....	18,880	24,880	6,000
(d) Rearing fur-bearing animals.....	8,500	10,200	1,700
(e) Destruction of ground squirrels on national forests and other public lands.....	15,000	16,000	
(f) Destruction of predatory animals on national forests and public domain.....	198,800	227,000	28,200
(g) Suppression of rabies in predatory wild animals.....	125,000	125,000	
	464,440	583,400	118,960
Biological investigations:			
Supervision.....	3,300	3,300	
Investigation of birds and mammals of the public domain.....	6,500	6,500	
Biological survey of the States and Territories.....	13,700	13,700	
Bird migration.....	900	900	
	24,400	24,400	
Enforcement of migratory bird treaty act and Lacey Act:			
Supervision.....	13,500	20,400	6,900
Protection of migratory birds.....	107,700	196,050	88,350
Investigation of migratory water fowl.....	10,000	20,000	10,000
Interstate commerce in game.....	11,750	14,000	2,250
Importation of foreign birds and mammals.....	1,500	1,500	
Inspection and quarantine of quail.....	750	750	
Publication of information concerning game laws.....	1,800	1,800	
	147,000	254,500	107,500
General administration.....	10,780	15,000	4,240
Total.....	686,200	922,035	235,835

¹ Includes \$8,400 transferred to statutory rolls.

² Includes \$4,500 transferred to statutory rolls.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Saturday, December 20, 1919.

DIVISION OF PUBLICATIONS.

(Mr. McLaughlin of Michigan presiding.)

Mr. HARRISON. We will next present the estimates of the Division of Publications. Mr. Reid, chief of the division, is here. The estimates appear on page 192.

STATEMENT OF MR. EDWY B. REID, CHIEF OF THE DIVISION OF PUBLICATIONS, DEPARTMENT OF AGRICULTURE.

Mr. REID. Mr. Chairman, I wish to pass these photostat copies of a chart showing the organization of the Division of Publications, so that you can see very plainly what we are recommending.

Mr. McLAUGHLIN of Michigan. Have you a statement you wish to present?

Mr. REID. Yes, sir. These estimates provide for the consolidation with the Division of Publications of the Office of Information, Office of Exhibits, and motion-picture activities, involving about 40 people.

The estimates do not contemplate any radical changes in the present organization or in the methods of carrying on the work as it is now administered. As you may recall, at the beginning of the war Mr. Clarence Ousley was called here from Texas by the Secretary to act as Assistant Secretary in charge of all publication and informational work of the department. He also had charge of the motion pictures and exhibits. When Mr. Ousley left, the Secretary put this work in the hands of the Chief of the Division of Publications, who had charge of much of it under the Assistant Secretary while he was here. Thus we are not putting before you a program which has not been tried but are submitting estimates which involve merely the making of statutory changes which naturally would follow the changes which have been made administratively.

I want to call your attention to the fact that you are now dealing not with one bureau, one division, or one office, but with a vital factor which affects the Department of Agriculture as a whole. You are going to appropriate millions of dollars for this department for the purpose of investigational and demonstration work, as well as regulatory activities. To provide this money for that work and not to take care of the machinery for getting the results to the people, of course, would be merely wasting the large appropriation.

As business men you know you have to spend a certain percentage of your income for advertising your products. With the Department of Agriculture the necessity for advertising its products is even greater than in business, in that the investigations uncover valuable information which has been acquired at a heavy expenditure of time and money and which must be given not to a few individuals but made accessible to all of the hundred million people who will use it. I have no doubt you will continue to appropriate a sufficient amount so that the department's light will not be "hid under a bushel" but will be seen from the farthest corner of the Nation.

The part which the Office of Information has played and is playing in the getting of the department's scientific discoveries to the public is one of the most important, in that it has an immediate contact with the daily, weekly, and agricultural press and magazines, sending out timely, instructive, informational articles which are given a vast circulation through these mediums.

The preparation in the Division of Publications of the formal publications or bulletins is an indispensable function which makes available to the people in simple form the latest results regarding the multiplicity of activities in which the department is engaged. It also undertakes the vast work of distributing these publications, many of which are sent out at the request of Members of Congress. During the last fiscal year there were distributed through the Division of Publications more than 62,000,000 copies of bulletins and other publications. Ninety new Farmers' Bulletins were issued, besides many other bulletins and circulars of a popular nature. New publications of all classes numbered 840, and reprints were 401, making a total of 1,241 publications issued during the year. Job printing and binding received from the Government Printing Office amounted to more than 44,500,000 pieces, while the aggregate of printing and binding was more than 100,000,000 pieces. Some idea of the size of the task involved in the distribution may be gained from the fact that our incoming mail requesting publications alone now amounts to about 2,000 letters daily.

The preparation of the manuscripts for the printer involves careful, painstaking work, in which much improvement has been made in the recent past. The text of the circulars and Farmers' Bulletins is made as simple as possible and it is illuminated with the best photographs, charts, and other illustrations we can secure. The cover pages have been made more attractive, so the recipient of the publication will be interested in reading what the bulletin contains.

The motion-picture activities speak for themselves. There probably is no need of presenting statements to you regarding the need for this sort of visualization of agricultural information. If the motion pictures did no more than to draw crowds for the speakers who generally show the films they would be worth many times what the department has put into them to date.

The Office of Exhibits, of course, seeks, through another kind of visualization, to educate the public regarding the various improved processes of production and marketing of agricultural products and the latest discoveries concerning domestic science. Since June 30, 1919, the department has made exhibits at 57 fairs and expositions.

The total attendance at these shows was about 8,500,000 people and the total amount of floor space occupied exceeded 214,000 square feet. In order to show at this large number of fairs it was necessary to prepare five distinct sets of exhibits which were sent out on five circuits. In so far as it was practicable the exhibits were prepared with a view to be instructive in the particular regions in which they were shown and also to illustrate the work of the department. Several special exhibitions were staged, such as at the National Dairy Show, where there was an attendance of 120,000 people, and at the International Live Stock Exposition, the attendance of which was estimated to be 250,000. With the funds available the department will be able to make exhibitions at a number of other fairs before the close of the fiscal year, requests for which have been received.

Possibly you can visualize from this organization chart just what we are asking in the estimates. This parallelogram represents the additional positions for which we are asking this year. There are 11 of them. This heavy white line shows the way it is proposed to link the organization together, the offices of information, exhibits, and motion-picture activities becoming a part of the general publication organization. This is a logical organization, a natural coordination of several related units in the department—activities which have grown up and have been tried out for a series of years, but which have been conducted as separate units.

Possibly it is not altogether evident why we want to draw these together. This has to do mainly with the work of getting information to the public, through publications, motion pictures, material sent out to the press and to magazines, and exhibits. All of it is more or less of the same character and should be guided from the same source; that is, we want these sections articulated so that, if a thing comes up which the department wishes to stress (for instance, we are making a drive now on better sires), we key this whole organization into that drive. Under this organization each section here knows what the drive is, knows all about it, and the activity is all headed to one focus.

Mr. McLAUGHLIN of Michigan. As to that particular line of work, you get requests from some of the other bureaus, do you not; you get papers prepared by the other bureaus on the subject of better sires, and it is up to your office to provide for their printing and distribution?

Mr. REID. Yes. Not only that, but suppose we get a paper prepared in the Bureau of Animal Industry on better sires. If it is a worthy pamphlet, if it is worth distributing to the farmers as a bulletin or as a circular—

Mr. McLAUGHLIN of Michigan. Who determines that?

Mr. REID. We do in the Division of Publications.

Mr. McLAUGHLIN of Michigan. You determine in what form it shall go out?

Mr. REID. Yes, sir; that is our activity.

Mr. McLAUGHLIN of Michigan. Who determines the number that shall be issued?

Mr. REID. We do, largely. It is a publication activity. We start in, we will say, with a circular, and from that circular we write news items which go out to the press in various forms.

MR. McLAUGHLIN of Michigan. As to that particular line of work; that will be an example?

MR. REID. Yes, sir.

MR. McLAUGHLIN of Michigan. You get some kind of writing from the Bureau of Animal Industry?

MR. REID. Yes, sir.

MR. McLAUGHLIN of Michigan. Then you determine whether or not it shall be published and in what form it shall be published?

MR. REID. Yes, sir.

MR. McLAUGHLIN of Michigan. And how many copies of the publications shall be printed and distributed?

MR. REID. Of course it is not an arbitrary decision on our part as to whether it shall be published. We take this up with Dr. Mohler, Chief of the Bureau of Animal Industry, if we see any reason why this thing should not be published; but if it comes over and should be published, we go ahead and get it out.

MR. McLAUGHLIN of Michigan. Then the question of whether or not it shall be published is alone in your hands and Dr. Mohler's?

MR. REID. Yes, sir. Of course, if it involves some matter of policy, it goes up to the Secretary; but in the ordinary course of events that is the way it works.

MR. VOIGT. If the bulletin were on some other subject, you would not go to Dr. Mohler?

MR. REID. No; we would go to Dr. Taylor, or Mr. Nelson, or Mr. Estabrook, or whoever is in charge of that particular line of work. Of course this is a service organization for the Department of Agriculture; it is hardly an entity within itself, except that it works with the whole department. Whenever anything is dug out by the department we take hold of it and put it in language so the farmer understands it and so the ordinary layman can get hold of it. For instance, this treatise that comes over from one of the research bureaus of the department might be Greek to the ordinary farmer. We have to put specially trained writers on that and get it up in a news form, and then we put another man on it—an editor—to get it up in proper bulletin form.

Then, for instance, if it is a better sire proposition, we may put it on in motion pictures, and then in exhibit form. For example, at the National Fat Stock Show, we had two big posters prepared a little larger than an ordinary size door, showing the poor, scrubby cattle going downhill and the better sires going uphill. It is one of the best posters we ever issued. That shows how we key into the exhibits, and we might use it in some other way. This one [indicating] shows how we are trying to articulate all these activities in connection with our publication and informational work.

MR. TINCER. Who decided the matter of publishing how to make substitutes for sugar out of cider? The bulletin you recently got out over there about making substitutes for sugar out of cider, who decided about that?

MR. REID. I do not recall any such bulletin, but the working idea probably originated in the Bureau of Chemistry and was passed upon first by a board of chemists in the Bureau of Chemistry (if it was a formal publication) as to whether it was the right publication to get out, whether it was the right form, and that was sent over to us.

Mr. TINCHER. Who simplified it so that it would be plain to the farmers?

Mr. REID. I do not remember the particular publication, but it would go through the regular editorial channels.

Mr. McLAUGHLIN of Michigan. Usually in taking up a division like this we consider the statutory roll first and the changes and increases which you wish to propose, and perhaps you had better follow that course. Then as to these particular matters, they will come up as we reach the items to which they relate.

There is a change of title, first, is there not, on page 192?

Mr. HARRISON. Item No. 2 is a new place.

Mr. REID. Item No. 2, "One executive assistant," is a new place.

Mr. McLAUGHLIN of Michigan. Has the one who fills that place been employed before in the department?

Mr. REID. The man who is doing that sort of work now has been employed for some time in the department. We do not know, however, whether that man will be the person to fill this particular position if we get it, or whether we will have to bring somebody in from the outside.

As indicated in the explanatory data under item 2, on page 192 of the Book of Estimates, with the enlarged responsibilities of the chief of the division incident to the consolidation of all the publication and information work under one head, the services of an assistant will be necessary in order to relieve the chief of some of the administrative details. It is proposed to have this employee also exercise general supervision over the business operation of the division. The salary recommended for this additional employee is based on the salaries paid administrative and executive assistants who perform similar duties in other bureaus of the department. Practically each bureau of the department now has such an officer, and the salaries range from \$2,250 to \$3,000. The need for such an assistant in the publication work is acute, owing to the fact that the chief of this division has no assistant who can share the administrative duties. As explained under item 4, the employee formerly designated assistant chief is engaged entirely on work of an editorial nature. He handles the printing business of the division, and is an expert in such matters, but is not familiar with the general administration of the work and has no contact with the administration of the offices of exhibits, information, and motion-picture activities.

Mr. McLAUGHLIN of Michigan. What has been the work of the one you have in mind?

Mr. REID. He has been an assistant in the Bureau of Markets, where he has been thoroughly trained in business administration and the various laws and regulations of the department.

Mr. McLAUGHLIN of Michigan. What was his salary where he was employed before?

Mr. REID. I think it was about \$1,800. I am not conversant with his exact salary. As you can see, this organization carries a lot of work with it.

Mr. RUBEY. When we give you a new place, such as an executive assistant, who decides on the man who shall go into that position?

Mr. REID. Of course, we would have to abide by the civil-service regulations in that case and appoint according to them.

Mr. RUBEY. For instance, here are two or three men who have the civil-service qualifications; then some one would determine as between them?

Mr. REID. Yes; it would be put up to the chief of the bureau who would recommend the appointment to the Secretary.

Mr. McLAUGHLIN of Michigan. Was the man you have in mind for this executive assistant position on the statutory roll or the lump-sum roll in the Bureau of Markets?

Mr. REID. Can you answer that question, Mr. Harrison?

Mr. HARRISON. As I understand the situation, this place was inserted in the estimates with no particular person in view to fill it. With the growth of the activities of the Division of Publications and the constant increase in the work it was decided that it was necessary to have an assistant to the chief of the Division of Publications, especially in view of the fact that the man who formerly held and performed the duties of assistant chief of the Division of Publications is no longer performing those functions. He is now engaged in handling some of the printing business of the department.

Mr. RUBEY. Who is that?

Mr. HARRISON. I refer to Mr. Stallings. You perhaps know him, Gov. Rubey. We suggest in these estimates that his title be changed to that of assistant editor in order to conform to the duties he is actually performing.

Mr. RUBEY. The reason I asked the question was that I thought he might have left the department.

Mr. HARRISON. No; he is still there.

Mr. RUBEY. He is still there, but doing editorial work?

Mr. HARRISON. Yes. I understand, also, as a temporary measure, that Mr. Reid is using the services of the chief clerk of the division to a certain extent in the administrative work, taking him away from his duties as chief clerk. The man who occupies the position of chief clerk and who receives a statutory salary of \$2,000 was formerly in the Bureau of Markets, and when the former chief clerk of the Division of Publications died he was transferred to that place. That occurred some time during the summer. The man in the Bureau of Markets was receiving \$1,800 a year then. He was on the statutory roll of that bureau when he was transferred to the Division of Publications.

Mr. McLAUGHLIN of Michigan. He has been transferred, then?

Mr. HARRISON. Yes. He is now in the Division of Publications, actually performing the duties of chief clerk of the division, and, in addition to that, is handling some of the administrative work under the immediate direction of the Chief of the Division of Publications.

Mr. McLAUGHLIN of Michigan. When he was in the Bureau of Markets he was getting \$1,800?

Mr. HARRISON. Yes, sir.

Mr. McLAUGHLIN of Michigan. And was transferred to this division at what salary?

Mr. HARRISON. At \$2,000; to the statutory place of chief clerk.

Mr. McLAUGHLIN of Michigan. When was it that he was transferred?

Mr. REID. In May, 1919. We could give no other salary than \$2,000. The chief clerk died, and it was a statutory place.

Mr. HARRISON. That is item 12, on page 192.

Mr. McLAUGHLIN of Michigan. The next change is in item No. 4— one assistant chief of division, \$2,500, changed to one assistant editor, \$2,500.

Mr. REID. That is just a change of title. As was just explained, this is the man who is now carried as assistant chief of the division, but he is now doing editorial work exclusively.

Mr. McLAUGHLIN of Michigan. When a man is transferred from one position to another, is it necessary for him to take a civil-service examination?

Mr. REID. Not always. If his qualifications are such that he can take the new position, it is not necessary for him to pass an examination.

Mr. McLAUGHLIN of Michigan. If a man gets into the department in any capacity, having passed the civil-service examination, and you think his ability justifies it, he can be transferred to any other position with the department?

Mr. HARRISON. That is not strictly true, Mr. McLaughlin. For instance, we would not transfer a clerk to a position of veterinary inspector, nor could we transfer a clerk to a position of editor. We can, however, transfer a person in the department from one position to another so long as the two positions are in comparable grades; that is, grades which call for essentially the same sort of civil-service examination in each case. But where an examination under which the man originally entered the service is totally different from the examination scheduled for the position to which we wish to transfer him it can not be done.

Mr. McLAUGHLIN of Michigan. If the work, then, is at all similar and a man enters the department as the result of a civil-service examination you can put him in any other place?

Mr. HARRISON. Yes. For instance, a clerk may be promoted through the various grades to the position of executive assistant or administrative assistant without any other examination, as both positions call for work of essentially the same character, though, of course, in the case of the executive assistant and administrative assistant it is of a higher grade.

Mr. RUBEY. You simply drop item 4, and that assistant editor comes in under item 5?

Mr. REID. Yes, sir.

Mr. HARRISON. That is correct, Gov. Rubey.

Mr. RUBEY. And the same man who was assistant chief at \$2,500 will be an assistant editor at \$2,500?

Mr. HARRISON. Yes, sir. On the 1st of next July the chief of the division will make a recommendation that his title be changed from assistant chief and that he be placed in the position of assistant editor. That completes the action.

Mr. RUBEY. One difficulty about these changes of title is that they always give the committee a good deal of trouble on the floor of the House. It would be a good idea for you to get these things once fixed so that you would not have to make these changes so frequently.

Mr. HARRISON. In some instances we have suggested that more general titles be given, so as to afford greater flexibility in the handling of the force and make unnecessary these changes from year to year. In the case of the carriage driver, to which reference was

made to-day, we asked to have the title changed to laborer or messenger, as it is a more flexible arrangement, and we can better adjust our force to meet the needs of the work.

Mr. McLAUGHLIN of Michigan. What other changes in this roll are you asking?

Mr. REID. I would like to call your attention to item 8, one assistant in charge of motion-picture activities, transferred from the lump sum for general administration, Forest Service, \$2,520.

Mr. McLAUGHLIN of Michigan. Has he already been transferred to that work?

Mr. REID. He has administratively been doing this work at least two years.

Mr. McLAUGHLIN of Michigan. He was employed in the Forest Service?

Mr. REID. Yes, sir. He was doing educational and motion-picture work in the Forest Service for a number of years. Recently he has been directing the motion-picture work for the department, as a whole, and we now want to bring the position under the Division of Publications by statute.

Mr. McLAUGHLIN of Michigan. What was his salary in the Forest Service?

Mr. REID. \$2,520 per annum. We are asking for the statutory place just the same as it is carried now by the Forest Service. There will be no increase.

Mr. RUBEY. The Forest Service appropriation will we reduced that much?

Mr. REID. Yes, sir.

Mr. HARRISON. It has been reduced.

Mr. RUBEY. It has been reduced in the Forest Service and put in here?

Mr. HARRISON. It might interest the committee to know that, since these estimates were prepared, the man you are now discussing has resigned from the service, and I understand that he will receive a salary of \$6,500 a year. It will be exceedingly difficult to get a man to handle our motion-picture work for \$2,520. As a matter of fact, we think it will be absolutely impossible. We hope the committee will increase the salary to at least \$3,000, so as to put it on a comparable basis with the assistants in charge of other units of the Division of Publications. The assistants in charge of exhibits and information get \$3,000 each, and we would like to have the same salary for this position. It will not go to the man who has hitherto occupied the place, because he has resigned from the service. It will not go, so far as we can now determine, to anyone in the Department of Agriculture, because we know of no employee who is particularly qualified for that work. We expect that we will have a great deal of difficulty in getting anyone, even for \$3,000. The place of chief editor, which you provided in the current appropriation act, remained vacant for more than five months, and was filled only a few weeks ago.

Mr. McLAUGHLIN of Michigan. Can not you put him on the lump-sum roll and give him \$3,000?

Mr. HARRISON. In the Division of Publications there is only one very small lump-sum roll out of which salaries could be paid, and

the whole appropriation is only \$2,500; so that the plan you suggest would hardly be possible.

Mr. McLAUGHLIN of Michigan. You would not have to keep him there very long. Transfer him to the lump-sum roll at the original salary, and put him back on the statutory roll at an increased salary.

Mr. HARRISON. It is pretty hard to get \$3,000 out of \$2,500, nevertheless.

Mr. TINCHER. Who is this man going to work for at \$6,500?

Mr. HARRISON. The Universal Film Co., I understand. I may say that the motion-picture companies pay some of their camera men as much as \$100 a week.

Mr. REID. You gentlemen will realize the logic of that request. The motion-picture industry, of course, is paying salaries away beyond anything we can touch, but we do want to get an intelligent man who will go in there and build up this work on a plane which will be creditable to the Department of Agriculture.

Mr. TINCHER. Perhaps the competition is getting so strong in the moving-picture business that we will have to go out of it.

Mr. REID. Mr. Ellis has succeeded in producing some very fine films. We have, I think, 57 complete scenarios now, besides a good deal of undeveloped film, which will run that up a good bit higher.

Mr. RUBEY. Does it not require a pretty good man to do this kind of work; does he not have to know what he is doing, be familiar with the subjects of the pictures he presents, and all that sort of thing?

Mr. REID. He does; he must know the work of the Department generally and must see the film through, from the preparation of the scenario to the distribution, for exhibition of the completed film.

Mr. RUBEY. Does he do any lecturing in connection with his pictures?

Mr. REID. No; that is done by the scientists and extension workers. All he does is to plan and make the films. When a scientist or extension man goes out, he uses the film largely to draw a crowd and to give the main idea; then he supplements the picture with a lecture giving the details, and finally, ideally, he should have bulletins there to give the printed directions, so a man, when he goes away, can do something. This is getting the results of the department work back to the people.

Mr. HARRISON. This employee, Gov. Rubey, is the man who produces the pictures. He must have vision, he must be able to visualize a picture, and he must be able to determine the best subjects to picturize. He must know the motion-picture business in all its aspects.

Mr. McLAUGHLIN of Michigan. There are a number of agencies employed in conducting the work of the department, and no one member of this committee can state what the policy of the committee is going to be about those agencies, but I will say to you that some members are going to try to keep these appropriations down. When, however, the suggested increase in each of the items comes before us with the same force behind it as to its necessity, it is a pretty hard proposition for the committee to determine the relative importance of these matters.

When an increase is suggested in one item, and it is urged upon us as absolutely necessary, and a suggested increase in the next one

is suggested with the same force, it puts us in a pretty hard position to decide relative values when we come to cut, as there is bound to be some cutting in these estimates, because altogether there is a considerable increase asked for. I do not believe the House will stand for this large increase, and some of us think it ought not to stand for it, because the Government will not have the money for it.

Mr. REID. Mr. Chairman, in connection with the Division of Publications appropriations, there is no increase. There is what you might call an apparent increase, but everything is transferred. If you will turn to page 198 you will find that the \$54,010 mentioned there is for salaries already paid to employees in the department, and corresponding reductions have been made in other places in the bill, so that there really is no increase. There are no increases in salaries. There are new positions amounting to about \$19,000, but those new positions are absolutely necessary for the proper conduct of this work, and to partially offset that increase we are dropping places to the aggregate amount of about \$4,000.

As a matter of fact, the estimates for 1921, which we are discussing, represent an actual reduction of \$33,170 below the amounts appropriated for the same work—publications, exhibits, motion pictures, etc.—for the current fiscal year. This is shown as follows:

Increases recommended.

Additional positions (net) (see p. 198)-----	\$15, 050
Labor-saving machinery and supplies-----	1, 000
Furniture and fixtures-----	280
Telephone and telegraph, freight, and express-----	150
Miscellaneous expense-----	350
	16, 830
Reduction in exhibit appropriation from \$100,000 to \$50,000-----	50, 000
Less increase listed above-----	16, 830
	33, 170
Actual reduction in estimates for 1921 below amount provided for publications, information, and exhibits work for current fiscal year-----	33, 170

Mr. McLAUGHLIN of Michigan. An appropriation is made for a certain kind of work; the money is appropriated and men are employed; that work is done and completed. There is a feeling that some of those men might be separated from the service, but, being in the classified service, they believe, and others believe with them, that they are entitled to a permanent job, and you find something for them to do—transfer them to some other place to do some work, some of which is necessary and some of which perhaps would be just as well left undone. You must find a place for a man who has been engaged in some line of work.

Mr. REID. That is not the situation in the Division of Publications. Our work does not consist of projects which seek to accomplish a specific object and then are over with. Our work is necessary as long as the Department of Agriculture has information to get before the people of the country.

Mr. McLAUGHLIN of Michigan. I know many of these men are transferred from some other roll where their work is finished.

Mr. REID. Take these writers that we have been discussing, for instance, these men who have come in from the outside: Take the case

of Mr. Dacy, who was employed for some time in the Bureau of Markets in the live-stock work, and doing considerable writing. The bureaus engaged in live-stock work wished to get out news stories, magazine articles, etc., regarding their various activities. We already had an organization in the Office of Information. The logical place for that man was in the Office of Information where, if he had any spare time, he could turn to other work than the live-stock writing but primarily cover the Bureaus of Animal Industry and Markets. It is only a question of whether he stays in the bureau or whether he comes over to the Office of Information. You can see that where we have somebody guiding those writers their time will be better occupied than in a bureau where they would be writing only a part of the time and doing some other kind of work the remainder of the time.

Mr. McLAUGHLIN of Michigan. What I had in mind was that a lot of new work is recommended by the department which commends itself to the judgment of the committee, and the work is undertaken. When that work is finished, some of us think that that ought to be the end of it and that the Government ought to do as private interests would do—let the men go and stop the expense.

Mr. REID. That is something that does not apply to the Division of Publications, as there is always need to let the people know of the advancement being made in agriculture.

Mr. McLAUGHLIN of Michigan. Other places are found for those men in some line of work that often, we feel, is not necessary.

Mr. ANDERSON. As I understand it, this proposition is to consolidate the Office of Information, the Office of Exhibits, or whatever you call it, with the Division of Publications; am I correct about that?

Mr. REID. Yes, sir.

Mr. ANDERSON. It would be natural to suppose that one purpose of such a consolidation would be to reduce the force necessary to do the same amount of work. It would be reasonable to suppose, when you get all these units under one head, that you would have less overhead connected with it, whereas apparently the result of the consolidation is an increase in the number of employees required. Is that due to any added work proposed?

Mr. REID. No, sir; that is due to the desire to increase the efficiency of the Division of Publications, which is the old unit. Possibly you know that for years the salaries in that division have not been what they should be, that we have had to put up with some help which was not young and mentally alert, but otherwise, and these positions have been statutory.

For instance, during the last year we have had a turnover of 33 per cent in the \$900 positions and 127 per cent in the \$840 positions. With a lot of positions such as that, you can not expect the work to be efficient. What we are asking for in the Division of Publications is a certain number of people who will help us to put this whole work on a more businesslike basis. The organization is big enough to be put on a businesslike basis so that we can function more properly for the public. It is a service bureau primarily; it is a division which makes contacts with the public, and if it does not function properly the whole Department of Agriculture is being wronged.

Mr. ANDERSON. If you need more salaries, that is one proposition; if you need better men, that is another proposition; if you need more men, that is still another proposition. Now, which proposition is it?

Mr. REID. We need more men and we need better men. We are asking for top positions here. We are not asking for the lower positions of \$840 and \$900. Frankly, I do not see how the people live on the \$840 and \$900 salaries, and you can see how difficult it is from the turnover which we have had in the last year. For instance, we need this key man, one executive assistant, at \$2,500, who will help to knit this organization together, who will take some of the work off of the chief of the Division of Publications.

Possibly you gentlemen do not know what a great amount of mail and how many administrative matters come over my desk. I want to get free from that to a certain extent so that I can attend to some of these larger matters in connection with the real informational work of the department. That is why we want this position. The same is true of the other 10 additional positions requested. The explanations in the Book of Estimates show how we propose to use these people to strengthen the organization at vital points so as to insure its functioning in a manner creditable to the Government.

Mr. ANDERSON. What kind of informational work?

Mr. REID. The informational work of the Department of Agriculture; giving the results of the department's investigations to the public in proper form.

Mr. TINCHER. I do not know whether I understand you or not, or whether I understand these estimates. On page 202 it says that the amount appropriated for the fiscal year ending June 30, 1920, was \$240,140, and the amount to be appropriated this year is \$362,480. As I understand you, there is not to be any increase in this appropriation.

Mr. REID. I probably did not make that clear a few minutes ago when I referred to the figures on page 198. The discrepancy is represented by the incorporation in this year's estimates of these positions in the Office of Information, Office of Exhibits, and motion-picture activities, and the transfer to the Division of Publications of the appropriation for agricultural exhibits; whereas the figure for last year covers only the old Division of Publications—a single unit. The estimates now provided for all these units under one heading, the Division of Publications. There is really no increase, a deduction having been made elsewhere in the bill in each instance. Do I make myself clear?

Mr. TINCHER. Yes; I understand your statement. I do not know just where the reductions are made, though. I do not know of any other place in the bill where you have made a deduction that you have not put in something else to take the place of the amount reduced.

Mr. REID. I can take them up page by page, if you wish. It is only a matter of going through it.

Mr. TINCHER. I do not care to take your time.

Mr. REID. A reduction has been made in each instance.

Mr. JONES. In this increased figure on page 202 there is a difference of twenty-odd thousand dollars brought about by your proposed consolidation?

Mr. REID. Exactly.

Mr. HUTCHINSON. Can you tell us where that is taken from?

Mr. REID. On page 198 you will see all of these appropriations and where they are from.

Mr. HARRISON. The total amount includes \$50,000 for exhibit work, which this year is dropped from the miscellaneous section of the bill and included under the Division of Publications. Furthermore, whenever a transfer from the lump fund to the statutory roll is made the lump fund is correspondingly reduced.

Mr. McLAUGHLIN of Michigan. In the item on page 299, for printing, binding, and so on, you will find an increase of \$125,000 instead of anything being dropped.

Mr. HARRISON. That is a different matter.

Mr. McLAUGHLIN of Michigan. That is only for the work of doing printing?

Mr. HARRISON. That is for actual printing, and the appropriation is carried in the sundry civil bill annually.

Mr. McLAUGHLIN of Michigan. I realize that there is no printing done in the Division of Publications and that the work Mr. Reid is doing is in preparation for the printer.

Mr. HARRISON. As a matter of fact, considering the exhibit work and the fact that the transfers represent only an apparent increase, there is an actual reduction in the total amount for the fiscal year 1921, as suggested in these estimates, of approximately \$33,000.

Mr. TINCHER. It may be that I have got the system sized up incorrectly, but I got it into my head that, while you say there is an actual reduction in one bureau because you have taken some of the work of that bureau and added it to another bureau, which accounts for the increase in the figures of the latter bureau, there is really no reduction in the total funds available for that work. Maybe I am wrong about it, but I think, if you will turn to the other sections of the bill, such as miscellaneous, etc., you will find that they have no actual reduction in their estimates but that the figures will be larger than they were last year, because they have taken on the work of some other bureau or added something to it, and it looks to me as though that is the way the whole thing is all the way through. There are no reductions in the sum total.

Mr. REID. I am not sufficiently familiar with all the estimates to say whether the other bureaus have taken on other activities.

Mr. HUTCHINSON. Where do they get their increase? Do they take it from another bureau and put it in here?

Mr. HARRISON. We have suggested certain increases, which are for the committee to consider. We have given the reasons for these increases.

Mr. McLAUGHLIN of Michigan. These transfers are all of the same nature?

Mr. HARRISON. They are all of the same nature, and are merely incidental to the consolidation of the publication, informational, and exhibit work.

Mr. McLAUGHLIN of Michigan. The next increase, then, is in item 23?

Mr. RUBEY. Before we get to No. 23 let me ask about item 9. I notice in paragraph 9 one superintendent of distribution, \$2,500, changed to assistant in charge of distribution, \$2,500.

Mr. REID. That is merely a change in language.

Mr. RUBEY. That is similar to item 4, above?

Mr. REID. Yes.

Mr. RUBEY. There is no change in the position; you are merely changing the man's title?

Mr. REID. Yes, sir.

Mr. RUBEY. And that is repeated in item 10; that is, the same man?

Mr. REID. The same man and the same position.

Mr. RUBEY. The same man will be continued in that position?

Mr. REID. Yes, sir; under the changed title.

Mr. HARRISON. Items 9 and 10 go together. One place is dropped and another is added. The purpose of the change in title is to make the designation of the position comparable with the designations of the other supervisory assistants, such as the assistant in charge of distribution, the assistant in charge of information, and the assistant in charge of exhibits.

Mr. REID. Item 23 provides for two new indexers and compilers, at \$1,800 each. These people are badly needed for indexing the publications of the department, etc. They are particularly needed in making comprehensive indexes of information contained in department publications. They will assist in preparing indexes for volumes of department bulletins, which work is in arrears, and in compiling cumulative indexes for the Yearbook of the department in five-year series. These additional employees are needed to place in effective operation an improved system of handling the numerous requests received by the Division of Publications. As I said a few minutes ago, we are receiving about 2,000 letters a day. Our publications are almost legion, dating back from the beginning of the Department of Agriculture, and it requires a good index, one that is workable and one that we can turn to immediately to answer intelligently this large volume of correspondence.

Mr. McLAUGHLIN of Michigan. Are you doing that work now, or work that you are going to take up the 1st of July?

Mr. REID. It is an improvement on the work that we are now doing in indexing. We are behind in indexing, and we have not a sufficient number of good people. We are not satisfied with the service we are able to give the public with our present system of handling the mail, and we are asking for these \$1,800 positions in order to place the work on a satisfactory basis. We are going to have difficulty in filling those positions at \$1,800, that is, with men who are good at indexing work, but we are willing to try it, and if we can get those people we are going to bring and keep these indexes up to date and use them more and more effectively in answering correspondence.

Mr. McLAUGHLIN of Michigan. It is not entirely new work, is it; work that you are going to take up the 1st of July?

Mr. REID. It is not entirely new, but we contemplate a sort of reorganization and making it more of a key unit in connection with correspondence. Heretofore it has been an index which we have prepared for the use of the department, the experiment stations, and anybody who wishes to ask for information regarding our publications.

Mr. McLAUGHLIN of Michigan. Are those who are doing the work of indexing and compiling employed under some other title?

Mr. REID. The indexing is now done by very much lower-salaried people, who are really not competent to do this kind of work.

Mr. PURNELL. Have you any field agents in your department?

Mr. REID. No, sir; they are employed for the most part in the States Relations Service.

Mr. McLAUGHLIN of Michigan. Are the same people who are now employed and doing the indexing to be continued after next July?

Mr. REID. Yes, sir.

Mr. McLAUGHLIN of Michigan. And they are employees who are now on the roll at lower salaries?

Mr. REID. Yes, sir.

Mr. McLAUGHLIN of Michigan. Then you are adding the new title "indexers and compilers" for the purpose of enabling you to increase the salaries of those who are now in the division doing the work?

Mr. REID. No, sir; these positions are not for promotions. We have got to have new people for this work. The people at the lower salaries, I might say, at \$1,200 and \$1,000—

Mr. McLAUGHLIN of Michigan. They are doing the work now?

Mr. REID. They are not doing the work now. That is just the point. We want to get two new people in there who can do the work and do it properly, and we will have to pay \$1,800 in order to get the right kind.

Mr. ANDERSON. What are you going to do with the two that you have?

Mr. REID. They can be occupied assisting these other people—doing a lower-grade work. You can not turn over this indexing work to a stenographer who has no qualifications of that kind or no experience. The work requires a logical mind and special training. For this work a broad knowledge of agriculture is desirable, too.

Mr. McLAUGHLIN of Michigan. Those who are doing the work now, by the time July 1 comes, will likely be as competent as the new ones you could employ, would they not?

Mr. REID. Unfortunately, they would not. They are very old people. They have been there for years. They can do so much and no more. Their work is largely confined to routine—for instance, typing the index cards, sorting, etc.

Mr. HARRISON. Mr. McLaughlin, I understand there are only two people in that section who are actually doing indexing work. They have clerks, of course, who do routine work in connection with indexing, but the men who actually index the publications and who are responsible for the work are indexers and are so called in the bill. One of the items appears on page 192, item No. 11; the second is on page 193, item 24. These employees are real indexers. The sole purpose here is to get additional assistants who are capable of working out an index, taking a publication and framing an index in such a manner that it will be intelligible and so that you can find what you are looking for.

Mr. ANDERSON. Mr. Harrison, your statement does not quite gibe with what Mr. Reid has said. He is talking about two people at \$1,800, and you are talking about one man at \$2,000 and another at \$1,400.

Mr. HARRISON. I have just stated my understanding of the situation, because it seemed to me that Mr. Reid's statement gave an erroneous impression of the matter. I think he will verify what I have just said.

Mr. REID. I was talking about item 23, two indexers and compilers at \$1,800.

Mr. HARRISON. Those are new positions that we are asking for. We intend to use them, not for promotions, but for the employment of two new people at \$1,800 each, if they can be secured at that salary. There is no thought of making any promotions.

Mr. RUBEY. You will keep employed the indexer under No. 11 at \$2,000 and the one under item 24 at \$1,400, and you will need these two new men to assist them in the work?

Mr. REID. Yes, sir.

Mr. HARRISON. Gov. Rubey, you know that we receive any number of letters of a general character, asking for all the information the department has on this subject or that subject; in fact, one letter may cover a dozen subjects. We have a central section where we keep an index of all our publications, and the indexers can turn to their records and indicate to the applicant all the material that the department has issued on the subject or subjects in which he is interested; in that way we handle the inquiry and see that the man gets everything for which he is asking. Work of this sort can not be satisfactorily done by \$840 or \$900 clerks.

Mr. McLAUGHLIN of Michigan. The next increase requested is in item 26.

Mr. REID. We are asking for a new place for an artist and designer at \$2,500. As indicated in the explanation in the Book of Estimates, considerable progress has been made in the past few years in placing the department publications, especially Farmers' Bulletins, special leaflets, posters, etc., before the people in more inviting form through the use of attractive covers, appropriately designed with regard to subject matter, well illustrated, and artistically lettered. The services of a well-qualified, experienced artist and designer are needed to handle personally the more difficult pieces of work which require creative ability, involving initiative of thought and a broad knowledge generally, including thorough training in applied art. A man with the requisite qualifications can not be secured for less than \$2,500.

Now you gentlemen handling these Farmers' Bulletins have seen them as they are issued. We will have to put the case up to you as to whether we have not improved the appearance of those bulletins and made them more useful within the last few years. The old Farmers' Bulletins were written by the scientists with very little editing, and some of them were almost impossible to read or follow. In fact, we get these impossible manuscripts now from men whose business is not to write but to engage in scientific activities and dig into one subject or another. We have tried to take these manuscripts and edit them so as to put them in the most readable form.

Let me say, in connection with the improvement in these bulletins, that whenever we make a display at a fair, whenever we get outside of Washington into the rural districts we come into competition with the various commercial agencies and their publications. They put real money into advertising their products and into making

their publications attractive. When our old-style Government documents were put alongside of the commercial exhibits, the commercial posters and publications, the people would not pay any attention to them.

You gentlemen sent out the old-style Farmers' Bulletins by the millions, but unless a person was particularly interested in the bulletin he received he never opened it. They made good material to start a fire. We are trying to get away from that in trying to make these bulletins so the person who receives them will get some benefit from the money which you have appropriated for the investigational work. In order to do that we want to dress them up a little more. We have made a start; that is what we feel it is, a start. We are asking for a man at \$2,500, but we are going to have some trouble getting a man at that salary, because in commercial concerns they pay from \$60 to \$120 a week for a good designer, a man who is capable of making covers such as we desire and of retouching with the air brush the photographs which are used in the Farmers' Bulletins. The men we have now are good, but with a capable artist to guide them and also to do the more technical and better work, we will be able to turn out Farmers' Bulletins which are much superior to those we are now issuing. Already we have printed some bulletins in colors as an experiment. We are sending one down to the Government Printing Office now. Color makes all the difference in the world; it makes them more attractive and valuable to the people receiving them. This man is absolutely essential to our going much further in the progress of illustrating our bulletins and making them more attractive.

Mr. RUBEY. I would like to verify what Mr. Reid says from my own experience. I have been here 8 or 10 years, and I know that the bulletins we used to send out when I first came here did not attract the attention that the bulletins we are sending out now do; and I think one of the greatest works that this office is doing is to get these bulletins out in the attractive form in which they are now gotten out. I think it is exceedingly important and valuable work.

Mr. HARRISON. Mr. Chairman, I would like to say that most of the work of designing covers up to date has been done by Mr. Reid himself, but with the pressure of work upon him, it is absolutely impossible for him to continue it. We need a man with considerable vision to plan and direct the work of the artists who do the cover drawing.

Mr. McLAUGHLIN of Michigan. What is the next change?

Mr. REID. The next one is item 30, I believe. We want an increase of two draftsmen or photographers at \$1,400 each. These are people who would prepare such material as the pictures used on the inside of bulletins. The photographs we get from the scientists are not such as can be used by the Government Printing Office and give us good results. Air-brush work or careful pen or brush work is required. Hence, in order to get good results from our illustrations we have to ask for two more draftsmen. The department is constantly using the section of illustrations more and more. We are several weeks behind in all phases of the work of the section of illustrations, and that is the situation throughout the year.

These draftsmen not only do work on bulletins but work on posters, which is a very important phase of our activities. There, for instance [exhibiting posters], is a poster showing the cattle rustlers of bygone days, compared with the cattle rustlers of to-day. This pictures the cattle-fever tick running off the cattle compared with the human rustlers of olden days. As a bit of advertising I want to explain to you the efficiency of this poster. Recently I was in Florida, and the Bureau of Animal Industry inspectors down there say the people think so much of that poster that they have it framed in their parlors. The man who drew this picture was only getting \$1,200. He has now left the department. I think he is getting \$1,800 or \$2,000 outside. In order to carry on that sort of work we must have two more draftsmen.

Here is another poster [indicating]: This we used during the war when we were making a drive for more boys and girls to join the sheep clubs. That was very effective. We used that all over the country where we tried to promote the production of more sheep and wool.

MR. PURNELL. Were you able to estimate the benefit derived from that drive in the increased production of sheep?

MR. REID. We have some figures on that and also on swine. They were very effective in increasing the production of pork in the country.

Here is a poster [exhibiting] on the drive for better storage of sweet potatoes. I was speaking to you awhile ago about the need for articulating all these activities. Here is an example in the drive for better storage of sweet potatoes. Two or three of the Southern States each produce about \$15,000,000 worth of sweet potatoes a year. The losses which are caused by the rot entering these potatoes when improperly stored is staggering. One of the activities that the department has entered into is trying to stop the loss through the proper erection of storage houses and the drying of these tubers before they are shipped to the north. This poster illustrates only one phase of the campaign through which we hope to stop this loss.

Here is another poster [exhibiting] illustrating our drive for improving hides. The take-off of hides by most farmers is destructive. The farmer does not know how to do it. He slashes and cuts the hide, and consequently there is a big reduction in value in the hide and the finished product.

MR. McLAUGHLIN of Michigan. You have a man or men employed in making these pictures, and they have to be printed and circulated. Can you tell us the expense involved in all the steps and stages?

MR. REID. That would be almost an impossibility. We could figure it out for any one poster or any one informational activity. We can give you the cost of printing for any one of these and the cost of distributing.

MR. McLAUGHLIN of Michigan. This is something comparatively new?

MR. REID. Within the last three or four years, yes.

MR. McLAUGHLIN of Michigan. You have a certain number of new men employed on the work and a certain additional cost involved in preparing for printing and for circulating this new kind of work

Can you not tell us how much increased expense is involved altogether?

Mr. REID. I never thought of it exactly in that way. It would be rather difficult to draw the line at where it started in the department and where it stopped.

Mr. McLAUGHLIN of Michigan. Then you have no idea as to whether this is worth the money that is called for or not?

Mr. REID. We have a very definite idea that we are getting excellent results from this sort of display work and that, as a general business proposition, it can not but help.

Mr. McLAUGHLIN of Michigan. I think your judgment is good, but can you not tell us, so that we can exercise our own judgment, if we wish, how much money is involved in this new kind of work?

Mr. REID. I can get you up a statement showing as closely as it is possible to estimate what it involves.

Mr. McLAUGHLIN of Michigan. Will you make up an estimate as close as you can as to the cost involved in this new line of work that you have undertaken?

Mr. REID. Yes, sir. I will insert that in the record.

(The statement referred to follows:)

STATEMENT CONCERNING POSTERS USED IN THE INFORMATION AND PUBLICATION WORK OF THE DEPARTMENT OF AGRICULTURE.

The preparation of posters such as those exhibited at the hearing on December 20, 1919, in connection with the estimates of the Division of Publications for the fiscal year 1921 entails the following steps:

(a) Complete information covering the subject matter of the proposed poster is furnished the Office of Information by the scientific investigators of the staff of the bureau concerned. This may cover a number of pages.

(b) One of the staff of the Office of Information who is a specialist in such work then prepares a "dummy" which embodies the ideas of both the scientist and information worker, and which meets the viewpoint of the latter as to typography or lettering, general layout, etc.

(c) The rough layout is submitted to the section of illustrations for the necessary art work.

COST OF POSTER.

The expense involved under (a) and (b) above can not be determined definitely, as these steps in the preparation of a poster represent a part of the regular duties of the personnel so employed. For instance, the idea contained in a poster may represent the result of a number of months of research and study. Perhaps bulletins, scientific circulars, etc., also have been prepared on the same subject, going into detail. The idea of the poster may have taken an hour's planning or a day's planning, or it may have taken form much more quickly.

To gauge the expense of the physical preparation of the poster of course is an easier matter. In a typical poster the services of the artist would involve from 7 to 10 days' time, usually of an employee whose annual salary is \$1,200 or \$1,400, making an approximate cost of from \$30 to \$50. This, plus the printer's and lithographer's charge, would represent a fair estimate of the cost of the average type of poster issued by the department.

For example, the poster "Dip that tick in March," which was issued in February, 1919, involved an expenditure of \$400 for 10,000 copies. The expense of distribution was small, as the poster was shipped in bulk by the lithographer to field agents of the Bureau of Animal Industry, who in turn distributed copies where they would be helpful.

VALUE OF POSTERS.

The official in charge of cattle-tick eradication of the Bureau of Animal Industry states with reference to the value of posters in tick-eradication work:

"During 1919 the posters used were 'Dip that tick in March' and 'Cattle rustlers.' The former was used principally in the eastern territory and the latter in Texas, Oklahoma, and the western area where tick-eradication efforts are being made. Thus both posters were used and each was most effective in the area mentioned. They were displayed principally in country stores, blacksmith shops, railroad depots, post offices, and other places where they were protected from the weather. Bureau employees engaged in tick eradication work were instructed to put the posters up themselves, thus preventing wastage and likewise furnishing a topic for an impromptu talk on tick-eradication at the time the posters were displayed.

"The posters have been valuable principally for the following reasons: They were an effective means of reaching persons who do not read or can not read. Reaching a few of the leading people is not sufficient, since tick-eradication must be supported by the owner of a few cattle as well as by those having large herds.

"Even illiterate live-stock owners are influenced by the pictures shown in the posters to spell out the few words or have someone spell the posters to them. In many cases the interest aroused results in attending meetings or in obtaining information on tick-eradication that later develops into a favorable attitude toward the work.

"It is difficult to state in exact terms just what part posters have played in tick-eradication work, but the excellent results of 1919 efforts are attributed by employees in tick-eradication work to have been possible because the posters in large degree prepared the way for dipping and related field activities. Display of posters has also encouraged persons who formerly would not read bulletins on tick-eradication to write to the department for literature giving more details than the poster contained. Briefly, the two posters mentioned have been of great assistance and value in hastening eradication of cattle-fever ticks."

"Join a sheep club"; 50,000 copies of this poster, costing \$1,075, were issued October 31, 1918. Distribution was made through the department's extension forces engaged in club work. One of the extension specialists reports that through the interest aroused last year—to a large degree through the poster—the enrollment in the sheep clubs was increased from 1,263 in 1918 to 2,253 in 1919. When it is realized that each club member is required to secure four or more bred ewes, it will give some idea as to the increase of sheep as a result of this work.

To quote further from his report:

"I feel that the sheep club poster was quite an asset in fostering this particular piece of work, particularly as it was a very attractive poster, and one that would appeal to boys.

"Of course, I have mentioned only the influence that this has had on club members. No doubt, as this was placed in post offices and other public places, it likewise had influence on adults. I feel that this poster was well worth while, and I only regret that we could not get one of like nature for use this year."

These posters may be considered typical of all that have been issued by the department. The cost to the department of distributing posters is negligible. In most cases the posters are sent in bulk to county agents or to other field agents for distribution. Miscellaneous requests are handled by the regular mailing force of the Division of Publications without appreciable increase in the work.

The Department of Agriculture for many years has used placards or posters of a conservative type in connection with its projects. These have been made more attractive, more popular in style, and greater in number during the past few years. However, the expansion does not represent any new project or work, no new force of employees has been engaged for this class of work, and the posters have been prepared and distributed with the regular force. This has been accomplished by improved management of the resources at hand and by eliminating what have been considered to be less effective means of publicity.

(Thereupon, at 12.45 p. m., the committee took a recess until 2 o'clock p. m.)

AFTER RECESS.

The committee met at 2 o'clock p. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. The committee will come to order. You may proceed, Mr. Reid.

DIVISION OF PUBLICATIONS—Continued.

STATEMENT OF MR. EDWY B. REID, CHIEF OF THE DIVISION OF PUBLICATIONS, DEPARTMENT OF AGRICULTURE—Continued.

Mr. ANDERSON. Before you go on with item 45 I want to talk to you about item 36, one laboratory aid at \$840, in lieu of one clerk, \$840. Is that a film man?

Mr. REID. No; he is not much of a film man. He is an embryo; he is just getting into the work, and helps around the laboratory.

Mr. ANDERSON. He works in the exhibit end of it; he is a sort of apprentice?

Mr. REID. Yes, sir; that is all.

The CHAIRMAN. I wish to call your attention to several of these items—items 45 and 46, five assistant clerks.

Mr. REID. We propose to drop several of these \$840 places. We can not afford to drop many of them, because we can not ask for a lot of new places. For instance, we are asking for 2 clerks at \$1,600 and 3 clerks at \$1,400. These are new places, but, in lieu of those places, we are expected to drop 5 places at \$840. That means that there will be a net increase of \$3,200 in the roll.

The CHAIRMAN. You jump from \$840 to what?

Mr. REID. We drop five \$840 places, and we are asking for two additional clerks at \$1,600 and three additional clerks at \$1,400.

The need for these additional employees is urgent, and a brief explanation of why we need them is found in the Book of Estimates under items 45 and 46. I hope the committee will give favorable consideration to the recommendation for these new places. None of them are for the purpose of promoting employees now in the division. Our sole purpose is to secure additional help of a higher grade than we have at present, to occupy relatively important assignments. Due to the extremely low salaries obtaining in the Division of Publications, the standard of the clerical personnel has not kept pace with the standard maintained in other branches of the service where it has been possible to pay the salary required under changing conditions for efficient clerks. This has handicapped the Division of Publications in many ways, and the situation necessarily reflects itself in the quality and quantity of work which we turn out. Other bureaus of the department have at least a fair proportion of positions in the higher grades on their statutory rolls—\$1,400, \$1,600, \$1,800 per annum, etc.—and these positions are used for the employment of the clerks who occupy the supervisory and more responsible clerical positions. Thus some of the bureaus have a skeleton organization which, through these key men, is able to maintain the work in a satisfactory manner without being so seriously affected by the turnover in the low grades and the predominance of employees of

mediocre efficiency in the routine positions. In the Division of Publications, however, the statutory roll does not adequately provide for the employment of such clerks. For instance, we have only one position at \$1,600 and only two at \$1,400. One of the additional \$1,600 positions recommended is needed in order that an appointment may be made of an executive clerk to take charge of the mails and files of the division. At present the files are maintained in each section throughout the organization, and the mailing work also is handled as an individual matter. This creates considerable confusion and makes adequate supervision and control of the work very difficult.

It is proposed to establish a central mail and file room to do all the mailing and filing of correspondence. This section probably will be composed of six or eight employees, since the files for the Offices of Exhibits, Information, and Motion Pictures will be included. We have sufficient clerks to handle the routine part of the work, but a thoroughly competent executive clerk is needed to install the new system and direct its operation. This plan is being used with considerable success in some of the other bureaus, where the clerks in charge of such sections are receiving salaries of \$1,800, \$1,980, etc. The second \$1,600 position is needed in order to secure a capable clerk who will have sufficient ability to supervise and assist in the preparation of special fiscal and administrative statements, assist in the preparation of estimates, visé outgoing correspondence, and act as a general assistant in handling special tasks which arise constantly in the administration of the work and which frequently can not be handled in a satisfactory manner at present because of the lack of such a qualified employee. As explained previously, the ability of our organization to do work of this kind is greatly impaired. The lack of sufficient employees of a high grade is making it extremely difficult to place the work of the division on an absolutely efficient basis. A clerk of considerable intelligence would be required for this particular work. The employee would have to be above the average. Clerks doing this kind of work in other bureaus are paid salaries of \$1,600 and higher, and we could not hope to secure a qualified man for less.

Item 46 recommends three new positions at \$1,400. As indicated in the note explaining this item in the Book of Estimates, it is proposed to utilize these three positions for obtaining additional stenographers. The very difficult situation we are in concerning the employment of stenographers is explained in the note under this item in the Book of Estimates. This situation has had the effect of seriously handicapping the work of the Division of Publications.

We are seriously in need of stenographers at this time and could obtain them if we had the positions available for their employment, such as the \$1,400 positions recommended for 1921. We have a tremendous volume of mail to handle in the Division of Publications, and while the replies have been reduced to printed circulars, cards, etc., just as far as practicable, there still remains more than can be handled properly with the present force of stenographers and typists. The low degree of efficiency of some of the stenographers we have had to employ at salaries of \$840 and \$900 per annum, the present entrance salaries in this division, is such that there is no doubt

that it would be economical to employ capable stenographers at more nearly the present salary standard. Naturally, the stenographers we are able to secure at these salaries are of very limited general education and usually are without experience; frequently we have to take them before they have completed their studies at night school. These five positions recommended, the two at \$1,600 and the three at \$1,400, will mean a great deal to us in our work in the Division of Publications, and I hope the committee will give them favorable consideration. As mentioned previously, the five positions will represent a net increase of only \$3,200, as, if they are granted, the estimates propose that five \$840 places be dropped. This would be done toward the end of the current fiscal year by letting the positions stay unfilled as vacancies occur through the expiration of temporary appointments, etc. No permanent employees would be dropped from the rolls.

The CHAIRMAN. Does that mean you are going to increase the salaries from \$840 to \$1,600?

Mr. REID. No, sir; they are not for promotions. They will be new places and new people, and these \$840 people will be dropped off the roll approximately as fast as they resign or temporary appointments expire. The turnover during the year in the \$900 roll has been 33 per cent and in the \$840 class 127 per cent.

The CHAIRMAN. Going through the list hurriedly I find there are 129 people at \$1,000 or less salary. That seems entirely out of line with everything else in the estimates. I would like to know why there are so many low-salaried people in this division.

Mr. REID. The character of some of the work of the Division of Publications is different from that in the bureaus where a large amount of scientific work is done.

The CHAIRMAN. I understand that a number do clerical work, while some are stenographers and typewriters.

Mr. REID. Yes, sir; there are all types of workers.

The CHAIRMAN. All have taken an examination and are under the classified service?

Mr. REID. Yes, sir.

The CHAIRMAN. Can you explain why they should be paid so much less than others?

Mr. REID. To go back through a number of years, the Division of Publications apparently has not asked for or been allowed increases at the same rate as the other bureaus.

The CHAIRMAN. I remember that Mr. Arnold made a very urgent appeal to the committee at one time for increases. We did allow a number of increases, but apparently this division has not been given the same consideration that others have.

Mr. REID. No; it has not.

The CHAIRMAN. You have a number of employees doing an easy class of clerical service?

Mr. REID. Yes, sir.

The CHAIRMAN. What do you pay the people, for instance, who handle the publications that are sent out under Members' franks?

Mr. REID. They are in the \$840, \$900, and \$1,000 grades. It is a routine matter. We can pick up people of that kind to do that sort of work, although, of course, the Government should not be pay-

ing any salaries that low because people can not live on them. You will not find commercial establishments, which require that grade of service, paying as low salaries, but we are depending upon the Reclassification Commission to improve the situation. We are now asking you only for a few new places that will be more or less key positions in the organization. They will be used to strengthen the present force and will be more or less supervisory over these lower-salaried places. It was our understanding that no increases were to be included in the estimates.

The CHAIRMAN. But, Mr. Reid, if it is proper to give relief to a number of them, we should give relief all along the line, not by piecemeal. We should reclassify and readjust the salaries.

Mr. REID. We are waiting upon the Reclassification Commission to accomplish that result.

The CHAIRMAN. The committee took this matter in hand once before. I think it can do it again. If the committee finds that there is discrimination against these employees or that inadequate salaries are being paid them, it is the duty of Congress to adjust the salaries. It is your duty to bring the matter to our attention, and we will be very glad to give it consideration.

Mr. RUBEY. Are you compelled to get permission from the Civil Service Commission to employ people temporarily? Do they fill these places permanently?

Mr. REID. It has been so difficult to fill some of these low-salaried positions that the Civil Service Commission at times has not been able to make certifications to us. Ordinarily the positions are filled through Civil Service appointment.

The CHAIRMAN. What would you suggest, taking as a whole, as a fair increase?

Mr. REID. I should think that none of them should be asked to work for less than \$1,100, or \$1,200.

The CHAIRMAN. Some are receiving less than \$1,000?

Mr. REID. Yes, sir.

Mr. ANDERSON. They all get the bonus and have been getting it?

Mr. REID. Yes; practically all of them.

The CHAIRMAN. If the committee should increase them, say, from \$100 to \$200, would that give relief?

Mr. REID. It certainly would. It would give material relief and would help them to get along.

The CHAIRMAN. Would that be fair to the others?

Mr. REID. In the other departments, for the character of the work, I think it would.

The CHAIRMAN. Of course, low salaries are also paid in other divisions and bureaus.

Mr. REID. I want to state here that the reason I have not said anything about the low salaries in the Division of Publications is that we are waiting upon the Reclassification Commission. Unless something results from that commission's recommendations, there will not be much of a Division of Publications in a year from now. Many people are leaving their positions because they can not afford to work for the low statutory salaries paid in the division.

The CHAIRMAN. Give us the turnover, please.

Mr. REID. There has been a turnover of 33 per cent for the \$900 positions and 127 per cent for the \$840 during the last fiscal year.

These are in the clerical grades. The turnover is even greater in the laborer grades. We can hardly do business under these conditions. We hire persons and about as soon as they are trained they go elsewhere to get better positions.

The CHAIRMAN. You spoke about bulletins sent out by Members of Congress. That is done in the Government Printing Office, is it not?

Mr. REID. The requisitions are made and the records are all kept in the Division of Publications. They are sent out mainly from the Government Printing Office.

The CHAIRMAN. That is, the Government Printing Office simply attaches the frank to the envelope?

Mr. REID. Yes, sir.

The CHAIRMAN. Is that done in your office?

Mr. REID. No; that is done in the Government Printing Office.

The CHAIRMAN. The recording is done in your division?

Mr. REID. In the division it is a matter of record and keeping the books and work of that kind.

The CHAIRMAN. Then it is bookkeeping the same as in other bureaus?

Mr. REID. One part of the division's activities is largely bookkeeping. There is the counting of millions of franks and checking up of quotas. Quite aside from this is the answering intelligently of a vast amount of miscellaneous mail. We are receiving about 2,000 letters every day.

The CHAIRMAN. It requires as much skill as is required in the average bureau?

Mr. REID. It certainly does. The designating of the publications to be sent these correspondents we regard as very important work.

The CHAIRMAN. What else do they do?

Mr. REID. We have a mail of more than 2,000 letters daily. It consists partly of direct requisitions upon the department for publications and partly of letters stating in general terms what is wanted. If the request is specific, for Bulletin No. 1001, for instance, the clerk writes the name on a frank and it is forwarded to the Superintendent of Documents for filling; but if the request is general, calling for information on various subjects or for bulletins of which we have no supply, that requires another type of reply and a higher grade of clerical ability. Much of this work is occasioned by the many miscellaneous requests received from constituents of Congressmen. That is why we are asking for these higher-grade positions, primarily to help improve that service.

The CHAIRMAN. You say they require a reply. Are the replies dictated?

Mr. REID. Form letters are used wherever possible, but of course there are many letters requiring special study and knowledge of our publications and those letters are dictated.

Mr. RUBEN. How many clerks does it take to handle the congressional distribution?

Mr. REID. There are about 50 employees in the section for handling the mail and other matters of distribution. I have not the details here as to how many of these handle the congressional mail, but there are quite a number.

Mr. RUBEY. It is a considerable number?

Mr. REID. Yes, sir; because Congress distributes about 5,500,000 bulletins every year, and the requests come in for anything from one bulletin up to a sack full.

Mr. RUBEY. Who fixes the allotments that go to each Congressman?

Mr. REID. There is an appropriation of \$200,000 for Farmers' Bulletins. We figure out how many bulletins we can print for that amount. There are about 500 Senators and Representatives; it is simply a matter of estimating how many we can give each Congressman. The wording of the law is to the effect that not to exceed four-fifths of the entire supply may be distributed by Congress. That amounts to 20,000 bulletins for each Congressman this year. The cost of printing and other matters in connection with it have gone up in price, and we have had to cut the allotment from 25,000 to 20,000 this year.

Mr. RUBEY. I was just reading here from your report that a distribution of something like 9,000,000 was set aside for congressional distribution. Is that true?

Mr. REID. The law says that four-fifths of the total amount may be distributed by Congress. We will give you up to that limit; but if you don't ask us for them, we take it for granted that you are willing for them to be distributed by the department.

Mr. RUBEY. Here is one point. Some Members use these and others do not. What becomes of those that are not used by some Members?

Mr. REID. In the past the policy has been to let this credit accrue to the Congressman from year to year; so we have a book credit running up to large figures. Because of an unwritten agreement between the department and Members of Congress that we would honor beyond the regular quota, provided we had them in hand, we did not feel that it was fair to cut them off short this year. We wrote each Member of Congress telling them we would try to honor requests beyond the 20,000 copies if we had them on hand. Next year we are planning to tell you that, because the appropriations are made for the printing and distribution of bulletins during a given year, we can not carry them over into a succeeding year. We can not reservoir them.

Mr. RUBEY. The point I want to get at is this: In my own case I have a purely agricultural district. The largest city in my district has about 3,000 inhabitants. I have a great demand for bulletins, and the amount set aside for me to use will not meet my demands at all. That is the reason I brought this matter up. In the State of Missouri we have what is called a board that gets out a course of study for the rural schools.

Mr. REID. Yes.

Mr. RUBEY. In that course of study they set forth the teaching of agriculture, and they put into that report certain Government bulletins, which they advise these teachers to get for the teaching of agriculture in their schools. I have a thousand teachers in my district. It is necessary, in order to give them a copy of each one of these bulletins, to send in the neighborhood of 20,000 bulletins. When I distribute bulletins to the teachers in my district for the teaching of agriculture—and I think that is the best distribution a man can make of them—I take on my entire quota right there. It occurred to me—

and I tried last year to get the department to see it that way—that a distribution of that kind along educational lines ought to be made by the department and that it ought not to be charged up against the Member of Congress. I am in a position now where I am begging for bulletins from somebody. I get letters every day from the school children in my district. They study a certain subject in agriculture and they want a bulletin upon that subject, and I am besieged by the young folk in my district. I want to accommodate them. I feel it is the best possible kind of distribution to make of these publications. I was just wondering whether there is any way of meeting that sort of situation. Here is a man who does not use his bulletins. After this year is over these bulletins will be out of print. Of course, if his quota goes on next year he could get the next year's bulletins, but it seems that some of us fellows who are using these bulletins to great advantage ought not to be shut off when there are a lot of others who do not use them at all and they are simply lying about unused.

The CHAIRMAN. Is it not a fact that there are more calls for the bulletins of early print than the later ones? Do not the neighbors become interested and ask for them, so that it is necessary to have them reprinted?

Mr. REID. Yes, sir. The bulletins are reprinted as long as they are up to date. They are revised periodically.

Mr. RUBEY. I am frank to say that the bulletins you are getting out, with the illustrations and pictures, are very attractive. They go into the community; they are seen and wanted, and that increases your efficiency in getting out excellent bulletins and, of course, increases our demand for them.

The CHAIRMAN. Is there some way of supplying these teachers?

Mr. REID. We are in a worse dilemma than you are. We are supposed to distribute about one-fifth of these bulletins. You can imagine the demands on the department when we get 2,000 letters a day and how many requests we have to turn down. We have to refer applicants to the superintendent of documents, from whom they can buy these publications.

The CHAIRMAN. And you refer them to Members of Congress?

Mr. REID. Yes.

The CHAIRMAN. We are all glad to have you refer them to us, but the question is, How can they be fully supplied?

Mr. REID. There are certain Congressmen who have city constituencies, who are not so familiar with the bulletins. These Congressmen do not care to distribute them to so great an extent as Members from the rural districts. There is considerable trading of bulletins or credit for bulletins among Members, and I do not see why that is not the best solution of the situation. You may be able to get more bulletins from some of the Representatives or Senators who do not use them. The Senators do not use them in such great numbers as the Representatives.

The CHAIRMAN. That reduces it to a begging or buying proposition. Members expend considerable money for the purchase of documents in addition to the cost of sending them out.

Mr. REID. That is a bad situation.

Mr. HARRISON. The new printing bill, which has been under consideration for the past 15 years, provides for distribution of publications on the value basis.

The CHAIRMAN. Item 33, one assistant photographer, \$900. Is that a fair salary?

Mr. REID. No, sir; that is \$300 below what it should be, if you want my candid opinion as to what this salary ought to be.

The CHAIRMAN. You say \$300. On what do you base that estimate?

Mr. REID. By comparing it with salaries of assistant photographers in other bureaus of the department.

The CHAIRMAN. How is the pay outside the department?

Mr. REID. This man happens to be in the motion-picture laboratory, and therefore he would command more than the ordinary aid. A man doing that character of work in a motion-picture laboratory would get fully \$300 more than this man.

The CHAIRMAN. How about the next one, item 34, one lantern-slide colorist, \$840?

Mr. REID. That case is the worst discrimination and worst injustice in the Division of Publications. I would like to point out that this lantern-slide colorist ought to be getting from \$1,200 to \$1,500 in order to bring her pay up to the scale for similar services in other departments. She is one of the best lantern-slide colorists in the department.

The CHAIRMAN. How much would she get outside of the department?

Mr. REID. From \$1,500 to \$1,800.

The CHAIRMAN. How about the item 35, one laboratory aid, \$900?

Mr. REID. This laboratory aid is a motion-picture man and is worth about \$300 more than he is now getting. A laboratory aid of his type in a commercial concern would get fully that and more.

The CHAIRMAN. Item 36 is also a laboratory aid; the salary in this case is \$840. What ought he to be getting?

Mr. REID. That work is about the same character as the aid at \$900 is performing. The position ought to pay \$300 more than the amount now provided.

The CHAIRMAN. Item 37 is also a laboratory aid; salary, \$720.

Mr. REID. That is about on the same order.

Mr. HARRISON. We had to increase the amount by \$450 in order to correct a typographical error which crept into the bill last year; the printer got the figures reversed, and instead of having a position at \$720, we got one at \$270.

The CHAIRMAN. I remember that it was not corrected.

Item 38, one assistant in charge of document section, \$2,000, changed to one assistant in distribution, \$2,000. That is tied up with item 20?

Mr. REID. That is just a change of designation.

The CHAIRMAN. Item 48, 18 clerks at \$1,000. What is the character of their work, and is the salary equitable?

Mr. REID. I will let Mr. Jump, the chief clerk, answer that.

The CHAIRMAN. We will be glad to hear Mr. Jump.

**STATEMENT OF MR. WILLIAM A. JUMP, CHIEF CLERK OF THE
DIVISION OF PUBLICATIONS, DEPARTMENT OF AGRICULTURE.**

Mr. JUMP. These employees at \$1,000 are distributed over the various sections. I think it is safe to say that practically every one of them performs work for which salaries of at least \$1,200 are paid in other bureaus of the department and in other departments of the Government. It just happens that they are there at \$1,000 because the Division of Publications has been bound by its statutory roll and has not been able to pay the present salary standard, which is usually \$1,200.

The CHAIRMAN. They get \$1,000 and the \$240 bonus, or \$1,240?

Mr. JUMP. I am speaking of the basic salary. I would say that their work compares with clerks at \$1,200, with the bonus of \$240, in other branches.

The CHAIRMAN. What is the character of the work?

Mr. JUMP. Some are stenographers, some are general clerks, some occupy positions which I consider are much higher grade than their salaries indicate. For instance, they handle the correspondence, of which you have already heard—miscellaneous correspondence, where a farmer writes in and wants all that we have on a particular subject.

The CHAIRMAN. Should they all be paid the same salary increase?

Mr. JUMP. In order to answer that intelligently, it would be necessary to give consideration to each place separately. We would be glad to submit a statement later showing the relative value of the positions. I would not say that they should all receive the same because they are scattered over nine different units in the division and performing varying grades of work.

The CHAIRMAN. Would you make it \$1,160 and \$1,200 in different places?

Mr. JUMP. For those who do stenographic work I do not believe the salary should be less than \$1,200; others performing a good grade of clerical work should receive \$1,100 as a basic salary, while those doing the more difficult tasks might be worth \$1,400. There are some there who belong in the \$1,000 grade.

The CHAIRMAN. How do you figure the 40 clerks at \$900, item 49?

Mr. JUMP. The same thing is true there. These clerks are scattered over these nine units. Perhaps seven of them are engaged in routine work, in what we call our index section. I would say \$1,100 would be a fair minimum salary for them to place them on the basis paid in other bureaus for similar service. Four of these people, as I recall, are stenographers assigned to the stenographic section; we have had to pick them up wherever we could get them, because the Civil Service Commission could not supply them at this low salary from their registers. Those stenographers are just as much entitled to receive \$1,200 per annum as stenographers anywhere else, and I believe a basic salary of \$1,200 would be fair. The remainder, about 30, do all kinds of work, such as that connected with the automatic-addressing machinery, miscellaneous correspondence, and so on. Certainly none should get under \$1,100 a year, and \$1,200 would be, I think, a fair figure.

The CHAIRMAN. You are comparing these salaries with those paid in other departments or other bureaus of your department?

Mr. JUMP. Yes, sir. We should pay them on a basis comparable with the rest of the department. I was connected with the Bureau of Animal Industry for about 10 years and the Bureau of Markets for two years, and I am basing my opinion on my observation of salaries paid in the other bureaus.

The CHAIRMAN. How about other departments?

Mr. JUMP. I would not undertake to say as to that.

Mr. HARRISON. Usually the minimum in the Government service for newly appointed clerks and stenographers is \$1,200; practically all new appointments are made at that figure.

The CHAIRMAN. The next item, No. 50, is for 15 clerks, at \$840. Is the character of that work about the same?

Mr. JUMP. In that grade we have three stenographers who should receive a minimum of \$1,200. The rest of these clerks certainly should go to \$1,000 if the committee adopts the basis of adjustment suggested in the cases already discussed.

The CHAIRMAN. You assign them to various sections of the divisions, do you not?

Mr. JUMP. We have nine sections of work, and these clerks are assigned to certain sections and reassigned from time to time, according to the needs of the work, so that it is impossible to give offhand a specific description of the duties in each case. We should be glad to submit a detailed statement showing the duties attaching to each position.

The CHAIRMAN. How about two skilled laborers at \$900, item 53?

Mr. JUMP. This is supplanted by item 57, which carries three places. One of these is a man assigned to duty as a machine operator; he is a very skilled machine operator and does the same character of work as the five machine operators at \$1,200, under item 51.

The CHAIRMAN. In your opinion, the salary of these skilled laborers should be \$1,200?

Mr. JUMP. Yes, sir. It just happens these three men have been in the service all along. The other two work with the cuts in the illustration section.

The CHAIRMAN. How about the seven skilled laborers at \$840, item 54?

Mr. JUMP. For these seven at \$840 a minimum of at least \$1,000 would be necessary in order to do justice to them.

The CHAIRMAN. How about the next, item 55, four skilled laborers at \$780?

Mr. JUMP. Of the four skilled laborers at \$780, three certainly should be given \$1,000. The fourth one is a chauffeur, and to put him on a par with other chauffeurs his salary certainly should be made \$900.

Mr. HARRISON. \$1,080 is the usual salary for chauffeurs.

The CHAIRMAN. How about the three messengers or laborers at \$900, in item 57?

Mr. JUMP. That is the item we have just discussed; they do the same work as \$1,200 people; \$1,200 would be a fair salary for them.

The CHAIRMAN. In item 58 you have 10 messengers or laborers at \$840.

Mr. JUMP. Four of those people are machine operators and are in the same class, as far as their work is concerned, with the \$1,200

people. The remaining six certainly should be given a minimum of \$1,000, because they are mature people and perform work that could not be done by immature people.

The CHAIRMAN. Item 59, four messengers or laborers at \$780.

Mr. JUMP. That was discussed under item 55.

The CHAIRMAN. Item 60, 14 messengers or laborers at \$720.

Mr. JUMP. \$900 should be a fair salary for these \$720 people. They are assigned various kinds of duties, ranging from those of an ordinary laborer to those of machine operators.

The CHAIRMAN. Item 61, on page 197, one skilled laborer at \$720.

Mr. JUMP. That is combined with item 60.

The CHAIRMAN. Item 62, three messengers or laborers at \$600 each.

Mr. JUMP. These men are doing the usual work of laborers; they should be paid \$900 a year in order to do them justice. They work hard.

The CHAIRMAN. Item 71, two messenger boys at \$420. That is the regular rate?

Mr. JUMP. Those two positions are vacant; we are unable to get boys to accept the positions at that salary. The same is true of item 72, two messenger boys at \$360 each. We are deprived of the services of four messenger boys, that we need, because of the low salary.

The CHAIRMAN. What should they be?

Mr. JUMP. It is practically impossible to get messenger boys at less than \$60 a month. We have seven, under item 68, at that salary now. We have to pay that rate in order to obtain them. Boys are getting more on the outside.

The CHAIRMAN. Item 70, four messenger boys at \$480.

Mr. JUMP. Two of the boys we now have have been in the service for two years or more. If it is necessary for us to pay \$60 to get new boys it would be an injustice to pay only \$480 to the boys we now have. They should get \$720.

The CHAIRMAN. Item 69, four messenger boys at \$600.

Mr. JUMP. The same is true of them. It just happens that we have those boys and they are staying with us.

Mr. RUBEY. How in the world are you able to keep them?

Mr. JUMP. It is difficult to keep them, and there is a great turnover in the messenger force, as they are constantly getting better opportunities.

Mr. HARRISON. That is true throughout the department.

The CHAIRMAN. Item 68, seven messenger boys at \$720.

Mr. JUMP. Sixty dollars a month seems to me to be a fair salary. We would have no trouble in filling the positions at that salary.

The CHAIRMAN. Item 63, one folder at \$1,000. Is that all right?

Mr. JUMP. That position presents a peculiar situation. The employee who occupies that position is assigned to clerical duties that should pay \$1,200. The place should be designated as clerk. The present title is not descriptive; it was originally given to an employee working on mail.

The CHAIRMAN. How about item 64, two folders at \$900?

Mr. JUMP. One of those folders is a machine operator and should receive the same salary, \$1,200, that we are paying to the five machine operators under item 51. The other has charge of our janitor

force. It just happens that they are old employees. I don't know how they live on their small salaries.

The CHAIRMAN. Item 66, six skilled laborers at \$1,000.

Mr. JUMP. Five of these employees are machine operators; the remaining one is doing a grade of work that is really supervisory. They should all receive \$1,200; that is the lowest salary at which we can get new, capable machine operators.

The CHAIRMAN. You are basing your estimates on the salaries paid by other divisions and bureaus?

Mr. JUMP. Yes, sir.

Mr. VOIGHT. How about these three charwomen at \$480 each, under item 75 at the bottom of page 197?

Mr. JUMP. That is the usual classification. The Reclassification Commission probably will have something to do about that.

There are also four charwomen at \$240 each, item 76. These charwomen usually have other positions or work outside. They come in and work in the morning, cleaning the offices.

The CHAIRMAN. How about your employees in charge of the various sections,

Mr. JUMP. They have various titles. I presume Mr. Reid will wish to present these.

The CHAIRMAN. Thank you, Mr. Jump. You might take them up section by section, Mr. Reid.

Mr. REID. Item 3, on page 192, is the first one. That is at the beginning of the statutory roll. This place of chief editor at \$3,000 was vacant for about five months before we could find a man to fill it at that figure. That position is worth at least \$3,500 a year in the Government, because people of the proper caliber, who are able to edit agricultural papers or who know the agricultural business of the country, know farming, are graduates of agricultural colleges, and have been brought up through newspaper, magazine, or other publication work, are commanding all the way from \$4,000 to \$7,500 on the outside.

The CHAIRMAN. I take it that we would hardly be justified in taking up these salaries of \$2,000 and over except upon direct recommendation. With the others in charge of sections, however, where the salary is less than \$1,500, we might take them up.

Mr. REID. There is one indexer at \$1,400, item No. 24, page 193. Then there are two draftsmen or photographers, at \$1,600 each, item 28, page 193. Those two men are worth \$2,000 apiece. They are key men and very good.

The CHAIRMAN. Who are they?

Mr. REID. One is Dr. Olmsted and the other is Mr. Stevenson. One has charge of drafting work and poster work. The other is chief photographer of the division.

The CHAIRMAN. Is Mr. Crandall with you?

Mr. REID. He is not in our division.

The CHAIRMAN. If we increase the salaries of the employees under them, I take it that the heads of sections should be given some consideration also.

Mr. REID. Item No. 41, page 194, one assistant, \$1,800. That is Mr. Bracey, assistant in charge of the document section. He has 50 people under him. He is one of the hardest working men in the division, and that place is worth fully \$2,000, if not \$2,200. We

have in mind, possibly, giving Mr. Bracey charge of other work, in addition to his present duties.

The CHAIRMAN. Item 43, page 195, one foreman, miscellaneous distribution, \$1,500. What about him?

Mr. JUMP. That is a position that should pay a higher salary, eventually, when we proceed with a plan for further consolidating the addressing and mailing work of the department.

The CHAIRMAN. What is the next one?

Mr. JUMP. The section heads receive salaries ranging from \$1,800 up, and, unless you want to consider salaries in those grades, it would be difficult for us to suggest. We could submit a statement—

The CHAIRMAN. What I had in mind is that, if we increase the salaries of these lower places first and you have others in supervisory positions receiving low salaries, probably the persons in charge of the various sections should be given consideration in connection with the others. Have you any heads of sections at \$1,200 or \$1,500?

Mr. JUMP. We have one, Mrs. Thorn, who is listed as assistant at \$1,400; she has about 16 employees under her supervision. She is a very efficient worker and has been very successful in supervising the work of the clerks engaged on our mailing-list record.

The CHAIRMAN. Where does her position appear here?

Mr. JUMP. In item 22. She is one of the two assistants at \$1,400.

The CHAIRMAN. I take it that, if you increase the salary of all the clerks in a certain division, the chief would feel slighted unless some consideration were given to his position.

Mr. JUMP. As a matter of fact, several of the subsection heads or unit supervisors—those who occupy the positions requiring the supervision of the work of other employees—are included in the \$900 and \$1,000 grade; and that should be taken care of if the committee wishes to consider adjusting the salaries in these grades.

The CHAIRMAN. Then it would be necessary to make a graduated scale to take care of them?

Mr. JUMP. There possibly would be 10 positions in the grades \$840, \$900, and \$1,000 that should be selected for special consideration, and, since we did not know that the committee would consider anything in the way of salary increases, we are not prepared to discuss the matter in detail; but we would like the privilege of submitting a statement.

The CHAIRMAN. Will you submit a list?

Mr. JUMP. Yes. We could give it much more intelligent consideration in that way.

Mr. HARRISON. That can be inserted in the record.

(The statement referred to follows.)

PROPOSED READJUSTMENT OF LOW-SCALE SALARIES IN THE DIVISION OF PUBLICATIONS.

The following statement is submitted by the chief of the Division of Publications concerning certain positions in and below the \$1,200 grade, the salaries of which, it is understood, the committee desires to consider at this time with a view to place them on an equal basis with similar positions in other branches of the service.

The statement shows (1) the present salary of the positions involved, (2) the salaries which it is considered would meet the object in view, and (3) the duties of the respective positions.

There are a number of positions in the Division of Publications in the grades above \$1,200 per annum, the salaries of which should be adjusted, but mention of these has been omitted as it is understood the committee desires to consider only the lower grades at this time.

The data submitted have no bearing on the 11 additional positions requested for the Division of Publications summarized on page 198 of the Book of Estimates. These additional employees are deemed necessary to the efficient operation of the publication work for the next fiscal year.

		Increase.
Item 32:		
Present, 10 draftsmen or photographers, at \$1,200-----	\$12,000	
Proposed, 10 draftsmen or photographers, at \$1,400-----	14,000	
	-----	\$2,000

Four of these employees, at \$1,200 are illustrators and designers, and the remaining 6 are photographers. These employees are engaged in skilled work, as their occupation implies, in connection with the publications of the department. Their work is of a grade much higher than the salary indicates, as shown by the bulletin cover designs, posters, etc., issued by the department. Extensive education, training, and experience is required and it is believed \$1,400 per annum should be a minimum for this class of employee.

Item 33:		
Present, 1 assistant photographer-----	\$900	
Proposed, 1 assistant photographer-----	1,140	
	-----	240

The employee assigned to this position is engaged in work in the motion-picture laboratory in connection with the making of film. The duties of the position require a knowledge of the technique of the motion-picture work and it is believed the position warrants a salary of \$1,200 per annum.

Item 34:		
Present, 1 lantern-slide colorist-----	\$840	
Proposed, 1 lantern-slide colorist-----	1,200	
	-----	360

This employee is engaged not only as a lantern-slide colorist, as the title implies, but in addition is called upon from time to time to do the original work of an artist, in which she is skilled. Transparencies prepared by this employee have been one of the most attractive features at the department exhibits. The work is of a highly skilled character, and the salary paid at present, \$840 per annum, is considerably below a fair compensation. It is believed the position warrants a salary of at least \$1,200 per annum, based upon the work performed and the salaries paid in similar positions in other branches of the service.

Items 35, 36, and 37:		
Present, 1 laboratory aid (35)-----	\$900	
Proposed, 1 laboratory aid-----	1,080	
	-----	180
Present, 1 laboratory aid (36)-----	840	
Proposed, 1 laboratory aid-----	1,020	
	-----	180
Present, 1 laboratory aid (37)-----	720	
Proposed, 1 laboratory aid-----	900	
	-----	180

These 3 employees, at \$720, \$840, and \$900 per annum, respectively, are aids in the motion-picture laboratory. They splice, test, patch, inspect, and assist generally in the making of motion-picture film. The work requires a knowledge of the technique of a motion-picture laboratory, and it is believed warrants salaries \$1,080, \$1,020, and \$900 per annum, respectively.

Item 47:		
Present, 16 clerks, class 1-----	\$19,200	
Proposed, 4 clerks, class 2, \$5,600; 12 clerks, class 1, \$14,400-----	20,000	
	-----	800

Item 47—Continued.

The positions occupied by 4 of the employees in the \$1,200 grade, the duties of which are described below, it is believed at this time warrant salaries of \$1,400 per annum.

(a) This employee supervises the shipping and receiving work of the Division of Publications, including the operation of the motor trucks, wagons, etc., and the employees engaged therein. The work is of tremendous volume, involving receipt from the Government Printing Office and other sources of millions of pieces of printed matter, certifying bills for same for payment and redistribution to the proper sources.

(b) This employee acts as clerk and stenographer to the assistant in charge of the distribution of publications. The work requires a thorough knowledge of the handling of the great volume of department publications.

(c) This employee reads and refers to the proper sections all of the incoming mail of the Division of Publications, Offices of Exhibits and Information, and Motion-Picture Section. The work is of considerable volume and requires intelligence and a thorough knowledge of the work handled in the various sections.

(d) This employee is the principal assistant to the officer in charge of the miscellaneous correspondence unit of the division, and in his absence supervises the work of a force of approximately 19 clerks. Considerable executive ability is required and the employee must be familiar with the methods of handling the thousands of requests for publications received here.

Item 48:

Present, 18 clerks, at \$1,000 each.....	\$18,000
Proposed, 10 clerks, class 1. \$12,000; 8 clerks, at \$1,140 each, \$9,120	21,120

\$3,120

Ten of the \$1,000 positions now on the roll, it is believed should pay salaries of \$1,200 per annum. The duties of these positions are as follows:

(a) This employee acts as "time clerk" for the Division of Publications. The duties are to keep the record of leave of absence, etc., and give notification of deductions to be made from the pay roll. The work is of considerable volume, entailing the keeping of a detailed record of the attendance of approximately 200 employees, and is of a character for which higher salaries are paid in other branches of the service.

(b) This employee acts as the principal assistant to the officer in charge of the mailing-list records of the division, in the absence of the latter; 14 employees are engaged in that work.

(c) The duties of this position are those of stenographer and clerk to the acting chief clerk of the division. In addition to a knowledge of stenography the employee must be familiar with the organization and business operation of the entire publication work.

(d) This employee examines congressional correspondence requesting Farmers' Bulletins, and issues orders based on these for mailing from the Government Printing Office, frequently determining what publications are to be sent.

(e) Same as (d) above.

(f) This employee has charge of the stenographic unit under the distribution section. She supervises a force of six stenographers, reviews their work, and dictates answers to certain routine correspondence.

(g) This employee supervises a force of 18 persons engaged in the machine-addressing work conducted by the Division of Publications.

(h) The duties of this position are to handle correspondence requesting publications, designate the publications to be sent, etc.

(i) The duties of this position are to act as information clerk to visitors, selecting publications on subjects desired by them, and assisting in filling orders received from county agents.

Item 48—Continued.

(j) This employee acts as clerk and stenographer to the assistant in charge of our addressing, duplicating, and mailing section.

The remaining eight positions in the \$1,000 grade, it is believed should pay salaries of \$1,140 per annum. The duties of these positions are described below:

(a) This employee keeps individual accounts of all miscellaneous publications, acts for the superintendent of distribution in carrying out details involved in schemes of distribution for department publications.

(b) The duties of this position are those of a typist, making changes in the mailing lists, and arranging mailing-list orders for the Government Printing Office.

(c) This position involves the handling of correspondence requesting publications and consists principally in drawing orders on the Government Printing Office for mailing the bulletins desired.

(d) This position involves principally the work of revising mailing lists and filing index cards in connection therewith.

(e) The duties of this position are to handle correspondence requesting publications, draw orders for mailing the proper bulletins, etc., by the Government Printing Office.

(f) This employee is assigned to folding room work and the duties of the position consist chiefly of folding, wrapping, filling, sealing, and franking envelopes.

(g) Two of the \$1,000 clerks, suggested for increase to \$1,140, are assigned respectively to the Offices of Information and Exhibits, where they are engaged in typewriting, filing, and accounting work in connection with the operation of these offices.

Item 49:

Present, 40 clerks at \$900 each.....	\$36,000
Proposed, 5 clerks, class 1, \$6,000; 35 clerks, at \$1,080 each, \$37,800	43,800

\$7,800

(a) Five of these employees are stenographers and typists, and as such it is believed these positions warrant salaries of \$1,200 per annum.

(b) The positions occupied by the remaining 35 employees, the duties of which are described below, are believed to warrant salaries of \$1,080 per annum. The employees occupying 12 of these positions are engaged in handling the requests for publications, of which approximately 2,000 are received daily. They search the indexes, designate publications to be sent, draw orders for mailing them from the Government Printing Office, keep records of the publications sent, etc.

Three of the employees in this class are assigned to duty as correspondence file clerks.

Six of these employees are engaged in routine clerical work in connection with the mailing list records of the department. They record the additions, removals, and changes on the mailing lists, arrange orders for same on the Government Printing Office, etc.

Two of these positions are occupied by employees assigned to the addressing section, where they operate addressograph machines, etc.

Two of the \$900 positions are occupied by employees engaged in typing, arranging, and filing index cards, searching indexes for information, etc., in the index section.

Two of the positions in this grade are occupied by employees assigned to folding-room work. The duties consist principally of folding, wrapping, franking, inserting, sealing, and filling miscellaneous orders in preparation for mailing. The work is very strenuous.

Eight of these positions are filled by employees assigned to general clerical work and typewriting in connection with the accounting, addressing, printing, and illustration sections of the division.

Item 50:

Present, 15 clerks, at \$840 each.....	\$12, 600
Proposed, 15 clerks, at \$1,020 each.....	15, 300

\$2, 700

Three of the employees in this grade are stenographers and typewriters.

Five of these positions are occupied by employees assigned to the addressing, duplicating, and mailing section. The duties of the positions are to operate duplicating and addressing machines, emboss mailing list plates, maintain mailing list files, and assist at times in folding, inserting, wrapping, mailing, and related work.

Three of these positions are filled by employees assigned to the mailing list record section, where they are engaged in typing, alphabetizing, and filing address cards of persons whose names appear on the lists.

Two of the employees in this grade are assigned to the index section, where the duties consist of typewriting, arranging index cards, and searching for information in the index files.

Two of these employees are assigned to miscellaneous clerical work—one in the distribution and one in the illustration section. The latter is engaged also in typewriting.

It is believed these positions warrant a salary of \$1,020 per annum.

NOTE.—At present there are 21 positions in this grade. The estimates for 1921 proposed that 5 of these be dropped altogether, provided the two \$1,600 and three \$1,400 positions requested for new employees are granted. One \$840 position also is proposed for change of title to laboratory aid. With these deductions fifteen \$840 positions would remain.

Item 51:

Present, 5 machine operators, at \$1,200 each.....	\$6, 000
Proposed, 2 machine operators, at \$1,440 each, \$2,880; 3 machine operators, at \$1,200 each, \$3, 600	6, 480

480

Two of these \$1,200 positions, the duties of which are described below, are considered to warrant salaries of \$1,440 per annum.

One of these is occupied by an employee who acts as mechanic for all of the automatic addressing equipment of the Division of Publications. He is charged with the supervision of the operation and maintenance in good condition of six graphotype machines and seven addressing machines, and other mechanical equipment of a similar nature. The machinery represents a considerable investment by the Government and its oversight represents quite a responsibility.

Another acts as foreman of the machine operators engaged in multigraph and mimeograph work. In this capacity he supervises the work of 6 employees.

Item 57:

Present, 3 messengers or laborers, at \$900 each.....	\$2, 700
Proposed, 3 messengers or laborers at \$1,080 each.....	3, 240

540

One of these positions is occupied by an employee whose duties are those of a machine operator in the multigraph section.

The other 2 are occupied by employees assigned to the illustration section, where the work consists of finishing, binding, and matting lantern slides, mounting and ferrotyping photo prints, and acting as custodian of the original illustrations and cuts used in the publications of the department.

It is believed these positions warrant a salary of \$1,080 per annum.

Item 58:

Present, 10 messengers or laborers, at \$840 each.....	\$8, 400
Proposed, 10 messengers or laborers, at \$1,020 each.....	10, 200

1, 800

Item 58—Continued.

Four employees in this grade are assigned to folding-room work, consisting of addressing envelopes, filling miscellaneous orders for publications, etc.

Three of the employees in this grade are assigned to duty as laborers and messengers. They are engaged in storing bulk publications, carrying mail, and other duties of laborers as required by the needs of the service.

One employee, who occupies an \$840 position, is assigned to duty as an addressing-machine operator.

One employee in this grade is assigned to duty as chauffeur of one of our motor trucks.

One employee is engaged in work in the photographic laboratory consisting of making photostats and solar-bromide prints.

These positions are filled by adults and the character of the work performed it is believed, under present conditions, warrants a salary of \$1,020 per annum.

Item 59:

Present, 4 messengers or laborers, at \$780 each.....	\$3, 120	
Proposed, 4 messengers or laborers, at \$1,020 each.....	4, 080	
		<u>960</u>

\$960

Two employees in the \$780 grade are engaged in the work of machine operators in connection with our addressing and duplicating work.

One employee in this grade performs the duties of a chauffeur, driving one of our motor trucks.

One employee is assigned to folding-room work, consisting of folding, inserting, mailing, etc.

These positions are all filled by adults and it is believed the character of the work warrants a salary of \$1,020 per annum.

Item 60:

Present, 14 messengers or laborers, at \$720 each.....	\$10, 080	
Proposed, 14 messengers or laborers, at \$900 each.....	12, 600	
		<u>2, 520</u>

2, 520

Nine employees in this grade are assigned to duty as machine operators in connection with our automatic addressograph system.

Three of the employees in the \$720 grade perform the regular work of a laborer, consisting in the handling and storage of bulk publications; sacking, and assisting in moving mail and other heavy material in connection with shipping, etc.

Two of the employees in this grade are assigned to work in the photographic laboratory operating the photostat machine, mounting photographs, maps, charts, etc.

The work performed by the employees who occupy these positions, it is believed, is such as to warrant a salary of \$900 per annum.

Item 62:

Present, 3 messengers or laborers, at \$600 each.....	\$1, 800	
Proposed, 3 messengers or laborers, at \$900 each.....	2, 700	
		<u>900</u>

900

Two of the employees in this grade are engaged in the miscellaneous duties of a laborer—cleaning the offices, removing waste material, and other miscellaneous duties of a laborer as required.

One position in this grade is filled by an employee assigned to the motion-picture laboratory, where he is engaged in keeping the laboratory clean, carrying film back and forth, and making himself generally useful in the preparation of film.

It is believed these positions warrant salaries of \$900 per annum.

Item 63:

Present, 1 folder.....	\$1, 000	
Proposed, 1 assistant.....	1, 200	
		<u>200</u>

200

The employee who occupies this position performs the duties of a distribution record clerk. The duties include keeping a stock account of Farmers' Bulletins and an individual account of

Item 63—Continued.

the distribution for each Senator and Representative in Congress. Also preparation of records on condition of stock of publications. The employee has been in the service more than 25 years, and the wide knowledge of the publication work and the responsible nature of the duties performed it is believed warrant fully a salary of \$1,200 per annum.

Item 64:

Present, 2 folders, at \$900 each-----	\$1, 800
Proposed, 2 messengers or laborers, at \$1,080 each-----	2, 160

\$380

One of the employees in this grade is assigned to duty as operator of an automatic addressograph machine.

The other acts as custodian of the building and supervises a force of eight laborers and charwomen.

It is believed the duties of these two positions warrant a salary of \$1,080 per annum.

Item 65:

Present, 2 skilled laborers, at \$1,100 each-----	\$2, 200
Proposed, 2 skilled laborers, at \$1,200 each-----	2, 400

200

One of the laborers, at \$1,100, is assigned to handling miscellaneous requests for publications, selecting the bulletins to be sent, and preparing the necessary orders for mailing upon the Superintendent of Documents, Government Printing Office.

The other laborer is assigned to the duties of a machine operator in connection with our automatic addressograph system.

It is believed the duties performed by the employees occupying these two positions warrant a salary of \$1,200 per annum.

Item 66:

Present, 6 skilled laborers, at \$1,000 each-----	\$6, 000
Proposed, 3 machine operators, at \$1,200 each, \$3,600; 3 skilled laborers, at \$1,200 each, \$3,600-----	7, 200

1, 200

Five of the employees in this grade are assigned to duty as machine operators in connection with our addressograph, graphotype, multigraph, mimeograph machines, etc. It is a skilled grade of work requiring considerable training and experience. Three of these employees have a civil-service status as "machine operators."

The other employee in this grade supervises a force of several employees engaged in maintaining a stock of bulk publications for use of the various bureaus and offices in the Department of Agriculture. The duties of the position require a knowledge of the large volume of publications, posters, etc., and ability to produce them when called for.

It is believed the duties of the employees occupying these positions are such as to warrant a salary of \$1,200 per annum.

Items 69, 70, 71, 72:

Present, 4 messenger boys, at \$600 each (69), \$2,400; 4 messenger boys, at \$480 each (70), \$1,920; 2 messenger boys, at \$420 each (71), \$840; 2 messenger boys, at \$360 each (72), \$720-----	\$5, 880
Proposed, 6 messenger boys, at \$720 each, \$4,320; 6 messenger boys, at \$600 each, \$3,600-----	7, 920

2, 040

The messenger boys, as their title implies, are assigned to messenger work, consisting of running errands, routing and carrying mail, distributing publications, performing duties of an office boy, helping in the photographic laboratory, etc. The \$360, \$420, and \$480 positions are vacant a great part of the time owing to our inability to secure and retain boys at these salaries. The turnover in these grades is extremely high, the boys not remaining long enough to become familiar with the location of the various offices before they secure better positions elsewhere. This causes considerable inconvenience in the transaction of business.

Items 69, 70, 71, 72—Continued.

Under present conditions it is considered the services of first-class messenger boys are worth salaries of \$600 and \$720 per annum.

Total increase, if above changes are adopted..... \$28,760

STATEMENT OF MR. EDWY B. REID, CHIEF OF THE DIVISION OF PUBLICATIONS, DEPARTMENT OF AGRICULTURE—Continued.

Mr. REID. This morning we were talking about the total appropriation requested for the Division of Publications. We are asking for additional places amounting to \$15,050; for labor-saving machinery and supplies, \$1,000; furniture and fixtures, \$280; telephone, telegraph, freight, and express, \$150; and miscellaneous expenses, \$350; making a net actual increase of \$16,830. The reduction in the exhibits' appropriation from \$100,000 to \$50,000 leaves us with a request for \$33,170 less than was appropriated for the same purposes last year. That may not be entirely evident at the first glance at these estimates, because we have tried to bring into the Division of Publications three extra units. The Office of Information, the Office of Exhibits, and the motion-picture activities. The people doing this work have been carried on the rolls of other branches of the department, and the proposed change will not increase the department's appropriation. Therefore, this is not an actual increase in the Division of Publications.

We are actually asking for less money than we did a year ago. We will do away with a few low-salaried places and with the additional higher-salaried positions bring the Division of Publications into a good strong unit. We would have to ask for these extra people even if we had not been trying to bring these units into one, because the old Division of Publications was very loosely organized. It was not giving the service that it should, and, in order to articulate the Department of Agriculture with the public properly, we should have these extra positions.

The CHAIRMAN. That is, assuming that the transfers are made and activities are added to it?

Mr. REID. No, sir; the new positions are not primarily contingent on the proposed consolidation, but, as stated, are needed to put the Division of Publications, as at present organized, on an efficient basis.

The CHAIRMAN. We had better take up the additional items commencing with page 199.

Mr. REID. We ask for an increase of \$1,000 under the item for labor-saving machinery. This amount is needed for the purchase of new machines to replace old ones; duplicating and addressing machines, stencil-cutting machines, and multigraphs, mimeographs, and things of that kind.

Mr. ANDERSON. Is there a considerable increase in the work of the division from year to year?

Mr. REID. The publicity that we have given to the department's publications is reflected directly in increased work on the part of the Division of Publications. There is a tremendous increase from one year to another.

Mr. ANDERSON. Is there anything to indicate that at all? Is there any way in which you can indicate the extent of the increase?

Mr. REID. The Division of Publications is called upon to do mimeograph and multigraph work, and maintains mailing lists on the addressograph system for a number of the bureaus and offices of the department.

The Office of Information alone during the last fiscal year sent in approximately 750 stenciled press notices—a greater number than in any other year with the exception of 1917–18, when the department's activities were expanded temporarily under the food-production act. Several million impressions of these stencils were made, envelopes addressed and filled, and the material placed in the mails by the Division of Publications.

The constant wear and tear on the addressing and duplicating machinery makes it imperative to purchase new equipment from time to time to enable the division to handle the department's work.

The publicity given the department's publications is reflected in the increase in the demand for bulletins, as shown by the distribution figures in a table I have prepared. This shows the output in the various lines of publication and information work since 1914. With your permission, I will insert this statement in the record.

(The statement referred to follows:)

Information and publication work of the Department of Agriculture.

[Fiscal years ending June 30.]

Activities, publications issued, etc.	1914	1915	1916	1917	1918 ¹	1919 ¹

Fairs at which department exhibited.....	2	5	7	10	18	35

¹A considerable part of the increase in 1918 and 1919 was incident to the war activities under an appropriation made available by the food production act.

² It is impossible to gauge the amount of illustrating and designing in one year by the number of drawings prepared. It may take a draftsman two weeks or more to prepare an intricate piece of work, and he may make 10 easy small drawings in one day. During the past few years production of tracings and small charts has had to be curtailed in order to produce a more popular style of illustrations, such as cover designs, posters, etc.

³ The motion-picture work was not conducted as an activity of the department as at present until the fiscal year 1917.

⁴ The department has exhibited at 57 fairs during the current fiscal year.

Mr. VOIGT. Instead of sending the Members' franks to the Government Printing Office, would it not be more expedient to have a supply of these bulletins in your office and send them out from there?

Mr. REID. We think so; but the law makes it necessary for us to send them to the Government Printing Office.

Mr. HARRISON. The department always thought that was a mistake.

The CHAIRMAN. We had that up a few years ago, and the distribution end was transferred to the Government Printing Office by act of Congress.

Mr. VOIGT. Is there a law that compels you to do that?

Mr. REID. Yes. It would facilitate matters a great deal if we handled the distribution ourselves. We have a great deal of trouble to keep our lists the same as those of the Government Printing Office. The Government Printing Office has nothing to do with sending out lists of crop estimates or news stories. The Printing Office is far behind much of the time in sending out publications.

Mr. HARRISON. There are a great many complaints about delays in sending out publications through the Superintendent of Documents.

The CHAIRMAN. We will pass on to the next item, Mr. Reid.

Mr. REID. Item 79, for "Envelopes, stationery, and materials, \$9,000," involves an apparent increase of \$1,500. There is no actual increase, however, as this merely provides for the transfer of that amount from the appropriation for "Miscellaneous expenses" of the Secretary's office, which fund has been reduced accordingly. It represents the amount that has been allotted from the Secretary's appropriation for paper and envelopes for the Office of Information for the current fiscal year. With the consolidation of the Office of Information and the Division of Publications the expenditure should come under the Division of Publication's fund in order to simplify the accounting and make the administration of the work more logical and convenient.

Item 80, "Office furniture and fixtures, \$1,600," contemplates an increase of \$280 over the appropriation for this object during the current fiscal year. This slight increase will cover additional furniture and fixtures required, as the Division of Publications, beginning July 1, will be called upon to supply furniture and fixtures for the Office of Information, Office of Exhibits, and Motion Picture Section, which now obtain such supplies from the office of the Secretary. The amount recommended for furniture and fixtures is conservative, as were it not for the need of rigid economy we would like to ask for a considerably larger sum under this heading in order to replace some of the very old equipment in use in the Division of Publications. At present we are able to do this but slowly, as a considerable portion of the appropriation, due to rising costs, etc., is taken up in meeting current needs.

Item 81 proposes the insertion of the word "hereafter" in the language authorizing the department to loan, rent, or sell copies of motion-picture films under certain conditions. This change is recommended in order to make the legislation permanent and avoid the necessity of repeating the proviso year after year.

Item 82 recommends an increase of \$150 in the appropriation for telephone and telegraph service, and freight and express. Nine

hundred dollars is recommended, whereas the appropriation for the current year is \$750. As explained in the Book of Estimates, a part of this amount will be required to provide for telephone service for the Office of Information and the office having charge of motion-picture activities, which will be consolidated with the Division of Publications under the plan of reorganization. This expense heretofore has been met from the appropriation, "Miscellaneous expenses," under the Secretary's office. Additional funds also are needed to cover transportation charges on motion-picture films in consequence of the increased demand for the exhibition of motion pictures, lantern slides, etc.

Item 83. No change is recommended.

Item 84, "for purchase of manuscripts, traveling expenses, electrotypes, illustrations, and other expenses not otherwise provided for, \$4,350." A slight increase—\$350—is recommended in this item, which amount is necessary to provide for necessary expenses of the Office of Information heretofore paid from the appropriation, "Miscellaneous expenses," under the Secretary's office, and to meet in a degree the general advance in the cost of all items coming within the scope of this appropriation.

Item 85, "to enable the Secretary of Agriculture to make suitable agricultural exhibits at State, interstate, and international fairs held within the United States."

You will notice that the paragraph has been amended so as to eliminate specific mention of the National Dairy Show at Chicago. However, it is our intention, if we get this appropriation, to show at this big exhibition at the Fat Stock Show, and also at other national shows, such as the swine exposition; but we think it hampered us somewhat last year to have a specific appropriation for the National Dairy Show.

The CHAIRMAN. I take it that the dairy people will register a vigorous protest if it is eliminated. How would you take care of them if we should drop this language?

Mr. REID. They would be taken care of in the regular way of making exhibits the same as we did this year, only it would not be mentioned specifically. If we mentioned them we ought to mention the Fat Stock Show and all the others.

The CHAIRMAN. What is the average expense for these shows?

Mr. REID. We have been successful in showing at 57 fairs and expositions this year. We have had five circuits carrying representative work of the department.

The CHAIRMAN. What is the average expense?

Mr. REID. We have spent about \$60,000 on the 57 fairs.

The CHAIRMAN. What is the largest amount expended in connection with any of them?

Mr. REID. The largest was in connection with the National Dairy Show, for which \$25,000 was specifically provided in this item.

The CHAIRMAN. What was the expenditure last year—some of the bigger State fairs, say, in Minnesota and Iowa?

Mr. REID. The cost of the Illinois and Indiana State Fair was \$1,300.

The CHAIRMAN. Is that about the largest amount?

Mr. REID. At the Iowa fair it was \$1,420; Wyoming State Fair, \$1,200. That is the way it runs.

Mr. ANDERSON. What is the cost of the National Dairy Show?

Mr. REID. \$21,000; at the International Stock Show it was \$5,000. There is a big discrepancy between the cost of these two exhibits, but we were able to make a very good showing at the International because the circuits were in and we could combine the material that had been out to State fairs and send it to the International; and we really put on a better show than the \$5,000 indicated.

The CHAIRMAN. If we eliminate the language as suggested, what would you do with these larger shows—give them all the same amount?

Mr. REID. We couldn't do that.

The CHAIRMAN. The dairy show is national in character.

Mr. REID. We couldn't do that, because the character of the exhibits changes and the demand for material is different at different times. The national shows usually are specialized in character, and we have to prepare material especially for them. It sometimes happens that we can use some of the material that is prepared for State fairs or other exhibits.

The CHAIRMAN. Would you put on as many shows next year as you have during the present year?

Mr. REID. No; we could not.

The CHAIRMAN. That, of course, would depend on the appropriations made, I suppose.

Mr. REID. On a \$50,000 appropriation we can't make more than half the shows we did this year.

The CHAIRMAN. Only half?

Mr. REID. Not more than half. Further than that, we will not have any money left to prepare exhibits for the next season.

The CHAIRMAN. You spent \$60,000 last year; you have \$40,000 in the Treasury, and, if that is made available with this \$50,000, you would have \$90,000; that is \$30,000 more than you spent this year.

Mr. REID. This table was made up a little while ago. I think we have something like \$30,000 now with which to prepare for shows next year.

The CHAIRMAN. \$30,000 and \$50,000 would give you \$80,000. Would that not enable you to give about the same number of exhibits that you did last year?

Mr. REID. Not quite as many.

The CHAIRMAN. How many less?

Mr. REID. I don't suppose we could make over 40 shows.

Mr. ORMSBY. Possibly 40. Mr. Chairman, the material we used this year on the circuits was prepared, for the most part, with money we had left over from last year's appropriation of \$40,000. During the year 1918 we covered, with the aid of the State-fair associations, about 35 fairs; but the fair associations bore part of the expense. This year we bore practically all expenses except for space; we paid for no space but this year had to bear the entire expense for local drayage, installation charges, labor, carpentry work, and hauling, which during 1918 was borne by the fair associations.

Mr. ANDERSON. Don't you think that ought to be paid by them?

Mr. ORMSBY. I think so; but, inasmuch as the members of the two large fair organizations known as the American Association of Fairs and Expositions and the International Association of Fairs and Ex-

positions were instrumental in having Congress authorize \$100,000 for agricultural exhibits at fairs during the past year, they felt that the department should pay all expenses except for space. In my opinion, the fairs should bear local expenses, such as hauling to and from the cars, for space, and for local common labor to assist in unpacking and repacking the exhibits. Of course, they should not be expected to pay for special services, such as special electrical power for the operation and lighting of models and cases, the construction of special tables, cases, etc., plumbing and steamfitting when necessary in installation work, special decorating features, etc. Such work of a special character, however, is only necessary where the department makes an unusual or special exhibit, such as is desired at the dairy and live-stock shows, those national or international in scope and character, and those where more money is expended than at the fairs of general importance to the public.

Mr. HARRISON. It has always been our policy to require the local authorities to pay expenses of that sort, Mr. Chairman, and we always insisted upon that requirement until this appropriation was made available. The appropriation was provided, as you know, to cover practically all expenses connected with our exhibits, with the exception of the rental of space and possibly a few other items.

The CHAIRMAN. This affects every section of the country. You appreciate that it is a live issue. When we get on the floor of the House I want to be in a position to state specifically what is going to be done.

Mr. HARRISON. I just want to point out one thing: It is always necessary for us to keep a balance over for the following spring's work, because the appropriations for the succeeding fiscal year do not become available until July 1, and we have to begin the preparation of our exhibits much before that time in order to be ready when the fair season opens. The fair season begins about July 1, but we begin preparing for it early in the spring.

The CHAIRMAN. I have received a number of communications about the swine show. That would be a new one, would it not?

Mr. HARRISON. That would be a new one, and I imagine the department will have an exhibit there if the necessary arrangements can be made.

The CHAIRMAN. There is the same request for the dairy show. Assuming that you are to take care of the dairy show, the swine show, and all the other shows that you took care of this year, how much money would be required to do justice to all of them?

Mr. ORMSBY. If you will permit me there, Mr. Chairman, I would like to distinguish between the nature of the exhibits we made at the dairy show from those displayed at the ordinary State fairs. At the dairy show the department staged live demonstrations along dairy lines and models in action and occupied more than twice the amount of space occupied at the State fairs. Of course, this was a special show for which specific provision was made. At the State fairs the work of the department is shown with models, charts, and photographs. Live demonstrations and special models are required and necessary at large and special shows, such as the dairy show.

The CHAIRMAN. It is really required?

Mr. ORMSBY. Yes; the dairy show requires a great deal of demonstrational work.

The CHAIRMAN. It takes in the whole country, does it not?

Mr. ORMSBY. Yes, sir. For example, at the dairy show last October the department showed the cost of keeping a dairy cow for one year, together with her production. This exhibit consisted of a live Holstein cow and her calf, her feed requirements, and her milk production in one year, illustrated by actual feed and models; whereas at a State fair we would put that in small-model form, with supplementary charts and photographs.

The CHAIRMAN. More money is required, then, for a national show than a State show?

Mr. HARRISON. The department, in ordinary circumstances, would probably expend more money at national shows, like the National Dairy Show and the Swine Growers' Exposition, because they are national in scope and they are much larger than the ordinary State fair. Not only that, but we will specialize our exhibits at these national fairs in such a way that they will be particularly interesting to the people who visit them. For instance, in the case of the live-stock show, the live-stock exhibits will predominate, while at the dairy show, dairy matters will predominate.

The CHAIRMAN. Following out that line, how much money would be required?

Mr. ANDERSON. For the whole business?

Mr. HARRISON. You mean to make exhibits at 58 places?

The CHAIRMAN. Figuring on the same basis as last year allowing for increases and treating them all alike?

Mr. HARRISON. I think it will take, Mr. Chairman, at least \$100,000 to do that next year.

The CHAIRMAN. With a total of \$100,000 for exhibits, could you also take care of the swine show and the dairy show?

Mr. REID. It will take as much to run us next year as it took this year, including the spring work.

The CHAIRMAN. You ought to be able to put on two good shows. You put on a very good exhibit at the fat-stock show.

Mr. REID. That happened to break just right. We had our circuits arranged so we could use that material. If we had had to secure new material we couldn't have put on any such show for \$5,000.

The CHAIRMAN. You will have the same circuits next year and the fat-stock show will come at the same date?

Mr. REID. If the fat-stock show will be that late.

The CHAIRMAN. It is generally the same week.

Mr. REID. It is generally the first week in December.

The CHAIRMAN. It is practically always at that time.

Mr. REID. There is the swine show, for instance; it will be a new show for us. We have already requests from a lot of new fairs for next year, and undoubtedly the fairs at which we showed this year will repeat their requests. I believe it will take a little more than the \$100,000 to put on as many shows as we did this year.

The CHAIRMAN. You spent \$60,000 of the \$100,000, and you are going to do practically the same work next year, with the exception of the swine show?

Mr. REID. We have to have some money with which to prepare exhibits. We want at least as much left over next year as we have this year, to continue the work.

The CHAIRMAN. But you have \$40,000 in the Treasury for that.

Mr. REID. About \$30,000, as in addition to the \$60,000 spent on specific shows, there are expenditures of about \$10,000 for general items.

The CHAIRMAN. You would be able to make the necessary preparation with \$30,000. Then, if we appropriate \$100,000, you will have \$100,000 for next year's work.

Mr. REID. Of course, by making some changes in the arrangements with the fairs, and getting them to bear a part of the expense, we might be able, with \$100,000, to show at these fairs and also at some additional fairs. Otherwise we may not be able to do that.

The CHAIRMAN. If we eliminate the language, would you give the same consideration to these national shows that you did this year?

Mr. REID. Yes; with the \$100,000.

The CHAIRMAN. Whatever appropriation we make.

Mr. REID. We would like to put on just as good shows, or a little bit better.

In the case of the international this year, we had to confine our efforts to the hay and grain section. We have a lot of information in the Bureau of Animal Industry that never has been put before the people in proper form.

The CHAIRMAN. Is it not a fact that at any dairy show your exhibit would be the main attraction, while at the fat-stock show it is simply a side-show attraction, because many go to the latter especially to see the fat stock.

Mr. REID. Certainly.

The CHAIRMAN. It is necessary to put on as large an exhibit at the fat-stock show as it would be at a dairy show?

Mr. ORMSBY. At the National Dairy Show the department exhibit occupied something like 11,000 square feet of floor space, while at the International Live Stock Show it occupied slightly over 4,000 square feet.

The CHAIRMAN. I think what you put on at the dairy show this year was very good. It was a very good show. Were you in charge of it?

Mr. ORMSBY. Yes, sir.

Mr. REID. We didn't do anything regarding the work of the Bureau of Animal Industry at the International Live Stock Show; it all had to do with the hay and grain sections. The Bureau of Animal Industry is anxious, if it can, to be in the show.

The CHAIRMAN. The States had a number of exhibits. What you had there fitted in very nicely.

Mr. REID. Yes; in that section.

The CHAIRMAN. We are asked all sorts of questions about these shows. What can we say to these people? If we appropriate \$100,000, can you do as well by them next year as you did this year? That is, will you try to do as well by them as you did this year?

Mr. REID. Yes. We can't take on more than two or three new shows, however. We can do as well by the old shows—that is, the same number, 57.

The CHAIRMAN. And with \$50,000 you would have to cut it down to 40?

Mr. REID. To 25.

The CHAIRMAN. You say you would have to reduce the number to 25?

Mr. REID. Yes, sir. That would be on the average of only \$2,000 per show, to provide for getting up all the material, shipping it out, hiring the help, and everything else connected with the work.

Mr. ORMSBY. The department received about 65 requests this year from State fairs and larger expositions. As Mr. Reid says, we took care of 57.

The CHAIRMAN. You received 65 requests?

Mr. ORMSBY. Yes, sir; we could have taken care of all of them if we had had more men and material to make up a new circuit. Our circuits cover from 7 to 10 fairs each. There were only five original circuits, and we had to make up an extra circuit consisting of Wyoming, the International Farm Congress at Kansas City, and the Evansville Centennial Exposition at Evansville.

The CHAIRMAN. How about your Kansas City show?

Mr. REID. We took care of that with a complete set of material that we sent to Wyoming, supplemented by material from the other circuits that were passing from the north to the south through Kansas City.

The CHAIRMAN. That can be taken care of next year if we make a \$100,000 appropriation?

Mr. ORMSBY. Yes, sir.

Mr. ANDERSON. You will be relieved somewhat on this proposition next year if we put in a limitation the effect of which would be to require the local expenses to be borne by local people, won't you?

Mr. ORMSBY. It would be a great help to us, because the expense varies so much in different places. For example, I have had places where I would get a car unloaded for \$20, and at other places it would cost from \$50 to \$75.

Mr. ANDERSON. They wouldn't be so apt to gouge the local people as they would the National Government?

Mr. ORMSBY. No; and most State fairs and organizations have their own labor which they can turn over to us; whereas this past year we have paid for that labor, which the State fairs themselves ought to furnish.

Mr. ANDERSON. They certainly ought.

The CHAIRMAN. I submit a letter from Mr. Skinner, of the National Dairy Association, whom the committee knows, and which, without objection, will be inserted in the record.

CHICAGO, ILL., October 15, 1919.

HON. GILBERT N. HAUGEN,

House of Representatives, Washington, D. C.

MY DEAR CONGRESSMANS Probably the most useful and constructive exhibit ever made by any department of our Government was that made by the bureaus and divisions of the Department of Agriculture at the National Dairy Show just held in Chicago, under appropriation made by Congress. This whole exhibit was replete with information on dairy subjects for both producer and consumer, and was a center of attraction throughout the entire show.

It gave the people of America and our foreign visitors an insight into the results of scientific and practical development work of years for this most vital industry to humanity, and disclosed the activities of the Dairy Division particularly for improvement in American dairying, embracing the manufacturing of dairy products that our country has heretofore been dependent upon

imports for, and was beyond question of the greatest possible value to our industry as a whole. This division has had little opportunity in the past to let the people know just what form of effort was being conducted by it, so that the whole exhibit was astounding in its distinct relations to the present world conditions of dairying, and it would be unwise indeed to not follow this splendid work up, especially since the knowledge gained by those in charge of the exhibits this year will assist in making a second exhibit of even far greater value to the American farmer. I therefore ask and urge that an appropriation be made for a similar exhibit for 1920, and that it be made early, that the department officials may have a full year in which to prepare.

Will you kindly advise me as to what we should do to start such an important matter going at the earliest moment possible.

Thanking you most sincerely for your splendid help in getting this year's appropriation through, I beg to remain,

Very sincerely, yours,

W. E. SKINNER,
General Manager.

The CHAIRMAN. Are there any questions that the committee desires to ask?

Mr. ANDERSON. I take it that this new language is intended to make it certain that part of this money can be spent in the District of Columbia in the preparation of exhibits?

Mr. REID. That is almost a prerequisite to our getting up the exhibits. We were handicapped in every way this year because we couldn't employ men to do this work. We had to go to the bureaus and put on people who know nothing about the business, you might say. It was their first experience. The result was that the kind of assistance we secured was not nearly as good as we would like to have. We would like to have permission to employ some probably for part time and some for the whole year, on work of this kind; we should have men who will devote their entire time to getting up exhibits.

The CHAIRMAN. Why not include that in the item of general expenses and not divide up every item by this language? Can you not assign people from one division to another or from one section to another?

Mr. ORMSBY. The only objection I see to that, Mr. Chairman, is that the bureaus can not spare their best men for this work.

The CHAIRMAN. But the same men can be employed under one head as well as under several heads.

Mr. REID. The people have to be brought into the District to do the work. The work has to be done here largely; and we have had to resort to renting three warehouses down in Alexandria, just across the line, in order to have our material where we can get at it. That arrangement is very inconvenient. We would like to rent a warehouse in the District where we could see this material and work with it and not lose so much time going back and forth; we could then have it in much more presentable form.

The CHAIRMAN. We have one rent item; why not have all rent included in that rent item? Why not make an adequate appropriation under one head and thus dispose of the whole matter?

Mr. HARRISON. That would be entirely satisfactory to us so far as rent is concerned, Mr. Chairman, but the language for the employment of persons in the District of Columbia is absolutely necessary if we are going to have any force with which to do this exhibit work.

The CHAIRMAN. That was the contention last year, but you got along without it.

Mr. HARRISON. But the arrangement this year was merely a makeshift; but if we are going to have this responsibility every year we ought to be in position to employ a force capable of doing the work, and not have to do it in makeshift fashion.

The CHAIRMAN. What is the difference whether we appropriate \$10,000 for employing people on page 10 or page 11? Isn't that all the same?

Mr. HARRISON. It doesn't make any difference where the appropriation is made, so long as we have authority to employ some people, as the need may arise, to handle the exhibit work.

The CHAIRMAN. Exactly.

Mr. HARRISON. I understood that you wanted to provide for all the exhibit work in one paragraph.

The CHAIRMAN. The idea that 15 or 20 branches should keep a separate account of little rent items is all nonsense. You should have it all under one head.

Mr. HARRISON. That would be entirely satisfactory to us.

The CHAIRMAN. You could probably save considerable in the rent expenditure by doing so.

Mr. REID. We will be glad to put that under the regular department item for rent, but it still leaves us in the air in regard to hiring clerks and people to do this sort of work, getting the exhibits together, and so on. We have got to have more or less of a force that knows something about exhibits, Mr. Haugen.

The CHAIRMAN. Why not appropriate a lump sum for whatever amount is required for rent for the department—whether it is for one division or one bureau it matters not, but let it be all in one lump sum. When it comes to the employment of people here in Washington, let us not reiterate this language in every section.

Mr. HARRISON. Mr. Haugen, perhaps it might be well to call your attention to the fact that an introductory paragraph preceding the subappropriations for the various lines of work in practically every bureau has a clause providing for the employment of such persons as may be necessary in the District of Columbia. In the Division of Publications, however, that language does not appear in the introductory paragraph, which you will find on page 199; therefore none of the lump-sum appropriations of the Division of Publications is available for the employment of persons, with the exception of the item of \$2,500, which specifically provides for extra labor and emergency employment in the District of Columbia.

The CHAIRMAN. Put it under the head of emergency.

Mr. REID. If you want to put it under the head of emergency employment, that will be agreeable to us.

Mr. HARRISON. That is item 86, on page 202. The language could be inserted as an introductory clause and accomplish the same purpose.

Mr. ANDERSON. How much money does that require?

Mr. REID. It varies with the size of the appropriation. We can't tell exactly.

Mr. ORMSBY. At \$100,000, Mr. Anderson, it would run between \$10,000 and \$15,000, I presume.

Mr. HARRISON. \$15,000 would be the maximum.

The CHAIRMAN. All the rent can be included in one item, and all labor, emergency employment, etc., in the District of Columbia can

go in one item. What is the use of reiterating it hundreds of times in one bill?

Mr. HARRISON. The only possible objection I can see, and it is certainly not a controlling objection, is that the fair people will not recognize these items if they are included under other paragraphs and will say that you are not appropriating enough for exhibits.

The CHAIRMAN. The Secretary of Agriculture has power to see that the appropriation is expended in that way.

Mr. HARRISON. We will see that the money is expended for the purpose for which appropriated, but many people will look at the exhibit item and assume that that is the only money available for the work.

The CHAIRMAN. If we put the money in there and it is actually used for that purpose that is all that is necessary.

Mr. REID. If we can increase the appropriation under this item for extra labor and emergency employment from \$2,500 to about \$17,500, that would be all right.

The CHAIRMAN. How much is required in the District of Columbia; \$17,500?

Mr. REID. I am figuring on a \$100,000 appropriation for exhibits. You could subtract \$15,000 from that and strike out the words "and employment of persons and means in the District of Columbia and elsewhere," and increase the other item by \$15,000.

The CHAIRMAN. You mean item 86, on page 202?

Mr. REID. Yes, sir.

The CHAIRMAN. There may be other items in the other bureaus, or are these the only ones?

Mr. HARRISON. These are the only ones I know of, Mr. Chairman.

The CHAIRMAN. What is the next item?

Mr. ANDERSON. You have some new language there in item 87.

Mr. REID. Yes; this item provides as follows:

Hereafter employees of the Division of Publications may be detailed by the Secretary of Agriculture for publication, informatoin, and related work in any of the bureaus or offices of the department, for duty in or out of the District of Columbia, and employees of the bureaus and offices may also be detailed to the Division of Publications for duty in or out of the District of Columbia, traveling expenses of employees so detailed, when necessary, to be paid from the appropriation of the bureau or office in connection with which such travel is performed.

We are merely asking for permission to have employees of other bureaus detailed in times of stress to the Division of Publications, so we may have some elasticity in our organization. If the exhibits work is to become a part of the division's work, the detail from other bureaus will be necessary, so bureau employees may temporarily be detailed to do exhibit work.

Mr. ANDERSON. Under that item you could start an entirely new extension service under the Division of Publications.

Mr. REID. That is not our purpose.

Mr. ANDERSON. You could detail men and send them all over the country.

Mr. REID. We will have to have some such wording in the bill in order to send bureau men out on exhibits. Men from the bureaus have to accompany these exhibits. If there are 57 fairs to take care of and three men are required to go out to each fair, we must get the men somewhere.

Mr. HARRISON. They can only be detailed to do the work that the Division of Publications is authorized to do, Mr. Anderson.

Mr. ANDERSON. That division has pretty broad publicity functions.

Mr. HARRISON. Authority now exists to detail persons from the bureaus to the office of the Secretary.

Mr. ANDERSON. I am not referring to what is at all; what I want to know is what is going to be.

Mr. HARRISON. Some of the informational work, as I have indicated, is now conducted under the office of the Secretary, which has authority to detail to and from the bureaus; and in connection with the proposed transfer of that work from the office of the Secretary to the Division of Publications, we are simply asking that the same authority with reference to details be given to the division.

Mr. ANDERSON. We agreed to the details to the Secretary's office because we thought that was sort of under the Secretary's thumb and that there wouldn't be any abuse of it on that account.

Mr. HARRISON. The committee also agreed to details to the library and to the Division of Accounts and Disbursements; in other words, to other service branches of the department, the branches which serve the whole department. In these cases, when a bureau wishes a particular piece of work done and the existing working force can not handle it, we can call on the bureau to detail some of its employees for the purpose. The authority to detail exists only in the case of what are known as the service branches of the department, namely, the library, the Division of Accounts and Disbursements, and the Secretary's office, and we are asking that the same authority be given to the Division of Publications.

The CHAIRMAN. You say the Secretary has the authority now to make the details?

Mr. HARRISON. He now has authority to make details to and from the Secretary's office.

The CHAIRMAN. Why has he not authority in this instance?

Mr. HARRISON. Because the law is specific. It provides for details only to and from the office of the Secretary. Another law was passed in 1912 authorizing details to and from the library.

The CHAIRMAN. Has he not the authority to detail from one division to another?

Mr. HARRISON. No, sir.

Mr. ANDERSON. There is a general law that prohibits that, as I recall it.

Mr. HARRISON. You will note that the provision suggested here speaks to the Secretary, and the Secretary will pass on each detail made under it. The Chief of the Division of Publications will not have the authority to make details himself, but he will have to present the facts to the Secretary in each instance, and the Secretary will determine whether the detail is justified and whether the employee concerned is actually needed in the Division of Publications for the performance of the proper and legitimate activities of that division. There will, therefore, be a constant check on these details.

The CHAIRMAN. My understanding is that there is a law against detailing from one department to another at an increased salary.

Mr. HARRISON. I think you have in mind transfers from the statutory to lump-fund rolls.

The CHAIRMAN. No; I am talking about transferring or detailing from one department of the Government to another.

Mr. HARRISON. These details will be all made at the same salaries. There will be no authority to detail at increased salaries.

The CHAIRMAN. I have reference to the authority granted the Secretary.

Mr. HARRISON. I do not know of any such authority with reference to increased salaries.

The CHAIRMAN. My understanding was that he could transfer from one department to another, but not at an increased salary.

Mr. HARRISON. You are referring to a provision included in the urgent deficiency act about two years ago which prohibits the transfer of an employee from one executive department to another at an increased salary and also the promotion of any employee transferred from one department to another within the period of one year. But that is a different matter entirely. That is a case of transfer between departments. There has been some suggestion regarding the repeal of that law.

The CHAIRMAN. So if a person is needed in one division and not in another, he must stay there, holding down a swivel chair, and do nothing?

Mr. HARRISON. No, sir; his appointment can be terminated; or, if there is a need for his services in the other division, he can actually be transferred.

The CHAIRMAN. Can he not be detailed?

Mr. HARRISON. Suppose we are making an exhibit of the work of the Bureau of Plant Industry at the International Hay and Grain Show. Some technical men must accompany that exhibit and demonstrate it on the ground. Now, we want to detail these men to the Office of Exhibits, so that they will work under the general supervision of the officer who is in charge of all the exhibits at that particular show, but their salaries will continue to be paid by the Bureau of Plant Industry. We call it a detail when the salary of the employee continues to be paid by the bureau from which he is detailed, but he works under the supervision of another agency. A transfer is where he leaves one bureau entirely, goes off the rolls of that unit, and is transferred to the rolls of another unit. These are two entirely separate and distinct matters. The details will be merely temporary and are necessary to take care of situations such as I have just indicated.

The CHAIRMAN. I understand that, but I supposed they had the power to detail from one bureau to another. They have the right to transfer, and I should think they should have the right to detail.

Mr. HARRISON. The reason why the Secretary does not have such authority is because there is an old general law which provides that employees shall be paid from the appropriations of the bureau in which he is actually working and from none other. Now Congress has given the Secretary authority to make details to and from the office of the Secretary—that is, from any bureau to the office of the Secretary, or from the Secretary's office to any bureau. It has also given him authority to make details to and from any bureau to the library and also from the library to any bureau.

The CHAIRMAN. That is a provision of general law? Would you not prefer to have it the other way?

Mr. HARRISON. We would prefer it, of course, Mr. Chairman, but we are asking for the authority contained in the provision under discussion, as I explained to Mr. Anderson, merely because we are transferring the exhibit and information work to the Division of Publications. We are asking only what we really need. More general authority would be highly desirable and would provide elasticity which we ought to have in the administration of the work of the department.

Mr. ANDERSON. You had it once and it was abused to such an extent that Congress had to put an end to it; at least they did.

Mr. HARRISON. I do not think the department of agriculture abused the authority.

Mr. REID. We are asking this merely for the temporary detail of people for one, two, or three months to help us in the main work of preparing and showing the exhibits. That is all we contemplate by this phraseology.

The CHAIRMAN. How was this taken care of last year? Were they detailed by the other bureaus to do that particular work?

Mr. REID. The exhibit work was in the office of the Secretary; therefore he had the authority to detail from the bureaus.

The CHAIRMAN. What is next?

Mr. REID. That completes it so far as I am concerned.

Mr. HARRISON. That completes the Division of Publications.

The CHAIRMAN. Thank you very much, Mr. Reid.

Mr. HARRISON. We would like to take up next the estimates of the Federal Horticultural Board, Mr. Chairman.

Mr. RUBEY. Not this evening. Mr. Chairman, we have been here all day, and this is the last day of the session. We have been here all the afternoon.

The CHAIRMAN. Very well; the committee will stand adjourned.

(Thereupon, at 4 o'clock p. m., the committee adjourned, to meet again at the call of the chairman.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Tuesday, January 6, 1920.

AFTER RECESS.

The committee reconvened at 2 o'clock p. m., pursuant to the taking of the recess, Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. Mr. Harrison, who will we hear next?

BUREAU OF CROP ESTIMATES.

Mr. HARRISON. Mr. Estabrook, Chief of the Bureau of Crop Estimates, is here and will present the estimates of that bureau.

STATEMENT OF MR. L. M. ESTABROOK, CHIEF OF THE BUREAU OF CROP ESTIMATES, DEPARTMENT OF AGRICULTURE.

Mr. ESTABROOK. Mr. Chairman and members of the committee, the Bureau of Crop Estimates is asking for a considerable increase in its appropriation—over half a million dollars—at a time when Congress has publicly announced its policy and intention of reducing the expenses of the Government, in response to a very widespread and public demand for some relief from the heavy burdens of war taxation. Now, I assume that members of the committee, and that Congress, will want to know why, and very likely your constituents will want to know why, under the circumstances, the Bureau of Crop Estimates is asking for an increase at this time. I think there are very convincing reasons—conclusive reasons—why this increase should be made for the next fiscal year, and I should therefore like to have the opportunity to make a connected preliminary statement, before taking up the details of the bill.

First of all, I should like to answer this question, which is fundamental, and which has a direct bearing on the bureau's request for an increase of appropriation: What is the greatest need of agriculture to-day? Unquestionably the answer to that question is, to make the business of farming a profitable business. Is not that the object of every farmer in the United States—to make his business a profitable business? And is not that the object of the Federal Department of Agriculture, to make the business of farming more profitable? And so also with the State colleges of agriculture and the State experiment stations and the State extension services and the county agents, for which millions of dollars of public money,

Federal and State, are appropriated annually; they have for their primary object to make the business of farming more profitable. And when this committee recommends legislation to Congress, and Congress passes it, for the promotion of agriculture, is not the sole object of that legislation to make the business of farming more profitable? And in making the business of farming more profitable, is not such legislation in the interest and for the welfare of all the people?

It is hardly necessary to remind the members of this committee that agriculture is still the greatest basic industry in the United States, if not in the world. On the basis of present prices, and the growth that has taken place since the last census, the capital valuation of the farms and equipment in the United States is now in excess of \$80,000,000,000. No other industry in the United States can compare with it. No combination of any three industries you may select can compare with it. And anything that makes the business of farming more profitable tends to make agriculture more prosperous; and unless agriculture is prosperous other industries can not expect to prosper. It is fundamental; it is paramount.

In addition to that capital valuation of over \$80,000,000,000, agriculture is the source now and for all time to come of the food supply of the entire United States. It contributes very largely to the raw materials used in other industries. It contributes very largely to our export trade. Its annual production and increase in the wealth of the United States is in excess of \$20,000,000,000. This year it is nearly \$25,000,000,000. And so, in considering any request for an increase in an appropriation of this kind, it is necessary to bear in mind the fundamental and paramount importance of the great industry which we are trying to serve.

A second fact which this committee should bear in mind in connection with this request for an increase in appropriation is this: The farmers of this country are not rolling in wealth, as many city people have accused them of being. They are organizing more rapidly, more effectively, and more completely than at any previous time in their history. The farm-bureau movement is growing and spreading from New York westward through all the great corn belt States. They have formed State federations, and in November last they formed a national federation.

Now, what is the first thing that those organizations must have in order that they can accomplish the purposes for which they are organized? They absolutely must have dependable data with respect to the essential facts of production and supply. And in the same way the great Federal Department of Agriculture and the State colleges of agriculture and experiment stations, and the State extension services and the county agents, for which many millions of dollars of public funds are expended annually, must have essential data with respect to production and supply before they can function properly or efficiently or economically.

Agriculture as an industry, like all other industries, has two main lines of business, one production and the other marketing. The production end of the farm business has already been largely developed. The farmers have been specializing on production all their lives. They already know how to produce. They can very readily produce

in excess of the demand, as was demonstrated during the war, and all that the Federal and State agencies can do to assist farmers on the production end is to devise ways and means to produce crops more efficiently and more economically; in other words, to reduce the cost of production.

But the whole marketing end of agriculture is largely undeveloped. For half a century, more or less, these great public agencies, the Federal Department of Agriculture, the State colleges of agriculture and experiment stations, and the State extension services and county agents, which are maintained at public expense for the promotion of agriculture, have devoted their main energies to increasing production. It is only within the last six or eight years that Congress realized the necessity for developing the marketing end of agriculture, and that it has made liberal appropriations for the establishment and maintenance of the Federal Bureau of Markets, a bureau which has before it the greatest undeveloped field of any organization in the Department of Agriculture, a bureau which has the greatest opportunity for service to the farmers of this country; and it was within the same period that State legislatures have realized the importance of the marketing end of the farm business, and they also have been establishing bureaus of markets.

But before the marketing end of the farm business can be properly developed, before these great organizations for which millions of dollars are appropriated annually can operate effectively or economically, they must have essential data with respect to production and supply, because such data are fundamental.

The demand for this kind of information, for information with respect to production and supply, has been constantly increasing. That demand focusses on the Bureau of Crop Estimates. That demand had trebled and quadrupled before the beginning of the World War. It was greatly stimulated when the Great War broke out; and when the United States entered the war in the spring of 1917 the bureau was literally overwhelmed with requests for information as to the present and prospective food supply, not only of the United States, but for practically all countries of the world. The demand for that information came from the Cabinet, from Congress itself, from other branches of our own department, from the War and Navy Departments, from the Council of National Defense, the Food Administration, the War Industries Board, the War Trade Board, and a host of other war emergency organizations, to say nothing of the thousands and thousands of requests that came from business men and farmers, and State institutions, and from writers, and public men of all sorts.

In the bureau's attempts to take care of this demand with its limited appropriations, it has developed what we believe to be the most efficient organization in the entire Government service. I doubt if there is any organization in the entire Government service that can show the accomplishment that the Bureau of Crop Estimates can, with its modest and inadequate appropriations. It has already extended beyond the limit of its present resources. It can not carry on to the end of the fiscal year its present service on its present appropriation.

Now, to provide for the future and in response to specific demands which are continually coming to the bureau in increasing volume and insistence, we have prepared a systematic, comprehensive, and constructive program for the expansion and improvement of the service. Every feature of that program has been demonstrated to be entirely feasible. There is not a single item in the program that is in any sense experimental. We know absolutely what we can do. We know that our skeleton organization can be very readily expanded. We know that results of very great practical and financial value to every farmer in the United States can be obtained very shortly after the necessary funds are provided.

Now, I should like to ask and to answer a question which I think will interest the committee, which has a direct bearing on my argument, and it is this: Why and how data with respect to production and supply are absolutely necessary to make the farm business a profitable business; are absolutely necessary to enable Federal and State agencies to function properly, effectively, and economically?

The profitableness of the farm business depends upon three things. First is the production of marketable surpluses. A business can not be profitable unless it produces something to sell. Second, it depends upon the cost of production; and third, upon the prices the farmers receive. Unless there are marketable surpluses which can be sold, unless the cost of production is low enough, and unless the prices the farmers receive are high enough—exceed cost of production—the business can not be profitable. So it is vitally important that farmers shall produce marketable surpluses and that they shall do it in the most economical manner. That is the production end of the farm business, which I have said is already largely developed, and all that Federal and State agencies can do is to make production more efficient and more economical.

They can do that by bringing about better utilization of the land, the use of better seed, the use of more productive varieties, by better methods of overcoming plant diseases and insect pests, by better methods of farm management, by more intelligent use of fertilizers, and by a far greater use of mechanical power on the farm.

The third factor in the determination of whether the farm business shall be profitable or not is prices. Cost of production does not determine the prices that farmers receive at any given time. Farm products will sell for only what they will bring in the open competitive market. They will bring only what buyers are willing or are compelled to pay.

That cost of production has nothing whatever to do with the prices farmers receive in a given year is shown by the fact that large crops frequently sell in the aggregate for less than small crops. And that fact hurts the farmers. They know that.

It has been done time and time again. If you will look in the Yearbook of the department at the production of potatoes, year after year, and the farm prices of those potatoes, as I did the other day, you will note that in 1916 the potato crop amounted to about 286,000,000 bushels, and that it had a farm value of \$419,000,000. Now, that potato crop of 1916 has been exceeded 13 times; and in those 13 years of larger crops, in only 3 of them has the aggregate value equaled or exceeded the value of the small crop of 1916, and

those 3 years are the last 3—1917, 1918, and 1919, years of abnormal conditions and excessively high prices.

What does determine the prices farmers receive? It is the old law of supply and demand, which operates, like gravity, all the time and everywhere except as it may be temporarily suspended or interfered with by legislation, by monopolistic control, or by manipulation. We all know—it is elementary—that a large supply, in relation to demand, tends to depress the price, and that a small supply, in relation to demand, tends to raise the price. Now, just how that works out is very well illustrated by a formula of an old English economist named Gregory King, who lived in the seventeenth century, and his formula is almost as true, almost as applicable to present-day conditions, as it was to those of more than a century ago. Expressed on a percentage basis, it would be about like this: A 10 per cent change in the supply in relation to demand results in a 30 per cent change in the price, or as one to three. A 20 per cent change in supply in relation to demand results in an 80 per cent change in the price, or as one to four. A 30 per cent change in the supply in relation to demand results in a price change of 160 per cent, or as one to about five. A 40 per cent change in the supply in relation to demand results in a price change of 280 per cent, or as one to seven. A 50 per cent change results in a price change of 450 per cent, or as one to nine.

In other words, the price effect of a change in the relation of supply to demand is not in direct proportion; it is more like a geometrical progression; it is out of all proportion.

Now, which of those two factors, supply and demand, is variable and which is stable? The demand for agricultural products may be regarded as fairly constant. Per capita consumption does not vary perceptibly from one year to another. The total consumption tends to increase, and the demand tends to increase, with increasing population; but for all practical purposes the demand for agricultural products is fairly constant, one year with another. It is the supply that varies, and therefore the relative supply is the determining factor of prices, and prices are one of the determining factors in the profitableness of the farm business.

Mr. HUTCHINSON. Let me ask you a question. I would like to know what this has to do with the Bureau of Crop Estimates?

Mr. ESTABROOK. It has just this to do. The relative supply is the determining factor of prices which in turn determine whether the business is profitable. Now, it is the function of the Bureau of Crop Estimates to furnish accurate information with respect to relative supply.

Mr. HUTCHINSON. In respect to what?

Mr. ESTABROOK. With respect to present and prospective production and supply of all farm crops and live stock.

Mr. HUTCHINSON. How do you get at that?

Mr. ESTABROOK. If I might be permitted to complete this statement, I will then gladly explain—

Mr. HEFLIN. He asked at the beginning to be permitted to complete his statement without interruption.

Mr. ESTABROOK. I made brief reference, a while ago, to the enlarged program which the Bureau of Crop Estimates has prepared, and for which this increased appropriation is requested. Just what

kind of information does the bureau propose to furnish with respect to production and supply, and with respect to which it proposes to utilize the increase in appropriation?

With respect to crop production the bureau plans to furnish, for each State and for each county and for each recognized district of surplus production, estimates of the acreages which farmers intend to plant—and this for every crop; as to the progress of farm work, the progress of the planting, cultivating, and harvesting, and marketing, and with reference to the relative requirements and supply of seed, fertilizer, labor, insecticides, and fungicides; as to the acreages which are actually planted; as to the condition of the growing crops; as to the losses from diseases, from insects, and from adverse weather conditions; as to the acreage which is abandoned; forecasts of production; indicated yield per acre and total production.

For each of these crops the probable marketable surplus and the disposition or utilization of the remainder of the crop; the grade or quality of each crop, which largely determines its value; the amount of shrinkage and loss in storage; and the farm prices—all of these are items of information which are in constant demand by farmers and by every one who has anything to do with the buying or selling or handling of farm crops.

Now, all this information the bureau proposes to furnish with respect to each of about 70 crops, which includes about all crops that are grown, and which includes 10 crops which are not now reported upon, which have never been estimated quantitatively, and yet which have a value annually in excess of \$1,500,000,000.

There are several new features in this program of very great importance to farmers and business men. One is county estimates—data by counties. No class of information has been in more constant demand than estimates by counties. The county agents, for whom millions of dollars are expended annually, State extension services, State colleges, and departments of agriculture all need information on a county basis—

Mr. HUTCHINSON. Who knows more about it than the county agent does?

Mr. ESTABROOK. The county agent necessarily knows very little about the statistical side of agriculture in his county, although he may fully realize the need for such information. He is not a statistician, and has no training along that line, and it would be a waste of his time to make him devote it to that work.

Mr. HUTCHINSON. Can he not do it?

Mr. ESTABROOK. A few of them can do it, but not all.

Mr. HUTCHINSON. A few of them?

Mr. ESTABROOK. Yes.

Mr. HUTCHINSON. Can they not do it better than the men that you send around?

Mr. ESTABROOK. No, sir.

Mr. HUTCHINSON. I disagree with you on that.

Mr. ESTABROOK. It is not that those men are not qualified for it, necessarily, by training and experience, but they have other duties to perform which would be interfered with and rendered absolutely impossible if they undertook to do statistical work.

Mr. MCKINLEY. Is it not a fact that your bureau has been running along for a long time, and now the Bureau of Markets has taken

two-thirds of the work that you formerly did and the county agent has taken the other third?

Mr. ESTABROOK. Hardly. That is not a correct statement. These data, as I say, have been in constant demand for many years, and there is an increasing demand for them, and the information is needed by the county agents themselves. They have tried time and time again to get it, and they have failed each time.

Mr. MCKINLEY. Why have they been unable to get it?

Mr. ESTABROOK. Because most of them are not qualified by training and experience, because they were employed for an entirely different purpose, and because they had other work to perform. We can get these statistics, and we can get them for one-tenth of the cost for which they can be gotten in any other way or by any other existing organization.

Mr. MCKINLEY. From whom do you get them?

Mr. ESTABROOK. From the farmers themselves. Besides our trained field agents and crop specialists we have more than 215,000 voluntary reporters, most of whom are farmers.

Mr. MCKINLEY. Does a farmer know more than a county agent about what is going on?

Mr. ESTABROOK. He knows precisely what is going on on his own farm, and in his immediate neighborhood. You do not have to examine every grain in a carload of wheat, corn, or oats in order to get the weight or determine the grade. If you take samples you can get it in that way. That is the theory upon which this crop estimating work is done. We have the judgment of trained field agents, and crop specialists who go through every county personally observing conditions during the growing season, who interview the best-informed men in each county, and who get the best-informed men in each county to report to them; and we get the stability which comes from the use of large numbers. If you have a sufficiently large number of farmers reporting for every county, farmers who are representative of the farms which surround them, by the law of averages their estimates will balance, the over estimates will balance or offset the under estimates, and the resulting averages will be approximately correct. That has been proved thousands of times. The question of accuracy will come up later, and I will be glad to discuss it; but these county estimates are of great practical value to the county agents, to the farmers, to leaders of the State extension services, the State agricultural colleges, to all marketing and distributing agencies, as well as to merchants and business men of every description. The transportation lines need information by counties in order to provide in advance sufficient rolling stock to move the surplus crops and to know when and where to send cars and how many of them to send, which is a service of great value to farmers and to all marketing agencies.

Mr. MCKINLEY. Is not that what the \$900,000 for your bureau or the \$3,000,000 appropriated for the Bureau of Markets is used for?

Mr. ESTABROOK. No, sir.

Mr. MCKINLEY. What is it used for?

Mr. ESTABROOK. The Bureau of Markets deals with the marketing end of the business; it specializes on marketing, just as the Bureau of Crop Estimates specializes on ascertaining and verifying the statistics of farm production and supply, without which the

Bureau of Markets can not function properly or effectively or economically.

Mr. MCKINLEY. What is that about but moving crops and cars.

Mr. ESTABROOK. The Bureau of Markets can not deal intelligently with respect to marketing the crops and live stock of the United States until they know how much is to be marketed and from where it is to be moved, and that it is the function of the Bureau of Crop Estimates to tell them. That is what our organization is for. That is why it has been developed through more than half a century of experience. If the Bureau of Markets undertook to do that on its own account it would have to duplicate the organization and methods of the Bureau of Crop Estimates to do it and double up on every expense. At present they have not the necessary experience. They could get it, of course, but it would take several years for them to get it, and in the meantime it would be rather expensive to duplicate the experience of this bureau.

The next new item of information, in addition to shifting from a State to a county basis, is estimating the marketable surplus production on farms of each of these 70 crops. The marketable surplus production is the part of the crop which is sold from the farm and shipped out of the county where it is grown, enters the channels of trade, and becomes a part of the visible supply; the part of the crop which concerns all marketing and distributing agencies; the part in which consumers are interested, and it is the part of the crop which largely determines the farm price.

A large part of the criticism which has been directed against the Bureau of Crop Estimates in former years is due to the simple fact that the estimates relate to total production, of which considerably more than 50 per cent—perhaps 75 per cent—of the total production is consumed on the farm or in the counties where grown. It does not move in the channels of trade, and you can not check it except in the most general way. When the bureau estimates marketable surplus production by counties, it will be possible to put your finger right on the locality, and you can check it against shipments. The Bureau of Markets will then know where the supplies are coming from, and the transportation companies will be able to estimate exactly the number of cars needed to move these crops; and that in itself is a great service to the farmers, as you gentlemen must realize from what has happened in the last 12 months. Great losses are sustained when cars are not available to enable farmers to move their crops, or their fat cattle when in condition to ship.

Mr. ANDERSON. That was not due to the fact that they did not know when to get the cars there but to the fact that they did not have the cars.

Mr. ESTABROOK. During the last few months?

Mr. ANDERSON. Yes.

Mr. ESTABROOK. During the last three or four years it has been largely due to the fact that cars were not available; but in normal times, during peace times, when cars are available, it is quite important that the railway lines should have this information. They are spending thousands of dollars to get that very information; perhaps as much as the Bureau of Crop Estimates is spending to get it.

Mr. HUTCHINSON. How often will you make these reports?

Mr. ESTABROOK. Monthly. Thirdly, the next new item of information relates to the intention of farmers to plant before the planting season begins. Now, of what use is that information? It is information which will be worth thousands and thousands of dollars to the farmers of this country, because if it appears that too much or too little acreage of a particular crop is going into the ground the farmers want to know that before it actually goes into the ground in order that they may modify their plans and make proper adjustments. It is entirely feasible. The bureau did it for two years during the war for the information of the Secretary and the administrative officials of the department; and those estimates checked up to within 1 or 2 per cent of the final estimates.

Next, estimates by varieties. It is highly important to show the relative productivity of different varieties of a crop. It is information that would be very valuable to every farmer, and it is information they are entitled to have.

Grade or quality is of very great importance some years. We all know that in some years of large production, because of adverse weather conditions before or at the time of harvest or shortly thereafter, the quality—the merchantable quality, the value—of some crops has greatly deteriorated. It has happened this year with the cotton crop. It happened a year or so ago with the corn crop, and a few years ago it happened with the wheat crop; and the bureau was severely criticised for not reporting the quality and the extent of damage; and we propose to do that in future if sufficient funds are provided.

Abandoned acreage is an item of information which is valuable in some years. It was important this last year with regard to cotton. It has been reported in the past only with respect to winter wheat. For other crops the bureau in the past has made allowance for abandoned acreage by showing a smaller average yield on the entire acreage planted. But that is not sufficient.

It would be far more satisfactory to show the acreage planted, the acreage abandoned, and the correct average yield on the acreage actually harvested. But without the necessary funds and facilities, we can not do these things.

Shrinkage and loss in storage is quite an important matter. It relates directly to the supply, which is the price-determining factor. For such a crop as potatoes, shrinkage or loss after harvest and while in storage is quite considerable in the aggregate; and should be known. And so with some other perishable products.

Information with respect to the requirements and supply of seeds and of fertilizers, of farm labor, insecticides and fungicides, is of value to the farmers of the country, because those are essential factors in crop production; and while such information does not add to the supply, it does show where the supply is located; it brings about a better and more equal distribution; it tends to equalize prices; and it is information that should be available.

Now, with respect to live stock—and this branch of our program is perhaps the most important part of it, because no feature of the work of the Bureau of Crop Estimates is less satisfactory, less valuable, or more faulty, than the live-stock reports of the bureau, and no one knows it better than the bureau itself. Here is an

industry which represents a farm value in excess of \$10,000,000,000; it represents the present and future meat supply of the entire population; it represents a long-time industry which takes several years to bring about necessary adjustments; it is an industry which contributes very considerably to our export trade; it is an industry which represents more than 50 per cent in value of all sales from farms; it is an important factor in economical farm management, the utilization of forage, roughage, and waste products, and in the maintenance of soil fertility—a most essential factor of profitable farming—and yet for this great industry, amounting to more than \$10,000,000,000—and there are few industries in the United States which equal it—the Bureau of Crop Estimates has available less than \$25,000. Gentlemen, it is absurd. Twenty-five thousand dollars in each State would not be too much, when you consider the size of the industry and its importance and its value; an industry concerning which you can not find any statistics of value between census years except the meager information which the Bureau of Crop Estimates has attempted to supply one a year; once a year the total numbers; once a year the number of brood sows; once a year the total losses.

The bureau has never attempted—has never been in a position to attempt—to estimate dairy or poultry production, two items which together have an annual value in excess of \$3,000,000,000. And the Bureau of Crop Estimates has less than \$25,000 with which to do that work. Is there a corporation in the United States with a business of one-tenth of that amount that would not spend more money than that on its bookkeeping?

What does the bureau propose to do with the increased appropriation for the great live-stock industry? It proposes to show for the United States, for each State and for each county, monthly or as often as may be necessary, the number of horses, mules, dairy cows, beef cattle, swine, sheep, goats, and poultry; and in January of each year to show the number of each kind by sex and by age classifications corresponding to those of the census, that is, the number of each sex below 1 year of age, from 1 to 2 and from 2 to 3 years, and so on; and the number of pure-bred animals of each kind; so that we may know the breeding strength and quality of the live stock of this country; and monthly thereafter to show the changes in number that take place, how many animals are bred, how many are born, how many are purchased or brought onto the farm, how many are sold, how many are slaughtered, and how many are lost from disease or various causes; and the net number of each kind of animal remaining on the farms.

Mr. JACOWAY. I wish you would permit me to ask you just one question there. I will make it short.

Mr. ESTABROOK. Yes.

Mr. JACOWAY. It has been argued for years that the sort of information you gather, put in the hands of these monopolistic organizations that you speak of, gives them an advantage, whereas the people who pay for it all do not get the benefit of that. Is that true?

Mr. ESTABROOK. There has been some foundation in the past for that general belief because members of exchanges and boards of trade, speculators, and representatives of combined interests were

in a position to make quick use of the information, while individual and isolated farmers could not; but as I see it, the farmers' organizations are going to remedy that situation. They are appointing capable leaders and employing competent business managers, and those men are utilizing that information and passing it out to their members, so that the farmers can use it just as well as the speculators, the packers, or other combined interests. Without the unbiased and dependable Government crop reports producers would be at the mercy of the buyers, speculators, and big concerns, who have their own agencies for collecting information, and who would then be free to issue false or misleading reports to serve their own special interest.

Then we want to show the number of animals on feed; the condition of live stock, monthly; the whole feed and forage situation, present and prospective; number of silos and the quantity of silage; condition and carrying capacity of meadows, pastures, and ranges; because the feed situation is highly important with respect to the live-stock industry. It becomes very important in years of deficient moisture and continued drought over large areas in the West, when it becomes necessary to move live stock out, or to ship in feed in order to save them. The bureau proposes to make forecasts for live stock just as it does for crops; forecasts of swine production and sheep production, and forecasts of dairy production, meat production, poultry production, hide production, and wool production. It can be done with a high degree of accuracy; and, of course, the bureau will report on prices received by growers.

Mr. PURNELL. What work is being done by the individual States along that line, if anything?

Mr. ESTABROOK. No State is attempting to do what we have outlined in our enlarged program. Many States are doing more or less crop and live-stock reporting. Perhaps half a dozen States have been attempting to do crop-reporting work in recent years. During the last two years the bureau has entered into cooperation with 15 out of the 48 States to issue cooperative State crop reports, combining all our resources in order to eliminate the duplication of effort and unnecessary expense and to improve the service in those States; so that we can say that 15 States now have this cooperative system. That includes all the great corn-belt States except Kansas. Kansas is one State which still has its own independent crop-reporting system, although even in Kansas there is close cooperation with the Bureau of Crop Estimates.

Mr. RUBEY. A few days ago I received from the secretary of the State department of agriculture of Missouri a complete statement giving the estimates of the various crops raised in the State in 1919—wheat, corn, oats, all sorts of grains, live stock, and hogs—a detailed statement. Does your department assist him in getting up that estimate, or did he get that up through a Missouri organization?

Mr. ESTABROOK. That was done by the Bureau of Crop Estimates, through its field agent. A little more than a year ago we entered into a formal cooperation with the State department of agriculture in Missouri. Their own system was discontinued and our system was taken up. They gave us office space and clerical assistance. Our field agent took charge of the organization and has developed

the work, and it is proving highly satisfactory not only in Missouri but in all States with which we are cooperating in the same way.

Mr. RUBEY. That work, then, is the result of your organization?

Mr. ESTABROOK. Yes; our officers work in cooperation with the State officials. We combined our resources and facilities with those of the State. That is one State where county estimates were possible, because more data were available there than in many States in which the State department of agriculture had done no work along that line.

Mr. HUTCHINSON. Do I understand you that that was for 1919, Mr. Rubey?

Mr. RUBEY. Those figures were for 1919. It was an estimate of what had been raised in Missouri during the year ended December 31, 1919.

Mr. HUTCHINSON. It must have been an estimate.

Mr. ESTABROOK. They were absolute estimates, you know.

Mr. RUBEY. You know and I know that they could not tell absolutely how many bushels of wheat were raised at that time.

Mr. HUTCHINSON. It was a thing of the past, was it not?

Mr. RUBEY. No; it was issued in December, for the year 1919, and the year 1919 did not close until the 31st of December.

Mr. ESTABROOK. This map which I have here shows the 15 States in which such cooperation is now in force.

The next most important subdivision of our program is with reference to foreign crop and live-stock production. Great interest has developed since the World War, among farmers and business men, in the foreign situation. They have now come to realize that the law of supply and demand is not limited to any particular county or State, or even to the United States. It is world-wide and the prices of some American products are greatly influenced, if not determined, by the foreign situation. It is proposed to issue all obtainable information with respect to acreage and production of foreign crops and live stock, especially for countries of surplus production, in competition with the farm products of the United States, and to prepare regularly, perhaps quarterly, world balance sheets showing per capita consumption and requirements of each country, acreage, production, surpluses and deficits, net imports and exports, and the world balances, whether it be a shortage or a surplus.

Mr. MCKINLEY. Is not that contained in the communications of the International Institute of Agriculture at Rome, Italy?

Mr. ESTABROOK. The International Institute of Agriculture at Rome, Italy, does some such work as that; but, like many institutions of the kind, it is rather cumbersome; it does not act quickly enough for American farmers. It does not get all the information. It gets only such official information as the adhering countries or members of the institute may furnish.

Mr. MCKINLEY. Then we are wasting our money in making appropriations for that purpose?

Mr. ESTABROOK. Not necessarily; the information they supply is of value, and the institution itself is doing good work in bringing about better organization in many foreign countries for obtaining statistical information. It is only those who have to deal with the statistics of agriculture in foreign countries who have any conception

of how absolutely unreliable some of them are. The mere fact that they are published in the form of figures does not mean much, and it is necessary—

Mr. MCKINLEY. How do you get that?

Mr. ESTABROOK. And it is necessary to bring together information from all sorts of sources.

Mr. MCKINLEY. How do you get that information?

Mr. ESTABROOK. We get information not only direct from the International Institute of Agriculture—the Bureau of Crop Estimates is the official channel of communication with the institute—but we get directly from all Governments their published statistical reports. We have in our bureau—

Mr. MCKINLEY. You say that that is likely not to be correct?

Mr. ESTABROOK. Yes; that is true. We have to know the degree of correctness, so far as we can ascertain it, and we get all of those reports; but those reports are very slow in being issued; very slow in being printed. They are historical, mainly, when they reach here.

As a matter of fact, the United States Government could very well afford to place competent representatives of the Bureau of Crop Estimates in every country of surplus production, to ascertain at first hand the changes that are taking place in regard to crops and live-stock production there which is in competition with the products of the United States and that is a field for development in future. We have not asked for that in our present estimates of appropriation. We think it is more important this year first to develop the system right in our own country; but, unquestionably, that is what we should have. That is what an \$80,000,000,000 industry is entitled to have—competent and well trained men in Canada, Australia, Argentina, India, and Russia, watching what is taking place, sending by wireless, by telegraph, immediate information, so that the American farmers and business men shall have the benefit of that information which is often of vital importance in their business.

Mr. HUTCHINSON. Would the speculators have any advantage of it?

Mr. ESTABROOK. Surely they would.

Mr. HUTCHINSON. Would not they have more advantage than anybody else?

Mr. ESTABROOK. Not necessarily. When these farm organizations are fully developed, as they are developing now; when they get men just as bright and just as competent as any speculator; when that information goes in—

Mr. LEE. Very often the speculator has the information anyway, and the farmer has not.

Mr. ESTABROOK. Yes; the speculator profits only by the fact that the farmers have not the information that he has; that he has it and the other people have not got it; and it is the business of the United States Government to see that the farmers have the information as quickly and as accurately as the speculators. They are entitled to it.

Mr. MCKINLEY. I heard Jim Patten, the greatest wheat speculator in the United States, make the statement before the committee the other day that your estimates were not any good; that he never pretended to depend on them.

Mr. ESTABROOK. It is frequently to the interest of speculators of the United States to discredit the reports of the Bureau of Crop Estimates. Nothing pleases them more than to have anyone question the accuracy of those estimates. And I will say this, gentlemen, that since my connection with this bureau there has been only one important or influential request that a crop report be suppressed. It came from the officials of the greatest exchange in the United States. It came in the spring of 1917, when the greatest disaster which ever overtook the wheat crop had taken place, when over 12,000,000 acres of the winter wheat was abandoned, and the speculators knew that, and they had, in all probability, sold to the Allies far more wheat than was in existence, and it would have been worth millions of dollars to them probably if they could have suppressed the Government's crop report showing the facts; but no attention was paid to that demand, which came by telegram. And so, of all men, the speculator is the one man who would like to have the Government crop reports suppressed or discredited. Speculation thrives upon, it has its very foundation in, uncertainty; and the very best curb upon speculation is an accurate, dependable, unbiased, authoritative set of data with respect to supply, and pitiless publicity. It will do far more than any law you can pass.

Mr. HUTCHINSON. Do you remember your estimate of the spring wheat crop last July?

Mr. ESTABROOK. I do not recall it. I do not attempt to carry in my head the details of all the estimates monthly for over 60 crops and 8 classes of live stock, any more than the accountant or the statistician for a large corporation would attempt to carry in his mind the details of those accounts.

Mr. HUTCHINSON. Are your estimates always of the same correctness that that was?

Mr. ESTABROOK. The estimates are all made in accordance with the same system. They are all comparable, and the data is all on file in the bureau, and it will be gladly furnished if you desire it.

Mr. HUTCHINSON. What I am trying to get at is whether your estimates are always as near to the facts as your crop estimate of last July?

Mr. ESTABROOK. The estimates check out very accurately whenever we have dependable data with which to check them, which is the case with only a few crops.

Mr. HUTCHINSON. Do you not have dependable checks at the end of the season?

Mr. ESTABROOK. No, sir; not dependable checks. Dependable checks are not always available, contrary to the general belief.

Mr. MCKINLEY. Do you not believe you would get them if you had more confidence in the county agents?

Mr. ESTABROOK. No, sir; it has been tried repeatedly and demonstrated that county agents can not be relied upon for them.

Mr. MCKINLEY. The county agents in many cases have been in the service more than three years.

Mr. ESTABROOK. In many places they have been employed more than three years.

Mr. MCKINLEY. I was thinking about down in Alabama.

Mr. HUTCHINSON. The county agents are on the ground all the time?

Mr. ESTABROOK. Yes.

Mr. HUTCHINSON. Your people only get around once a month or once year?

Mr. ESTABROOK. The farmers—215,000 of them—who report to the Bureau of Crop Estimates, are on their farms all the time, and know what is taking place on their farms, and know a good deal about what is taking place on their neighbors' farms.

The CHAIRMAN. Do you claim that the county agents know nothing about what is taking place on the farms?

Mr. ESTABROOK. No, sir; I would say that the county agent is regarded as perhaps the best source of certain kinds of information in his county. The county agent knows methods of cultivation, methods of handling seeds, fertilizers, and best methods of cultivating, harvesting, and marketing crops; in other words, the best methods of farm management, which the experience of the best farmers and the investigations of the Federal Department of Agriculture and the State colleges of agriculture and experiment stations have shown to be the most successful. He does not necessarily know about statistics.

The CHAIRMAN. What are the functions of these men?

Mr. ESTABROOK. County agents furnish most valuable information to the Bureau of Crop Estimates.

The CHAIRMAN. I have heard them lecture on the quality of corn, on how to select seed corn; yet you say they do not know anything about crops.

Mr. ESTABROOK. But that has nothing to do with the statistical side of crop production in the county. A man should know all about it to try to—

The CHAIRMAN. They could not estimate whether the crop was 20 bushels or 50 bushels or 100 bushels?

Mr. ESTABROOK. I might make this clear to you gentlemen: We have had more experience than anybody else with county agents with reference to crop estimates. I am talking about the statistical side of the question. Now, theoretically the county agent is the best man in the county—the best qualified to supply crop estimates. Everybody thinks that, everybody believes it, who has not been up against the practical end of it, which is something quite different from the theory. The bureau has tried it out repeatedly. What was the result? The estimates were uniformly too high. Why? Because the county agent, to be a successful county agent, has got to be an enthusiast. He has got to be an optimist. He is not worth his salt if he is not. He can not induce other men to adopt other and better practices and methods unless he really believes that certain methods are going to give the greatest production and the most profitable results. That is what he is paid for. That is what he is thinking about. That is his mental attitude, and, besides, he is dealing with the more progressive farmers in his community. He sees the best crops in his community. And when you ask him "Has the acreage of this, that, and the other crop been increased?" or "Is there more live stock on the farm this year than last year?" he will say "Yes," of course. So that statistically the county agent is not the best source of information.

Mr. MCKINLEY. Do you not think that a county agent, continually impressed by the farms of his county in riding around over the county as he does, would know more and have more accurate information than you would get in 10 reports from 10 of these farmers in the county?

Mr. ESTABROOK. If he is the right sort of man, yes; far more, but not all of them are the right sort of men—close observers and statistically inclined. It is the business of our field agents in the States to become acquainted with each of those county agents, and to know from which of them helpful statistical information can be secured; and they do know that. We utilize them so far as it is practicable to utilize them to advantage.

Mr. HUTCHINSON. Do you pay the farmers for the information you get from them?

Mr. ESTABROOK. No, sir.

Mr. HUTCHINSON. I see that in this appropriation you ask for \$225,000 for traveling expenses.

Mr. ESTABROOK. Yes.

Mr. HUTCHINSON. Do you not think that the county agents can go to those farmers and get information just the same as you can by sending a man out in that way?

Mr. ESTABROOK. No, sir, I do not; but I will be glad to discuss this question when we come to the individual items of the appropriation estimates.

The CHAIRMAN. I should think that the county agents would be chosen for that work.

Mr. ESTABROOK. My statement, Mr. Chairman, is not to the effect that they do not know about crops. They do, decidedly.

The CHAIRMAN. The county agent is an expert. He goes into the field and counts the rows of corn; he is an expert on that line. If you want expert information, you would naturally go to the county agent. They are experts, and they are excellent men.

Mr. ESTABROOK. If the department will turn over the entire force of county agents to the Bureau of Crop Estimates we will train them in our work and utilize them to splendid advantage.

The CHAIRMAN. A half an hour a day so far as that is concerned would take care of that proposition. A stenographer could attend to sending out these reports with the assistance of the county agents—you would have some information that would be of value. You have just criticized your service, but you have not pointed out how you are going to improve it, except that you are asking for more money so that you can send more agents into the field to get information that, according to the information we have before the committee, is now being gotten by the county agents.

Mr. ESTABROOK. The bureau does and will utilize the county agents so far as they are available for that purpose.

The CHAIRMAN. If they are made available, you would not need any additional force, would you?

Mr. ESTABROOK. Yes; certainly additional funds would be needed. No class of men, no matter how well qualified, can work efficiently and economically on a uniform basis except under proper instruction and supervision, and a large increase in clerical force would be required to tabulate and summarize results.

The CHAIRMAN. Do you think they could devote their services to any better advantage than to furnish that information?

Mr. ESTABROOK. I think so. I think the county agents form a channel of communication between the Department of Agriculture and the State colleges and experiment stations and the individual farmers and farm bureaus. They bring directly home to the farmer the results of all the investigations which are carried on by trained specialists of the Federal Department of Agriculture and the State colleges of agriculture and experiment stations, where many millions of dollars that Congress and the State legislatures appropriate annually are spent.

Mr. JACOWAY. Is not this your proposition: That the county agent can not discharge the duties of a county agent and at the same time perform the duties of a statistician?

Mr. ESTABROOK. Absolutely. He has his hands full with something else, he is trained for something else, and he is employed and paid for something else.

Mr. MCKINLEY. Is it not a fact that these county agents on the average are paid twice as much as your field investigators, and would it not stand to reason that they would know twice as much?

Mr. ESTABROOK. No, sir; not necessarily. Our field agents should be paid more, but unfortunately they are not. I think county agents earn every dollar they get, but because some of them earn larger salaries than others does not imply they know more—it indicates that the farmers who agree to pay the higher salaries are better business men than in some other counties.

The CHAIRMAN. Your office could compile the statistics if the agents could furnish them. They would devote their time to it as well as these farmers who work for nothing. You can not expect the farmer to go out and make a general survey when you have never paid him a cent and do not intend to pay him, although he may be just as intelligent and just as much of an expert on crops. These agents, with experience and college education and training, are naturally expected to know a little more about the general situation than any one man who is confining his activity to his own farm and its vicinity. You can not expect the farmer to run all over the county in his automobile to inspect crops and make reports on them. It is the business of the county agent to get information.

Mr. ESTABROOK. Probably it would be possible to utilize all the time of the county agents, if Congress is willing to direct that all the time of the county agents shall be devoted to getting this information. It is impossible for them to furnish all the data required without seriously interfering with their present duties.

Mr. RUBEY. Mr. Chairman, may I just make this statement: I have been listening to these hearings ever since they commenced, and I have been wondering what sort of a man a county agent would have to be to do everything and accomplish everything that would be required of him if he were called upon to do the various duties concerning which different witnesses before this committee are asked "Can not the county agents do that?" There has hardly been a man before this committee upon any proposition who has not been asked somewhere during his testimony "Can not the county agent do this and that and the other?" You would have to increase his time and

give him 48 hours a day, instead of 24, and let him work all the time, in order that he might do all those things.

This gentleman here says that a county agent could become a statistician; that a county agent could make a report of all the crops of the county. And he could, provided he gave his entire time to that. I take it, however, that a county agent who goes out over the county, day in and day out, is not going out for the purpose of getting an estimate of a crop but to do all he can to encourage production, to get men to farm better, to diversify their crops, and to do this and that and the other; he does not go out for the purpose of making an estimate of how many sheep are raised on every farm in every township in his county. So I take it that if we keep on and put all these duties on the county agent, we had just as well abolish the Department of Agriculture and turn it all over to him.

The CHAIRMAN. It is true that that question has been asked. We have been trying to find out whether the county agents could possibly handle some of these activities. I know what they are doing in the country, of course.

Mr. RUBEY. You know what they are doing and I know what they are doing in the counties. I do not know that it is necessary to put into the record here what the county agents are doing. We will get to that, possibly, before these hearings are over, because we get something from everybody.

The CHAIRMAN. We find that they send three or four employees at the same time into a county that has a county agent to duplicate work. Upon investigation we find we have two or three other men from some other bureau or bureaus traveling in the same county, sometimes duplicating the service. I know of one case where three offered their services on a proposition. I am trying to find out something about this duplication of work. We have this machinery, and now we are asked to provide more machinery. We are told that what we have is not sufficient to handle the simple proposition that the farmers do without any compensation.

Of course, if they are going on as they have gone in the past, gathering information that department has admitted is inadequate, we had better discard the whole thing. If you want to furnish real information, then get an expert on the work. You do not propose to send out trained men. You have not got them. What you need is an expert; and the county agent is an expert.

Mr. EASTABROOK. We propose to employ experts, crop specialists and field agents who are also statisticians. That is a part of the estimate that comes under the items we propose.

The CHAIRMAN. Statisticians?

Mr. EASTABROOK. Not necessarily.

Mr. HARRISON. Trained agriculturists; we have them now.

The CHAIRMAN. Are not your county agents trained agriculturists?

Mr. HARRISON. Of course they are.

Mr. EASTABROOK. I can not speak authoritatively of the county agents. They form no part of the Bureau of Crop Estimates. They come under the State's Relations Service and full information concerning them can be obtained from representatives of that service when they appear before this committee.

The CHAIRMAN. Does your bureau cooperate with others bureaus in the department?

Mr. EASTABROOK. We do, so far as we can.

The CHAIRMAN. You say you do. What is your cooperation?

Mr. ESTABROOK. We cooperate in this way: Our State field agent, the trained, experienced man, who, before he can get a position at all, must have had five years' practical experience in farming, who also has his agricultural college education, and who at the present time has had three to five years' practical experience in the statistical end of crop reporting, travels over his State, and probably one of the first men he goes to in each county is the county agent. If the county agent is at all statistically inclined, if he is a good observer, if he really knows about his crops as he ought to know them, our field agent gets orally full information from him. It is said in the States Relations Service that the county agent has not the time to fill out written reports. Our agent gets them orally from the county agents, and in that way visits them all and gets the benefit of their first-hand knowledge.

He also obtains from the county agent information as to who are the best-informed and most intelligent farmers in this, that, and the other part of the county. He gets the names and addresses of these farmers, and just where they live, and then he goes to see some of these men and gets some of them to agree to report monthly to him, so that if he is unable to get into that county every month during his absence he will have a report showing what changes have taken place in crop production. In that way we are utilizing the county agents so far as they can be utilized.

The CHAIRMAN. The county agent travels about every day, while these men of yours get around only once a month.

Mr. ESTABROOK. Our men get around, of course, perhaps once a month or once in three months only in a particular county; but after one of those men has been around and then comes back after a month and does that month after month and year after year, he knows how that crop ought to look by the month of June or the month of July or the month of August. He knows whether it is better or worse this year than it was last year or the year before. He becomes personally a trained judge of crop conditions; and then he utilizes the best men he can find in the county and takes their reports.

The CHAIRMAN. Is it not a fact that the county agent goes all over the country; he is on the go every day; he gets into every place in the county in covering his county? Of course, the county agent would not drive over the county without observing the condition of the crops. He could not do it. That is his whole interest. He is the best informed and the most capable of passing upon the condition of the crops.

Mr. RUBEY. I take it that the county agent is the man who would probably be the very best man in the county to give you a statement along generalities, as to the condition of the crops over the county; but that is an entirely different thing from giving a detailed statement of how many acres of corn and how many acres of wheat, and this, that, and the other crop, is all over the county, and its condition, and all that sort of thing. I take it that the county agent is a very valuable man to get information from a general standpoint; but

when it comes right down to the details, he could not give that information unless he devoted his entire time to it.

Mr. JONES. Then, how could the Federal agent get it in one day?

Mr. McLAUGHLIN of Nebraska. He does not get it in one day. Is it not a fact that the expert does, in many instances, get his information from the county agent and from him only?

Mr. RUBEY. As a rule he does get information from him; but this department, as I take it, has four or five of these men in each county, each of whom gives an estimate of the condition in his immediate neighborhood, and then he takes those statements, and the general statement of all those statements together, and makes out his estimate of what may be raised in that county.

Mr. JONES. Do you mean to say that the county agent could not take those reports that he gets from those five or six men and make a fairly respectable report to the department?

Mr. RUBEY. If he was required to make the estimate from those reports, he could; but in the meantime he would be neglecting a whole lot of things that he ought to be doing.

Mr. JONES. Not if the Federal agent takes the same time that it is said it takes him to do it.

Mr. MCKINLEY. If you get the amount asked for, how many field investigators would you have in Iowa?

Mr. ESTABROOK. If you will excuse me, that is a part of the details of the estimate itself, and I would very much prefer not to take that up in my preliminary statement, but to do so when I get to it, item by item, if the committee will permit me to proceed. I had said that this enlarged program included a very largely increased crop reporting system, a greatly enlarged live-stock reporting system, and an improved system of foreign crop and live-stock reporting.

There is another thing I want to mention in this connection: The bureau already has what is said to be the most complete collection in the world of statistics relating to agriculture. It has a vast amount of information of great practical value which is not available to the public simply because the bureau has not a few competent statistically trained men to go through that material, to select out the essential portions of it, and to shift the wheat from the chaff and present the results in readily understandable form to the public.

The last subdivision of our program relates to the more complete summarization, analysis, interpretation, and presentation of agricultural statistics, not only accurate and complete data in tabular form, but brief text summaries and full illustrations by means of maps, graphs and diagrams.

This matter of presentation is highly important. Those statistics should be illustrated by maps and diagrams so that the essential facts will be presented in striking form, and can be readily understood, and so that they will economize the time of all those who have occasion to use them.

Now, the next question which logically follows is, who will benefit from the expanded and improved service which the bureau proposes to render with this increase?

Mr. HUTCHINSON. Mr. Moon is here to make his statement. Will you require all the afternoon?

Mr. ESTABROOK. At the progress I am making it is going to take several hours.

The CHAIRMAN. It will probably take all the afternoon?

Mr. ESTABROOK. Yes, sir.

Mr. JONES. This is your general statement.

Mr. ESTABROOK. My general statement regarding the essential reasons why the crop and live-stock reporting service of the Bureau of Crop Estimates should be expanded and improved and why additional funds should be provided by this Congress for the next fiscal year.

The CHAIRMAN. Will the committee hear Mr. Moon to-morrow?

Mr. RUBEY. What is Mr. Moon to appear about?

The CHAIRMAN. In the interests of nursery stock. Without objection, it is understood that we will hear Mr. Moon after Mr. Estabrook completes his statement.

Mr. RUBEY. Make it to-morrow; then he will not have to wait all the afternoon.

The CHAIRMAN. We will hear you to-morrow, Mr. Moon.

Mr. ESTABROOK. Who will benefit from this proposed expanded and improved service?

First of all the farmers of the United States, and there are probably 14,000,000 of them, 14,000,000 adult male voters, and most of them taxpayers. Every one of them is interested in making his private business of farming a profitable business, and the information which the Bureau of Crop Estimates supplies and proposes to supply has a direct bearing on his individual business. Those 14,000,000 farmers have a capital investment, as I said before, worth over \$80,000,000,000, and their annual output has a value in excess of \$20,000,000,000. It will be hard to pass any legislation which will benefit a number of men at all comparable with the number of farmers in these United States. They will benefit from this information practically and financially, individually and collectively, and they are entitled to this service which the Bureau of Crop Estimates proposes to render.

Next, the farming organizations which are developing absolutely must have this kind of information. They will get it either from the Bureau of Crop Estimates or they will attempt to get it on their own account, and the moment that they attempt to get it on their own account, it will cost them and it will cost the farmers ten times the proposed cost of this improved service.

The CHAIRMAN. Have these organizations of which you speak made any request for this service?

Mr. ESTABROOK. The National Federation of Farm Bureaus, which was formed in Chicago last November, passed a resolution recommending to Congress the principle that adequate appropriations should be supplied to the Bureau of Crop Estimates. The Federation of Farm Bureaus in the State of Iowa is strongly in favor of giving adequate support to the Bureau of Crop Estimates. The Federation of Farm Bureaus of the State of Illinois in the same manner has indorsed this proposition.

The CHAIRMAN. Our trouble has been in explaining to the farmers why we spend so much money. I do not know whether they want this appropriation increased or decreased.

Mr. ESTABROOK. It is assumed, Mr. Chairman, that in reducing the expenses of the Government, something which ought to be done, it is a policy which we all favor, it is the right thing to do, but in doing

it is assumed that you business men on this committee will use the same discretion, the same discrimination, and the same business sense that you would use in your own private business in bringing about that reduction. Now, if it was your business in which you were trying to cut down expenses, or the business of any other member of this committee, what would you do? You would cut out the least profitable portions of your business. You would cut out the portions of the business which were resulting in a loss, and if there was a part of your business that was highly profitable, promising larger returns than any other branch of it, you would not hesitate to increase the investment in that particular branch.

Mr. McLAUGHLIN of Nebraska. What particular branch of the Department of Agriculture would you recommend cutting down?

Mr. ESTABROOK. That is for the committee to determine. It would be highly embarrassing for me to express any opinion. But I think the committee right here just for a moment might consider what parts of the Department of Agriculture are most directly related to the business end of farming—markets, crop estimates, farm management. The remainder of the department is doing splendid work in connection with the production end of agriculture and regulatory work of the department, but in the Department of Agriculture these three bureaus—the Bureau of Markets, with its great undeveloped field, its wonderful opportunity for service, for serving the farmers in a financial way; the Bureau of Crop Estimates, which supplies the essential facts of production and supply which the Bureau of Markets must have before it can function properly and effectively; and the Office of Farm Management, which specializes on the farm business as a business just as efficiency experts specialize on other lines of business, the branch of the department which is directly concerned in cost of production studies and in the planning and arranging of the farm business on the most profitable basis—those three branches of the Department of Agriculture are directly concerned with the business end of farming.

These organizations that I have spoken of as developing so rapidly in the corn-belt States are all business organizations. They are not social organizations at all. They are organized for business, to make the business of farming profitable, and that is why in their first annual convention, when they organized, among the first resolutions they passed was one recommending the securing of adequate appropriations for those three branches of the Department of Agriculture, Markets, Crops Estimates, and Farm Management. Now that is not a direct answer to the question the gentleman asked, but it throws light on it.

So in answering this other question, who will benefit from this improved service? I say, first of all, the 14,000,000 farmers of the United States; secondly, their great organizations which are developing and just preparing to get busy. Next the Federal Department of Agriculture.

The CHAIRMAN. How do you figure that there are 14,000,000 farmers? Are there not only 7,000,000?

Mr. ESTABROOK. In this way, Mr. Chairman. There are now about 7,000,000 farms, about 7,000,000 farm owners, and the farm helpers number about 7,000,000 in addition. That was about the proportion

of the last census, six and one-third million farm owners and six and one-third million farm hands.

The CHAIRMAN. You include the farm hands?

Mr. ESTABROOK. Yes. It seems to be the consensus of opinion that there are about 7,000,000 farms now.

After farmers and their organizations comes the Federal Department of Agriculture, for which more than \$33,000,000 are expended annually. That department in the formulation of constructive programs and policies, in laying out its work intelligently, relies and must rely very largely upon the statistical data collected and supplied by the Bureau of Crop Estimates. That statement applies to practically every branch of the Department of Agriculture. Some of them do not realize it. Some do.

Mr. HUTCHINSON. You say that with crop estimates a man would lay out his plans for 1920. Is he taking last year's estimate?

Mr. ESTABROOK. No; not altogether.

Mr. HUTCHINSON. What is the information he gets before him?

Mr. ESTABROOK. By formulating constructive programs and policies I mean this. I will try to explain it. Do you not suppose that every branch of the Department of Agriculture asks itself, What is the most useful line of inquiry? What should any branch of the department, what should the whole department recommend and advise the farmers to do with respect to planting crops next year?

Mr. HUTCHINSON. Do you do that?

Mr. ESTABROOK. We did do that for two years during the war. Anything of this sort, of course, requires the most complete and comprehensive and the most accurate statistics obtainable with reference to the production and supply through a period of years, not only in the United States but for every competing country in the world. I mentioned a moment ago in our project for foreign crop statistics the preparation of world balance sheets, bringing right down to date the requirements, the production, present and prospective, the probable surpluses and the deficits, the net balance for the world, whether it be cotton, wheat, or corn. These organizations, the Federal Department of Agriculture and the State colleges need that information.

Our bureau prepared such statements a year ago. We attended the meeting of the presidents of the colleges of agriculture over at Baltimore a year ago, and one of the statements was read. A number of those college presidents, including Dean Davenport, of Illinois, jumped up and said, "That is the information which the farmers want, which the colleges want, and if the Department of Agriculture has got it, get it out and publish it." We do not have the money to do it, although we did get out one statement last year. That kind of information is the correct basis and the only proper basis for constructive programs and policies.

Mr. HUTCHINSON. Out in my country now fatted calves bring only 10 cents a pound. They claim that they can not sell any meats. Can you give any solution as to why meats are going down to 10 cents a pound?

Mr. ESTABROOK. I would not attempt to give it offhand, but, if we had the proper statistical data before us, that would be perfectly clear.

Mr. HUTCHINSON. This is recently. I can not understand why fattened calves should go down to 10 cents a pound, when recently they have been bringing 20 cents.

Mr. ESTABROOK. Without this kind of data the farmers and every one interested in farming are groping in the dark. You do not know. Of course you do not. You have not sufficient information.

Mr. HUTCHINSON. I do not see how the department can get it; if people will not eat meat, the department can not help it.

Mr. ESTABROOK. I have said that every branch of the department needs this information. The Bureau of Markets needs it for its marketing program. It can not turn a wheel without it. It has to get information relative to marketable surplus production on farms, present and prospective, from Crop Estimates.

The States Relations Service, connecting up with the State agricultural colleges and the county agents, needs this information for the proper organization and program of work of the county agents.

Plant Industry needs it with respect to different varieties, farm practices, rotations, the methods which are followed in different States with respect to preparation of soil, planting, cultivation, and harvesting of different crops and especially with respect to the presence and the kinds and locations of plant diseases and the extent of damage. So also with the Bureau of Entomology, with respect to the kind and the location and the extent of damage of different insect pests.

The Bureau of Animal Industry needs this information, every item of it, which I mention in our program for live-stock reporting. They are groping in the dark unless they have it and it is simply unavailable anywhere in the world to-day. We will get some information out of the next census, but it will cover only a part of the ground. They especially need accurate information with respect to the number of each kind of live stock on farms, by age and sex classifications, the number of purebreds, the monthly changes in number, births, deaths, sales, and farm slaughters, and the entire feed situation, number of animals on feed; and forecasts of production, especially swine and sheep; as well as full statistics of dairy and poultry production.

The State colleges of agriculture, the experiment stations, the extension services, and the county agents all need information of the same kind and for the same reason, only they need it more than the Federal Department of Agriculture needs it. Without that information they can not function properly, effectively, and economically. They are groping in the dark without it, and they have no means of getting it on their own account because if they got it it would be only fragmentary. It would relate only to certain States, and the law of supply and demand is not limited to a particular State. The Bureau of Crop Estimates is the only organization that can get it on a nation-wide basis.

State departments of agriculture need more or less of this information, especially on a county basis, in their regulatory work.

Transportation companies need full and timely forecasts and estimates of marketable surplus production on farms by counties in order to estimate the cars required.

Boards of trade and chambers of commerce which deal in agricultural products need accurate, disinterested, and authoritative crop

statistics so that the price adjustments and price movements shall be responsive to the facts of production and supply rather than to the conflicting claims of interested speculators.

Buyers, distributors, and handlers of farm products all need this information, and just to the extent that the information is accurate and dependable, the risk involved in buying farm crops and carrying them in storage is reduced, and just to that extent in competition with each other they can afford to pay better prices to the producers.

Banks and other financial institutions need this information in order that they may supply the necessary funds to finance crop production and marketing. That is a big item in agriculture. Few people realize that hundreds and hundreds of thousands of dollars, running into millions, have to be supplied to carry farmers to produce and to handle crops when they are harvested and ready for market.

Insurance companies are beginning to call for this information. Why? Because there is a great wide and undeveloped field of insurance for crops and live stock. It is a field that they are considering entering and developing more widely than in the past, and unless they have dependable information it means that their rates of insurance must be sufficiently high to cover the unknown element of risk. Just to the extent that the information is supplied them and is dependable, they can reduce those rates.

Manufacturers need this information in order that they may buy the necessary raw materials and convert them into manufactured commodities, farm implements, equipment, and supplies months in advance of the time they will be needed, and in order that they may know the counties of surplus production in which these commodities must be distributed.

And so also merchants, jobbers, and retailers need the information for the same purpose, that is, information upon which to base their advertising and selling and distributing campaigns, so that their wares may be available when and where needed. And just to the extent that that crop information is dependable and is localized by counties, so that they can avoid sending the manufactured products into counties of deficient production and low purchasing power, they avoid losses, and by avoiding losses their costs are reduced, and they can afford to reduce the selling price, and in the aggregate that amounts to considerable. It means millions of dollars to the American people.

The CHAIRMAN. You are now speaking of advance information, when you speak of manufacturers estimating in advance?

Mr. ESTABROOK. I am simply enumerating the classes of people who will be benefited by having this improved service. The manufacturers have to estimate these things months in advance, in order that they can secure raw material, get it to the factories and convert it into commodities which they have to sell to the farmers, and get it back and distributed by the time the farmers need it.

The CHAIRMAN. Do you propose to estimate in advance?

Mr. EASTABROOK. Yes, by counties. We propose to map monthly the regions of surplus and deficient production. It is information that will be worth millions of dollars to merchants and manufacturers of this country as well as to the farmers. They are now

spending hundreds of thousands of dollars in attempts to obtain that information through their salesmen and other sources.

The CHAIRMAN. What information could you give a manufacturer as to next year's crops? He is manufacturing now for next year.

Mr. ESTABROOK. He would not get much now, because now it is not available. But I included in our crop production program this item of information, the farmers' intention to plant in advance of the planting season.

The CHAIRMAN. The proposition, then, is to interview the farmers and find out what they are going to plant?

Mr. ESTABROOK. We obtain from this estimate of 215,000 farmers that we now have on the list—and we will have more if our facilities are expanded—we will obtain from them just as was obtained in 1917 and again in 1918 a report from them as to what they intend to plant. They make up their minds definitely in advance of the planting season. They know precisely what they are going to plant. And those reports will be obtained and published perhaps in February or March of each year. With that before us we have real, definite information on what the prospective plantings are going to be, and the only object of obtaining that information is this, to ascertain before the crops go in whether or not the acreage to be planted is likely to be too large or too small and thereby to avoid possible overproduction with its ruinously low prices or possible underproduction, which is almost equally unsatisfactory. Both are unprofitable, and both are unnecessary.

Mr. HUTCHINSON. Where can you find a man that will know beforehand what he is going to plant next spring?

Mr. ESTABROOK. Nearly every farmer in the United States.

Mr. HUTCHINSON. He can not tell where he is going to get seed potatoes.

Mr. ESTABROOK. That is contrary to my experience.

Mr. HUTCHINSON. I am a farmer, and I say that they do not know what they are going to do.

Mr. ESTABROOK. I beg to differ from that. I am a farmer, and I know now exactly what will be planted on my farms the coming crop year.

Mr. HUTCHINSON. I think I know in my own section.

Mr. ESTABROOK. That possibly may be true of some few sections.

Mr. HUTCHINSON. Can you tell me if the farmers in this country know if they are going to get all the fertilizer they want next spring?

Mr. ESTABROOK. Not at all.

Mr. HUTCHINSON. How can they tell?

Mr. ESTABROOK. Because crops will be planted whether fertilizers are obtainable or not.

Mr. HUTCHINSON. They will not have a big crop, will they?

Mr. ESTABROOK. That is true, but so long as the memory of man runneth crops have been planted. I do not know of a year when they did not plant, nor do you, either, do you? I have a farm, and I know exactly on every acre what is going in, and so does nearly every other farmer I have talked with. As I say, in 1917 and 1918, while we were in this great World War, and it was said that the winning of the war depended upon the food production, and that was a most important factor, the Department of Agriculture wanted

definite information and the Bureau of Crop Estimates obtained it months before the crops went into the ground. It was for the information of the Cabinet, the Secretary and the administrative officials. Those reports were reassuring. They showed very clearly that the farmers proposed to increase the acreage in food crops and they did, they increased it in 1917 and 1918 to something like 32,000,000 acres more than had ever been planted in food crops before. And those preliminary estimates of farmers' intention to plant before the season began checked out to within 1, 2 or 3 per cent of final estimates, demonstrating conclusively that farmers do know before planting exactly what they will plant if weather conditions permit.

Mr. HUTCHINSON. You take last year's winter-wheat crop, they were guaranteed \$2.26 for wheat. It is estimated to-day that they are 12,000,000 acres short, is it not?

Mr. ESTABROOK. Yes.

Mr. HUTCHINSON. Why do you estimate it that short; what are the reasons?

Mr. ESTABROOK. Because of the evidence that was submitted to us by the American farmers. That is why we estimate that reduction.

Mr. HUTCHINSON. Why did they say they did not plant it?

Mr. ESTABROOK. Many reasons were assigned, a great many reasons, but the estimate of the Bureau of Crop Estimates was based on the evidence before it.

Mr. HUTCHINSON. And you estimated that there would be 12,000,000 acres less.

Mr. ESTABROOK. I do not recall the exact figures. It will be found in the December crop report. It is very much less. Just recalling from memory only, the acreage of winter wheat for the 1919 crop was around 50,000,000. I am speaking from memory only; the estimate for last month of the winter wheat crop is around 38,000,000 acres. There is a reduction of about 12,000,000 acres, as you say. That is not wholly unaccounted for. The farmers have good reasons.

Mr. HUTCHINSON. The main reason is that they could not get it in.

Mr. ESTABROOK. That is part of it.

Mr. LEE. The main reason is that they did not have the guarantee, I think.

Mr. HUTCHINSON. Yes.

Mr. ESTABROOK. If you will permit me to resume the thread of my argument, I will continue to point out other classes of people who are interested in these estimates.

The CHAIRMAN. Do you contend that this increase of crops was due to the reports that you furnished?

Mr. ESTABROOK. No.

The CHAIRMAN. You have spoken of the reports in 1917 and of the large increase. Did the report have anything to do with the increase of crops?

Mr. ESTABROOK. No; I can not say that it did. There were many contributing causes to the increase in crops. It was largely due to the appeal to the patriotism of the farmers.

The CHAIRMAN. Practically every farmer was appealed to to plant and do his best.

Mr. ESTABROOK. Yes; and he responded.

The CHAIRMAN. The preliminary report had nothing to do with that, did it?

Mr. ESTABROOK. Absolutely not; but it did this: It was highly important that the Government, which was responsible for the conduct of the war, which was responsible for the lives of those young American citizens who went across the water, should know what the food supply of the United States was. It was of paramount importance for the winning of the war, for the preservation of our form of government, and of human liberty, and for the protection of our lives and property that the food supply should be ample, and it was vitally important that the Government should have definite information regarding present and future food supply. This was the kind of information which the Government tried to get, and they got it through the Bureau of Crop Estimates. Now, it turned out that the information was reassuring. Suppose that those reports had indicated that a decrease in food-crop acreage was impending? Would not that information have been of tremendous value? Would it not have been necessary then for the Government and all State agencies to have redoubled their efforts to insure ample production? I mention that because it is the probable course of agriculture in the future, an intelligent preparation and following out of systematic programs of production to maintain a proper relation between production, or supply, and consumption requirements, or demand.

The CHAIRMAN. You took an invoice and told them how much they had in the country? That is outside of what you are contemplating in the future, is it not?

Mr. ESTABROOK. No, sir; we did not take an invoice; we estimated the farmers' intention to plant, and that is exactly what we propose to do in future.

The CHAIRMAN. Crop estimates and invoices are two different things?

Mr. ESTABROOK. That was a crop estimate, an estimate of prospective acreage.

The CHAIRMAN. It was not estimating as to the future in telling them what they had in the bins, was it? •

Mr. ESTABROOK. No, sir.

The CHAIRMAN. That was what they were interested in at the time?

Mr. ESTABROOK. No, sir; this was in the way of estimating an intention to plant, purely a psychological deduction. The acreage had not even been planted. It was not a matter of record. It existed only in the minds of farmers.

The CHAIRMAN. They were impressed and urged to plant?

Mr. HUTCHINSON. And guaranteed the price.

The CHAIRMAN. Was the price guaranteed or cut?

Mr. ESTABROOK. If I may proceed again with my argument to show who will benefit from the improved service: Seedmen are interested, buyers of seed especially are interested, in knowing the production of seed and the supply, the probable relative supply and the probable prices.

Nurserymen in the same way are interested, and buyers of nursery stock are interested in having definite information with respect to the essential facts of the production of those crops, and they are large crops. They run into hundreds of millions of dollars.

Mr. ANDERSON. Are you seriously contending that many farmers in the United States look over your estimates before they determine what their year's rotation is going to be?

Mr. ESTABROOK. No, sir; on the present basis the number would be relatively small. We know that many farmers do that now; intelligent farmers study the crop reports carefully, and all farmers would profit financially by paying more attention to the Government crop reports. The Federal Department of Agriculture, the State colleges of agriculture, the State experiment stations, and the county agents are the organized agencies that reach out and carry the information to the farmers. The press of the United States is carrying this information. The statistics which you see in local papers and in various magazines are in 99 per cent of the cases the figures of the Bureau of Crop Estimates. They do not bear the tag of the Bureau of Crop Estimates, but that is where most of them originate.

Mr. JACOWAY. They get the benefit of your work?

Mr. ESTABROOK. They get the benefit of our work, and that is how it reaches these farmers. There are unquestionably many farmers in the United States who have never heard of the Bureau of Crop Estimates, who have never seen a monthly crop report, and it is partly because the printing fund is so low and inadequate that we can not even send it free to those who apply for it. We send it only to our crop reporters, who are rendering a service of great value and worth large sums of money.

Mr. ANDERSON. There is no question that, if you could send it free to the people, you would send out many more of them than you now have. My observation has been that it is a whole lot easier to give people something for nothing than to give them something they have to pay for.

Mr. ESTABROOK. That is true. Now, in 15 out of the 48 States in which we are cooperating we publish more detailed figures than we can in the Monthly Crop Reporter, and that reaches all the local papers in the State and obtains a very wide dissemination. But my contention is this: That the farm organizations are going to make use of this information in the future as they have never made use of it in the past, and that they are going to give the cue to the farmer members as to what is the wise thing to do in the future with respect to increasing or decreasing their acreages or increasing or decreasing the number of live stock. That is how it is going to work.

Mr. ANDERSON. If they do that, if some of the legislation now proposed is passed, they will all be in jail.

Mr. HUTCHINSON. Going back to your estimate of spring wheat and winter wheat crop. If your estimate of the spring-wheat crop had been correct, the Government would have lost a billion dollars that they appropriated to help out the farmers, would it not?

Mr. ESTABROOK. No one contends that an estimate as early as that in the season would be true. I never heard anybody contend that they were correct, except for the time when they were pre-

pared. They were absolutely correct then, but the future course of a crop depends almost entirely on the weather, and in the present state of our knowledge we can neither control nor forecast the weather in advance of harvest.

Mr. HUTCHINSON. But we are appropriating money for such estimates.

Mr. ESTABROOK. At the time it was made it was the best estimate that could be made. We do not claim it was a correct estimate, except for the date on which it was made, but the farmers thought that was the condition of their crop at that time and they so reported. Now, the Bureau of Crop Estimates is not responsible for the weather that comes afterwards.

Mr. LEE. That is what happened this last year?

Mr. ESTABROOK. Absolutely. While we are on that question, will you permit me to say that we now have for the first time a pretty accurate check on the wheat estimates of the bureau from the United States Grain Corporation, since it has had charge of the buying and distribution of the grain crop of the United States. For the first time the bureau has a check on its estimates of wheat production. In 1918, at the close of 1918, Mr. Barnes or Mr. Hoover made the statement that the Bureau of Crop Estimates had overestimated the wheat crop. Now it happens that the Grain Corporation gives out weekly reports of receipts at all mills and elevators of a certain capacity, and keeps tab on all the wheat. At the close of the 1918 season, taking the total receipts as reported by the Grain Corporation, and adding to it the 80,000,000 or 90,000,000 bushels of wheat that must have been used to plant the following crop, and adding to that the 2 per cent that is normally fed to poultry and live stock—the damaged and inferior grain—and making a fair allowance for the wheat that is ground in local country mills of small capacity, which were not required to report to the Grain Corporation, the published estimate of the Bureau of Crop Estimates came within 2 per cent, less than 2 per cent, of the total 1918 wheat crop thus accounted for, and that was nine years after the last census was taken, when the difficulties involved in estimating acreage correctly were greatly increased.

Picking up the thread of my argument again, I have said that the seedsmen and nurserymen and the buyers of seed and nursery stock are interested in this information. It means dollars and cents to them.

Chambers of commerce and boards of trade and local committees of various kinds are constantly calling for estimates as to crop and live-stock production of all kinds, in order that they may advertise the agricultural resources and advantages of their communities, and this is a laudable ambition on their part, because it stimulates local pride and local enterprise. The other side of this phase is that prospective investors and settlers would be benefited by such information, authentic and authoritative, disinterested and complete, with respect to crop and live-stock production of countries in which they are becoming interested. Such information would save investors and settlers millions of dollars annually if they had disinterested information emanating from the Government as a check upon the rather lurid statements of unscrupulous promoters of various kinds.

Another important class of people interested in complete and dependable crop and live-stock production statistics are teachers, economists, publicists, students, and writers, and it is greatly to the public interest that these men shall have such data as a basis for right thinking and correct conclusions.

Consumers—and that takes in everybody—are or should be interested in the crop estimates because they are an index of present and future supply, and of farm prices. Farm prices are of interest to consumers in comparison with the prices which they have to pay, and it is the gap between those two prices which the Bureau of Markets will be supposed to bridge as time goes by.

Legislators—and that includes you gentlemen in Congress, and in the State legislatures—have need of definite and dependable information with respect to the essential facts of crop and live-stock production. I have no doubt that every member on this committee at times has occasion to use crop and live-stock statistics, and they need them as the basis of wise legislation. Otherwise you are groping in the dark.

And last, but not least, the Federal and State departments need the most complete, the most dependable, and the most unbiased, and authoritative information with respect to the essential facts of crop and live stock production. The Government needs accurate data for this greatest of all industries, needs it in time of peace to promote the prosperity and welfare of all the people, and needs it especially in time of war to insure victory.

Now, I have attempted to point out the fundamental and paramount importance of agriculture. The primary object of all Federal and State agencies and of all farmers is to make the business of farming profitable. I have referred to the rapid growth of the farmers' organizations. I have shown the vital connection of the price-determining factor, relative supply, on the business end of farming, as determining whether or not it is a profitable business. I have outlined in a very brief way the enlarged program of the bureau for supplying the kinds of information that are needed, the information which is not now available, and I have attempted to enumerate the different classes of business interests that need this information.

Now, another question that the committee will probably be interested in is, why can not this enlarged and this improved service be rendered with the present appropriation? The most direct answer to that is that in trying to meet the increased demands upon the bureau in the last few years, demands which had doubled and trebled and quadrupled before the World War broke out, which were greatly stimulated by the war, and which have continued to increase since the signing of the armistice, the bureau has expanded beyond the limits of its resources. It has added first one crop and then another, one item of information and then another, to its regular program. It has loaded up its field agents until they have had to work nights and Sundays and holidays in their attempts to supply the information called for, and it is quite apparent to the administrative staff that this service can not be continued until June 30th next on the present appropriation. We shall absolutely have to cut out certain kinds of work. Right now returns for certain investigations

are accumulating in the bureau, for want of sufficient clerical force to tabulate and summarize them. So it is absolutely apparent that there can be no further increase without additional funds.

In its attempts to take care of this growth in the work without corresponding increases in its appropriation, the bureau has developed what we believe to be the most highly efficient organization in the entire federal service. If there are any more efficient, we do not know it. It has developed the best system of crop estimating in the world. It has taken 50 years or more to do it. Specialists have come from the ends of the earth, from all the great governments of the world, to study the organization and system of the Bureau of Crop Estimates, and they have all said that there is nothing comparable with it in the world; and yet notwithstanding this splendid organization and service which has been developed, there are important kinds of information which the bureau simply can not supply with its limited resources, information that is fundamentally important to agriculture, information with respect to live stock, county data, marketable surpluses, foreign crop and live-stock information, and better methods of summarizing and publishing data that are collected. To supply this information, having already exceeded our resources, it is absolutely necessary to have additional funds.

The committee may be interested in asking this question, Why, if this enlarged program and if this improved service is so valuable to the American farmers and business men, why has it not been submitted to Congress before? There are good reasons and conclusive for that. The bureau was reorganized in 1914, a reorganization made necessary by the fact that it had fallen into a rut. Its personnel was demoralized. It was disorganizing and disintegrating. It was not rendering the service the country was entitled to for the amount of money that was being expended. It was the subject of a great deal of adverse criticism. It was falling into disrepute, and there were ugly rumors concerning it. By far the most important innovation in the reorganization of 1914 was the appointment of trained field agents, a man in each State or each group of small States, a man of at least five years' practical experience in farming, with an agricultural education, who would devote his entire time to collecting and accumulating the statistics of agriculture in the State, traveling over the State monthly and personally inspecting and judging crops, personally interviewing the best informed men in each community, and building up lists of selected crop reporters, the best informed men in each community, and obtaining the necessary cooperation of State officials.

Mr. ANDERSON. When these crop estimators report a situation, do they give you an estimate of what the situation is in the county or do they give you specific facts with respect to matters which are within their own knowledge?

Mr. ESTABROOK. We have various kinds of reporters, Mr. Anderson—the county, township, and special. The county reporter reports on conditions throughout the county, as the result of his observation, and he also has aids reporting to him. We try to get men who get through the county in the course of their business occasionally.

The township reporters report for their immediate neighborhood; that is, the farms within their personal knowledge, the farms that they see from week to week.

Then we have a very large list of individual farm reporters, men who report simply what is on their own farms. That is as exact as any census can be; more exact, in fact. They report so many horses, and the changes in number that take place, so many cows, so many swine or sheep, so many acres of this, that, and the other crop on their own individual farms. And these crop estimates are a combination of every possible source of information that is available.

Mr. ANDERSON. The reason I asked the question was that I can not see how any compilation of guesses of men who make statements as to the condition of crops would be very valuable unless it was backed up by sufficient number of cases representing actual conditions, actual facts to give a basis.

Mr. ESTABROOK. That is absolutely true, and that is the principle we follow with respect to each of these crops. It can be determined mathematically, for instance, just how many reports are required, how many individual reports are required to give a certain degree of accuracy, and we try to have an ample number to give us that statistical average.

Mr. HUTCHINSON. You said a number of farmers report. To whom do they report?

Mr. ESTABROOK. We have various classes. Some of those classes report direct to the field agent in each State and some directly to Washington.

Mr. HUTCHINSON. Some report to you?

Mr. ESTABROOK. Yes.

Mr. HUTCHINSON. And you have a township reporter?

Mr. ESTABROOK. The township reporters, and the county reporters, and many of these special reporters report direct to Washington.

Mr. HUTCHINSON. Have you any State reporters that cover the whole State?

Mr. ESTABROOK. We have only the trained field agents. The trained field agent in each State has all the way from 500 to 5,000 men in his State reporting directly to him.

Mr. HUTCHINSON. Directly to him?

Mr. ESTABROOK. Yes; and he applies to the reports as they come in his own personal observations and trained judgment; he interprets them by the personal knowledge that he has picked up in his travel and interviews with the best informed men, and at the end of the month he summarizes all these reports and sends to the Washington bureau the average of the reports that come to him, his personal judgment, and brief comments in explanation of the numerical estimates. These reports of field agents and crop specialists are in addition to the many thousands of reports received at the Washington office directly from various large classes of reporters, such as the county, township, and special reporters.

Mr. HUTCHINSON. At Washington you sort them out so that they do not conflict?

Mr. ESTABROOK. Only the results of the States' figures come to us from the field agent. He retains individual reports there. The reports of each class of reporter received at Washington are tabulated and summarized separately and each is used as a check on the others.

Mr. HUTCHINSON. You said that some farmers report directly to Washington.

Mr. ESTABROOK. We have all the county reporters—about 3,000—and all the township reporters—about 33,000—and many special lists of reporters reporting directly to Washington. Now, each class of information is tabulated separately and independently. Each is used as a check on all the others, so that we are never dependent on any one source of information.

Mr. JACOWAY. I know a man in my home town who will take the testimony of 50 or 100 farmers before he sends in a report. He is a very conscientious fellow. He used to be, and I think he still is, doing some work of that sort. I have checked up his reports and found them more than fairly accurate. They are good. But he takes pains to ask men in this and that portion of the county. He is the county reporter of my county.

Mr. ESTABROOK. That is frequently done. Among the crop reporters are many county agents. Wherever they are willing we are glad to utilize them.

Mr. HUTCHINSON. You do not pay them?

Mr. ESTABROOK. No, sir.

Mr. HUTCHINSON. You do not pay any of the township reporters?

Mr. ESTABROOK. None.

Mr. HUTCHINSON. The only men that you have to pay are the field agents?

Mr. LEE. They have the franking privilege?

Mr. ESTABROOK. That, of course, relates only to postage on official correspondence.

Mr. JACOWAY. You do not pay anything to anybody but the field agents?

Mr. ESTABROOK. No; and the franking privilege is simply for sending reports to us.

I was trying to explain why this enlarged program had never been presented to Congress before. I said that the bureau was reorganized, that we employed these new field agents in 1914, and that they had certain qualifications. Now, it does not make any difference how competent, how well qualified, how well educated a man is when he enters the crop-reporting service, he is of very little value to the service until his judgment has been developed, until he has made all the necessary connections, until he has become acquainted with the best-informed men in each community, and until he has visited each county month after month and year after year so that he knows conditions on a comparable basis. No man can enter a state for the first time and form a very intelligent judgment of crops on a comparable basis. It takes years to do that. It took three or four years for this corps of field agents to be trained, to become acquainted with the crop-estimating system, and to overcome the prejudice that existed at that time. They have succeeded in doing it. It was not until after we had gotten into the war that the field agents were really developed into live, useful men.

The chief of the bureau was new to the service. He was assigned to the job for administrative reasons. He never asked for it, and the first three or four years of his service was devoted to studying the system that has grown up and developed through half a century of experience, to studying the organization and its personnel, to improving the organization, tightening up and improving here and there, to building up a morale, and *esprit de corps*, to inspire these

men with the idea of practical service to the farmers of the United States, and the result is that instead of having a bureau which is in disrepute, as it was six years ago, the bureau now commands the respect of farmers and business men throughout the United States. It now has friends in every State and in every county. The entire press has changed its attitude. It is no longer full of unjust criticisms, and the entire press is at the service of the department in publishing these crop reports and disseminating them to the public.

It would have been manifestly unwise and uneconomical to have formulated such a program for the expansion of the service and presented it to Congress until the necessary changes had been effected in the organization, or until the administrative staff had by actual experience found the limit of efficiency. And they found that by adding to the load which was carried by the employes of the bureau until the breaking point was reached, so that we know absolutely what the bureau can do and what it can not do. And that is why this program is submitted now, because we have reached that stage in the development of the organization.

Why should this expansion be made now? Why should it not be deferred until some future time? There are many reasons, and some of them to me are very convincing. One of them is that if this service is of practical financial value to the farmers in their business, if from a purely business standpoint it is worth dollars and cents to them, the 14,000,000 farmers and taxpayers in this country are entitled to that information now, and it is not fair to ask them to wait until some future time to get it.

MR. JACOWAY. You said there were 14,000,000 farmers. How did you arrive at that figure?

MR. ESTABROOK. It is estimated that there are 7,000,000 farms now with the growth that has taken place since the last census; 7,000,000 farm owners and 7,000,000 farm helpers, hired men. It was about that proportion at the last census, six and one-third million owners and six and one-third million helpers, making between 12,000,000 and 13,000,000 farmers at the last census, so it is fair to say that there are about 14,000,000 now, in round numbers.

Agriculture is the greatest of industries, an industry that is fundamental and paramount. It is the foundation of the prosperity of all other industries. It needs this information, and it needs it now, and it is big enough to justify giving that information to it now and not at some later time. This service should have been available to the American farmer years ago. If it had been, it would have prevented the loss of many, many millions of dollars, and agriculture would have been more prosperous, more efficient, if it had had such service in the past. The reasons why the matter has never been broached to Congress before, I have already explained.

Farmers' organizations need this service now, especially while they are organizing, and, perhaps, there is no time when information of this character will be of greater value to agriculture and to the farmers of this country than right now. It is a period of changed conditions, of adjustments and readjustments, with accumulated demand, deficient supply, high prices, and reduced purchasing power of the dollar.

Another reason: Much of the estimating work of the Bureau of Crop Estimates is based on the decennial census. The decen-

nial census is now being taken, and this enlarged services should start off with the results of this census. Unless it does, if one or more years are allowed to elapse, it will be impracticable or impossible to undertake the improved service which we have outlined. It is especially important that estimates of acreage, numbers of live stock—and there is a great live stock program involved—and county estimates shall be available continuously beginning with the results of this present census.

Now, summarizing my statement, which has been interrupted and broken: Dependable data with respect to the essential facts of production and supply are absolutely essential to make the individual farm business a profitable business, absolutely essential to enable farmers' organizations to carry out the objects for which they have organized, absolutely necessary for much of the constructive work of the Department of Agriculture itself, and of the State colleges of agriculture and experiment stations, and the State extension services, and the county agents, for which millions of dollars of public funds are expended annually. The Bureau of Crop Estimates has developed what we believe to be one of the most highly efficient organizations of its kind in the entire Federal service. It has reached and even passed beyond the limit of its present resources. The demands for this kind of information have been constantly increasing in the past. They are increasing now, and from the very nature of things they may be expected to increase in the future.

The enlarged program which has been prepared to meet these demands is a comprehensive program. It is constructive, it is complete, and it is sound. This program, every feature of it, has been demonstrated to be feasible. No part of it is experimental. We know exactly what we can do. Results should be available, results of practical financial value to every farmer should be available very shortly after the necessary funds are made available.

That program has the approval of the Secretary of Agriculture. It was mentioned specifically in the President's message to Congress. The principle of supplying adequate funds for the bureau was embodied in a resolution of the National Federation of Farm Bureaus at its first meeting in Chicago. That same principle has the approval of the Iowa State Federation of Farm Bureaus and of the Illinois Federation. It was recommended by the statistical committee of the United States Chamber of Commerce at its convention last April.

Certain projects of that program are indorsed by the National Nurserymen's Association, whose president was here to-day. It is indorsed by the Peanut Growers' Association of Virginia and Carolina, the only two associations of the kind which have any knowledge of such a program. They obtained it incidentally when their officers called at the bureau and asked for increased service and criticized the bureau because of its inadequate service in the past. I considered it entirely proper to enlighten those officers as to the plans the bureau had in mind to submit to Congress later for developing their service and needs, and those organizations have representatives in Washington, and I believe they have applied for permission to appear before the committee. I have no doubt that all organizations of producers and all organizations for promoting agriculture, and all

men financially interested in agriculture would approve this program if it were brought to their attention.

Unless adequate funds are provided for this enlarged program, other branches of the Federal Department of Agriculture, the State colleges, the experiment stations, the State extension services, and the county agents, and the farmers' organizations will attempt to secure that information on their own account. Now, you may ask, Is that a calamity? Is there any reason why they should not? There are these reasons: They will attempt to collect this information because they must have it, just as they have attempted in the past, just as they attempted to collect it during the World War. They will attempt to do it with a much less efficient organization than the Bureau of Crop Estimates has developed. They will do it with much less experience. Statistical work is a speciality just like any other speciality in any line of business which requires long preparation, training, and experience. The results they obtain will be very unsatisfactory because necessarily they will be incomplete and fragmentary. The expense involved will be far greater than the appropriation proposed by the Bureau of Crop Estimates. Therefore the appropriation of adequate funds by Congress to enable the Bureau of Crop Estimates to expand and improve the crop and live-stock reporting service is an investment, and not a dead expense—an investment that promises profitable returns to every one of the 14,000,000 farmers of this country.

Much of the work of the bureau, as I have said, depends on the decennial census. That census is now being taken, and this improved service should be put into effect now or not at all.

It is hardly necessary to remind this committee that the crop and live-stock reporting service is purely a business service, wholly non-partisan, permanent, countrywide. It is useless to talk about any State organization attempting to get the information that the Bureau of Crop Estimates gets, because complete information with respect to one State is of very little value unless you have comparable data for all States. The law of supply and demand is no respecter of State lines.

A further fact should be borne in mind—that the expenditure of this increase in the appropriation will be made largely in the States themselves. It is the intention, the policy of the bureau, to develop and strengthen the field branches of the bureau in the States, to make those branch offices the clearing houses for statistical information in the States. The assistants of the field agents and crop specialists and clerks to be employed in the field will be legal residents of the States in which they serve and as such will be given preference in appointment. Their interests will be identified with those of the people with whom they are associated. The bureau organization in Washington will simply maintain uniform methods throughout the United States so that the data will be comparable, and will correlate and bring together and summarize the information collected in the various States for the Nation as a whole. So that each State will benefit equally from this improved service. Every county will benefit, every township, every local community, and every congressional district. They will all benefit alike.

The total appropriation for the Bureau of Crop Estimates as proposed here constitutes a per capita tax of less than a 1-cent postage

stamp. Is that such a heavy burden? Can the business men in this Congress consider cutting the corners off that postage stamp for a service which promises returns worth many dollars to every farmer, worth thousands of dollars to business men, and worth millions of dollars to the country as a whole? I hope the committee will bear that in mind.

Mr. JACOWAY. What did you say it was per capita?

Mr. ESTABROOK. The appropriation constitutes a per capita tax of less than a 1-cent postage stamp. In other words, we are asking for less than \$1,000,000. There are more than 100,000,000 people in the United States.

Mr. JACOWAY. It would be a half a cent, would it not?

Mr. ESTABROOK. About half a cent per capita. The entire appropriation we are asking for is \$967,000, less than \$1,000,000. The entire population is more than 100,000,000.

The CHAIRMAN. This appropriation is about \$1,000,000, while the population of the United States is about 110,000,000.

Mr. HARRISON. It would be a half a cent on the basis of the increase asked for and 1 cent on the basis of the total appropriation for the bureau.

Mr. ESTABROOK. Each dollar represents a hundred cents, and a 1-cent postage stamp would be the 1 cent. The entire appropriation estimated for the whole Department of Agriculture amounts to less than 40 cents per capita. It might be profitable to compare this modest appropriation for agriculture with some of the other appropriations already made or that will be made by this Congress for less important objects.

Now I am ready to consider the details of the estimates as they are printed before you, but before doing so I want to submit, with the recommendation that it be printed in the hearings, a copy of the enlarged program. It is not so very long, but it sets forth the details of what we propose to do for each and every crop and class of live stock, and the organization with which we propose to do it, and I think if this is printed in your hearings, it will be available for reference and you can turn to it at any time.

Mr. HEFLIN. Had you rather get through with this subject before I ask you some questions regarding the estimate of the cotton crop of 1919?

Mr. ESTABROOK. I am about through. There is a second exhibit which I should like to include in the printed report of the hearings, a brief statement, a sheet and a half perhaps, or two sheets, of specific instances of farmers, farmer crop reporters, benefiting by using information which they have obtained from the crop report, showing how many dollars that each farmer made by paying attention to crop reports. I do not know of any better evidence that could be submitted.

My assistant, Mr. Gage, has brought a number of commendatory letters from the files. I do not know whether you want to see them or include them in the hearings or not. They are there and we can add to them indefinitely. They came without solicitation and without suggestion.

We have also extracts from editorials from papers of various States commending the organization and work of the Bureau of

Crop Estimates. To anyone who cares to see them they are available. Now I am ready to consider your questions.

Mr. HEFLIN. Mr. Chairman, I want to ask some questions regarding the recent estimate of the last cotton crop. The ginner's reports show that up to December 12, 1917, we had ginned 10,130,000 bales; to December 12, 1918, 10,281,000 bales; and up to December 12, 1919, 9,400,000. This report shows 730,000 bales less than in 1917 and 881,000 bales less than in 1918. You estimated this crop at 11,030,000 bales and in doing so you have figured in your estimate the largest per cent of unginning since 1908. How did you arrive at such a conclusion, Mr. Estabrook?

Mr. ESTABROOK. That, Mr. Heflin, is based entirely on the evidence submitted to the crop reporting board. I can not attempt to carry the details in mind. I simply recall the fact that in western Texas and portions of Oklahoma and northern Georgia, the evidence was to the effect that there was a larger proportion of unginning cotton than usual. Now it happens that the western portion of Texas is where a large part of the crop is located this year. I noticed that the December 24 report from the cotton crop specialist of Texas showed that more than half of the cotton crop of western Texas was still unpicked and was undergoing great damage from bad weather; that they were short of help; that they were paying from 4 to 6 cents a pound to have it picked. But nevertheless the cotton is there.

Mr. HEFLIN. I am of the opinion that you have overestimated this crop from 300,000 to 500,000 bales. The president of the American Cotton Association agrees with me and the commissioners of agriculture in Florida, North Carolina, South Carolina, Mississippi, and Louisiana have all expressed to me their belief that your estimate is too large. Of course, the ginner's report will tell later on who is correct.

Mr. ESTABROOK. It is a matter of opinion.

Mr. HEFLIN. I have a letter here from one of my constituents in which he says that you estimated this last crop on the gross weight of bales instead of net weight of 500 pounds. Is he correct about that?

Mr. ESTABROOK. He is incorrect.

Mr. HEFLIN. Have you used the same system in estimating this crop that the bureau has been using all along?

Mr. ESTABROOK. We estimated precisely the same as always—so many pounds of lint. It is merely a matter of arithmetic to divide that by the number of pounds of lint in the bale to ascertain the number of bales. Your correspondent probably made the mistake of not allowing for tare to cover ties and bagging, and he probably divided by 500, which was a mistake.

Mr. HEFLIN. This gentleman stated that the gross weight made 11,030,000 bales, whereas the net weight estimate would have made it 10,555,000.

Mr. ESTABROOK. Your correspondent made no allowance for the tare.

Mr. HEFLIN. Bagging and ties?

Mr. ESTABROOK. Bagging and ties. To find the number of 500-pound bales of so many pounds of lint, we do not divide by 500. We take the tare out of the 500 and it leaves 478.3 pounds, and if he

will divide by that figure, he will find practically that it is 11,030,000 bales.

Mr. HEFLIN. In making this estimate did you figure the damage done by the boll weevil?

Mr. ESTABROOK. Yes.

Mr. HEFLIN. And abandoned acreage?

Mr. ESTABROOK. Yes; abandoned acreage.

Mr. HEFLIN. How did you arrive at the abandoned acreage?

Mr. ESTABROOK. Our field agents carried on investigations, and it is included in instructions to crop reporters themselves to make allowances for abandoned acreage or adverse weather or whatever it may be. It is their best judgment of what the crop under the present conditions, whatever those conditions may be, ought to be rated at.

Mr. HEFLIN. What percentage of the farmers in cotton counties are consulted each year as to the number of acres planted in cotton?

Mr. ESTABROOK. We have in the cotton States about 65,000 crop reporters besides our trained field agents.

Mr. HEFLIN. I asked several farmers in Alabama during the spring and summer whether they had been asked about the number of acres planted in cotton, and they said that they had not. You do not make inquiry of all of them, do you?

Mr. ESTABROOK. That is impossible. That would require a census and a census would cost \$10,000,000, to get that information from every farmer, and the results would not be available under one or two years after the census was taken.

Mr. HEFLIN. As to the acreage abandoned, it would be about the same percentage of farmers that would be consulted?

Mr. ESTABROOK. Yes. But you will note, Mr. Heflin that that is one of the items we are specifically providing for in the enlarged program for increasing and improving the service. That is an item of information that ought to be furnished that has not been furnished in the past except for winter wheat. It was furnished this year, of course, with respect to cotton in compliance with a resolution of Congress that was passed.

Mr. HEFLIN. I have in mind a farmer in my county who made 60 bales of cotton last year. The boll weevil was not so bad as he has been this year.

This same farmer will get only 30 bales from the 1919 crop, just half the number produced last year.

Mr. ESTABROOK. You will find many that made 60 last year who will not make one bale this year.

Mr. HEFLIN. That is true. I addressed the Legislature of Texas in June, 1919, on cotton and on my way to Austin I saw hundreds and thousands of cotton acreage that had been abandoned. Many cotton fields in Texas were turned into pastures for cattle. Do you know what percentage of the cotton acreage has been abandoned in Texas?

Mr. ESTABROOK. Yes; I could not recall them now for I do not carry them in mind. I do know this, that the abandonment this year was greater than it has been for many years. It has been many years since the abandonment was as great as last season. Our reports show—the estimate that was made in the fall—that the abandonment since June 25 was $4\frac{1}{2}$ per cent, which is very heavy. Ordinarily

it runs about 1 per cent. We had other information to the effect that the abandonment prior to June 25 was very much greater than that. The total abandonment was in excess of 10 per cent as I recall it. We estimate—we are required by law to estimate—the acreage under cultivation on June 25th, which is reported on July 1. Of course, up to that time—the idea in the mind of Congress in passing that law was that they would get the acreage after all abandonment had taken place. Ordinarily most of the abandonment was taken place by that time, but it happened this year that unfavorable conditions continued afterwards through the season.

Mr. HEFLIN. You suggested that a great deal of cotton was still ungathered in western Texas?

Mr. ESTABROOK. Yes.

Mr. HEFLIN. You just estimate the amount of cotton that is to be made and not the amount that is to be gathered and finally brought to market?

Mr. ESTABROOK. We estimate the amount of cotton that is produced in the fields, the crop on a certain date. All conditions point to a crop of so much being produced. At present we do not estimate what happens to the crop after it is produced.

Mr. HEFLIN. Then you do not have anything to do with the amount that is not gathered, but remains in the field and is never brought to market?

Mr. ESTABROOK. No.

Mr. HEFLIN. In your judgment, is not there a great deal of this cotton in Texas that will never be gathered at all?

Mr. ESTABROOK. Yes.

Mr. HEFLIN. And will be so damaged that it will not be fit for use?

Mr. ESTABROOK. Yes. The weather has been very unfavorable almost continually since the last estimate. The quantity will be reduced and the quality or grade will be very badly damaged.

Mr. HEFLIN. Do you think with the improved service you are suggesting here that you will be more accurate and come more nearly to getting the exact amount of the crop, whatever it is, that is being produced?

Mr. ESTABROOK. Unquestionably. Do you know how much money the Bureau of Crop Estimates has available for estimating the cotton crop of the South, the greatest crop of the South, a \$2,000,000,000 crop? We have about \$18,000. Why, more than that amount ought to be spent in every cotton State. It ought to be ten times as much. We are asking for \$39,000 for next year to estimate that \$2,000,000,000 crop and we think we can do it with that.

Mr. JACOWAY. Getting back to Mr. Heflin's question, do you estimate the number of pounds in the bale when you gin the bale or some time afterwards?

Mr. ESTABROOK. We estimate that there will be so many pounds of lint produced, which was this year slightly more than 5,000,000,000 pounds. To get the number of bales we divide that by a 500-pound bale, which is the standard adopted, less tare, bagging, and ties.

Mr. JACOWAY. If you gin a bale of cotton, say, in October, and it weighs 504 pounds exclusive of the tare, will not that bale lose 3 or 4 pounds afterwards?

Mr. ESTABROOK. Yes.

Mr. JACOWAY. Do you estimate the 500-pound bale when it comes from the gin or some time afterwards?

Mr. ESTABROOK. We simply do not consider the shrinkage or increase in weight from absorption of moisture or the decrease in weight from drying out.

Mr. JACOWAY. That is where the discrepancy comes?

Mr. ESTABROOK. There is an element there. Take the tobacco crop for instance. Tobacco can absorb up to about 10 per cent of its weight in moisture.

Mr. HEFLIN. After you receive the field report at your office, how soon do you make up your estimate?

Mr. ESTABROOK. Let us say, from the time that they make up the report until we make it up?

Mr. HEFLIN. Yes.

Mr. ESTABROOK. What time has elapsed since we received the last report from the field?

Mr. HEFLIN. Showing the conditions, the prospects.

Mr. ESTABROOK. The report relates, in the case of cotton, to the 25th of the preceding month. Cotton is estimated as a separate crop as of the 25th of the month. On that date the crop reporters fill out their blanks and send them either to the field agents or directly to the bureau. They relate to that date, filled out on that date. They are not presumed to fill out a blank after that. Some of them do. They all relate to that date.

Mr. HEFLIN. The 25th of November?

Mr. ESTABROOK. Yes. When the reports come to the bureau they are made up on the 1st day of the month. It is the 1st or 2d, depending on whether a Sunday or holiday comes in or not. This information all relates to that one day. In the case of the December report, that is a general review of all the reports coming in from the 1st and up until the 11th.

Mr. HEFLIN. Do any of these agents or correspondents who report to you report for any cotton factors or exchanges?

Mr. ESTABROOK. None of the salaried agents report to any other organization than the Government. Probably some of the volunteer crop reporters do. They are free to do what they please, and I presume some of them do. That is one reason why the bureau has guarded so well its list of crop reporters, why it has declined to furnish lists of crop reporters even to Members of Congress. It is because private crop reporting agencies have tried to get copies of the list of the Government crop reporters, and promoters of all kinds have tried to get these lists to utilize for their own purposes and speculators. If private persons could get our lists they would attempt to get advance information or to influence the reporters, and it is for that reason that we guard them very closely. They are treated as confidential.

Mr. RUBEY. I had a letter from somebody (I do not remember who it was) asking me to furnish Yearbooks for each one of the crop reporters, and I wrote to the department that if they would furnish me with a list of crop reporters I would be glad to send them a Yearbook, but they declined to do that. It does seem to me that a Member of Congress is a United States official, and he is not going to take that information and give it to anybody where

it ought not to go. It seems to me that that is information he ought to have.

Mr. ESTABROOK. That is quite a natural conclusion, but for the reason I have just stated, that private crop-reporting agencies, speculators, and promoters have tried to get those lists, which would be extremely valuable to them, and to use them for wrongful purposes. If the crop reports are worth anything at all, it is because they are disinterested and unbiased, and we can not afford to leave a loophole.

Mr. RUBEY. You can not afford to trust a Member of Congress?

Mr. ESTABROOK. It is not that, sir. We have every confidence in you, but we do not know how carefully you are going to safeguard them, what might happen to them some years later. Some of these crop reporters go on reporting for many years.

Mr. RUBEY. I am going to know who gets my Yearbooks, and I am not going to send them out unless I know to whom they are going.

Mr. ESTABROOK. We will be glad to have you or any of your representatives come down and look the list over and check it over, so that you can see to whom the Yearbooks go. What we object to is letting a copy of them get beyond our control.

Mr. HEFLIN. If you should supply a Member of Congress with this list of names it would get into the hands of members who represent grain-exchange and cotton-exchange districts.

Mr. ESTABROOK. It might prove very embarrassing.

Mr. HARRISON. You could not give it to one and refuse it to another.

Mr. ESTABROOK. This is not theoretical on my part. Application has been made to the bureau and to the department, and pressure has been brought to bear to obtain copies of the list, and when the application was denied quite naturally they went to their representatives in Congress to obtain it. Now, would it not have proved a little embarrassing to some Members of Congress?

Mr. RUBEY. I never thought about the list until they wrote to me to send them Yearbooks.

Mr. HEFLIN. If I understand you, you are safeguarding this matter in every way you can so that these people who make these reports to the Government may not be known to the speculating world?

Mr. ESTABROOK. Their names are strictly confidential. They will not be furnished to anyone. Every salaried employee of the bureau who has anything whatever to do with the preparation of the monthly crop reports is prohibited by a criminal statute from speculating in any product of the soil, from buying and selling, or from compiling or issuing any false statistics, or either directly or indirectly giving out in advance of the date set for the release of the crop report, any information, under penalty of a fine of not exceeding \$10,000 or imprisonment not exceeding 10 years, or both.

Mr. HEFLIN. I helped to pass that law.

Mr. ESTABROOK. Of course within the department itself we have surrounded the preparation and issuing of these reports with every possible safeguard. The doors are locked, telephones disconnected, and guards are stationed at the doors.

The board is locked in a room within the bureau, to which there is no ingress or egress whatever. The tabulation sheets are cut up

into different sections, and no desk clerk knows to what State these sheets relate. They are simply adding machines for the time being. We know absolutely who is responsible for every step in the procedure, and we can put our finger on any offender.

Mr. HARRISON. The board does not get the reports of the field agents on the speculative crops until the morning of the day it meets. They are kept under lock and key in the Secretary's office.

Mr. ESTABROOK. They are separated from the general mail in the post office as they come in and are delivered by special messenger directly to the office of the Secretary, where they are kept unopened under lock and key. Furthermore, the work is so systematized and arranged that no employee, no member of the Crop Reporting Board, and not even the Secretary himself has any means of knowing what the report for the United States will be until a few minutes before it is released for publication.

Mr. JACOWAY. You have made a clear statement here, and you have presented a most constructive plan. Have you figured down to the very last dollar in this appropriation that you need to carry it out?

Mr. ESTABROOK. We have. That was done.

Mr. HARRISON. Mr. Estabrook figured it to the last dollar, and the Secretary figured some more, so that the estimate has been cut to the bone.

Mr. ESTABROOK. We made the most conservative estimate which it seemed possible to make, and when we submitted it to the Secretary he fully approved of the program; he said it was constructive, was valuable, but he said, "We must economize," and he indicated a cut of about 10 per cent, which took about \$200,000, and I think as business men this committee would be justified in restoring that \$200,000. It is needed. The value of the industry justifies it a thousand times over.

Mr. JACOWAY. In order that this statement about the estimates may be complete, I ask unanimous consent to permit Mr. Estabrook to put into the record this project statement that he has presented.

The CHAIRMAN. Our expenses for printing are mounting up.

Mr. JACOWAY. This would not take up much space.

The CHAIRMAN. The committee was ridiculed, for we printed 1,700 pages one year. I want to keep down expenses. I would like to look it over first. It is practically what you have in the notes here?

Mr. ESTABROOK. I have merely summarized the general plan and pointed out its great importance and value.

Mr. JACOWAY. This statement is a summary. Anyone can understand the matter much more readily by referring to this project statement.

The CHAIRMAN. Can it not be understood as readily from the record of the remarks of Mr. Estabrook?

Mr. JACOWAY. I think not. I think this statement ought to go in the record in order that his statement may be fully appreciated. This information is so valuable that it ought to be given to the Members of Congress.

The CHAIRMAN. We will look into the matter and decide then.

Mr. RUBY. I believe in economizing as much as possible, but if you will examine some of these Senate committee hearings and see what they are printing and what other committees of the House

are putting into their hearings, I think you will find that we are very careful as to what goes into ours. This gentleman has made a long statement, but it is a very fine statement. I agree with Mr. Jacoway and think this ought to go into the record in order to complete and round out the entire statement.

The CHAIRMAN. We will take it up with the full committee.

Mr. ESTABROOK. Mr. Chairman, in connection with the inquiry of Mr. Heflin regarding the accuracy of the cotton crop report, I should like to suggest that there be included in the hearing as an exhibit an extract of a table from our annual report showing the number of pounds of lint cotton estimated by the Bureau of Crop Estimates each year for 19 years, the number of pounds of lint reported as having been ginned by the Bureau of Census of the Department of Commerce, and, in parallel columns, the percentage of error in the estimates of the bureau, both over and under.

Mr. HEFLIN. And the actual crop?

Mr. ESTABROOK. The actual crop, and it shows that for 19 years, ever since the figures of the Bureau of the Census were available—

The CHAIRMAN. How much space will it take? We do not want the whole census report.

Mr. HEFLIN. Just a page.

Mr. HARRISON. Half a page.

The CHAIRMAN. Anything that is necessary to make it clear ought to go in.

Mr. JACOWAY. I want to ask unanimous consent also to have him incorporate the duties of the county agents and also the duties of the statisticians under these crop estimates.

Mr. HEFLIN. You mean the county reporters.

Mr. JACOWAY. I mean just what I say—the county agents; that is set out in the department rules and regulations; also indicate the duties of the men under you, the statisticians.

The CHAIRMAN. That will be set out, I take it, by Dr. True.

Mr. JACOWAY. I want it stated at this point. It will require only a little printing in the record. It will hardly cost 5 cents. I would like the statement to go to Congress in its entirety, in order to make this presentation well rounded. It is something that ought to be done.

Mr. HUTCHINSON. I would like to ask one question. Are your reporters just giving you the number of pounds of cotton grown in a certain year? You do not go any further than that, do you?

Mr. ESTABROOK. The bureau estimates the acreage and the growing conditions from month to month, and finally estimates the yield per acre and total production for each State and for the United States.

Mr. HUTCHINSON. You do not give any reason why your estimate should run over 16,000,000 bales and the crop only 11,000,000 bales? Anybody that has to do with the growing of cotton would want to know the reason why.

Mr. ESTABROOK. No; it is the function of the bureau to report the facts.

Mr. HUTCHINSON. You do not give the reason why it was given as over 16,000,000 bales and was actually but 11,000,000 bales?

Mr. ESTABROOK. We made no such estimate. We have not had printing space in which to elaborate on the reasons for increase or decrease in the production of any crop.

Mr. HUTCHINSON. Do you know the reasons?

Mr. ESTABROOK. We know some of them.

Mr. HUTCHINSON. It was because of the boll weevil largely, I assume.

Mr. ESTABROOK. The boll weevil, adverse weather conditions, uncertainty as to the future; and the business of growing cotton has not been so extremely profitable as some people suppose.

Mr. HUTCHINSON. Forty cents a pound is not profitable?

Mr. ESTABROOK. Not any more so than the growing of wheat at \$2.26 a bushel. The costs of production are high. The cost of picking cotton is running from 4 to 6 cents a pound. That is as much as the lint used to sell for. In those days I have myself picked cotton many times for half a cent a pound, and if anyone should have told me that I would live to see cotton picking at 4 to 6 cents a pound I would have expected to get rich at picking cotton.

Mr. JACOWAY. Did you ever expect to live to see the day when it would cost \$3 a day for hoeing it?

Mr. ESTABROOK. No, sir.

Mr. HUTCHINSON. In our section they get \$10 to \$12 for picking up potatoes.

Mr. HEFLIN. How much did you use to pay?

Mr. HUTCHINSON. About \$2.

Mr. ESTABROOK. The members of the committee should know that every pound of cotton must be ginned; that is, the seed must be separated from the lint, and the entire crop is commercial. It has no other use or value except as it is passed into the channels of trade and is manufactured. The law requires the Bureau of the Census to ascertain and report the actual number of bales ginned in all the ginning establishments of the South, and so in that way we have a complete and absolute check as far as it is humanly possible to get a check on the cotton estimates of the bureau. For 19 years, as shown by this table, the average error of the Bureau of Crop Estimates is 1.4 per cent, and that is an underestimate and not an overestimate. For several years recently those estimates have come within less than 1 per cent, and for two recent years they have come within less than one-half per cent. There is no organization in the world, there is no individual crop-estimating agency in the world, that has estimated with any such degree of accuracy. This is a closer degree of accuracy than a grower can estimate the production of his own fields.

Mr. HEFLIN. When was the last time it was overestimated?

Mr. ESTABROOK. Out of these 19 crops the bureau has overestimated 7 times and underestimated 12 times. In any year the chances are 2 to 1 that the bureau will underestimate rather than overestimate, and the overestimate was in 1916, as near as I can follow these lines, 0.4 per cent, less than half per cent.

Mr. JACOWAY. What were your overestimates or underestimates for each season, so that you can show the percentage?

Mr. ESTABROOK. Beginning back in 1912 we had 0.9 per cent overestimate. The next year, 1913, we had an underestimate of 3.4 per cent. In 1914 we underestimated the crop 1.1 per cent. That was a

year of big production. Nobody kept up with it. The next year, 1915, we underestimated 0.3 per cent. The next year, 1916, we underestimated 0.4 per cent. For the last two years, 1917 and 1918, we have been 3 per cent under, and that is largely because of the bolly cotton, the fact that the high prices have made it worth while to pick more closely than ever, and the fact that the early frosts which usually kill the plant have held off a little later than usual so that more has been picked than the farmers expected. I saw cotton being picked year before last as late as February and March.

Mr. HEFLIN. How do you figure the crop?

Mr. ESTABROOK. We estimate how much will be produced just as the farmer estimates. He estimates that it will be so much, and our estimate is the consensus of opinion of the growers themselves, plus the trained and experienced judgment of our field agents.

The CHAIRMAN. Is that all, Mr. Heflin?

Mr. HEFLIN. I believe that is all.

The CHAIRMAN. The Bureau of Census makes reports every year?

Mr. ESTABROOK. Yes; of cotton ginned, and those reports begin after the picking season begins, and are issued about twice a month, every 10 or 15 days during the picking season up until the middle of January, and the last report is issued about March 20.

The CHAIRMAN. It makes an annual report?

Mr. ESTABROOK. Yes.

The CHAIRMAN. What is the extent of that report?

Mr. ESTABROOK. It relates solely to one thing, cotton ginned, the number of bales, and for that they have got \$250,000 or more, for that one thing. The Bureau of Crop Estimates with its \$18,000 is expected to estimate the acreage planted, the condition, forecast the production, and estimate the yield per acre, and total production, and do all of those things.

Mr. JACOWAY. You have 70 crops, you say?

Mr. ESTABROOK. The \$18,000 relates only to cotton—to a \$2,000,000,000 cotton crop.

Mr. HEFLIN. Where does the Bureau of Census get its funds?

Mr. ESTABROOK. That is another department of the Government. I understand it is \$250,000.

Mr. HEFLIN. Where do they get that appropriation?

Mr. ESTABROOK. From Congress, upon estimates of appropriation approved by the Appropriations Committee.

The CHAIRMAN. You say the appropriation is \$250,000?

Mr. ESTABROOK. That is my understanding.

The CHAIRMAN. What do they do?

Mr. ESTABROOK. They report the number of bales of cotton ginned.

The CHAIRMAN. How do they get the facts?

Mr. ESTABROOK. They employ a man in each county, as I understand it; a reporter at perhaps \$50 or \$75 a month for the picking season.

The CHAIRMAN. Do they get the information at the gin, at the farm, or where?

Mr. ESTABROOK. This information is a matter of record at the gin.

The CHAIRMAN. They simply take the record?

Mr. ESTABROOK. That is all they do.

The CHAIRMAN. That costs \$250,000?

Mr. ESTABROOK. Yes.

Mr. JACOWAY. Are you not a little wrong about that? One of the provisions is that the reporter has got to personally count the cotton ginned.

Mr. HEFLIN. He takes the gin report.

Mr. JACOWAY. You have to go to the gin, I think.

Mr. ESTABROOK. I did not intend to convey the impression—

The CHAIRMAN. Does he go to the gin?

Mr. HEFLIN. The farmer takes his cotton to the gin.

The CHAIRMAN. Does he stand there and count the bales?

Mr. HEFLIN. The gin reporter goes to the gin twice a month and gets this report.

The CHAIRMAN. They simply keep account of what is hauled to the gin?

Mr. HEFLIN. Every bit of it.

The CHAIRMAN. They do not go to the farm at all?

Mr. HEFLIN. There is no necessity of going to the farm, as the farmer hauls it all to the gin and the gin reporter makes his report from all the cotton ginned.

The CHAIRMAN. What do you do with the cotton?

Mr. ESTABROOK. Cotton is one of the many crops reported upon. The bureau begins in May with the condition report, showing the growing condition of the newly-planted crop. By law the bureau is required to report the acreage in cultivation on or about July 1, and condition reports and forecasts of production are made monthly thereafter, and in December the bureau estimates the yield per acre and total production for the year.

The CHAIRMAN. Who makes that report?

Mr. ESTABROOK. The Bureau of Crop Estimates.

The CHAIRMAN. How many reporters are there in each county?

Mr. ESTABROOK. We would estimate about 70 in each county if evenly distributed.

The CHAIRMAN. Seventy for each county?

Mr. ESTABROOK. That would be the average for the United States if they were equally distributed. In some counties there are not that many and in some counties there are more.

The CHAIRMAN. To whom do they report?

Mr. ESTABROOK. Either to the bureau headquarters at Washington or to the State field agents within the States, who in turn report to Washington.

The CHAIRMAN. That is your estimate?

Mr. ESTABROOK. These estimates are made monthly of the condition and prospective yield per acre and the production by States.

The CHAIRMAN. You report on cotton every month.

Mr. ESTABROOK. Every month from the beginning of May up to December except the month of November.

The CHAIRMAN. When you are through do you check it up with the ginner?

Mr. ESTABROOK. There is nothing more to be done except to compare it with the final gin report which is made about March 20 following.

The CHAIRMAN. Do you check it with that?

Mr. ESTABROOK. Yes; with the census, the final reports of cotton ginned as reported by the census, which is the total cotton crop produced the last crop season.

The CHAIRMAN. You have told us of the importance of this work. What do you propose to do with this money? Tell us briefly, so that we may have it in the record.

Mr. ESTABROOK. Briefly, we propose to employ in each State in addition to the present State field agents—

The CHAIRMAN. How many are now employed? How many extra men do you need?

Mr. ESTABROOK. We have about 42 field agents now in the United States, one in each State or in each group of smaller States. We propose to give to each of these men an assistant, an assistant field agent.

The CHAIRMAN. That doubles the force?

Mr. ESTABROOK. Yes.

The CHAIRMAN. What are you going to do?

Mr. ESTABROOK. We propose to do that, and we propose to put in the field agent's office an additional clerk.

The CHAIRMAN. That is three people in each State?

Mr. ESTABROOK. Yes. We propose also to employ a number of crop specialists, men who will specialize in particular crops.

The CHAIRMAN. What are they going to do?

Mr. ESTABROOK. A crop specialist is a man who is assigned not to a particular State, but to a particular crop.

The CHAIRMAN. One for oats, one for wheat, one for corn, and so on?

Mr. ESTABROOK. Yes; now we have some for apples, some for truck crops, one for cotton, one for tobacco, and one for rice. We propose to have one for corn, the greatest crop of all crops grown in the United States, and so on for other important crops and for live stock. That is what they will do. The crop specialist will devote his entire time to studying that one crop, studying the intricacies of that one crop, and collecting and summarizing, analyzing, and interpreting the statistics of that one crop.

The CHAIRMAN. What will he do throughout the country?

Mr. ESTABROOK. He will go and consult with the officials of the special growers' organizations who are interested in the particular crop. He will find out what they want, he will get their cooperation in securing information, he will go to the field agents, the State field agents in the different States where the crop is grown; he will give them the benefit of his expert knowledge of the technical side of that crop, the intricacies, the things to look out for. He will instruct them how best to obtain that particular sort of information, and he will coordinate all these agencies. He will secure cooperation of all State agencies that can help in any way in supplying information, and at bureau headquarters he will correlate all this information on a uniform basis, summarize it, analyze it, and prepare the results for publication.

The CHAIRMAN. What is the next step?

Mr. ESTABROOK. Of those crop specialists there will be about 40 or 50 additional ones.

The CHAIRMAN. Practically one for each State?

Mr. ESTABROOK. In addition to the State field agents, a specialist for each particular crop. They will be out in the field mostly during

the growing season. After the growing season is over they will be brought into the Washington office and there they will work up and correlate and summarize all this information from all sources, so that when information is called for with respect to live stock, say, the live-stock specialist will be the man to supply it.

The CHAIRMAN. You will have specialists in live stock?

Mr. ESTABROOK. Yes. Then we expect to enlarge the organization. We will have more reporters; we expect especially to build up special lists of men who are engaged primarily in growing a particular crop, who know all about that crop, and constitute the best source of information concerning it.

The CHAIRMAN. You have 215,000 of them?

Mr. ESTABROOK. Yes.

The CHAIRMAN. How many more?

Mr. ESTABROOK. That will depend on circumstances, how many will be found necessary, but the idea is to get men who know what they are talking about. After we build up these lists and we have more data coming in we must have sufficient force to tabulate the returns and we will need additional clerks to do that tabulating work. We will also need to employ some statistical specialists to summarize and make available to the public a mass of statistical material now in the bureau and material collected in future, which is of great practical value. That is about the sum and substance of what the increase in the appropriation is for.

The CHAIRMAN. Does that take in all the organization?

Mr. ESTABROOK. That is approximately the increase in the organization. We now have the field agents. We now propose to put in assistant field agents and competent clerks to assist them.

The CHAIRMAN. Who makes these estimates?

Mr. ESTABROOK. Then we propose to employ crop specialists, experts, the best that can be obtained. Then we propose to employ additional clerks to handle additional returns, and statistical specialists to summarize and properly present the essential facts of production and supply.

The CHAIRMAN. Who estimates the crop?

Mr. ESTABROOK. The 215,000 or 500,000 individual farm reporters we now have or may have will estimate for their individual farms, and our trained field agents and crop specialists.

The CHAIRMAN. Who are the 500,000?

Mr. ESTABROOK. I say if we enlarge this service, the number may be 500,000. The bureau already has the names of about 1,500,000 farmers in addition to its regular reporters. They will report to the department and to the field agents. They estimate, so far as they can themselves, for their own farms and the farms of their neighbors. The trained field agents, and the assistant field agents and the crop specialists, will also be estimating on their own account, because they are trained judges of crop and live-stock conditions, and they will interview the best-informed men in every community and get the benefit of their judgment and observation, and we expect—

The CHAIRMAN. But, after all, those who make the examination are these 215,000?

Mr. ESTABROOK. Not altogether. So far as we know there may be 500,000 men, and in addition we will have our own specially trained

agents, and we will utilize all other agencies and sources of information that may be available.

The CHAIRMAN. These 500,000, or whatever the number is, are the farmers; they are the owners?

Mr. ESTABROOK. The 500,000 will not all report to the bureau, but some of them to the field agents.

The CHAIRMAN. Let us confine ourselves to one thing. Who makes the estimates?

Mr. ESTABROOK. Examination is made by the crop reporters, by the field agents, by the crop specialists, and the—

The CHAIRMAN. The examination made by the specialists must be very limited, because you have only one to a State; but the men who do the work, make the examination and the report are these 215,000, or whatever the number is?

Mr. ESTABROOK. The crop reports in the counties in each congressional district will be based on the observation, experience, and judgment of the farmers in the community.

The CHAIRMAN. It will be based on the farmers' reports.

Mr. ESTABROOK. Exactly.

The CHAIRMAN. It is based upon the farmers' reports and the reports of the specialists who travel over the State?

Mr. ESTABROOK. Yes.

The CHAIRMAN. That is exactly as you have done in the past?

Mr. ESTABROOK. In a limited way.

The CHAIRMAN. In what way does that differ from the past? You simply add an assistant to what you have to-day?

Mr. ESTABROOK. Yes.

The CHAIRMAN. You propose now to employ the same 215,000 and you may add others?

Mr. ESTABROOK. Yes; I would like, Mr. Chairman, to mention one phase of the bureau's work that has not been touched upon to-day.

The CHAIRMAN. First let us get at this estimate.

Mr. ESTABROOK. This estimate is involved in it. That is the utilization of the local assessors in various States to make an annual census of acreage and numbers of live stock.

The CHAIRMAN. In my State—and I presume it is so in other States—the assessor goes around every year and takes an invoice for assessment. The statements are made under oath. I was going to suggest that that would probably be more reliable than anything you could get by these reports.

Mr. ESTABROOK. But your presumption that that is true in other States is not correct. You are mistaken in believing—

The CHAIRMAN. Are they not given under oath?

Mr. ESTABROOK. You are mistaken in believing that the assessors do collect that information in all other States. I am speaking for the United States. In certain States in which we have cooperative relations that matter has been taken up. Recently we have entered into cooperative arrangements in 15 States where we have combined forces. In Wisconsin, where we have this cooperative arrangement, and where the law requires that the assessors shall collect these data, that information was collected and sent to the Secretary of Agriculture, and the Secretary of Agriculture turned it over to

the Wisconsin field agent, who checked them up, and has been checking them up annually since. By enlisting the interest of State officials and issuing proper instructions to assessors, the system has been brought up and perfected until we have a census that is 99.9 per cent correct and much better than any decennial census that can be taken. But the essential thing, Mr. Chairman, is the checking up by the trained field agents. Why, sir; out of 1,600 townships there were only a few that were added correctly.

The CHAIRMAN. In the census?

Mr. ESTABROOK. No; in these township assessors' returns. That is why I say it is important for the trained man who knows—

The CHAIRMAN. Do you propose to go to the assessor's office to check over the books and make reports?

Mr. ESTABROOK. We propose to have those available to our field agents in some manner, through cooperation. We have no authority over the State and do not desire any. But we do desire to have these data. We do desire to develop that machinery, the State machinery. It is for the benefit of the State to do it, and it gives us the accurate data, the accurate basis which we need.

The CHAIRMAN. If the department should request the State assessors to give those data, would not every one of them respond?

Mr. ESTABROOK. Not 10 per cent. We have tried it. It has got to be done by a careful following up of the returns. We have met with such success in this field that we have tried to encourage the same idea in other States, and we met with such success that the last legislatures in 30 out of 48 States revived or amended old laws or passed new laws providing for the collection of data in this manner. That is one of the most constructive things the Bureau of Crop Estimates has done in recent years. If it is followed up, as it will be, we will have an annual census that is better than a decennial census.

The CHAIRMAN. They are taking the census this year?

Mr. ESTABROOK. Yes.

The CHAIRMAN. Just at the time when we are taking the census, spending millions of dollars, you ask for an increase of \$550,000 to duplicate, or what seems to be duplicating, what is to be done by the census.

Mr. ESTABROOK. Not at all.

The CHAIRMAN. We will admit that everything you have suggested is an estimate.

Mr. ESTABROOK. The duplication, if there is any, so far as it occurs in the census has already taken place, because the census relates to 1919. We are now in 1920 and the census data will only relate to 1919. Those are the last data you will get out of the census for 10 years. What are the farmers and the business men of the country going to do in the meantime?

The CHAIRMAN. Remember the States do some. Some States have a census just as often as the Federal Government.

Mr. ESTABROOK. But you must remember, Mr. Haugen, that the same conditions do not prevail throughout the United States as prevail in Iowa. The system is different in almost every other State and this information to be of much or any value must be comparable. It must be on a uniform basis. It must be country wide.

The CHAIRMAN. Are not practically all the States taking a census every 10 years?

Mr. ESTABROOK. Every 10 years we have a decennial Federal census.

The CHAIRMAN. I know; I am speaking about the States.

Mr. ESTABROOK. No; absolutely not.

The CHAIRMAN. How many do?

Mr. ESTABROOK. I could not say, offhand, but I am certain that not more than 8 or 10 out of the entire United States take a census* of any kind.

The CHAIRMAN. All that you contend for your system is that you simply furnish estimates? It is different from the census in that respect?

Mr. ESTABROOK. We do not claim that it is anything but an estimate. To take a census would cost \$10,000,000, and it would take two or more years to compile the information, and for all practical purposes it would be utterly useless when we got it. It would be purely historical. The Bureau of Crop Estimates is simply an organization and a system that gets out statistics that are often accurate to within 1 per cent at a very low cost.

The CHAIRMAN. It has been suggested by a member that it should be done by the county agents. It is not clear to me why it should not be done by them—why these county agents could not do it without materially interfering with their other work. It seems to me that the county agents, with an office and other help—even if we have to give them more help—could do this work better and more economically than anybody else and that by thus cooperating, considerable money could be saved. If it were necessary, some specialist could be sent out to check them up. They would not have to compile these reports. That could be done by experts and statisticians. But in gathering the information it seems to me that the county agent is the proper agency through which to gather it.

Mr. ESTABROOK. That, of course, is a branch of the service which is not now a part of the Bureau of Crop Estimates.

The CHAIRMAN. County agents are through the county all the time; they come in contact with the farmers, visit them, and know their names. No one in a county can be better informed of the conditions in the county than the county agent.

Mr. ESTABROOK. They are utilized as far as it is possible to do so.

The CHAIRMAN. They select the names of a few farmers. That does not go very far.

Mr. ESTABROOK. The field agent gets the best judgment and the best information that the county agents have.

The CHAIRMAN. Just the same as the elevator man or the merchant?

Mr. ESTABROOK. No, sir.

The CHAIRMAN. I take it they would confer with anybody that gives information. It does not matter the source.

Mr. ESTABROOK. An interested county agent, a competent county agent, one who really has a head on him and knows what he is talking about, will sit down with the field agent and will give him all the information he has got, and the field agent will draw out of him all the information that the county agent has, and that information

will be recorded in the field agent's notes and will be used in making up the monthly estimates. We now utilize them to the fullest possible extent to which they are made available. If the county agents were turned over to the Bureau of Crop Estimates, we could keep them busy day and night and Sundays and holidays on this work alone. The reports that come to us are that the county agents are overburdened, and they have not time to make crop reports. We would be glad to utilize them far more extensively if they had the time and were made available.

The CHAIRMAN. Have you any further statement to make?

Mr. ESTABROOK. I was prepared to discuss each item of the printed estimates, if you care to go into the details.

The CHAIRMAN. Is there any object in discussing each of the items?

Mr. ESTABROOK. I will leave that entirely to you, sir. If you have no questions to ask—

The CHAIRMAN. I want to leave that to you. We want complete information. If you have more information that we ought to have, we will be glad to have it; you certainly have gone over it in detail and in a comprehensive way.

Mr. ESTABROOK. The bill is itemized and, if taken in connection with this program, shows precisely what we propose to do with each of these groups of crops. From them you can arrive at a clear understanding.

However, I do want to ask the committee one thing, and that is in considering these salary items to divide each one by two to make it comparable with the prewar basis.

The CHAIRMAN. What salary have you reference to?

Mr. ESTABROOK. Any salary. Divide by two the salary of the chief of the bureau, for instance, which is \$4,000. To find what it is worth as compared with 1914, divide by two.

The CHAIRMAN. I take it the salary proposition is a matter that should be considered by taking into consideration the whole department.

Mr. ESTABROOK. Surely. I have no personal object in mentioning that particular salary. It might be any salary.

The CHAIRMAN. How do the salaries paid by your bureau compare with the salaries paid by other bureaus?

Mr. ESTABROOK. I think the salaries are somewhat less than other bureaus, considerably less than the salaries in the Bureau of Markets. The average salary of field agents is about \$2,100, although they are well worth from \$3,500 to \$5,000. We have lost a number of men since July.

The CHAIRMAN. He gets traveling expenses and subsistence.

Mr. ESTABROOK. Yes; but at present it costs more than the Government can reimburse to him.

The CHAIRMAN. How does that salary compare with salaries paid in the census for similar work? This is more specialized, is it not?

Mr. ESTABROOK. Ours is more specialized. The salaries in the Bureau of Crop Estimates will run low because we started low. We started on the wrong basis. I started with the idea that the new men ought to be started at \$1,600, and if they did not develop they would not be promoted. That has been slowly increased in six years to an average of \$2,100.

The CHAIRMAN. Some of the salaries in this list are \$3,700.

Mr. ESTABROOK. Those are the highest administrative officers who are all underpaid.

The CHAIRMAN. In your opinion, then, what is the discrepancy between salaries paid by your bureau and those prevailing in other bureaus?

Mr. ESTABROOK. I should say it would be 20 to 50 per cent. Our \$2,000 men are comparable with the men who get \$2,600 to \$3,600 in other bureaus.

The CHAIRMAN. Is there something else that you want to bring out?

Mr. ESTABROOK. No; I think not, at this late hour.

The CHAIRMAN. Have you not discussed all these items quite extensively?

Mr. ESTABROOK. I have simply outlined in a general way the proposed program, the proposed expansion of the service, the importance of the service, and how it will benefit farmers and other classes of people. Now, it seems to me that the estimates as they appear here are self-explanatory. There is sufficient information here to enable you to arrive at a correct conclusion, bearing in mind what I have said in a preliminary way.

The CHAIRMAN. If this statement regarding your enlarged program is printed in the record, that will give all the information necessary; will it not?

Mr. ESTABROOK. Yes, sir.

The CHAIRMAN. We are very much obliged to you, Mr. Estabrook.

(Thereupon, at 6 o'clock p. m., the committee adjourned until Wednesday, January 7, at 10 o'clock a. m.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Wednesday, January 7, 1920.

The committee met at 10 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. We have with us this morning, Mr. Moon. We will be pleased to hear you, Mr. Moon.

BUREAU OF CROP ESTIMATES—Continued.

STATEMENT OF MR. J. EDWARD MOON, PRESIDENT OF THE AMERICAN ASSOCIATION OF NURSERYMEN.

Mr. MOON. I represent, gentlemen, the American Association of Nurserymen, of which this year I happen to be president. This is a national association of nurserymen throughout the United States with a membership that includes California, Minnesota, Texas, and the Atlantic seaboard, having about 395 members, and the largest nurseries in the country are represented.

We are interested this year in two appropriations asked for in the department's budget. We have never been before this committee to ask any assistance, in a financial way, and the industry has, of

course, been in America since prerevolutionary days. But we have, in the last year, suffered a condition which I ask you to help us to remedy, and that is the condition brought about by the Quarantine Order No. 37, with which I know you are all familiar. That imposes a great responsibility on the nurserymen for propagation. Heretofore we could go to foreign countries and get any supplies of which we were short in this country; but now we must produce them here, with the exception of a few raw materials that can be brought in under restrictions and permits.

MR. McLAUGHLIN of Michigan. Have you a copy of that order with you?

MR. MOON. No, sir; I have not. It is well known, however, and can be produced if you wish it.

MR. MOON. The first item to which I wish to speak myself is one for gathering crop reports, which, I understand, Mr. Estabrook touched on yesterday. The other is what has heretofore been known as the Gould bill, about which our executive secretary, Mr. Watson, will speak, as he is better posted on that subject than I am.

Crop reports to the nurserymen are very vital. We have maintained two associations to collect them ourselves, one in the Central West and one among the growers of ornamental stocks. These efforts have been only partially successful, because we have no way of collecting statistics outside of our membership, and our membership is limited. We are called upon now to produce nursery stock that is going to take us from 3 to 10 years to manufacture, and in the case of the boxwood and rhododendrons—may be 15 years to do it. We feel, therefore, in order to interest capital in the propagation of those plants and to enter on it in any scale that is adequate to meet the demands of this country, we ought to have crop reports that will show us at all times what there is in the nurseries of this country of the different items that are basic or standard in the industry. And if we had such information we would know in any one year what to propagate in order to meet a normal demand, and, when we have a turnover of 8 or 10 years, you can see how vital it is to know when the seed is sown that there is not several million ahead of it or several million shortage, in which case we would plant accordingly. That is our great need for these statistics.

You have gathered them for the farmers in fruit. The fruit orchardist has a turnover every year and we do not have it as frequently; yet our need is just as great. This is a new item you never had before and it is made necessary, in our opinion, by this quarantine order. We realize that you are endeavoring to keep down the budget and to save expense which, as taxpayers, we appreciate; yet we do think new conditions bring about new requirements.

That, gentlemen, is all I have to say about this item, except as evidence of our earnestness for it we have called personally on Mr. Hutchinson, who is a neighbor of mine, and stayed here in Washington to get this opportunity and are really serious about it. Now, Mr. Chairman, if Mr. Watson might speak to this other item, he is here to do so.

MR. McLAUGHLIN of Michigan. I would like to ask a question or two: You say you have three associations composed of nursery-

men throughout the country. Does this number include all the nurserymen in the country?

Mr. MOON. The American Association is the national association. The other two I mentioned are the Ornamental Growers' Association, which includes 40 firms that grow ornamental stock entirely, and the Western Association, that has a membership up and down the Mississippi Valley and includes some 75 nurserymen. A great many of them are around Shenandoah, Iowa, down through Kansas and in Texas. There are different State associations, too.

Mr. McLAUGHLIN of Michigan. Do you not ask and require of your members to report on what they are doing?

Mr. MOON. These two associations do make that requirement, but they cover 75 in the Western and 40 in the other—about 120 nurseries.

Mr. McLAUGHLIN of Michigan. Together, these associations include practically all of the nurserymen of the country?

Mr. MOON. No, sir; the census of 1910—

Mr. McLAUGHLIN of Michigan. What proportion of them?

Mr. MOON. The census of 1910 gives 4,500 nurseries, I believe, in the United States. Of course many of those are allied florists.

Mr. McKINLEY. How many are there in your national association?

Mr. MOON. Three hundred and ninety-five. That includes this 120 which are in the sectional associations.

Mr. McLAUGHLIN of Michigan. Can not your associations ask and require the reports you are asking for some Federal authority to gather for you?

Mr. MOON. We can from the 395 people.

Mr. McLAUGHLIN of Michigan. In the one association; how about the other?

Mr. MOON. The two are merged together. I mean the sectional associations are all included in the national.

Mr. McLAUGHLIN of Michigan. Your associations include all the principal ones or the most of them, do they?

Mr. MOON. The 395 nurseries by no means include the majority of the nursery stock, because there are quantities held in small lots around the country.

Mr. McLAUGHLIN of Michigan. Another thing: I presume, when additional appropriations are asked, there will be some suggestion from those who ask them as to how we are going to get the money to meet them. I understand we are facing a deficit of some \$3,000,000,000.

Mr. MOON. That is true; but, as I say, this industry has, by the order of the department, had a responsibility placed upon it which it has never before had and, under those conditions, we feel we should have assistance from our Federal Government to help us in the security of growing our products. We have the hazards of the insect pests and we have the hazards of the weather conditions, all of which are trying enough; but we do feel we should have the stabilizing influence of statistics.

Mr. McKINLEY. Mr. Moon, how does it happen that only 395 out of 4,500 nurserymen belong to your association?

Mr. MOON. That is all that have joined the national association. That represents a majority of the acreage. If you know national

associations, there are always a lot who do not join and take the benefits which the leaders in the industry get. In the nursery industry a great many nurserymen have less than 10 acres of land; but we have in this membership practically every nurseryman in the United States operating over 200 acres of land and some 1,000. There are 175,000 acres devoted to nursery products, according to our best information.

Mr. LEE. In the entire country?

Mr. MOON. Yes; these little men have heretofore largely gotten their products from the European sources, and those of us who have been producing are now called upon to supply them in addition to our regular trade. You see, we are in a chaotic state, with our raw material shut off, except from stocks of roses.

The CHAIRMAN. Thank you, Mr. Moon.

(Thereupon the committee proceeded to consider another matter.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Saturday, December 20, 1919.

The committee met at 10.30 o'clock a. m., Hon. James C. McLaughlin presiding.

LIBRARY.

Mr. HARRISON. Miss Barnett is here and will present the estimates for the library, which appear on page 208 of the Book of Estimates.

**STATEMENT OF MISS CLARIBEL R. BARNETT, LIBRARIAN,
DEPARTMENT OF AGRICULTURE.**

Mr. McLAUGHLIN of Michigan. You have a statement, I presume, you wish to present first?

Miss BARNETT. Yes, sir.

Before discussing the library estimates in detail I should like, with your permission, to make a general preliminary statement about the library and its work, in order that the needs of the library may perhaps be better understood.

The library of the Department of Agriculture is a scientific and technical one. Its collections now number approximately 150,000 books and pamphlets, constituting what is without doubt the largest agricultural library in the world. The subjects which it covers are the matters under investigation by the department. It follows, therefore, that it is particularly strong in agriculture and all its branches and in the literature of all the sciences pertaining to agriculture, such as botany, entomology, zoology, chemistry, veterinary medicine, and forestry. Its statistical collections also are extensive and valuable.

The emphasis of the library is on the utilitarian side. It does not purchase books which are of interest because of their rarity unless they also have scientific or historic value. The resources of the Library of Congress and other Government libraries are always taken into account, our policy being to avoid unnecessary duplication. While there is no official connection between our library and the Library of Congress, there is close cooperation, and the fullest use is made of the resources of the Library of Congress. In the building up of our collections our library may be said to be administered as a branch of what has been called the "National Library," consisting of the Library of Congress and the special collections in the various departments and bureaus of the Government. In other words, it has

seemed wise to administer the library, not as an independent unit, but as a part of the system of Government libraries, of which the Library of Congress is the center, and to adopt a broad policy looking toward the increase of the sum total of scientific literature in Washington to be used for the benefit of the whole Government service and the country at large. With all its great resources, it is impossible for the Library of Congress to care for all the special needs of the various departments. Its resources must be supplemented by the libraries close to the work of the departments and bureaus. The library of the Department of Agriculture is trying to do its full share for the subjects covered by the department.

While the library exists first of all for the benefit of the department, it is free for reference to any who wish to use it. The use of its books by other institutions in and out of Washington is increasing from year to year. During the war there was a greatly increased use of the books by other Government departments, especially by the new offices, such as the Food Administration, the War Trade Board, and the War Industries Board. Without the use of our collections, some of their investigations would have been greatly hampered. A large number of books also are lent to institutions in every State of the Union, to the various State agricultural colleges and experiment stations in particular, and to other institutions engaged in agricultural research. In addition to the service rendered by the use of its books, the library endeavors to serve to some extent as a bureau of information about agricultural literature. In general, it aims to make its resources, its equipment, and the services of its staff as widely useful as possible. While the library endeavors thus in a broad way to take on the functions of a national agricultural library, its main reason for existence is, of course, its usefulness to the department. Its importance in the work of the department can not be too strongly emphasized.

If the library is weak or inefficient because of inadequate resources, or by reason of an insufficient or poorly trained staff, the work of the department is bound to suffer, for an adequate and well-equipped library is as necessary to the scientific investigator as is his laboratory. The library must grow with the growth of the department. During the past three years there has been no change in the library's appropriation either for salaries or for the general expenses of the library. In the meantime the department has expanded very materially and has taken on new lines of work. There has also been a corresponding increase in the demands upon the library. On the other hand, due to the war, there has been a decrease, economists tell us, and we experience it on all sides, of nearly a hundred per cent in the purchasing value of the dollar, which has made all the salaries most inadequate and has also, in effect, decreased to a large extent the amount of the appropriation available for the purchase of books and periodicals.

There are on the library roll now a number of assistants who have rendered most faithful and efficient service for 10, 15, and 20 years, who, as far as the purchasing power of their salaries is concerned, are getting less to-day than when they entered the library. This is a condition which does not make for efficient service.

I do not presume to say that our experience is unique, but I believe it is true that the library has suffered more than many offices since

its salaries are practically all statutory, which has made it impossible to meet the changed conditions through the appointment of new assistants at higher entrance salaries, and, furthermore, even before the war the salaries of the library employees were most inadequate. While the wording of the appropriation makes it possible to carry salaries on the appropriation for the general expenses of the library, we have been loath to do this because it would decrease the funds for the purchase of books and periodicals, which funds are inadequate, and because the library appropriation is the only department appropriation which can be used for the purchase of books and periodicals for use in Washington.

Possibly I have spoken at too great length in regard to salaries in general when the estimates, in accordance with the instructions of the Secretary of the Treasury, provide for no promotions because of the proposed reclassification of all Government salaries. In justice, however, to the staff, to the library, and to the department, it seemed necessary to point out how great the need is for a general increase in all the library salaries if the department is to retain the services of those who are well qualified by reason of education and training and years of experience in the library to perform the service which users of the library have a right to expect from the library.

I will now explain briefly the few changes in the statutory roll as shown in the estimates. These call for an additional clerk at a salary of \$1,400 and one at \$1,200, the latter by transfer from the lump fund. Both of these positions are needed on account of the growth of the department and the increased demands upon the library. The salaries requested are inadequate but for assistants they could not very well be made higher if they are to fit in with the present salary schedule, as the assistant librarian, for example, receives only \$1,600.

It is recommended that the position of messenger boy at \$480 be dropped on account of the difficulty in the past year or two of getting satisfactory service at this salary. As stated in the estimates, the position has been vacant for some time.

An additional charwoman at a salary of \$600 is recommended on the statutory roll by transfer from the lump sum. This charwoman puts away the books on the shelves and keeps the shelves in order. It has been found more satisfactory to have this work performed by a mature and responsible charwoman than by an immature and perhaps less reliable messenger boy.

The apparent increase in salaries is \$2,720, but deducting the two places which are at present carried on the lump sum, the actual increase is only \$920.

In the estimates for general expenses there is an apparent increase of \$8,200, but taking into consideration transfers to the statutory roll amounting to \$1,800, the actual increase is \$10,000. This amount, as stated in the estimates, is recommended in order to provide additional library facilities made necessary by the growth of the department and the inauguration of new lines of work and to meet the increased cost of books, periodicals, and library equipment. During the past five years many of the library's files have been broken on account of the difficulty of getting books from foreign countries. To be able to complete them the library must have greatly increased funds. Dictionaries, atlases, directories, and subscriptions

to periodicals have to a very large extent increased in price from 10 to 25 per cent and even more. Still another reason for this increase, which is considerably larger than the increases requested in previous years, is the opportunity which, it is believed, will be presented in the near future for the purchase of many rare foreign scientific books. These are likely to come upon the market due to war conditions, and the department should be in a position to purchase such as are needed to strengthen its collections.

In conclusion, may I point out again that there has been no increase in the library's appropriation for books in the past three years, and that at no time has the library's appropriation kept pace with the growth of the department. The department is frequently referred to as the greatest scientific and educational institution in the world. In a corresponding way the library should also be pre-eminent in the completeness of its collections and the quality and extent of its service. It is hoped that the library may have your support to this end.

Mr. McLAUGHLIN of Michigan. Is there any other bureau or branch of the department that has authority itself to buy books?

Miss BARNETT. Not for use in Washington.

Mr. McLAUGHLIN of Michigan. Your library fund is the only one, then, to be drawn on for any books?

Miss BARNETT. Yes, sir.

Mr. McLAUGHLIN of Michigan. How about magazines and periodicals?

Miss BARNETT. No office has authority to purchase books or periodicals but the library, except for use in the field—outside of Washington.

Mr. McLAUGHLIN of Michigan. You speak of additional facilities that will be added. What is the character of those facilities?

Miss BARNETT. Next year we will have to buy some additional stacks for the library.

Mr. McLAUGHLIN of Michigan. How much do you propose to use for that?

Miss BARNETT. I have not had any detailed estimate for them. They are expensive—the steel stacks.

Mr. McLAUGHLIN of Michigan. What other facilities?

Miss BARNETT. We may have to spend a part of that sum for salaries, too, because it is impossible at the present time to get—

Mr. McLAUGHLIN of Michigan. You spoke of facilities. I supposed that meant furniture, fixtures, and something of that kind. You have mentioned steel stacks; what other item in the nature of facilities do you have in mind?

Miss BARNETT. No others that will cost very much. Of course, all supplies cost more now.

Mr. HARRISON. The greater part of the increase will go for books, and it is not contemplated now that any portion of it will be used for increased salaries. It may be necessary, however, to make some new appointments, but this will, of course, depend upon the needs of the service.

Miss BARNETT. Most of the increase will be used for books and periodicals.

Mr. HARRISON. For books and periodicals; the other items are relatively small.

Mr. McLAUGHLIN of Michigan. Your answer would indicate part of the lump sum will be used for increase of salaries and part of it for books. Can you tell how much?

Miss BARNETT. As Mr. Harrison says, the bulk of it will go for books and periodicals. That being the only fund for the purchase of books, we wish to conserve it for that purpose as much as possible. We have made no provision in these estimates for increases in salaries.

Mr. McLAUGHLIN of Michigan. The larger part, you say; what part? Can you give us an idea how much will be used for salaries and how much for books?

Miss BARNETT. I estimated that it may be necessary to spend about \$3,000 for salaries and about \$22,000 for the books.

Mr. McLAUGHLIN of Michigan. You do not mean \$3,000 increase, do you, in salaries on the lump fund?

Miss BARNETT. I estimated that about \$3,000 of the total lump fund would be used for salaries.

Mr. HARRISON. Mr. McLaughlin, perhaps the table on page 209 will clarify the situation.

Mr. McLAUGHLIN of Michigan. The difference there is \$750.

Mr. HARRISON. \$750, but you will note that no provision has been made for any increase in salaries. You will note there were two employees at \$1,400 in 1919 and that we have estimated for two at the same salary in 1921. Then we had one temporary employee at \$660 in 1919. We have dropped this place in the 1921 estimates. We have estimated for one employee at \$480 in 1921, while we had two at that salary in 1919.

Mr. McLAUGHLIN of Michigan. But when we have tried to compare those two columns, 1921 and 1919, in other cases, we have been told that there was an intervening year there so that the comparison between those two years is not continuous, you say, and they do not furnish us with very much information.

Mr. HARRISON. That is true, but the comparison between these two columns will, nevertheless, in this particular case, show that there has been no change in the salaries during the current year and that we do not contemplate now any change in the salary roll during the next fiscal year, the difference between expenditures in 1919 and the estimate of the expenditures for 1921 being due to the fact that the employees in 1919 were carried on the roll only part of the year. Their salaries were not a charge against the appropriation throughout the year, and therefore the expenditures were naturally less than the estimate for 1921, because the latter is based on the assumption that the employees indicated in the table will be carried on the roll every month of the year.

Mr. McLAUGHLIN of Michigan. There were individuals who were employed from time to time, and there was somebody in each one of these positions all of the time, was there not, during 1919?

Mr. HARRISON. No; in these cases they were all temporary; they were merely employed for brief periods.

Mr. McLAUGHLIN of Michigan. Each one was temporary while he was employed, but the places were filled all the time, were they not?

Mr. HARRISON. I do not have the details in mind, but it is possible, for example, that one of the \$480 employees served during the first

three months of the year, while the other served during the last three months.

Mr. McLAUGHLIN of Michigan. And you might have had them for one month or six months?

Mr. HARRISON. Yes. I have not the details; perhaps Miss Barnett will remember them.

Mr. McLAUGHLIN of Michigan. The amount is very small. I do not think it will be necessary to spend very much time on it. That would leave about \$9,254 for books and the appliances and facilities that you speak of, would it not?

Miss BARNETT. You mean—

Mr. McLAUGHLIN of Michigan. \$750 is for salaries and \$9,254 would be available for other things. If you buy no additional fixtures the entire amount will be available for books?

Miss BARNETT. Yes, sir.

Mr. McLAUGHLIN of Michigan. You say there has been no increase in the appropriation available for books since when?

Miss BARNETT. In the last three years the appropriation for the library has been the same.

Mr. HARRISON. The table on page 209 indicates that. You see that there was a slight increase in 1917—from \$16,300 to \$18,000—and that there has been no change in the appropriation since then.

Mr. McLAUGHLIN of Michigan. And during this year, how much have you spent for books?

Miss BARNETT. We spent between \$14,000 and \$15,000 in the fiscal year 1919.

Mr. McLAUGHLIN of Michigan. Is this library all in one place or scattered to some extent?

Miss BARNETT. It is scattered and has branches in the various bureaus.

Mr. McLAUGHLIN of Michigan. Does that make necessary the employment of some one at each place to take care of the books you have at that place?

Miss BARNETT. Yes, sir.

Mr. McLAUGHLIN of Michigan. Is that necessary? Could not the head of the bureau, or some one in the bureau, take charge of the books that are in his bureau?

Miss BARNETT. It really is necessary to have a librarian in charge of each library.

Mr. McLAUGHLIN of Michigan. The force does not seem very large. Of course, the whole thing is not very large as to the number of employees. Are there any other questions?

Mr. PURNELL. It would not be practicable to consolidate all of these libraries at one point, would it?

Miss BARNETT. As long as the department is so scattered, I am afraid not.

Mr. PURNELL. Would it result in any material reduction or saving if it were practicable?

Miss BARNETT. Yes; I think it would. It requires more service when it is scattered.

Mr. HARRISON. There are two difficulties in the way of consolidation, Mr. Purnell. One is the lack of adequate quarters for a single central library—at present the main library is very much crowded for

space. The other is the distribution of the units of the department all over the city. As I explained the other day, we occupy something like 42 different buildings in the city of Washington.

Mr. McLAUGHLIN of Michigan. Where is the main library?

Mr. HARRISON. It is located in the Bieber Building, the building in which the Bureau of Markets is located. The library is on the first floor of that building. It was formerly in the main building of the department, the red-brick building, in which the Secretary's office is situated.

Mr. McLAUGHLIN of Michigan. I knew it when it was there, but I have not followed its movements.

Mr. HARRISON. The space formerly allotted to the library in the main building is now occupied by the Bureau of Crop Estimates. The library was transferred to the Bieber Building when that structure was erected.

Mr. PURNELL. How extensive a library would you have if they were all combined? I am asking for information.

Miss BARNETT. We have 150,000 books and pamphlets.

Mr. PURNELL. Are they consulted frequently?

Miss BARNETT. Yes; they are. I think the department could not very well get along without a library.

Mr. PURNELL. I would not want to advocate the abolition of the library, but I was wondering whether or not it might not work out to advantage if they were combined at one point and have the distribution at one place?

Mr. McLAUGHLIN of Michigan. I was thinking there might be somebody in each office where the branch library is located to take care of the books at that place and not make it necessary for some one from your office to be at each one of these places, and in that way it would leave more money for the purchase of books and not so much for the care of them.

Miss BARNETT. Each bureau requires special library service. You see the subject matter with which each bureau deals is quite different, and the librarians in charge of the various branches also do a great deal of work other than their library work; that is, work in which their library training is an advantage. For instance, some help in the editorial work, some spend part of their time in indexing correspondence, and some look after the distribution of the publications of the bureaus. But principally they do reference and bibliographical work for the bureaus. I think each bureau needs this special service.

Mr. McLAUGHLIN of Michigan. You have given that matter careful thought and have concluded that the best way is as you are doing it now?

Miss BARNETT. If the offices of the department could be together, I think one central library would be a great advantage; but, as Mr. Harrison says, with the buildings scattered as they are at present, I think the bureau libraries are necessary.

Mr. McLAUGHLIN of Michigan. Did you mention the number of branch libraries?

Miss BARNETT. We have 13.

Mr. PURNELL. I presume the books kept at any one point are peculiarly adaptable to the work carried on that point; is that true?

MISS BARNETT. Yes; they are.

MR. PURNELL. Are these books at one point consulted frequently by other departments?

MISS BARNETT. Yes; we have to borrow from the various branches.

MR. PURNELL. How do you get those books? Suppose one department wants to use the books at another place, how do you get those books?

MISS BARNETT. We maintain in the main library a complete record of all the resources of the department; that is, in the way of books and periodicals; and if one office calls for a book we can immediately tell, from our records, whether we have it, and then, from our records, where it is. We either telephone, or send a written request if it is not needed in haste, and the book is brought back to the main library and then sent to the office that called for it.

MR. HARRISON. For example, Mr. Purnell, if the Secretary's office desires a particular book, it makes a request on the main library, and the main library secures the book, no matter where it may be located, and sends it to us.

MR. PURNELL. It will find out the place where it is located and send and get it?

MR. HARRISON. Yes; the library knows where it is located, and it gets the book and sends it to our office.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Friday, December 19, 1919.

AFTERNOON SESSION.

Hon. Gilbert N. Haugen (chairman) presiding.

MISCELLANEOUS EXPENSES.

STATEMENT OF MR. B. M. REESE, CHIEF CLERK, DEPARTMENT OF AGRICULTURE.

The CHAIRMAN. Who do you have next, Mr. Harrison?

MR. HARRISON. There is another item on page 210—"Miscellaneous Expenses." It is a very short item and will take only a few minutes.

The CHAIRMAN. That is the item for stationery, blank books, twine, paper, gum, dry goods, soaps, brushes, brooms, etc., and the amount is \$141,000.

MR. REESE. There is a decrease in this item of \$34,500, due to the omission of \$33,000 for repairs to the power plant, which repairs will be completed during the fiscal year 1920, and the transfer to the Division of Publications of \$1,500, heretofore allotted from this appropriation for the purchase of envelopes and miscellaneous supplies in connection with the informational and exhibit work of the department, which it is proposed to merge with the Division of Publications. In other words, the miscellaneous supplies required in connection with the informational and exhibit work has been carried in this appropriation because it was a part of the secretary's

office. In the consolidation of those various lines of work, we merely transfer the \$1,500 to the Division of Publications, and this appropriation is reduced accordingly.

I have nothing further to add in regard to "Miscellaneous expenses," unless the committee has some questions they desire to ask.

RENT IN THE DISTRICT OF COLUMBIA.

The CHAIRMAN. The next item is on page 211, "For rent of buildings and parts of buildings in the District of Columbia, for use of the various bureaus, divisions, and offices of the Department of Agriculture, \$150,000: *Provided*, That only such part of this sum shall be available to pay rent for space which can not be furnished by the Public Buildings Commission in Government buildings located in the District of Columbia." The amount is \$150,000.

Mr. HARRISON. There is an apparent increase in this item of \$50,000. This amount, however, includes the transfer of the item of \$41,509 for rent carried in the sundry civil act for the fiscal year 1920. The actual increase, therefore, is only \$8,491. The total appropriation for rent in the District of Columbia for the fiscal year 1919 was \$158,689. Congress reduced the amount to \$100,000 in the appropriation act for 1920 on the assumption that the Public Buildings Commission would be able to allot space in temporary structures to make up the deficit, but the commission found it possible to allot only a very small part of the space required.

Mr. ANDERSON. Are we to understand that with all of the emergency buildings put up during the war it is impossible to find quarters for the various activities of the Department of Agriculture, and that we are going to pay a rent equal to that paid prior to the war?

Mr. REESE. The Public Buildings Commission, created last March, made an allotment of space to this department on June 25, or just five days before the close of the fiscal year. In lieu of space that they allocated they required us to vacate seven rented buildings, which the department did promptly. Since that time the department has made several appeals to the Public Buildings Commission for space, and none has been allotted. I understand, informally, that the Public Buildings Commission is about to make another allotment of space, but I have no information as to what the Department of Agriculture may get.

Mr. ANDERSON. It looks rather ridiculous, on the face of it, with all of these buildings erected during the war and all of the parks all over town covered with temporary buildings, that we should pay \$150,000 a year for rent for the Agricultural Department.

Mr. HARRISON. I would like to call attention to what happened last year. The committee reduced the item for rent from \$158,689 to \$100,000, on the theory that we could secure a large allotment of space in the temporary structures. We filed applications with the Public Buildings Commission, and made every effort to get sufficient space to bring our expenditures for rent within the \$100,000. After the reduction had been made in the appropriation we were told by the Public Buildings Commission on the 25th of June to give up certain buildings occupied by the department, for which we were

paying rentals aggregating \$17,180. This was only five days before the expiration of the fiscal year, and we were approximately \$41,000 short. The chairman of the Public Buildings Commission suggested that we take the matter up with the Committee on Appropriations and secure through that committee any funds that might be needed in order to comply with the directions of the commission. I learned that the Committee on Appropriations still had under consideration the sundry civil bill, and we accordingly laid the situation before it, with the result that the additional amount required was included in the sundry civil bill. We were, however, placed in a very embarrassing situation, with only five days within which to secure relief.

We have continued our efforts to secure additional space in the temporary buildings in order that we might vacate some of the rented quarters which we now occupy. The Public Buildings Commission, however, has stated that it has given us every foot of space that is available for allotment to the Department of Agriculture. I want to make it absolutely clear to the committee that the department will not spend all this money for rent unless it is absolutely necessary, and we earnestly hope that the full amount will be appropriated, so that we will not be placed again in a situation similar to that which confronted us at the close of the last fiscal year.

The CHAIRMAN. Let me say this about the Saulsbury resolution: Congress provided a way to protect the Government against excessive rents. The matter is now up to the President. If the President desires to protect this Government against excessive rents, he has the authority. If he does not act, the country will suffer the consequences.

With regard to the space, there was adequate space to take care of the Department of Agriculture. There is no question about that. The committee, consequently, as you stated, cut the appropriation from \$158,689 to \$100,000. After an investigation, however, it was found advisable to allot the space to the War Department and other departments, and the space that it was thought could be allotted to the Department of Agriculture was allotted to other departments. To make up the deficit in rents for the Department of Agriculture \$41,000 was appropriated for the Department of Agriculture under the sundry civil act.

Mr. HARRISON. I want to make it clear that the department is in full sympathy with the view that the temporary structures erected during the war should be used to the fullest possible extent.

The CHAIRMAN. We will take the matter up and see how much space can be allotted.

Mr. RUBEY. Who is the chairman of the Public Buildings Committee?

The CHAIRMAN. Senator Smoot. This committee will see Senator Smoot and have the matter arranged, so as to ascertain whether or not it is necessary to appropriate this \$41,000 in order to allot the space to other departments.

Mr. HARRISON. I think it should be borne in mind, in considering the matter, that there are many activities which could not be moved into the temporary structures, because of the enormous cost that would be involved. I have in mind particularly the activities

which require the use of laboratory facilities. It would be a mistake, also, to move into nonfireproof buildings branches of the department which have a large accumulation of valuable and irreplaceable records.

Mr. RUBEY. It seems to me that the Agricultural Department should be given space in the temporary buildings near that department.

Mr. HARRISON. That is what we would like to have. Practically all the space allotted to us is in the Council of National Defense Building, at Eighteenth and B Streets NW., a considerable distance away from the department. It would have been very much better for us if we could have been given some of the space on the Mall, near the Smithsonian Institution. As you know, we now occupy something like 42 buildings.

Mr. RUBEY. And they are scattered all over the District of Columbia?

Mr. HARRISON. Yes.

The CHAIRMAN. The Public Buildings Commission has gone over the situation as applied to all of the departments, including the Department of Agriculture, to determine how space should be allotted in these temporary buildings. They will make another survey, so it is a matter to be ironed out by the commission.

Is that all you have, Mr. Reese?

Mr. REESE. Yes, sir; except that in any readjustment of the appropriation for rent in the District of Columbia consideration should be given to the fact that the department is paying rent for quarters used in the work under the cotton futures act out of the continuing appropriation originally made in the act of August 18, 1914 (which carried authority for paying rent in the District of Columbia), the unexpended balance of which was made available until expended by the agricultural appropriation act approved August 11, 1916. The sum of \$7,689.06 from this unexpended balance is now being used for the payment of rent for quarters occupied by the cotton futures work. The balance of the appropriation is sufficient to carry this charge until the end of the fiscal year 1920 but is not sufficient to carry it through the fiscal year 1921. Therefore the appropriation for rent in the District of Columbia should make provision for this amount over and above whatever amount may be finally fixed upon as the appropriation for rent in the District of Columbia if that appropriation is reduced on account of the assignment of free quarters to the department by the Public Buildings Commission.

The CHAIRMAN. Thank you, Mr. Reese.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Thursday, January 8, 1920.

AFTERNOON SESSION.

The committee met, pursuant to the taking of recess, Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. We will next take up the estimates for the States Relations Service. Mr. Harrison, who do you wish to testify first?

STATES RELATIONS SERVICE.

MR. HARRISON. Mr. Chairman, the States Relations Service begins on page 212. Dr. True will present the estimates.

The CHAIRMAN. We will be pleased to hear Dr. True.

STATEMENT OF DR. A. C. TRUE, DIRECTOR OF THE STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE.

DR. TRUE. The lines of work of the States Relations Service are the same as heretofore, but there has been a material reduction in the working forces of the service due to the cessation of special activities relating to the stimulation of the production and conservation of food under war conditions and the withdrawal of emergency funds.

Since the force reached the highest war level in 1918, the Washington force has decreased from 475 to 319, a decrease of 156, and the field forces, which are mainly the cooperative extension forces, have decreased from about 6,500 to 3,800, those figures being for the 1st of January. The Washington force is now just about equal to the force employed in July, 1917, before the emergency funds were available, though the regular funds of the service have increased \$436,140 since that time. Owing to conditions after the signing of the armistice, which made it inexpedient to push the emergency work as we had been doing up to that time, fully \$1,000,000 of the emergency appropriation was not expended and will remain in the Treasury.

The CHAIRMAN. Why was not the \$1,000,000 expended at that time?

DR. TRUE. Because after the signing of the armistice—

The CHAIRMAN. The money was available, but was not used?

DR. TRUE. It was available, but we did not push the work to the extent that we had been pushing it before.

Now, that is the general situation, and with that introduction we might, if you desire, take up the different items in the bill. The first item is the statutory roll, and in that there are no promotions or new places. There are a considerable number of transfers from the lump

sum to the statutory roll in accordance with the law, and in the case of three places we desire to change the title, as indicated in the estimate.

The CHAIRMAN. Let us take it up item by item, so that we will have it in the right order in the record. Is not the first item, No. 7, "5 clerks of class 4, increased by 1 from the lump sum"?

Dr. TRUE. Yes, sir.

The CHAIRMAN: The next is No. 8, "one executive clerk, at \$1,740, by transfer from lump fund for home economics."

Dr. TRUE. That is under item 7.

The CHAIRMAN. No. 11 is the next, "seventeen clerks of class 2, increase of 4 by transfer from lump fund for farmers' cooperative demonstrations in North and West."

Dr. TRUE. Yes.

The CHAIRMAN. The next is 14, "52 clerks, class 1, increase of 16 by transfer from lump fund, 4 from colleges and stations, and 12 from farmers' cooperative demonstrations in North and West." Is there any comment on that?

Mr. HUTCHINSON. May I ask you from what special appropriations these men have been paid?

Dr. TRUE. The lump funds are indicated here.

Mr. HUTCHINSON. Were they paid from emergency funds?

Dr. TRUE. At the time these transfers were made, they were on the regular funds.

Mr. HUTCHINSON. Why do you put them on the statutory roll now if they were on these lump funds? Take, for instance, item 14, an increase of 16. Where were they before you transferred them over? What were they paid from?

The CHAIRMAN. They were carried on the lump sum.

Dr. TRUE. They were carried on the lump sum.

Mr. HUTCHINSON. Under what appropriation?

Mr. McLAUGHLIN of Michigan. Twelve of them were carried on 37, on page 216.

Dr. TRUE. Four of them were on the item for the administration of the experiment stations and extension acts, and 12 were employed in connection with the Office of Extension Work in the North and West.

Mr. HUTCHINSON. What I want to get at is this: In making the transfer to the statutory roll, did you take them from the emergency fund or from item 37? What did you take off? There is an increase in item 37, I see, over last year.

Mr. McLAUGHLIN of Michigan. The note to 37 says that there is a decrease in this item of \$35,560 due to transfers to the statutory roll of this bureau.

Mr. HUTCHINSON. But you have \$551,000 in your estimate for 1920, and now it is \$715,000; and you have taken the men off and put them on the statutory roll.

Dr. TRUE. Yes.

Mr. HUTCHINSON. And still the estimate is increased. That is what I don't understand.

Dr. TRUE. The estimate for the North and West?

Mr. HUTCHINSON. I do not know whether it is the North and West or not; it is item 37.

Mr. HARRISON. This item has been decreased from \$751,280 to \$715,720 on account of transfers to the statutory roll.

Mr. HUTCHINSON. We gave you more than was estimated for last year.

Mr. HARRISON. Yes.

Dr. TRUE. \$200,000 was added to that item last year.

Mr. McLAUGHLIN. That was put on in the Senate.

Mr. HUTCHINSON. That is what I wanted to know.

Dr. TRUE. Now, we are asking in the total for just the same appropriation as at present. So it goes through, Mr. Chairman, with the different items. They are all small items.

The CHAIRMAN. Please read them so that we will have them in the record.

Dr. TRUE. Under item 15 there is one clerk or artist-draftsman, at \$1,200, transferred from the lump fund for farmers' cooperative demonstrations in North and West.

The CHAIRMAN. You skipped item 14, I believe, "52 clerks, class 1, increase of 16 by transfer from lump funds, 4 from colleges and stations, and 12 from farmers' cooperative demonstrations in North and West."

Dr. TRUE. Item 15 I have just read. No. 16 is "one clerk or machine operator at \$1,200, by transfer from lump fund for farmers' cooperative demonstrations in the South." Item 17, there are 24 clerks transferred from lump funds, 3 from colleges and stations, 10 from farmers' cooperative demonstrations in North and West, 8 from farmers' cooperative demonstrations in South, 2 from farmers' institutes and agricultural schools, and 1 from general administrative expenses.

Mr. McLAUGHLIN of Michigan. What is this appropriation that you speak of, for "colleges and stations"?

Dr. TRUE. That is the phrase that has got into use.

Mr. McLAUGHLIN of Michigan. Is that the permanent appropriation?

Dr. TRUE. That is the item for the administration of the extension and experiment station acts.

Mr. HARRISON. He refers to item 36, Mr. McLaughlin, on page 215.

The CHAIRMAN. The next one is 21, "one clerk, decrease of two by change to two messengers or laborers.

Dr. TRUE. That is a decrease of two by change of title to two messengers or laborers at \$840 each.

The CHAIRMAN. The next item is 22.

Dr. TRUE. That is a decrease of one clerk at \$720 by change to one messenger or laborer at \$720.

Under item 23 we have two messengers or laborers at \$840 each, in lieu of two clerks at \$840 each.

Under item 24 there is an increase of one messenger or laborer at \$720 in lieu of one clerk at \$720.

Under No. 27 there is an increase of one messenger boy at \$600 by transfer from the lump fund for farmers' institutes and agricultural schools.

Under No. 33 there is an increase of seven charwomen by transfer from lump sums. Two of these are from the general administrative expenses item, two from farmers' cooperative demonstrations in the North and West, one from farmers' cooperative demonstrations in

the South, one from farmers' institutes and agricultural schools, and one from the home economics. That concludes the list.

The CHAIRMAN. Are these transfers from the lump-sum rolls to the statutory roll made at the same salary?

Dr. TRUE. Yes, sir.

With reference to the statutory roll I wish to say that it is not in satisfactory condition, because we have on it at least 30 places which are not permanently filled on account of the salaries being too low to attract properly qualified persons.

The CHAIRMAN. You have 30 vacancies, you say?

Dr. TRUE. There are not actually at present 30 vacancies, because we can use some of these places for temporary people, but at the last account that I had there were 29 actual vacancies, and during the fiscal year just passed over \$30,000 of the amount appropriated for our statutory roll reverted to the Treasury for this same reason that it is impossible to get, at the low salaries for those places, people qualified to do the work. That is the reason why we had so many clerks on the lump-sum rolls that have to be transferred now to the statutory roll.

Mr. HUTCHINSON. Why do you do that? You say it is not satisfactory to transfer them to the statutory roll. Why do you not leave them on the lump sum and then pay what you please?

Dr. TRUE. We are not permitted to do that. We have to transfer at the end of the fiscal year all employees in the clerical and sub-clerical grades from the lump-sum to the statutory roll for the next year.

The CHAIRMAN. If the places are vacant, do you have to transfer them?

Dr. TRUE. We do not transfer the vacancies, but we are under instructions to report the statutory roll as it existed last year, with the transfers.

The CHAIRMAN. But you are transferring men from the lump-sum to the statutory roll.

Dr. TRUE. Yes, sir; we are obliged to do that.

The CHAIRMAN. For instance, No. 27, one messenger boy, at \$600, by transfer from lump fund for farmers' institutes and agricultural schools. Is that position filled?

Dr. TRUE. Yes, sir.

The CHAIRMAN. Let us first take up these low-salaried people.

Dr. TRUE. Take No. 19, where we have 31 clerks, at \$900 each, amounting to \$27,900. There is no transfer; but that is the kind of place that I am referring to. We can not fill those places at that salary. The entrance salary for clerks now is \$1,100 or \$1,200.

Mr. McLAUGHLIN of Michigan. Why not abolish some of these places, then?

Dr. TRUE. Those places are of no use to us except occasionally we can find some person who is willing temporarily to fill the place for some extra work that we have.

Mr. McLAUGHLIN of Michigan. In item 19 how many of those \$900-clerk places are not filled?

Dr. TRUE. My understanding is that there are now 22 places that are not filled.

The CHAIRMAN. Twenty-two of those \$900 places are not filled?

Dr. TRUE. Yes, sir.

Mr. HUTCHINSON. Is the department just as efficient with 22 vacancies as it would be if all of those places were filled?

Dr. TRUE. From our point of view, the statutory roll has on it too many of these low-priced places, and we have an undue number of places a little higher up, at \$1,100 or \$1,200. The result is that we appoint those clerks at the initial salary of \$1,100 or \$1,200 and get so many of them there and have so few places above that that there is very little chance for promotion.

Mr. HUTCHINSON. Suppose you had \$21,000 and suppose we make it 21 clerks instead of 31—knock off 10; would the department be just as efficient with 21 clerks as with 31?

Dr. TRUE. Yes; under present conditions, because we are not employing clerks at \$900. At the same time, I would like to have the committee consider this condition of affairs, that we have a relatively large number of places at \$1,100 and \$1,200 and very few places above that, with the result that just as soon as a clerk coming in becomes experienced in our work he gets uneasy and seeks some place outside, so that we are constantly losing good clerks. What we would like to see is the addition of a few places with salaries higher than \$1,200 and the elimination of these very low-salaried places which we can not satisfactorily fill. That matter was discussed last year, but for some reason the statutory roll was left just as it had been.

Mr. ANDERSON. If you have too many places at \$1,200, why do you transfer 16 clerks at \$1,200 to the statutory roll? I understand you to say that you had relatively a great many clerks at \$1,200.

Dr. TRUE. I did not say that we had too many people employed. Here is the actual situation: I do not remember the exact figures, but this will illustrate it clearly: We have, let us say, 60 places for clerks at \$1,200 and we employ 60 people on our roll at \$1,200—people that we need. In the \$1,400 grade we have only five places. Now, those clerks at \$1,200 are fixed there for a long period practically because there is little opportunity for promotion to the \$1,400 grade.

Mr. ANDERSON. That gets you right into the proposition of automatic promotions. Is it the policy of the department to automatically or more or less automatically promote people who are doing the same work from year to year without any change in the character of the employment?

Dr. TRUE. We take into question efficiency and length of service. If a person comes in at \$1,200 we do not expect him to remain at \$1,200 after he has been there with us a considerable time and has shown that he is a specially efficient clerk. We have, of course, in the regular order efficiency records which are considered by an efficiency committee, and the promotion is determined by that. Promotion is so slow under present conditions on our statutory roll that there is constant discouragement of our more experienced and efficient clerks, with the result that as soon as they get an opportunity they leave us, and there is a considerable turnover that might be avoided and the efficiency of the service increased if we had a limited number of positions at higher salaries in lieu of these 30 places or so at the very low salaries which are not of any use to us.

Mr. HUTCHINSON. If we should change that to 21 clerks, instead of 31, you could make nearly all of them \$1,400 clerks with the

\$27,000. What I want to know is whether these 21 clerks would keep the department as efficient as the 31 if you gave them \$1,400?

Dr. TRUE. I would not want to promote those—

Mr. HUTCHINSON. I know, you do not do that, you are cutting off 10.

Dr. TRUE. I am reducing the list by 10 because the positions are not filled and can not be filled under present conditions.

The CHAIRMAN. What became of the 22 clerks at \$900? Did they go into some other department or leave the service?

Dr. TRUE. They have left for one reason or another, or have been promoted into higher places.

The CHAIRMAN. They left the department?

Dr. TRUE. I presume some of those have left the department and others have been promoted to higher grades as there were opportunities.

The CHAIRMAN. To higher grades? Were they promoted on the statutory roll or lump sum?

Dr. TRUE. They had to be promoted on the statutory roll if promoted at all.

The CHAIRMAN. You promote them from the statutory roll to the lump sum?

Dr. TRUE. No, sir.

The CHAIRMAN. Is that not being done in the department?

Dr. TRUE. We can not do that under the law, unless there is an absolute change of duties.

The CHAIRMAN. I understand. Suppose there is a change of duties?

Dr. TRUE. There are very few cases of that kind.

The CHAIRMAN. Were any of these transferred from one roll to the other?

Dr. TRUE. I could not tell you, Mr. Chairman, except by looking into the records, but I do not think there are any such cases.

Mr. McLAUGHLIN of Michigan. Can you tell us how many vacancies there are now in these other places on this page?

Dr. TRUE. On page 213, items 21, 22, and 23 are vacant. Under item 24 there is one vacancy. All the places under item 26—3 messengers or laborers—are vacant. Items 29 and 30 are also vacant.

Mr. McLAUGHLIN of Michigan. Is there any need of appropriating the money for these places if they are vacant?

Dr. TRUE. From my point of view, there is no necessity for appropriating money for those places. They are of no use to us.

Mr. McLAUGHLIN of Michigan. On page 212, are there any vacancies above item 19?

Dr. TRUE. No, sir. I had not noted any. I do not think there are any.

The CHAIRMAN. Do you have any trouble in filling these places of messengers or laborers at \$840?

Dr. TRUE. Yes, sir; but we have much greater difficulty in getting clerks at \$840 a year now. We are therefore asking that the titles of two clerks at \$840, in item 21, and one clerk at \$720, in item 22, be changed to messenger or laborer.

The CHAIRMAN. Are the places filled now?

Mr. McLAUGHLIN of Michigan. Some are not.

The CHAIRMAN. Do you suggest two at \$840 so as to enable you to employ men temporarily at times?

Dr. TRUE. Because we could use two such places to greater advantage for messengers or laborers; we can not get clerks at this low salary.

Mr. McLAUGHLIN of Michigan. What is the next item?

Mr. HARRISON. The next is No. 34, on page 214, Mr. Chairman, the appropriations to the State colleges and stations under the Hatch and Adams Acts.

Dr. TRUE. Items 34 and 35 are merely appropriations to carry into effect the provisions of the Hatch and Adams Acts for the experiment stations, namely, \$30,000 to each of the 48 States, making a total of \$1,440,000. These stations in the 48 States employ about 1,700 persons, and as a result of their work they issue annually 700 or 800 publications, which are distributed to about 1,000,000 farmers and others on their mailing lists, and also in large numbers to their extension agents and otherwise.

The income of the stations in 1918, which is the last year for which we have the complete figures, was \$6,000,000, of which \$1,440,000 was received from the Federal Treasury and the remainder, about four and one-half millions, from the State appropriations.

Mr. McLAUGHLIN of Michigan. Is there any expense in the department involved in the distribution of this money to the States under these laws?

Dr. TRUE. We have the administration of both the extension and the experiment station acts, and the language that immediately follows in the appropriation act and in the estimates (item 36) relates to that. The estimate for the administration of the experiment station and extension acts taken together is \$71,500.

The CHAIRMAN. Are you on item 34, "to carry into effect the provisions of the act approved March 2, 1887," and so on, \$15,000 for each of the 48 States?

Dr. TRUE. That is the so-called Hatch Act for the experiment stations. The next item refers to the Adams Act and carries an equal amount.

Item 36 is for the administration of the extension act, the Smith-Lever Act, and the Hatch and Adams Acts. The amount estimated for that is \$71,500, to which must be added \$8,100 transferred to the statutory roll, making an actual increase of \$10,000.

The work under this item is grouped in two divisions: First, the work connected with the experiment stations, which is conducted through the Office of Experiment Stations, to which \$35,500 of this fund is allotted. This money provides for the examination of the projects submitted by the station directors, the inspection of the work and expenditure of the stations, the preparation of the report required by law on the work and expenditures of the stations, and the preparation of the Experiment Station Record. This last item is the largest single item of expense. The Experiment Station Record is a periodical which contains abstracts of the reports of over 1,000 stations and similar institutions and similar scientific literature throughout the world, together with statements giving a large amount of advice and information to the stations regarding their work. In addition to this we do through the Office of Experiment Stations a large amount

of more general work in advising and assisting the stations regarding their plans of work, their equipment, and their personnel.

The business of the Office of Experiment Stations grows gradually with the enlargement of the station work in the States, and its expenses under present conditions for travel, supplies, etc., are necessarily greater than in normal times, and so the amount which is now allotted to the Office of Experiment Stations in the estimates involves an increase of \$1,500 for this work next year.

The permanent force employed in the Office of Experiment Stations under this item includes the chief of the office, who is also the editor in chief of the Experiment Station Record and by profession an agricultural chemist; a chief of insular stations, who also has charge of the work relating to botanical investigations, being, in fact, a professional botanist; nine scientific assistants, representing different branches of agricultural science, who are principally engaged on the Experiment Station Record; a part-time agricultural physicist and two other scientific assistants engaged mainly in the bibliographical work necessarily connected with the preparation of the Experiment Station Record. This is the same kind of work and practically the same force which we have had for a long time.

The rest of the money under this item is used for the administration of the extension act, the Smith-Lever Act. This sum amounts to \$36,200. It also includes some of the work which we do in administering the supplementary fund appropriated for the same purpose in the agricultural appropriation act this year, because that is spent for the same purposes as the Smith-Lever funds and comes under our administration in practically the same way.

The Federal and State Smith-Lever fund for the fiscal year 1921 will be \$6,680,000. There is an increase of \$1,000,000.

Mr. McLAUGHLIN of Michigan. That is, Federal and State?

Dr. TRUE. Yes; and the supplementary funds.

Mr. McLAUGHLIN of Michigan. The Lever law will carry \$3,580,000?

Dr. TRUE. Yes.

Mr. McLAUGHLIN of Michigan. And the States have to duplicate that, except \$480,000?

Dr. TRUE. Yes, sir; so that there will be in all \$6,680,000 and the supplementary fund estimated for, both Federal and State, amounting to \$3,000,000, making a total of Federal and State funds under the terms of the Smith-Lever Act of \$9,680,000. The plans of work and the resulting expenditures must be examined and approved by the States Relations Service for all this fund, and the annual report on this work and expenditure must be prepared as required by act of Congress.

Mr. ANDERSON. May I ask, Dr. True, if there is any limitation upon the amount of the appropriations of the Smith-Lever fund that may be spent for administrative purposes?

Dr. TRUE. No, sir; the act does not itemize, except with reference to the printing of publications. Only 5 per cent can be used for printing and distribution of publications.

Under this item for the administration of this work an increase of \$8,000 is estimated to provide for the increase of business connected with the administration of the increased extension funds.

The CHAIRMAN. In how many counties are you operating now?

Dr. TRUE. We have county agricultural agents in 2,000 counties.

The CHAIRMAN. Only 2,000?

Dr. TRUE. 2,000 is the last record.

If we may take up item 37, "For farmers' cooperative demonstration work outside the cotton belt"; that work is done in the 33 Northern and Western States. The estimate is \$715,720, to which must be added \$35,560 transferred to the statutory roll, making a total for this work of \$751,280, which is the same amount as the appropriation for the current fiscal year. Of this amount, \$574,825 is allotted to the States to be used in conjunction with other funds for cooperative extension work along these lines, the county agricultural agents, the home demonstration agents, the boys' and girls' club workers, the farm management demonstrations, and the supervisory officers for these lines of work; \$119,155 is allotted for the field service of the Office of Extension Work, North and West, and other service which it performs in cooperation with the State extension forces; and the remainder, \$57,300, is used in the supervisory work of this office.

The force of this office, with headquarters at Washington, at present consists of 24 scientific employees, 52 clerks, and 13 subclerical employees. This force aids the extension forces in the 33 Northern and Western States in organizing and conducting this work, arranging with the different bureaus of the department for their cooperation in extension work in those States; prepares and distributes publications and mimeograph material to the State extension forces and through them to the farming people; receives reports of the progress of the work in the several States; and uses these, with other information obtained by personal visits to the States, in carrying to the several States useful information about the work being done in different parts of the country, and, in general, acts as a clearing house of assistance, influence, and information on all matters relating to extension work in the Northern and Western States. Most of the scientific staff spend a large share of their time in the field studying the problems of the extension work and joining with the State forces in the conduct of their work.

Mr. ANDERSON. Doctor, there seems to be in my State an impression that a whole lot of this money is dissipated in some way so that it never reaches the county agents and never does any good to the people intended to be benefited; at least, there was a good deal of complaint in my State on that score, although how well founded I do not know. The impression seemed to be that the Agricultural Department down here took a whack at it and used a large portion of the funds in supervisory work and in specialists chasing around the country chasing up the county agents, and then the State administrations took another whack at it for their supervisory forces, and so forth, with the result that a good deal of it got away and was not used in the actual employment of county agents which the people out in my country thought it was intended for.

Dr. TRUE. That opens up a large subject which we will be glad to discuss in as much detail as the committee may desire.

Mr. ANDERSON. Have you any table or figures or any data showing the amount or proportion of administrative expense that is charged up against the various appropriations for extension work, both by the State and by the Federal Governments?

Dr. TRUE. Yes, sir; I propose to submit a little later on a number of tables showing how this money is used.

Mr. ANDERSON. I do not want to anticipate it.

Mr. HUTCHINSON. I want to ask you a question right there. You said a moment ago that you had 2,000 county agents.

Mr. McLAUGHLIN of Michigan. Two thousand counties provided with agents.

Mr. HUTCHINSON. In most of the States, if you pay for a county agent, does not the State pay an equal amount? In other words, if the county does not have a county agent appointed by the State or the county, do you put one in there and pay all the expense?

Dr. TRUE. No, sir. I do not know of any such case now.

Mr. HUTCHINSON. In other words, for every dollar that the Government gives the county puts up the same amount, does it?

Dr. TRUE. The county puts up more than an equal amount.

Mr. McLAUGHLIN of Michigan. The State?

Mr. HUTCHINSON. The State puts up more?

Dr. TRUE. Yes.

Mr. HUTCHINSON. In other words, you do not pay the county agent in any county in the United States where the State does not give an equal amount?

Dr. TRUE. At least an equal amount.

Mr. McLAUGHLIN of Michigan. Is that entirely true, Doctor? Under item 37 and under 38 contribution by the States is not absolutely required, is it? Under the Lever law it does have to be duplicated by the States.

Dr. TRUE. There is no requirement in law for any particular amount to be contributed under these two items that you are referring to now.

Mr. McLAUGHLIN of Michigan. Is it not a fact that some of the county agents are employed and paid entirely out of these two funds without contribution by the States in which they are employed?

Dr. TRUE. No, sir; that is not the case.

Mr. McLAUGHLIN of Michigan. I thought it was.

The CHAIRMAN. No cooperation is required under item 37 except in the discretion of the Secretary?

Dr. TRUE. No, sir.

Mr. McLAUGHLIN of Michigan. But he says it has been required in all cases.

Dr. TRUE. Yes, sir.

Mr. HARRISON. Under the emergency appropriation we paid the total salary of some of the county agents, but I do not understand that we are paying the entire salary of any agent under items 37 and 38.

The CHAIRMAN. Is it not a fact that the Federal Government contributes \$4,100,000 for which the States are required to match dollar for dollar?

Dr. TRUE. Yes, sir; under the Smith-Lever Act.

The CHAIRMAN. They are not required to match the \$715,720 nor the \$480,000?

Dr. TRUE. That is correct.

The CHAIRMAN. There is \$715,720 outside of the cotton belt?

Dr. TRUE. Yes, sir.

The CHAIRMAN. There is \$634,800 in the cotton boll-weevil district?

Dr. TRUE. Yes, sir.

The CHAIRMAN. That is \$1,350,520?

Dr. TRUE. Yes, sir.

The CHAIRMAN. Then under the Smith-Lever Act next year you get \$3,580,000?

Dr. TRUE. Yes, sir; plus the \$1,500,000 supplementary fund to be used under terms of the Smith-Lever Act.

The CHAIRMAN. The total is \$6,430,520 Federal funds?

Dr. TRUE. Yes, sir.

The CHAIRMAN. You pay the States \$480,000; to which they are entitled without matching?

Dr. TRUE. Yes, sir.

The CHAIRMAN. That leaves \$5,950,520.

Dr. TRUE. Yes, sir.

The CHAIRMAN. Then they pay the States \$715,720 and \$634,800, which it is within the discretion of the Secretary whether that be matched or not. We will say that they are not required to match that, which would leave \$4,600,000 to be matched by the States, dollar for dollar.

Dr. TRUE. Yes, sir.

The CHAIRMAN. Add to the \$4,600,000 put up by the States the \$6,430,520 appropriated in this bill for the work and you have 11,030,520; you say that you are now in 2,000 counties, so that would give an average of \$5,515 for each county.

Dr. TRUE. Yes, sir; if the money was spent in that way for a single agent in each county, if that is what you are thinking of.

The CHAIRMAN. The average of the 2,000 counties is \$5,515?

Dr. TRUE. Yes; under that enumeration for the 2,000 counties.

The CHAIRMAN. I understood you to say that you had 2,000 counties?

Dr. TRUE. Yes, sir.

The CHAIRMAN. That would be the average amount available?

Dr. TRUE. If you apportion it in that way it includes whatever is paid for the salary and expenses of the county agricultural agent, and also the woman agent, or boys' and girls' club leader. It also includes money that is spent for supervisory officers and for the extension specialists who go out to aid people living in the counties.

The CHAIRMAN. How much is used for the organizers and how much for the agents?

Dr. TRUE. The average expense for county agents—his salary and expenses at present—is \$3,600.

The CHAIRMAN. What is the average salary of the agent? You pay his expenses besides, do you not?

Dr. TRUE. You would have to take off \$1,000 for traveling expenses.

The CHAIRMAN. Then the average salary is about \$2,600?

Dr. TRUE. \$2,500 or \$2,600. For the woman agent the cost, including her expenses, will average \$2,600.

The CHAIRMAN. What would her salary average?

Dr. TRUE. The salary would be perhaps \$1,800 on the average.

The CHAIRMAN. That would make \$6,200 for the two.

Dr. TRUE. That, of course, is more money than you estimated, but, as a matter of fact, we have more money than that. Through the contributions of the counties and the States, in addition to what they are required to put up, we have a considerable amount of money;

so that the total amount of money which we have for extension work in the United States this year is \$14,250,000.

The CHAIRMAN. The States put up more than the Federal Government does?

Dr. TRUE. Yes, the States and the counties particularly. Since the emergency fund was withdrawn, we have to rely on the counties more; and those counties thus far that have really wanted to have agents have been very generous with their contributions and have supported the work beyond what we expected they would.

Mr. HUTCHINSON. Do you get a report of the expenditures of each county directly from the States?

Dr. TRUE. Yes, sir.

Mr. HUTCHINSON. Do you have that in printed form?

Dr. TRUE. I have tables here which show that, which I will insert in the record.

(The statement referred to follows:)

GENERAL STATISTICS OF COOPERATIVE AGRICULTURAL EXTENSION WORK.

The funds available in the fiscal year 1919-20 for cooperative agricultural extension work in the 48 States as shown in the projects submitted by the State agricultural colleges and approved by the Secretary of Agriculture, as compared with funds available for the same purpose in the five preceding fiscal years, are shown in the following tables:

Sources of funds.	1914-15	1915-16	1916-17	1917-18	1918-19	1919-20
Federal Government:

† Includes \$68,455 not allotted.

There are 525 extension specialists in the Northern and Western States and 250 in the Southern States, making a total of 775. There are at least 16 different subjects in which there are specialists, as follows: Agronomy, horticulture, forestry, plant pathology, animal husbandry, poultry, dairying, veterinary science, biology, rural engineering, farm management, marketing, rural economics, food and nutrition, clothing, household equipment and management. In large subjects, such as horticulture, there may be several specialists. On the average, there is at present one specialist in each subject for each State.

Allotment of Federal and State extension funds by lines of work, 1919-20.

† This includes \$751,280 for work in 33 Northern and Western States and \$645,040 for work in 15 Southern States.

The number of cooperative extension employees (including supervisory officers) engaged in county agent work, home demonstration work, and boys' and girls' club work at different times between April, 1917, and December, 1919, is shown in the following table:

Number of cooperative extension employees in the States, 1917-1919.

Date.	County agent work.	Home demonstration work.	Boys' and girls'-work.	Total.
April, 1917.....	1,461	545	143	2,149
July, 1917.....	1,659	593	248	2,500
January, 1918.....	2,351	1,408	445	4,204
July, 1918.....	3,001	2,034	1,181	6,216
January, 1919.....	2,774	1,679	445	4,898
July, 1919.....	2,808	1,774	686	5,268
September, 1919.....	2,603	1,210	447	4,269
October, 1919.....	2,501	1,115	439	4,055
November, 1919.....	2,496	1,070	409	3,966
December, 1919.....	2,413	1,058	430	3,901
January, 1920.....	2,382	1,032	384	3,798

The number of counties having agricultural agents and home demonstration agents on July 1, 1914-1919, inclusive, is shown in the following table:

Number of counties with extension agents, July 1, 1914-1919.

Date.	County agricultural agents.	Home demonstration agents.
1914.....	928	279
1915.....	1,136	350
1916.....	1,225	430
1917.....	1,434	537
1918.....	2,435	1,715
1919.....	2,257	1,049
1919 (December).....	1,999	813

The number of agricultural counties without county agricultural agents is 937, and without home demonstration agents is 2,123.

The CHAIRMAN. What other expenditure besides the two people in each county is contemplated?

Dr. TRUE. We have the expense of their supervision and assistants, and then we have the extension specialists, who go out from the college. I have the figures for that, Mr. Chairman.

Mr. ANDERSON. Whom do these extension specialists see?

Dr. TRUE. They go to the counties to instruct the county agents, and they also join with the county agents in the instruction of farm people. They prepare the literature which the county agents have in large measure to distribute. They also work in the counties which at present have no county agents.

Mr. ANDERSON. Do they do anything in the way of extension or institute work, or anything of that sort?

Dr. TRUE. Yes, sir. They hold farmers' meetings and so-called extension schools which last from three to five days, perhaps.

This is the situation: Here is a county agent in a particular county. Some of these counties are not so large, while others are very large—in fact, equal in area to some of our States. One man as agricultural agent has all sorts of problems coming up; and, while he is perhaps a well-educated man along agricultural lines, he may not be able to solve all of those problems. He can then send for the extension specialist at the college to come and help out.

Mr. McLAUGHLIN of Michigan. Besides the money in the lump sum that you let the colleges have, do you contribute something to

the college for the pay of those specialists that are sent out from the college?

Dr. TRUE. We do not from the funds directly appropriated to our extension offices, except in the case of the farm management demonstration work in the Northern States, which, as you will remember, has been carried a number of years in the item for the northern extension office.

Mr. McLAUGHLIN of Michigan. You spoke of problems coming up that the county agents are not able to solve, and that it is necessary to have some one better informed to go to help them. I have noticed that when representatives of other bureaus have been before this committee, in talking about their work, they have told us that they have specialists for cattle, specialists in cattle diseases, specialists in hog diseases, specialists in poultry, specialists in different kinds of farm crops, etc. These gentlemen came before us and told us that it is necessary to have specialists employed to do these different kinds of work, because the county agents in no cases are capable of doing it. That is a reflection on the county-agent system that is quite serious, and we have heard it here most emphatically for at least two or three years. None of these county agents can do it. There must be some specialist to do every little thing outside the most ordinary farm work.

Dr. TRUE. The theory, as I understand it, on which the extension work of the Department of Agriculture is conducted is that the department, as the result of its investigations, has special knowledge which it can carry out to the States and which can supplement what the States have along such lines. In some cases that may be something that is very new. In other cases it may not be, but the particular thing is a new thing to the region in which the extension work is done, though it is not a new thing to the department. For instance, as I understand it, cotton growing is now being developed in New Mexico and Arizona, particularly in Arizona. The department has been carrying on special experiments on long-staple cotton. That is a new industry in Arizona, and the college there has nobody who is specially expert in that matter. The county agents in the counties would not know about that. It is a new matter. In such a case as that the department can send out men who have a broader and deeper knowledge of the subject than either the State or the county agent. In a number of the Southern States in the past the department has done a relatively large amount of work along the line of dairy husbandry and dairying, because that work was not developed in those States and the colleges were not equipped with thoroughly informed experts in many cases. That thing is constantly shifting, but, as I said, the theory on which the department is conducting its extension work is that it has new and special knowledge, which not all the States and the counties have, to supplement the work which the States and counties are able to furnish themselves.

Mr. McLAUGHLIN of Michigan. Over and over again in our hearings, when the matter of sending out experts was talked about, some member of the committee has asked, "Why can not the county agent do that? It seems like a simple matter. Can not the county agent do it?" The gentlemen from the different bureaus have replied:

"No; the county agents are not competent to do it." The gentlemen who are here, the members of the committee, will bear me out that they have said that time without number.

Dr. TRUE. It is difficult for me to deal with that matter without more specific knowledge as to just what that means. The various experts in the department are undoubtedly enthusiastic about their own subjects, and they may in some cases overstate the thing, but in a good many cases it is true that they have some new or special knowledge which you would not expect a man to have who had graduated from an agricultural college some years ago and had gone out to help the people in the county in a general way.

Mr. McLAUGHLIN of Michigan. They had to hire men to go out to help form bull-buying clubs. They had to hire men to go out to organize cow-testing associations, and so on. I can not recall the different things, but they seemed to me like ordinary work and activities that a county agent might do.

Dr. TRUE. It may be so in certain sections.

The CHAIRMAN. How much money is now being used for these supervisors and how many are there of them?

Dr. TRUE. Here is the whole statement with reference to our funds.

The CHAIRMAN. Will you put it in concise form in the record?

Dr. TRUE. I have quite a number of details which I would like to insert in the record and which will put this in a connected way.

The CHAIRMAN. On the floor we can not conveniently go through all the tables you have had prepared, to answer these questions.

Dr. TRUE. I can tell you briefly in this way: We have now, as I said, nearly \$14,250,000. Out of that \$914,000, in round numbers, is spent for administration at the colleges. That is about 7 per cent. Two per cent, or \$207,000, is spent for printing and distribution of publications. That, you will see, is 3 per cent less than might be spent under the law. For extension specialists, \$2,271,500, in round numbers, is spent.

Mr. ANDERSON. Is that spent by you or through the colleges?

Dr. TRUE. Through the colleges. That fund does include some of the department people. That includes the amounts that are budgeted in the projects.

Mr. ANDERSON. Let me understand that now. That \$2,000,000 includes some men who are employed by the department?

Dr. TRUE. Yes; in various bureaus.

Mr. ANDERSON. Are they paid out of their appropriations or out of this appropriation?

Dr. TRUE. They are paid out of the appropriations of the different bureaus.

Mr. ANDERSON. But it does not come in here?

Dr. TRUE. It comes in here because I have given the total amount of money which is available for extension work.

Mr. ANDERSON. All right.

The CHAIRMAN. This \$914,000?

Dr. TRUE. That is for administration.

The CHAIRMAN. Is that for county agents?

Dr. TRUE. No, sir; that includes the administrative expenses at the college.

The CHAIRMAN. What does the \$914,000 include?

Dr. TRUE. That includes the general expenses of the extension offices, the accounting, supplies and equipment, etc.

The CHAIRMAN. It seems to me that is a large amount.

Dr. TRUE. Each college has set up under this extension system offices at the college. The funds are all accounted for there. They prepare a large amount of material, in the form of publications, charts, and mimeograph material, which they send out to counties for use. They have miscellaneous expenses, equipment, some travel, and salaries of the general administrative officers. For that they spend about 7 per cent of the total extension funds. That has not impressed me as an unduly large amount, considering what it covers.

The CHAIRMAN. It is practically \$20,000 for each State.

Dr. TRUE. Yes. Then we have the \$207,000 for printing and distribution of publications. That is 2 per cent. Then we have the \$2,271,500, in round numbers, for specialists, which is about 16 per cent. That leaves for the work of the county agents, home demonstration agents, and the boys' and girls' club work, \$10,861,000; or 75 per cent. For the county agricultural agents we have \$7,429,500. That is 51 per cent. For the home-economics agents the amount is \$2,571,700, in round numbers, or 18 per cent; for the boys' and girls' club work, \$859,600, or 6 per cent.

The CHAIRMAN. That does not leave very much for the agents.

Dr. TRUE. In general, we may say that 75 per cent of the money is spent for the work in the counties.

The CHAIRMAN. How many specialists have you and what do they do?

Dr. TRUE. Our present records show that in the United States as a whole there are about 775 specialists.

Mr. HUTCHINSON. Where are they located, Doctor?

Dr. TRUE. They have headquarters at the colleges.

The CHAIRMAN. Do they stay at the colleges or go through the country?

Dr. TRUE. They spend a large part of the time in the field, but their headquarters are at the colleges.

The CHAIRMAN. What do they do at the college?

Dr. TRUE. At the college they are engaged in the preparation of publications and in correspondence relating to the extension work, in the various lines, as in dairying, field crops, drainage, irrigation, and so on. There are about 15 or 16 different subjects for which each college may have extension specialists. However, all of them do not have as many as that. Some of these specialists are employed on part time; that is, they may give a half or a third of their time to this work, while others may give their whole time to it.

The CHAIRMAN. That is about 15 specialists for every State?

Dr. TRUE. About 15 or 16 specialists for each State. That is about one on the average for each of the main divisions of the college, that is, agronomy, horticulture, forestry, animal husbandry, dairying, and so on. Of course, there are not forestry experts for every State, but in some States where horticulture is a very important subject there may be more than one specialist in that subject. There may be a specialist on vegetables and another on fruits, for example. The subject is divided up. And there are plant pathology and animal pathology, etc.

The CHAIRMAN. The experts in various lines are sent out by you?

Dr. TRUE. They are sent from the colleges. I am speaking now of people employed at the colleges who go out.

The CHAIRMAN. Are we to understand that we are employing professors for the colleges?

Dr. TRUE. We are employing these people as extension specialists at the college.

The CHAIRMAN. In connection with this work?

Dr. TRUE. In connection with this work. Each college has an extension division.

The CHAIRMAN. Are they working for the college, the State, or the Government?

Dr. TRUE. They are working for the extension work in the State as far as they are employed for that purpose. As I said, some of these men are employed part time. A man may be employed for a half or a third of his time as an extension worker going out through the State.

The CHAIRMAN. You mean part of the time by the State?

Dr. TRUE. Yes; by the State at the college.

The CHAIRMAN. Paid out of the State funds?

Dr. TRUE. Out of the extension funds that they have at the college.

The CHAIRMAN. Outside of these Federal funds?

Dr. TRUE. We are talking about both Federal and State funds. They are working for us and also for the colleges—the States. It is a joint enterprise.

The CHAIRMAN. Then the colleges pay them for part time and we pay them for part?

Dr. TRUE. Yes.

The CHAIRMAN. They are paid part time out of the Federal funds and part time out of the State funds?

Dr. TRUE. Here is a man employed at the college, an expert in dairying, and he spends half of his time in teaching classes.

The CHAIRMAN. Who pays for that?

Dr. TRUE. The college pays that. We look after that very carefully.

The CHAIRMAN. Then he devotes half of his time to extension work?

Dr. TRUE. Yes.

The CHAIRMAN. And that is paid out of these joint funds?

Dr. TRUE. Yes, sir.

The CHAIRMAN. You say there are 775 specialists?

Dr. TRUE. Yes, sir.

The CHAIRMAN. What do they do during the half-time they are employed by you?

Dr. TRUE. Part of the half time they spend at the college preparing extension publications and also answering correspondence, inquiries that come to them from the country agents or from farmers around the State who want information. Then they go out to the counties by an understanding with the county agents. Sometimes the agent has them come out there to give him some definite instructions; he goes out with the specialist to see what is the trouble in certain cases and gets instructions which will help him the next time to solve that problem. Or it may be a group of farmers who want in-

struction on that subject. And meetings are held and they give them instruction.

The CHAIRMAN. They attend institutes also?

Dr. TRUE. Yes; what we often call institutes. I am speaking now of meetings in general terms.

The CHAIRMAN. Short courses and meetings?

Dr. TRUE. Yes, sir.

Mr. HUTCHINSON. Then, Doctor, you have 775 experts and they can handle almost any question that come up at any time, can they?

Dr. TRUE. Yes, sir; as far as we have the knowledge at all. Our knowledge is limited.

Mr. HUTCHINSON. Plant industry or some of the other departments send specialists out into different parts of the country; you have experts that understand practically anything that comes up that the county agent wants to know?

Dr. TRUE. Yes, sir. If a bureau in the department has a request for extension work, say, on some subject as in dairying, then that department, through the States Relations Service, enters into an arrangement with the State, at the college, to send out one or more of its men to help in the extension work of the State. That man, while he is doing extension work, may be located at the college. When a job is done there, he comes back to the department and may go to another State.

Mr. HUTCHINSON. Suppose we have a county agent that does not know how to make a crop estimate; have you men to tell him how?

Dr. TRUE. Our agents do not deal with the crop estimating. The department has its force.

Mr. HUTCHINSON. Suppose we have a county agent so ignorant that he does not know how to estimate a crop of wheat. Do you have some one to tell him?

Dr. TRUE. That work is not a part of the regular duties of a county agent.

Mr. HUTCHINSON. I know; but we have so many different departments that we want to consolidate some of them and save money.

Dr. TRUE. But the county agent is one of the busiest men in the United States now, and we are trying to protect him from having more duties put on him.

Mr. HUTCHINSON. His time is taken up?

Dr. TRUE. It is more than taken up.

Mr. HUTCHINSON. He generally has an automobile and three or four men, too?

Dr. TRUE. Stop and think of a county agent in one county where there may be 3,000 farmers.

Mr. HUTCHINSON. These county agents generally have an automobile and two or three to go with them all the time?

Dr. TRUE. They must have an automobile.

Mr. HUTCHINSON. And assistants, including, generally, a lady demonstrator?

Dr. TRUE. There is a lady demonstrator, but she deals with the household matters, chiefly. Those people are the busiest people, and the work is very strenuous. In fact, as far as the women are concerned, we have difficulty in getting and keeping good women agents, as that work uses them up too fast—the hard traveling under

all sorts of conditions and boarding around in different places. It is very strenuous work for a woman.

The CHAIRMAN. These specialists are employed by the colleges, and you also employ some of them?

Dr. TRUE. Certainly.

The CHAIRMAN. You get your specialists from the colleges?

Dr. TRUE. Certainly.

The CHAIRMAN. Most of them are professors in the colleges?

Dr. TRUE. Some of them are; but quite a considerable number of them do not do any teaching. They are employed all the time as extension specialists.

The CHAIRMAN. Some of them?

Dr. TRUE. A good many of them.

The CHAIRMAN. Have you any estimate as to how many specialists there are from the other bureaus of the department cooperating with you. For instance, does the Bureau of Plant Industry send out specialists?

Dr. TRUE. Certainly; under instructions from the Secretary, men are not to go into the States or extension work unless they have an arrangement through the States Relations Service with the college in the State, so that there shall not be a duplication of the work and confusion in the enterprise.

The CHAIRMAN. Do the specialists referred to by Mr. McLaughlin cooperate with you?

Dr. TRUE. Certainly.

The CHAIRMAN. If the Dairy Division should send out some one from that division, would he cooperate with your people?

Dr. TRUE. Yes, sir.

The CHAIRMAN. Thank you, Doctor. The committee will now recess.

(Thereupon, at 5.45 o'clock p. m., the committee adjourned until to-morrow, Friday, January 9, at 10 o'clock a. m.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Friday, January 9, 1920.

The committee met at 10 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

STATES RELATIONS SERVICE—Continued.

The CHAIRMAN. You may proceed, Dr. True.

STATEMENT OF DR. A. C. TRUE, DIRECTOR OF THE STATES RELATION SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

Dr. TRUE. Yesterday, when we concluded, we were still on item 37, for the farmer's cooperative demonstrative work in the Northern States. I have here a statement of the field force employed in these States. There are 31 State leaders of county agricultural agents, 78 assistant State leaders, and 1,108 county agricultural agents. There are 29 State leaders of home demonstration agents,

203 assistant State home demonstration agents, and 225 county home demonstration agents. There are 22 State leaders of boys' and girls' club work, 73 assistant State leaders of boys' and girls' club work, and 230 county club leaders. That makes the total number of cooperative employees 1,845. To these must be added 33 extension directors and 526 specialists, who are not paid anything from the direct appropriation to the department, making a total force in the 33 Northern and Western States of 2,404 persons.

The Federal, State, and county funds used in cooperative extension work in the 33 northern and western States amount this year to about \$8,900,000.

Mr. McLAUGHLIN of Michigan. To me, Dr. True, that is somewhat confusing. In the first place, that includes money contributed by the States from all sources in the States. We are interested only in the amount of money that is appropriated by Congress for that work. Those figures are interesting, and that may be just what some of the other members of the committee want, but I am particularly interested in the amounts Congress is appropriating; and when they are included in other great big amounts, as I say, it is confusing to me.

Dr. TRUE. Later on, Mr. McLaughlin, I will present some tables which, I think, will clear up that matter. As a matter of fact, this work is all of a cooperative nature and so joined together that, unless we take into account all the persons and funds, we do not get a complete idea of it.

Mr. McLAUGHLIN of Michigan. It is interesting to know the figures—how much the States have contributed and in what way and how they used it. I think we ought to have pretty definitely just the amounts for each kind of work appropriated for by Congress; but you say you will furnish that later.

Dr. TRUE. I have prepared a brief statement regarding some of the results of this work in the Northern States, if you desire to go into that, or I can put that in the record.

The CHAIRMAN. How long a statement is it?

Dr. TRUE. Just a few paragraphs.

The CHAIRMAN. You may give it to us now.

Dr. TRUE. In 1918, which is the last year for which we have complete figures, the county agricultural agents in the Northern and Western States conducted 77,668 demonstrations incident to crop and live-stock production. These demonstrations were visited by 677,653 persons, and the increased profits to farmers on whose farms they were conducted, due to better practices, amounted to \$22,206,307, or more than five times the total cost of the work in the Northern States.

The total value of the cooperative business conducted by farmers' exchanges and other cooperative associations organized with the aid of the county agents in this and preceding years amounted to \$41,847,783. The saving to farmers effected through these organizations amounted to \$4,500,000.

The home-demonstration agents brought about the home canning of 24,000,000 quarts of fruits and vegetables. The 250,000 boys and girls who made complete reports on their work produced \$6,000,000 worth of products, with a profit of \$3,500,000; while the total super-

visory cost of all the crop work in which, in all, 527,723 boys and girls were enrolled, was \$547,851.

The CHAIRMAN. Kindly state the character of the work of the demonstrations and the exchanges.

Dr. TRUE. Those were organizations which the farmers formed for the purpose of marketing their crops or live stock or purchasing fertilizers or other material.

The CHAIRMAN. You have reference to a cooperative association?

Dr. TRUE. Yes; cooperative associations of various kinds. I have used that term "farmers' exchanges" because it is often used in a general way.

The CHAIRMAN. Do they associate in marketing?

Dr. TRUE. Yes, sir.

The CHAIRMAN. And in buying also?

Dr. TRUE. Yes, sir.

The CHAIRMAN. What is the character of the demonstrations to which you refer?

Dr. TRUE. They covered a great variety of subjects. There were demonstrations with the various crops.

The CHAIRMAN. Do you go on the farms and make the demonstrations?

Dr. TRUE. Oh, yes. The demonstrations are carried on on the farm by the farmer himself, under the supervision of the county agent. The county agent and the farmer get together and arrange to make a demonstration of some new crop or some new method of cultivation or fertilization, and the farmer carries on that demonstration, and then meetings are held.

The CHAIRMAN. Does that operation include the whole farm or just a small plot?

Dr. TRUE. Just a small portion.

The CHAIRMAN. Is it a demonstration of what can be done with the use of certain fertilizers, intense cultivation, and rotation of crops?

Dr. TRUE. Yes; a variety of things.

The CHAIRMAN. You spoke about a certain profit, running into the millions. How was that arrived at?

Dr. TRUE. We receive the reports of the agents, in which statements are made about what is done in the demonstration, what the results were, what prices were received for the crops or live stock, and the profit.

The CHAIRMAN. Are books kept of the cost?

Dr. TRUE. Yes; books are kept.

The CHAIRMAN. And the increased production, compared with the increased cost, and also increased use under normal conditions?

Dr. TRUE. Yes, sir.

The CHAIRMAN. And the profits and advantages run up into the millions, as stated by you?

Dr. TRUE. Yes, sir.

Mr. HUTCHINSON. Do you get at the dollars and cents figures by keeping a record? Do the county agents keep a record?

Dr. TRUE. The farmer usually keeps the record. Mr. Smith, who is in charge of that work, will explain it to you if you desire.

The CHAIRMAN. We will be glad to hear Mr. Smith.

STATEMENT OF MR. CLARENCE B. SMITH, CHIEF OF THE OFFICE OF EXTENSION WORK IN THE NORTHERN AND WESTERN STATES, STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE.

Mr. SMITH. These 77,000 demonstrations are just the measured demonstrations—demonstrations on which actual records were kept by the farmers themselves and over which the county agents have supervision. Of course there was a great deal of additional work done and no record is kept of that additional work. These are simply the measured demonstrations in 40 lines of work.

Mr. HUTCHINSON. That is just a small part of the agriculture carried on, then—just what goes to your own demonstrations?

Mr. SMITH. Yes; just what is included in our demonstrations. We did not dare make any estimate on things on which we did not have the figures.

Mr. HUTCHINSON. Are these exact figures on just what you demonstrate, or are they multiplied by the agriculture of the country?

Mr. SMITH. They are the exact figures on these particular areas, sometimes of small extent and sometimes of large extent.

Mr. HUTCHINSON. I understood the amount is \$22,000,000.

Mr. SMITH. More than that on the demonstration areas alone.

Mr. HUTCHINSON. That is just what you get accurate accounts of, in a small way? Do you demonstrate around the country?

Mr. SMITH. It is just on the areas on those particular lines in which demonstrations are being carried on.

The CHAIRMAN. Will you kindly go into the details of certain of your demonstrations and tell us exactly what is being done?

Mr. SMITH. Take potatoes. It may be a matter of standardization of varieties of potatoes or a variety that is best adapted to the community. The college has worked out a variety that they think is better adapted to the community than some other variety. That variety is tried out in the community, we will say, on an acre plot, in comparison with the variety the farmer usually grows. Both are given the same kind of cultivation, and the differences in yield may show the differences in value of the variety that is recommended, for instance, over the varieties that are commonly grown. That is a minor type of demonstration.

Another demonstration in connection with potatoes might be the amount a group of farmers received from a carload of mixed varieties of potatoes versus a carload of all one variety of potatoes. They are just simply illustrations.

The CHAIRMAN. I take it also as to cultivation?

Mr. SMITH. Cultivation; yes, sir.

The CHAIRMAN. You try out different methods of cultivation?

Mr. SMITH. Yes; we try out different methods of cultivation if that seems to be an important matter in the community.

Mr. McLAUGHLIN of Michigan. That particular work was done in one of the counties in my district, and it was done very well indeed, under Mr. Blandford, in Newaygo County. You know him, do you?

Mr. SMITH. Yes, sir.

Mr. McLAUGHLIN of Michigan. I think it was with very good results.

Mr. SMITH. The cooperative marketing potato work in Michigan has been one of the outstanding features of the work in that State. I can not remember the exact figures now, but the cooperative marketing work for last year ran into the thousands of carloads marketed through their farmers' organizations.

Mr. McLAUGHLIN of Michigan. I know the county agents have encouraged the farmer to get better varieties of seed. I remember that one or two of the county agents recommended a certain kind of rye and induced the farmers to put in certain acreages, and they noted the acreage, the increased yield, and the increased price of the product on the market, and the results were very satisfactory.

Mr. SMITH. Rosen rye?

Mr. McLAUGHLIN. Rosen rye; and it is that character of work and that particular line you are speaking of that is being done?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. I think you can approximately get at the profit, the difference between the results of the better seed and the better cultivation and the old rye with the old system. That is the way you get at these figures that you speak of in making a comparison?

Mr. SMITH. Yes, sir. In the case of the county agent's work we rely on the county agent's report itself. In the case of the boys' and girls' club work, each boy and girl who sends in a report gets a certification by two witnesses as to the entire operation, the yields on their plots, and presumably the cost of production.

The CHAIRMAN. This demonstration, then, is largely a boys' and girls' club demonstration?

Mr. SMITH. No, sir; it involves a whole community.

The CHAIRMAN. Who carries on the demonstrations?

Mr. SMITH. The farmer himself carries it on, sometimes at the suggestion of the county agent. That is one class of people. Then the same kind of work may be carried on in our boys' and girls' club work.

The CHAIRMAN. Now kindly explain something about the marketing.

Mr. SMITH. Yes; I can explain, perhaps, the local live-stock exchange, which is very common in Minnesota and a number of the States. The farmers are accustomed to selling their stock to local buyers and the local buyers pay them what is necessary and make a profit on it. The farmers, when they get together at a group meeting, may decide that it would be better for them to club together and sell cooperatively, so that they might sell in carload lots. The county agent may advise them or tell them of the success that has been attained in that line of work in other communities which he may know about and encourage them to organize themselves into a live-stock shipping association.

On a certain day the cattle or live stock is brought in; it is graded by a committee of the farmers themselves and shipped in carload lots. Each one is so marked that they know who the owner is. They do their own business with their own officers. The county agent, in an advisory capacity, is a kind of stimulus to get them to do that thing.

Mr. YOUNG. I am curious to know just how you handle the shipment on the market. Suppose you get there, say, with 30 head of

steers in the car and these steers belong to 15 different farmers, are they sold as individual animals at the market point, or are they sold in carload lots?

MR. SMITH. I can not tell you exactly how that is done, but I know it is so handled that each one of the shippers gets the proper amount for his stock.

THE CHAIRMAN. If they are of the same quality, they are sold in a bunch, but weighed separately. Thank you, Mr. Smith. We will hear Mr. Knapp.

STATEMENT OF MR. BRADFORD KNAPP, CHIEF OF THE OFFICE OF EXTENSION WORK IN THE SOUTHERN STATES, STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE.

MR. KNAPP. They are weighed separately at the chute as the farmers bring them in. Records are kept separately, and when they arrive at the market they are sold in a carload as an individual would sell his. They go onto the market and are sold just as though they belonged to one individual, and the returns are prorated according to the grading. Before they go into the car they are all graded and are sold on the same grading.

MR. YOUNG. So that the farmers have no disputes when the returns come back as to whether some other fellow is getting the money for his particular steer?

MR. KNAPP. No; there is no dispute of that kind. The interesting thing about that, where they are just small farmers and have only a few cattle in the car, is that the losses in transit are prorated; so that, if one old farmer had only one steer and that was the only one lost in transit, he does not lose it, but the loss is prorated. I find that is one of the most encouraging things to the farmers themselves—the insurance on their shipments.

MR. McLAUGHLIN of Michigan. Heretofore, just as Mr. Smith has said, the farmers were at the mercy of the string butchers, as we call them—the men who run around the country and make a business of picking up cattle and paying the farmers just what they please. In these associations, composed of a large number of farmers, their stock is graded; they do not put good fat steers in with old cows on their last legs and thin cattle that are no good which, when they get to the market, bring a small price. Altogether it is very profitable. I have heard men connected with the associations with which I am familiar and of which I have some knowledge speak about it, and it is very satisfactory.

MR. KNAPP. The idea is to substitute a good business system in place of a bad system. In Mississippi, where the hog industry has increased since the last census by 76 per cent, the farmers did not know very much about marketing hogs. They never had marketed beyond just their local market, and it became necessary to train them in the marketing of hogs. Local buyers went in there from other States and bought up the hogs as low as 8 cents a pound, or \$8 a hundred, at a time when the St. Louis market was controlling at \$16. The minute they put in the cooperative system of shipping, the farmers began to get just as good a price as the northern market warranted; that is, they began shipping into St. Louis and got close to the top price.

Mr. ANDERSON. Do all these northern hogs come from the southern market?

Mr. KNAPP. No. I might say in that connection that there was a difference of 5 cents a pound in the county where there was no organization and no county agent and the place where there was a county agent. No, Mr. Anderson; the southern hogs are not all shipped north. A great many of them are not shipped north, especially those that are being produced in what we call the peanut region. A very serious problem with us now in this connection is that of soft pork. These hogs are mainly marketed at Jacksonville, Fla., Macon and Moultrie, Ga., Andalusia, Ala., and one or two other points. The Mississippi hogs in the main are going north, but the Tennessee hogs in the main are marketed either at St. Louis, Louisville, or Nashville. Nashville is beginning to be a very good market. The hogs of Clay County are marketed mainly in Cincinnati, St. Louis, and Chicago, and the hogs from the peanut region, which includes a large acreage in southern Alabama, southern Georgia, and northern Florida, are marketed mainly at those local points. It is not a good thing to ship north; they do not stand well in the northern market. I have been through a long investigation of that in cooperation with the Federal Trade Commission. That whole situation was thoroughly investigated, and I have been in personal contact with it.

The CHAIRMAN. They sell at a lower price?

Mr. KNAPP. Yes. One of the difficulties we are having right now is to get the packers to recognize the farmer to the extent of paying him for good, hard hogs when he produces good, hard hogs, and not to brand the whole section with disapproval by buying them all on the basis of soft hogs.

The CHAIRMAN. Is it generally conceded that there is a difference in quality?

Mr. KNAPP. There is.

The CHAIRMAN. A real difference?

Mr. KNAPP. Oh, yes. I do not think there can be any question about that—that there is a real difference in quality.

The CHAIRMAN. To what extent?

Mr. KNAPP. That is a difficult question to answer. There seems to be a very great difference of opinion. The packers say that there is a marked difference, due to the shrinkage in the process from killing to curing the meat, while the investigations of the experiment stations and of the Department of Agriculture thus far fail to verify that statement.

The CHAIRMAN. The hogs produce more lard and less meat?

Mr. KNAPP. The meat itself is softer; the tissue itself is softer. The lard has a lower melting point and requires stearine to be added to it, which is permitted under the rules, in order to make hard lard out of it. Our problem is to balance up the ration of the hog and not to feed him all peanuts, and we are at work with the farmers on that now.

Mr. YOUNG. I know something about it in a small way down in my State—not so much in connection with peanut-fed hogs as with mast-fed hogs, and in the earlier days we were confronted with the same problem.

Mr. KNAPP. The mast-fed hog presents the same problem.

Mr. YOUNG. We learned to let them run on the mast for a few weeks and then to put them on corn and harden up the meat.

Mr. KNAPP. Our experience is that that works out a great many times. However, the packers tell us that you can not make a hard hog after you have fattened him once on mast or peanuts. That problem is one that the department and experiment stations have to work out; we have to know about that; and I must confess I do not think we do know now.

Mr. YOUNG. Speaking as a layman, I have had a little practical experience on that, and my own judgment is the packers are holding us up on that proposition.

Mr. KNAPP. Mr. Young, I am inclined to agree with you. That is my experience, too.

Mr. YOUNG. Because the man who has raised hogs in that way and has eaten the meat himself and gone through the actual experience in everyday life knows it is not so.

Mr. KNAPP. Take the Smithfield hams, produced in West Virginia. Those hogs are fed on peanuts; the Brooks County (Ga.) hogs come the same way, and they are the most delicate and fine-flavored article you want to eat anywhere.

The CHAIRMAN. And they sell at a higher price?

Mr. KNAPP. Yes.

Mr. YOUNG. I raise my meat in that way; I feed my hogs on such feed as cottonseed meal or peanuts (I use just whatever I have), but when I finish them I use corn. In my own case, in curing and eating my own meat, I know when the packers say you have an article that is not just as good they are telling something that is not true.

Mr. TINCHER. And the packer hardly ever sells any soft pork?

Mr. YOUNG. He does not sell any soft pork, but when he buys his hogs he pays the price for soft pork.

The CHAIRMAN. Do the stockmen and merchants take kindly to this proposition?

Mr. KNAPP. Of course, the local buyer, who is in there to buy as cheaply as he can and beat down the price to the farmer and sell at a high price on the market, is not in favor of it; but the local banker and merchants are very highly in favor of it, because it puts more money in the hands of the farmer, and they have a better opportunity to fix up their farms. The result of that would be that the competition between the farmers' organization and the stock buyer would hold the price up so that there would be no difference between the two, except that the one has to pay the expenses of his manager and the other is a manager himself.

The CHAIRMAN. Thank you, Mr. Knapp.

FURTHER STATEMENT OF MR. CLARENCE B. SMITH, CHIEF OF THE OFFICE OF EXTENSION WORK IN THE NORTHERN AND WESTERN STATES, STATES RELATIONS SERVICE.

Mr. SMITH. Sometimes that local stock buyer becomes the manager for the farmers in handling their work. The number of purchasing and marketing associations organized last year through the influence of the agents were about 1,650, and the groups that they dealt with did a business of around \$26,000,000.

The CHAIRMAN. Is it generally a success?

Mr. SMITH. They are generally successful; yes, sir.

The CHAIRMAN. Do many of them incorporate?

Mr. SMITH. There is not much capital usually involved.

Mr. McLAUGHLIN of Michigan. It is sort of a voluntary organization?

Mr. SMITH. Yes, sir.

Mr. McLAUGHLIN of Michigan. It is not a corporation ordinarily, is it?

Mr. SMITH. Not ordinarily. There are all kinds, but ordinarily it is not.

The CHAIRMAN. In the northwestern States, in Iowa and Minnesota, they are nearly all incorporated.

Mr. ANDERSON. They are incorporated under the State laws authorizing that particular kind of a corporation, some of them having stock and others not; that is my recollection.

I have an impression that four or five years ago in Minnesota we had so-called State farms—that is, we had farms which were operated entirely under the direction of the county agent or the State college.

Mr. SMITH. Yes.

Mr. ANDERSON. Is that work being continued?

Mr. SMITH. Yes, sir; and it is being discontinued, too. They had 12 or 15 farms that they called farm-management demonstration farms. The land was owned by the farmers, and the college assumed entire direction of the farm. They have kept records on those farms now for 10 or 12 years and the results that they secure each year on each farm are presented usually at a mass meeting at the end of the year, where all the farmers of the community are invited to attend. They have found, while that is an accurate method, that it is rather expensive and does not reach enough farmers, and so they are gradually giving up that work now that the county-agent work is coming in and operates more broadly so as to reach many more farmers.

Mr. McLAUGHLIN of Michigan. You say it was expensive. Why should it be expensive?

Mr. SMITH. It required some representative from the college to go out there once about every two or three weeks.

Mr. McLAUGHLIN of Michigan. It was expensive to the State; not to the farmer?

Mr. SMITH. Expensive to the State; yes. The farms in practically every case worked out very satisfactorily and made good demonstration farms, but it required on the part of the college too much overhead supervision.

The CHAIRMAN. Did not the counties pay the expenses?

Mr. SMITH. No; it is a separate proposition in Minnesota; these farms were started by the colleges and the counties had nothing to do with it at all. The overhead expense was borne entirely by the college and the farmers in the county simply followed the directions of the college.

Mr. ANDERSON. This work was begun, as I recall, before we had any county organizations to speak of in Minnesota.

Mr. SMITH. I have a report right here on that very thing. There are 14 of those privately owned farms now in that State, and I have

the details of that if you are interested and can let them go in the record.

Mr. TINCHER. I see on your chart there that you have certain counties marked "organized." Does that mean that they have a county agent or had a county agent on November 1, 1919?

Dr. TRUE. Yes, sir.

Mr. SMITH. All these that are marked with this purple color.

Mr. TINCHER. The others, those not marked that way, did not have a county agent on November 1?

Dr. TRUE. Those shown in yellow have no county agent.

Mr. TINCHER. I am conducting correspondence with a lot of imposters, then, because I know in my congressional district they have half a dozen agents; they have county agents, and they did all summer. In my own county—I was there last summer when the agent was appointed. Take Barber County, Kans.; I had a fight with the county commissioners to appoint an agent there, and I know he is there and that he has been there all summer; but that chart shows there is no organization.

Mr. McLAUGHLIN of Michigan. Perhaps this chart was prepared before that time.

Mr. TINCHER. No; it says November 1, 1919. I know he was there and that he did good work in furnishing harvest hands to get the work done.

Mr. SMITH. That chart may not be accurate, but it is pretty nearly accurate.

Dr. TRUE. There may be some technical reason why that would not get on our record.

Mr. TINCHER. There are three or four counties that I know of which have county agents, but which are not shown on your chart.

Mr. SMITH. There are 40 county agents in Kansas. I have not the names of those agents here.

Mr. TINCHER. I do not think there were 15 counties in Kansas on November 1 that did not have county agents.

Mr. SMITH. There are 105 counties in Kansas, and on December 1 Kansas had 40 county agents. Before that they had a number of district agents—men who operated in five or six counties, but the counties contributed practically no money.

Mr. TINCHER. Have you a list of the counties there?

Mr. SMITH. Not here; but I can send it up to you.

Mr. TINCHER. I wish you would do that. The complaint is that on the first allotment they allotted all their money, so the Agricultural Department claims, and have no money to take on any new county agents. In my district there are 32 counties, only about five of which got any of the allotment; and the others are complaining because they did not get any. I just corresponded with your department recently, so I know something is wrong with this chart.

Mr. McLAUGHLIN of Nebraska. Along that line. I notice you have four counties marked "county agents" in Nebraska; we have six to my knowledge.

Mr. TINCHER. They were usually worth their price this summer, because they aided in doing the work and got the harvest hands and actually delivered the goods.

STATEMENT OF DR. A. C. TRUE, DIRECTOR OF THE STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN. This circular reports that at the present time there are 2,300 out of 2,936 counties in the United States with county agricultural agents. I understood you to say that you had only 2,000.

Dr. TRUE. Yes; the number has declined since that report.

Mr. HUTCHINSON. On your chart up there, I notice there is a decrease in most everything. Why is that—because of the condition of the funds? Are the States not giving as much?

Dr. TRUE. Last year we had a large emergency fund, which was withdrawn on the 1st of July.

Mr. HUTCHINSON. You mean in 1918?

Dr. TRUE. Yes, sir.

Mr. HUTCHINSON. That was on account of the war?

Dr. TRUE. Yes, sir.

Mr. McLAUGHLIN of Michigan. When the amount of money is limited, is it advisable to have a county agent in the county, a man, and a woman besides; and another employed on the boys' clubs and girls' clubs? Could not the county agent, if necessary, do that kind of work? There is not much difficulty about it and no particular skill is required, is there?

Dr. TRUE. That is just a question of the amount of money which the county has to put into the work. We go on the principle that the first thing to do is to get a man agent there. If the county is willing to go beyond that and to contribute toward the salary of a woman as well, then we desire to put her in; but you will note in the Northern States a large number of the counties have not decided to have a woman agent so far.

Mr. McLAUGHLIN of Michigan. Even where a county wishes a woman agent, it would take the money that can be used to employ a regular county agent, and the amount of your money is limited.

Dr. TRUE. But if the county desires to have a woman agent, she can do very useful work.

Mr. McLAUGHLIN of Michigan. Then you allow that county some money, although it is taken away from the fund that might be used in employing a county agent elsewhere?

Dr. TRUE. It does not necessarily work out that way.

Mr. McLAUGHLIN of Michigan. It must necessarily, because the amount of money is limited, and the amount next year may be still less than you have had this year.

Dr. TRUE. It is not true yet that all the counties are sufficiently interested in this work to even desire one agent.

Mr. McKINLEY. Do I understand this: For instance, we will take my county, Champaign County; we have a man agent for which the county is willing to contribute part and the Government then pays its share of the money for the man agent. That is right, is it not?

Dr. TRUE. Yes; either the Government or the college which receives the Federal fund.

Mr. McKINLEY. Suppose they decide they want a woman agent, also, for which they are going to pay \$100 a month: How much do you contribute?

Dr. TRUE. That would depend upon the circumstances.

Mr. MCKINLEY. How much would you contribute?

Dr. TRUE. Out of the direct appropriation to the department we might not contribute more than \$1.

Mr. MCKINLEY. How much would you contribute?

Dr. TRUE. Up to \$600, if we had the funds.

Mr. HUTCHINSON. If I understood it yesterday, the apportionment to each county was approximately \$5,000, and they could hire two agents if they wanted to.

Dr. TRUE. We do not apportion the amount to the county.

Mr. HUTCHINSON. You have over 2,000 county agents and you have \$10,000,000, have you not?

Dr. TRUE. The proposition is this, that in order to have an agent in the county, the county must show a sufficient interest in the work to contribute a liberal amount toward the support of the agent.

Mr. HUTCHINSON. But you can not give over your apportionment of the whole fund, can you—that is, \$5,000 to each county? That is what it figures up. The way we figured it yesterday it was \$5,000 to each county. Now, you get your county agents for \$3,500 and you have \$1,500 to hire a woman, or can you go as high as \$5,000?

Dr. TRUE. The thing would not work out practically that way. What is done with this money, as far as the Federal Government is concerned, is that it is allotted to the States and goes to the college. The college takes that money and combines with it the State appropriations or money which it has from other sources. Then the State deals with the county through the county government or the farm bureau in the county and enters into a cooperative arrangement. That cooperative arrangement varies, according to circumstances in the county, so that we have in detail a considerable variety of different arrangements.

Mr. HUTCHINSON. Then if any State or any counties in a State do not ask for it, the State does not get any portion of it; is that it?

Dr. TRUE. The State gets its allotment, but the county does not get the money.

Mr. HUTCHINSON. The State gets the full allotment—their share of the full appropriation?

Dr. TRUE. Yes, sir. I might say further, in reply to Mr. McLaughlin's question regarding the women agents, that thus far about 17 per cent of the Smith-Lever funds are spent for the home-economics work. That is at present a matter that is being criticized by the women quite extensively; there is an impression, which is quite widespread in this country among the women, that they are not getting as much of this money as they ought to have for home-economics work. We have gone on the principle that this work was not to be developed except as there was a demand for it in the counties and it was possible to put in competent women to do this work.

Mr. McLAUGHLIN of Michigan. When this farm-demonstration work was begun, when there was talk about a law and an appropriation, which developed into the Lever law, it was suggested that there would be money enough for one man in each county in the country. Many to whom that proposition was submitted were astounded with the idea that the Federal Government should undertake to have one man in every county in the country. But now we find that there is

the demand on the part of the department not only for a county agent in a county but for one or more women in a county, and a separate agent for the organization of boys' clubs, a separate agent for the organization of girls' clubs, and so on. It seems to me we are getting away from the idea that was in the minds of those who framed the Lever law and did not so strongly favor the proposition to begin with.

Dr. TRUE. The Lever Act provides for work in both agriculture and home economics. As far as the funds are concerned, we must bear in mind all the time that the value of the dollar has materially decreased, so that the money that is given under the Smith-Lever fund will not go nearly as far as it would have when the act was passed five years ago. Beside that, in a broader way, it is not simply the department and the colleges that want these things, but the people themselves desire to have aid along these lines. The result is that there has been built up quite a comprehensive system of extension work through the agricultural colleges and the department, and the States and the counties have been liberal in their contributions, greatly exceeding at present the contributions made by the Federal Government. We are simply working under the conditions which we have at present in developing this system.

The funds available at present are not sufficient to put this system into full operation in every county in the United States. It is not likely for a long time that there will be a woman agent or a club agent in every county. In those matters we follow the desire of the people themselves, and that varies greatly. For instance, in South Carolina, the women's work has been so popular and effective that every county in South Carolina, if I remember correctly, now has a woman agent.

Mr. MCKINLEY. But the State and county authorities pay half of that, do they not?

FURTHER STATEMENT OF MR. BRADFORD KNAPP, CHIEF OF THE OFFICE OF EXTENSION WORK IN THE SOUTHERN STATES, STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE.

Mr. KNAPP. They pay much more than that. Let me just say, in answer to Mr. McLaughlin, that as far as we are concerned in the South we are not advocating the placing of a separate agent for boys' and girls' club work in the county. We think that is a bad practice, just as you seem to indicate you think it is. I think it is making too much organization. Ordinarily, to be perfectly frank, I think it is enough if we have a county agricultural agent and a county home-demonstration agent. I want to explain, if you will permit me, why I think that the county home-demonstration agent is an important factor. I may say when I took charge of this work in the South, on the death of my father, that there were only three women agents in the United States. At the present time there are 600 counties in the South where there are home-demonstration agents, and I can point to many counties where they would part with their county agricultural agent before they would part with their home-demonstration agent. If you conceive of the home work of a woman as merely dietetics (and I am not criticizing that part; that is all important), and if you throw out of it the consideration of the practical side of the farm

women's work, you do not get the full conception of what these women are doing. Our farm-management people tell us that the farm is divided into enterprises, and that the proper correlation of the enterprises and choice of the correct enterprises make for successful farming. You know, from your own observation, that the farmer has his corn, his small grains, his hay, his pasturage, and his cattle and hogs, and these major enterprises on the farm.

Yet there are, let me say, what we might call the minor enterprises of the farm. There is the poultry, which almost universally falls to the lot of the women; there is the home dairy, the direction of which almost universally falls to the lot of the woman; there is the vineyard, if there be any, the home vineyard; there is the canning and preserving and putting away of the food products on the farm for future use; there is the home garden and its products, and her intelligence, as a rule, directs that. Then, besides that, of course, there is the whole problem of the management of the home.

In the South, it was a problem of adding to the income of the farm. For instance, of all women engaged in agriculture the last census showed that there were 84.9 per cent in the cotton territory, where they were getting 50 cents a day in the field. We knew, and we have demonstrated time and again, that they could add more to the family income by productive enterprises around the home that naturally fall to the woman's lot, if they were taught to do it, than they could by working as mere field hands out in the fields with a hoe. And one of the great accomplishments of this work in the South is the fact that we have changed hundreds and thousands of field hands into real home makers who are producing something, often quite a material production, for the sake of the home income. We put it on the practical proposition that our first step was to add something there that gave them an income in dollars and cents, and hence the garden, better poultry, better marketing of that poultry; and to save the products of the farm they ordinarily would not sell, they are canning the surplus products on the farm; and that has added very materially to the wealth of that section.

I have approached this matter from the other angle. Farm women and farmers themselves may not be much taken to it or attracted by it. We have approached it from the practical angle of improving the ability of the person to earn a livelihood. Then you get entrance into the home and the confidence of the people and you can take up questions of dietetics and health, the raising of babies, and those other things that have come into our work as incidental things, which flow from the confidence which the people generally get in the home demonstration agent as she travels over the county. Our women and the county agents cooperate very closely in working out those big problems of the country home.

We do not have in the South, except in a very few instances, any separate county agents to deal with the boys' and girls' club work. The county agent handles the boys' clubs and gives the boys instructions in agriculture if they have clubs (and they do organize them—we have them to a large extent), and the home demonstration agent gives instruction in the lines of work that naturally fall to the women and the girls. So we do not have those extra assistants. I am not criticizing those who do have them, but I simply say we

have never had them in our territory. I believe thoroughly in the efficiency of the present arrangement for our section, and I might say the colleges are all in perfect accord with me on this subject, with possibly the exception of one who thinks we ought to have some county club leaders; but almost universally in the South we have seen that we did not have enough money and felt that we ought to conserve that money and unite on those very practical lines of work that go definitely to the farm income, from the farmer's standpoint, and the home income, from the standpoint of the wife, and that we could take care of the boys' and girls' clubs along with that organization. So far we have reason to believe we have succeeded fairly well with that kind of an organization. I just wanted to say that.

That is my own personal opinion from my 10 years of experience here, and I simply give it to you for what it is worth. I do not criticize the others who have a different opinion. In the South, if the county wanted to put up a large amount of money and take the same amount from the United States and have extra employees in the county, they can do so. I know of counties where only six or seven hundred dollars, or under a thousand dollars, has been put up by the college and department combined, where the county puts up \$4,000 or \$5,000 (some rich, influential counties sometimes do that) and have extra employees, without any general club work, to give assistance to the county agent and possibly assistance to the home-demonstration agent; but that is the rare exception.

The CHAIRMAN. It is my understanding that that is the practice all over.

Dr. TRUE. We must bear in mind, in considering the extension work, that ours is a big country. Mr. Knapp has explained the system that has grown up in the Southern States, but when you come to deal with the Northern and Western States you have in some respects different problems in the organization of the work. I think, if you desire, Mr. Smith, who has charge of the northern work, can explain more fully some of these things to which Mr. Knapp has referred, from his point of view, as dealing with the Northern and Western States.

FURTHER STATEMENT OF MR. CLARENCE B. SMITH, CHIEF OF THE OFFICE OF EXTENSION WORK IN THE NORTHERN AND WESTERN STATES, STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE.

Mr. SMITH. I would like to give you the theory we are operating on with reference to the employment of these agents. First of all, the colleges and the department and the farmers usually are in accord with putting up their money for the county agents. That is the first agent put on the work there and that county agent helps the farmers put on their demonstrations and also extends his work usually to the boys' and girls' clubs and helps the women all he can. Time goes on and he becomes very busy and it is sometimes desirable to give him assistants in that work. The women themselves say, "Here is the law which contemplates work with women, and nothing special is being done with this; can we have the same help for the women that you are giving to our men?" So the women themselves and the farmers decide they would like to cooperate in the employ-

ment of a home-demonstration agent. The next one put on, then, is usually a woman agent. The people themselves determine that and they pay a larger part of the money. She works particularly with the women and also extends her work to the girls.

If it happens that county is a rather thickly settled county and there should be three to five thousand rural girls and boys in that county, as there may be, the fathers and mothers may decide that they would like to have some one give special attention to those boys and girls. The matter of keeping them on the farm is important. So they decide they would like to cooperate in the employment of some one to give his whole time to that work.

This chart will give you some notion of what they think of that work as well as of the county agent's work and home-demonstration work. This chart shows a comparison between the work of 1918 and the work of 1919.

Office of extension work north and west—Cooperative funds and staff on Dec. 1, 1918-19, v. same date, 1919-20.

Mr. McLAUGHLIN of Michigan. What are those letters at the head of the column—what do they mean?

Mr. SMITH. "C" means county agent; "D" means district agent. On December 1, 1918, we had 1,136 county agents and 67 district agents, covering about four-fifths of the agriculture of the North and West.

Mr. McLAUGHLIN of Michigan. Were those district agents employed to cover the counties that had county agents?

Mr. SMITH. No. They were employed to cover the counties that did not have county agents, such as out here in western Kansas and Nebraska, where one agent covered seven or eight counties.

Mr. McLAUGHLIN of Michigan. They were practically county agents with more than one county?

Mr. SMITH. Exactly. Now, this year, on December 1, 1919—I show you this to indicate the effect also of the result of decreasing the appropriations last year—we had 1,122 county agents and 11 district agents. The decrease in funds, you will notice, squeezed out the district agents, but it left practically all of the county agents.

There is a loss in the Northern States, then, of about 1 per cent in our county agents, while we lost about 83 per cent of our district agents.

In the case of the rural and urban home demonstration agents, you will remember at the time the war broke out we had about 15 of those home demonstration agents in the entire Northern and Western States, and with the emergency funds Congress gave us, amounting to over a million dollars, there were employed on December 1, 1918, 496 of rural home demonstration agents, who worked in the counties, and 101 agents who worked in the cities. There are now 234 rural home demonstration agents and 13 working in the cities.

Mr. McLAUGHLIN of Michigan. Will you tell us why you have agents working in the cities?

Mr. SMITH. Yes. Under the emergency act it was thought almost as necessary to conserve food and clothing as it was to produce it, and so Congress made an appropriation on that basis. As the city people were largely consumers both of food and clothing, it seemed desirable to extend the work to the cities.

Mr. McLAUGHLIN of Michigan. Are you continuing some of them—13 of them?

Mr. SMITH. Yes. In some cities the States have entered into obligations with those agents, and felt that the work was so important that they have continued it for the present in a few of the cities.

Mr. MCKINLEY. That means the State pays most of it?

Mr. SMITH. The State pays all of it. The department contributes in those 13 cities in no case to exceed \$1, and in some cases nothing at all.

Mr. McLAUGHLIN of Michigan. You say the State pays it all, but it pays it partly, at least, out of the money they get under the Lever law?

Mr. SMITH. Yes, sir; partly out of that money.

Mr. McLAUGHLIN of Michigan. So that those are partly paid by what we call Federal money; it is a Federal contribution?

Mr. SMITH. It is a Federal contribution; some of that Federal money is being put in for city work in these 13 cities.

The loss in our home demonstration work through the year has been about 55 per cent, but what I want to stress is that at the outbreak of the war we had but 15 of those permanent women agents, and now, after two years, there remain 234 of those permanent women agents. That, we think, will increase.

The CHAIRMAN. Why were so many of the district agents dropped?

Mr. SMITH. They were dropped because there was no local financial cooperation. They were largely paid from Federal and State sources.

The CHAIRMAN. You did not have local contributions?

Mr. SMITH. They did not contribute. We made it a practice even during the war not to locate a woman in a county to be there all the time unless the county paid part of her salary and expenses.

Last year, in the club work, we had a total of 68 county club leaders out of about 1,500 agricultural counties that we have in the North. Notwithstanding the funds were decreased this year, certain populous counties in the North think well enough of the club work so that there are now 156 counties that have a county club leader who gives his whole time to the club work. The staff for county club work in the Northern States, then, has increased about 114 per cent.

This column here shows the funds that were contributed last year and this year, and shows you whether the decrease has been largest in the Eastern States, the Central States, or the Western States. The county-agent fund decreased about 8.8 per cent, although the number of counties decreased but 1 per cent. The funds for the women's work decreased about 39 per cent; and, whereas in 1917 we had about \$90,000 invested in home-demonstration work, the colleges and the local people are now putting in about \$747,000. In the club work the loss has been about 14 per cent in funds.

Mr. HARRISON. Mr. Chairman, as Mr. Knapp is here and will be busy this afternoon preparing to leave the city to take up his new work in Arkansas, I would suggest that the committee hear him now in connection with item 38, on page 218, "For farmers' cooperative demonstrations and for the study and demonstration of the best methods of meeting the ravages of the cotton-boll weevil," and so on.

The CHAIRMAN. The committee will be glad to hear you, Mr. Knapp.

FURTHER STATEMENT OF MR. BRADFORD KNAPP, CHIEF OF THE OFFICE OF EXTENSION WORK IN THE SOUTH, STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE.

Mr. KNAPP. Mr. Chairman and gentlemen, I would not ask to break in here, except for the fact that I am very busy getting ready to go away.

Mr. LEE. Doctor, is it true that you are going to leave us?

Mr. KNAPP. Yes; I am resigning from my position in the Agricultural Department and am going to Arkansas.

Mr. HEFLIN. I think this committee and everybody who knows anything about your work regrets very much that you are leaving.

Mr. KNAPP. I appreciate that very much, Mr. Heflin.

The CHAIRMAN. I would like to say that Mr. Heflin voices my sentiment and, I am sure, the sentiments of every member of this committee.

Mr. KNAPP. I have been very close to the farmers of the South in my departmental experience, and I suppose that nobody connected with the department is acquainted with more farmers than I am; and it is rather unique that I am laying down the job at this time, when it has been in the hands of one with my surname since its very foundation.

Mr. McLAUGHLIN of Michigan. How long was your father in the work?

Mr. KNAPP. He began this particular line of work in 1904 and died in 1911.

Mr. McLAUGHLIN of Michigan. And you immediately took up the work?

Mr. KNAPP. I was appointed by Secretary Wilson to succeed my father, whose assistant I was before he died; and I have continued in the position from that time to this.

Before I leave the Department I am going to place in the hands of Secretary Houston the history of the progress in the matter of wealth that the farmers of the South have developed under this work, not meaning that the work is entirely responsible for that, but

indicating the lines we have advocated have been followed by the farmers to their profit.

Mr. YOUNG. I believe that your father established the first demonstration of this work in my home county, in Kaufman County.

Mr. KNAPP. Yes; that is correct.

Mr. YOUNG. My people down there have a very kind remembrance and feeling toward you, but the principal regret that we have in connection with your leaving the Department of Agriculture is that Texas does not get you instead of Arkansas.

Mr. KNAPP. Thank you, Mr. Young.

Mr. McLAUGHLIN of Michigan. The work of yourself and your father has been noteworthy and very satisfactory indeed, and we are all sorry you are going to leave, and hope your work in the future will be agreeable to you and as profitable to those you are working with as it has been to the Government in the past.

Mr. KNAPP. I appreciate that very much, Mr. McLaughlin. I do not expect to serve the people of Arkansas alone, but I hope and think that my work with them will be of benefit to the people of other States as well. I am very much interested in the position to which I am going, but I know that is another matter, and I will confine myself to the particular subject which I am here to present.

The 15 Southern States comprise 45.9 per cent of the rural population of the United States. They have 49 and a fraction per cent of all persons engaged in agriculture in the United States.

The funds appropriated both by the Congress of the United States, under the direct appropriation and under the Smith-Lever Act, are practically on the basis of this 45 per cent. Dr. True will give you a little later a statement of the amount apportioned to the States, which is approximately in conformity with the rural population.

We have at the present time 916 county agents, which is less, a little over 100 less, than we had at the high point in early spring of 1919, when the emergency act was in full force.

We have, as I explained to you a few moments ago, our county home demonstration work and our boys' club work and girls' club work in those counties.

Mr. McLAUGHLIN of Michigan. Doctor, formerly you had some people employed for the club work which you have not continued. Is that work now done by the county agents?

Mr. KNAPP. We have experimented with some extra club employees in the counties, but now the club agent acts as a specialist, going from county to county to help county agents in the club activities and attend the meetings of the boys and girls and help them in the organization. They help outline a system of work. That is what they do in the main and that is the work in which these 53 are engaged. It is exceedingly interesting, and I want to put into the record a table showing the distribution of funds in the Southern States. The average salary of the county agent in the South is at the present time approximately \$2,000. The average salary of home-demonstration agents is very much less, and less than the average for the United States—a great deal less; it is about \$1,100. Many of them can not afford to work for that salary, except that they have a

certain spirit of service. Many of these women have this spirit which leads them and keeps them at work when they otherwise could not afford to continue in the work. Public-spirited citizens may furnish them with a little Ford runabout, and these people keep it up in that way and they travel around the county. In passing, I might say that many of them are graduates in home economics.

The CHAIRMAN. Does not the county usually furnish all the facilities?

Mr. KNAPP. Yes, sir, generally; they also usually have an office in the courthouse, and they get along in that way.

We have 151 negroes, extension agents, working among negro farmers. They are located mainly in counties where there is a heavy negro population and work as assistants to the white county agents. I might say that this is to the credit of the Southern people. I try to encourage them in it, and the colleges have come to the general view of cooperating with the negro colleges to try to encourage them to better work. It is gratifying to know that the negro has responded and is making material improvement both agriculturally and educationally.

The CHAIRMAN. Have you a number of negro women employed?

Mr. KNAPP. Yes; there are 51 negro women employed, and they are mainly in counties where there is a very heavy negro population. I want it understood that the white agents in the South carry on work with the negro farmers also, and the whole service helps the good negro people just as freely as they help white people. This is, I think, to the credit of the workers. I think everybody realizes the fact. I have known the agent to come to a plantation manager who would call the folks together and when they came the agent would find that they were all negro tenants; and when the county agent went in the field to go over the processes of cultivation and tell what should be done for the crop in order to make a profit, he would be giving instructions to negroes.

The CHAIRMAN. It is of as much advantage to the one as to the other.

Mr. KNAPP. Yes.

Mr. KNAPP. In this connection I desire to state that the total amount of funds for all sources in the South for extension work was \$5,530,654.98. That is the way I have it.

Mr. LEE. When was that spent; and at what time?

Mr. KNAPP. For the present fiscal year.

Mr. McLAUGHLIN of Michigan. That includes appropriations of all kinds?

Mr. KNAPP. Yes, sir; I can give you the particular items if you so desire.

The CHAIRMAN. You may insert that statement if you wish.

Mr. KNAPP. I shall be glad to do so.

(The statement referred to follows:)

Distribution of all funds for extension work in the South.

Year.	Administration.		Publications.		County agents.		Home demonstration.		Boys' clubs.		Extension schools.		Specialists.		Total.

Mr. KNAPP. The grand total includes the Federal Smith-Lever appropriation for \$1,343,880.42. That is exactly the 45.9 per cent. The State appropriation offsetting that is \$1,193,880. Part of that comes from counties, most of it from direct appropriations by legislatures. Some of our States in the South are poor and in debt, and can not make the full appropriations, so the counties help them out.

There is a Federal supplementary appropriation, with its proportion for these States of \$688,777.17, which in turn is offset by the States—I think entirely from county appropriation of \$688,777.17. Then there are county appropriations, beyond all those used for offsets, of \$801,718.80. There is also the distribution from the direct appropriation to my office of \$522,600 of money that is apportioned to the States. The amount of this \$645,000 for extension work in the South. Of that, \$522,600 is apportioned directly out to the States.

Mr. McLAUGHLIN of Michigan. Out of the \$645,000? What is done with the rest of that?

Mr. KNAPP. A portion is used for the administrative expenses of the office in Washington and for the employment of persons to cooperate with the States, just as Dr. True testified.

The CHAIRMAN. The \$5,530,654.98 includes all those items?

Mr. KNAPP. Yes, sir. That total fund represents the following:

The total for administrative expenses at the colleges, 6.20 per cent.
For cost of publications, 1.70 per cent.

For agricultural county agents, 47.41 per cent.

For home demonstration agents, 26.65 per cent.

And as I described it to you, the last item consists of practical work, much of it home economics; much of it directly agricultural.

Mr. McLAUGHLIN of Michigan. Those different percentages which you give run 74 per cent, practically 75 per cent.

Mr. KNAPP. Then the boys' club work, being about 3.61 per cent, which added to that gives a total and makes 78 per cent, nearly 79 per cent, or nearly 80 per cent of the funds is used in this truly practical work in the counties. Only 13.60 per cent is used for specialists. That could be given for each separate fund—that is, for the Smith-Lever fund and other funds. It would give the cost for the total.

As your representative, gentlemen, I only want to say this: I personally have carried a campaign of education to our southern farmers, especially in the cotton territory, since the beginning of the war in Europe, which I called "safe farming," by which we mean all that diversification means and more—a system through which they produce their own food and feed as a measure of safety under the shifting circumstances of the European War and our own participation in it, and produce their cotton as a surplus of cash. Cotton has been largely changed into an actual cash crop rather than a living or credit crop. In proportion as they have progressed along that line they have prospered. I think a large part of the success and prosperity of our cotton growers is due to the fact that the South has increased its other crops rather than the mere fact that cotton seems to be high in price.

When cotton was 30 cents a pound many of the farmers of the South thought it was a pretty high price, but at that time you could not buy more of the products or of the supplies necessary to sustain life, feed the live stock, etc., than when cotton sold for 12 cents a pound, because other things had gone up in proportion as cotton had

gone up; and it was that very great and significant fact that my office and myself, personally, and my assistants, carried to the farmers of the South. We published and used tables of comparison of purchasing power of cotton at different times to show them that the situation was very deceiving unless they realized that the prices of other things had gone up in proportion as cotton had gone up.

If you take the figures of the December Crop Reporter, you will find that, while the value of the total cotton crop is estimated at \$2,353,193,000, the value of the other crops produced in the 11 cotton States is \$3,016,985,000. If they had to spend their cotton money to buy the food and forage and meat and flour and these other things, the Southern States would not be as prosperous as they are to-day.

Mr. YOUNG. It might be interesting in this connection for me to say that Texas became the second corn State this year.

Mr. KNAPP. Yes; Texas was a wonderful corn-producing State this year.

I myself feel that the idea of a public officer in the county, trained in agriculture, to represent the United States Department of Agriculture and to represent the college of agriculture also, working in a practical way with farmers, has been "put across," if I may use a slang expression; that is, the people have taken hold of this idea and are making use of this servant, the county agent, in the county.

We in the South have not developed, possibly, as quickly as in the North and Northwest in organized effort in the counties, but our counties are rapidly developing a system of organization to help in the extension work in the county. The farmers get together in communities and try to work out their own problems with the aid of the county agents. For example, farmers may say, "What are the things that are bothering us here?" Let us say they are having trouble because their cotton does not produce well. When they have talked it over they will want the county agent to put on a system of demonstrations to show what is the best variety of cotton. Our department and the colleges ought to know what is the best variety of cotton that will be uniform in production and best for marketing. You see, I am giving that as a rough illustration as to how this problem of organization works out and how extension work relates itself to these local needs.

Here is the problem of the hog production and marketing, which is increasing in the South. When more hogs were produced we immediately were confronted with the proposition of marketing hogs, as farmers in the South had little experience along that line. So they said, "Mr. County Agent, we must know how to market these hogs." The county agent may not have had any considerable experience in the marketing of hogs. He calls on the Bureau of Markets, and an expert from the Bureau of Markets comes to the county, works with the county agent, and helps farmers to learn how to market hogs through cooperative shipping associations. Extension work, of course, is to meet the problems as they come up—not to go out with the idea that you must approach men who are not confronted with difficulties because a man who is not confronted with difficulties may not care to give the county agent a hearing. But there are plenty of problems coming up, and it is to meet those problems when they come up that the county agent should be on

the job and work with organized groups of farmers in solving their problems. They all feel that this is a strong combination for bringing organized, practical knowledge to farmers.

On the other side, here is the problem of home life, of satisfactory home life, and the recognition of the practical side of the farm woman's part in agriculture. I often use the illustration, Mr. Chairman, of my wife's aunt who lives in Buena Vista County, Iowa. Her income, which came from her own effort, before the war—in normal times—was between \$400 and \$500 on things around the farm to which she devoted her efforts, like her poultry flock, her garden, and her orchard. The people in that community recognized her as a good business woman. Her life is happy because she has these industries on the farm which belong to her and from which she receives an income belonging to her, as her husband receives income from crops and live stock.

I have taken some ideas from the experience of my own mother upon the farm and my own wife and have developed them into this home work to make the life better for the farm woman by adding industries which bring an income. You realize that in the city we are taking away some of the industries to relieve the woman of work so that she can seek other remunerative employments. Rural conditions will not permit that. In order to have gainful work for the woman, you must take the work to her, and that is what we are trying to establish in the South through gardening and canning and selling of the surplus product, the home curing of meats, the development of good home orchards, and the sale of surplus product from them, and especially the care of poultry and the marketing of the poultry and egg surplus. Then there is question of the use of more milk. We have this work with the man and the woman together. We need more family cows in the South. We need more milk in the diet, more home butter making, some cheese making, and other things, even developing ultimately into some dairying, which we might advance in the South and which we are getting to do quite rapidly.

I have tried to give you a little insight or little view of the facts as to how the work has been developed.

The CHAIRMAN. You have pointed out the importance of diversified farming, which makes the farm self-supporting. Instead of spending all the money received from the sale of the cotton crop on corn or for other things, they produce practically enough to meet all needs on the farm?

Mr. KNAPP. Exactly.

The CHAIRMAN. They are making progress along that line?

Mr. KNAPP. I judge so, because, you see, the other crops amount to more than the cotton crop.

Mr. McLAUGHLIN of Michigan. Most people do not realize that?

Mr. KNAPP. That is correct.

Mr. McLAUGHLIN of Michigan. Have you any figures showing the increase in other kinds of products?

Mr. KNAPP. Yes; I can give that to you. It is in a report to the Secretary; and I will be very glad to furnish the committee with the increase from 1911, when my father died, or even from the 1910

census up to the present time. I will furnish the increases in these other things besides the cotton.

The CHAIRMAN. For instance, some States that formerly imported practically all their corn now are exporting corn?

Mr. KNAPP. Let me give you an illustration: Alabama, according to the 1910 census, in that year had a corn crop of approximately 20,000,000 bushels of corn. For the last three years the crop has run above 60,000,000 bushels. The highest year was about 77,000,000 bushels. It would be interesting to know that in Alabama, in the 1910 census, the average per farm was 18 acres of cotton and about 8 acres of corn. At the present time the average farmer in Alabama has about 8 acres of cotton and 18 acres of corn.

Mr. McLAUGHLIN of Michigan. And they find it profitable?

The CHAIRMAN. Is that due to the cotton-boll weevil?

Mr. KNAPP. Yes, sir.

The CHAIRMAN. Of course, corn can be produced at much less expense than cotton.

Mr. KNAPP. Yes, sir. Then they have other crops—the peanut, soy beans, and hay, and the acreage of those products has more than doubled in the South.

The CHAIRMAN. They hog the peanut?

Mr. KNAPP. They hog it; in a large measure it is hogged down.

Mr. LEE. In Virginia and North Carolina the crop is harvested and marketed.

Mr. KNAPP. Yes; but they are now harvesting the product and marketing it in some sections for crushing out the oil as well as eating. The peanut yields a good oil, which should go into commerce, while the peanut cake is good feed—just as cottonseed cake is good feed. The same is true as to the soy bean when they express the oil.

Mr. LEE. This report, which you propose to make to the Secretary—is it a very short report?

Mr. KNAPP. It will be very short. I will summarize the progress of the agricultural work in the South during the last 8 or 10 years.

Mr. LEE. I suggest, with the permission of the Secretary, that your report to the Secretary be incorporated in your statement.

Mr. McLAUGHLIN of Michigan. If the Secretary thinks we ought to have it, we would be very glad to print it in the hearings.

The CHAIRMAN. Is it in printed form now?

Mr. HARRISON. It is in typewritten form now. We lack funds for printing it.

The CHAIRMAN. If it is not very long, we would like to have it printed in connection with and as a part of your statement before the committee. I think it would be very well to incorporate it.

Mr. KNAPP. I can summarize it so that it can be printed.

I appreciate the opportunity, Mr. Chairman, of appearing before you and the many courtesies that have been extended to me in the last eight or nine years by this committee. I very deeply appreciate them. If I come before you again, it will be as the representative of the State of Arkansas. [Applause.]

The CHAIRMAN. We wish you success, Mr. Knapp. The committee will take a recess until 2 o'clock p. m.

(Thereupon, at 1 p. m., the committee took a recess until 2 o'clock p. m.)

(The report referred to above is as follows:)

REPORT OF BRADFORD KNAPP, CHIEF OF THE OFFICE OF EXTENSION WORK IN THE SOUTH, STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE, TO THE SECRETARY OF AGRICULTURE, JANUARY 12, 1920.

At the time of the death of my father the system of carrying instruction and information to farmers by the appointment of county agricultural agents was fairly well established. These agents operated mainly by securing farmers to act as demonstrators and advising them regarding production of crops and the feeding of live stock. The fundamental principle of instruction through practical demonstrations was well established. This principle has been continued as the one great cornerstone of the work from that day to this. At that time there was no cooperation with any of the agricultural colleges in the Southern States, except in the boys' club work in a few States like Louisiana, Arkansas, Alabama, Georgia, and North Carolina. There were no county organizations through which the county agents tried to reach the largest possible number of farmers and through which he could make his work more effective, though there were many incipient community organizations growing up through the leadership of local demonstrators, where the farmer demonstrator became the local leader. At that time quite a number of the States had begun to recognize this activity as an important contribution to the entire educational system. Laws had been passed in a number of the States authorizing appropriations to assist in the work.

In April, 1911, there was no work of this character in the Northern States.

In April, 1911, there were in the Southern States 578 county agents, 3 women agents, and about 8 boys' clubs agents, less than half of whom worked full time. Many of these agents were practical farmers with large experience and good executive ability.

I have thought it wise to make a slight record of the progress and growth of extension work in the South and the effect of this work upon the agriculture of the South during the time I have held the office, first of special agent in charge of the office of farmers' cooperative demonstration work and afterwards of chief of the office of extension work in the South.

In April, 1911, the full amount of funds from all sources invested in this work was \$448,697.06, of which the Federal Government appropriated \$259,075; the General Education Board appropriated to the department for use in this work as it saw fit \$113,000, and local counties, farmers, bankers, etc. appropriated \$76,622.06. I give these figures because they are interesting in comparison with the present situation. In 1911 there were only 12 States in the southern territory, Maryland, West Virginia, and Kentucky being added to our territory in 1913.

At the present time, January, 1920, in the 15 Southern States there are 15 directors of extension; 83 assistant State leaders and district agents who supervise the work of the county agents; 916 county agents and assistants; 151 local agents (colored); 15 State home demonstration agents; 73 assistant State home demonstration agents and district agents; 596 county home demonstration agents; 51 local home demonstration agents (colored); 15 State boys' club agents; 17 assistant State boys' club agents; 21 county boys' club agents; and 262 specialists, making a grand total of 2,215 persons employed in extension work in the 15 Southern States.

I have given the finances for 1911. It is interesting to compare those figures with the present situation. The total amount of all funds for extension work in the 15 Southern States at the present time is \$5,530,654.98, consisting of \$645,040 which is the direct appropriation to the United States Department of Agriculture for farmers' cooperative demonstration work in the Southern States; \$1,343,880.42 Federal Smith-Lever funds; \$1,193,880.42 State Smith-Lever funds; \$688,777.17 supplementary Smith-Lever fund appropriated by Congress; \$688,777.17 offset to supplementary Smith-Lever fund; \$801,718.80 county funds not used as offsets; and \$168,581 from other bureaus of the department. The total amount of appropriations made by counties, part of which is used as Smith-Lever and supplementary Smith-Lever offsets as scheduled above, is \$1,515,770.63. This figure is given for the purpose of comparison with \$76,622.06 appropriated from local sources in the South in 1911.

SAFE FARMING.

You are familiar with the fact that this work was originally designed to assist the Southern cotton farmer to meet the problems brought about by the advent of the cotton-boll weevil. Among the things advocated was what was called "diversified agriculture." The production of corn and other crops and some live stock was at the very beginning of the work a part of the program.

In 1914, under the crisis brought about by the war in Europe and the low price of cotton, I advocated a general plan for each farm in order that the farm might be self-sustaining. I did not conclude to call that plan "safe farming" until in 1915. In its simplest form that program is as follows:

First. A home garden for every family, including potatoes, and some cane or sorghum for sirup.

Second. Corn enough to supply the family and the live stock for a year, with an ample surplus for safety's sake.

Third. Small grain to supplement the corn for food and feed and to cover the soil in winter and prevent erosion.

Fourth. Hay and forage crops, including the legumes for soil improvement. These to supply the forage and pasturage for all live stock.

Fifth. Sufficient meat, eggs, and milk for the family by increasing the production of hogs, cattle, and poultry and the keeping of at least one, and better two, cows for every family.

Sixth. The production of cotton on the balance of the acres, to be sold as a cash crop.

Seventh. The paying of the family expenses out of the surplus products of the farm other than cotton, thus saving the cotton for cash sale and a real bank account.

What we have been after is to make farming profitable, believing that in the profit to the farmer would come the prosperity of the rest of the South.

RESULTS.

In 1910 the acreage in cotton in the Southern States was 32,403,000 acres, and in 1919 it was 33,344,000 acres; the production in 1910 was 11,609,000 bales, and in 1919 it was 11,039,000 bales. It should be added that 1919 was a poor cotton year.

The acreage in corn in the 11 cotton States in 1910 was 34,119,000 acres, and in 1919 it was 36,881,000 acres; the production in 1910 was 664,752,000 bushels, and in 1919 it was 730,624,000 bushels, an increase of practically 66,000,000 bushels. For the 15 Southern States the acreage in corn increased from 40,939,000 acres in 1910 to 43,209,000 acres in 1919, and the production increased from 856,542,000 bushels in 1910 to 911,327,000 bushels in 1919.

The acreage in wheat in the 11 cotton States in 1910 was 3,914,000 acres, and in 1919 it was 8,278,000 acres; the production has increased from 55,120,000 bushels in 1910 to 107,837,000 bushels in 1919. Taking the entire 15 Southern States, the acreage in wheat increased from 6,274,000 acres in 1910 to 11,574,000 acres in 1919; and the production increased from 88,034,000 bushels in 1910 to 148,439,000 bushels in 1919.

The acreage in oats in the 11 cotton States increased from 3,378,000 acres in 1910 to 6,727,000 acres in 1919, and the production increased from 90,577,000 bushels in 1910 to 203,505,000 bushels in 1919. In the entire 15 Southern States the acreage increased from 3,908,000 acres in 1910 to 7,662,000 acres in 1919; and the production increased from 103,490,000 bushels in 1910 to 225,255,000 bushels in 1919.

The hay acreage in the 11 cotton States increased from 2,776,000 acres in 1910 to 6,959,000 acres in 1919; and the production increased from 3,428,000 tons in 1910 to 9,977,000 tons in 1919. In the 15 Southern States the acreage increased from 4,717,000 acres in 1910 to 10,434,000 acres in 1919; and the production increased from 5,841,000 tons in 1910 to 15,033,000 tons in 1919.

The acreage in Irish potatoes in the 11 cotton States increased from 246,000 acres in 1910 to 404,000 acres in 1919; and the production increased from 17,503,000 bushels in 1910 to 31,066,000 bushels in 1919. In the 15 Southern States the acreage increased from 431,000 acres in 1910 to 709,000 acres in 1919; and the production increased from 35,033,000 bushels in 1910 to 57,901,000 bushels in 1919.

The acreage in sweet potatoes in the 11 cotton States increased from 520,000 acres in 1910 to 898,000 acres in 1919; and the production from 46,502,000

bushels in 1910 to 87,816,000 bushels in 1919. In the 15 Southern States the acreage increased from 580,000 acres in 1910 to 966,000 acres in 1919; and the production from 52,419,000 bushels in 1910 to 96,156,000 bushels in 1919.

Kafirs (grain sorghum, milo maize, feterita) have come in as a new crop. In west Texas and Oklahoma where we have been instrumental in introducing these crops in place of corn, which is an uncertain crop under drought conditions, the Bureau of Crop Estimates gives the figures for the years since 1915. The acreage in 1915 in these two States was 2,488,000 acres, and in 1919 it was 3,238,000 acres; the production in 1915 was 70,950,000 bushels, and in 1919 it was 92,454,000 bushels.

LIVE STOCK.

The number of milch cows on farms in the 15 Southern States in 1910 was 5,654,000, and in 1919 the number was 6,257,000; the number of other cattle was 13,744,000 in 1910 and 12,908,000 in 1919; and the number of swine was 18,376,000 in 1910 and 24,082,000 in 1919.

Some of the significant increases are the increases of hog production in Florida by 86 per cent; Mississippi, 76 per cent; Alabama, 75 per cent; and Georgia, 70 per cent.

These figures are presented because they show an agricultural revolution which I believe to be the most significant and definite change of agriculture in any similar period of time in any section of this country, and I believe that the earnest, persistent, and continuous effort of this service has had a very material part in this change.

In these years the wealth of the South has materially increased. The bank deposits of 11 cotton States, as shown by the report of the Treasury Department in June, 1910, including both State and Federal banks, were:

11 cotton States.....	\$854, 466, 450. 39
15 Southern States.....	1, 427, 691, 583. 06

The last report of the Treasury Department (June, 1918) shows the bank deposits as follows:

Alabama.....	\$134, 663, 000	Kentucky.....	238, 300, 000
Arkansas.....	120, 374, 000	Maryland.....	383, 040, 000
Florida.....	109, 589, 000	Virginia.....	261, 771, 000
Georgia.....	235, 410, 000	West Virginia.....	215, 066, 000
Louisiana.....	211, 306, 000		
Mississippi.....	117, 132, 000		
North Carolina.....	169, 173, 000		
Oklahoma.....	275, 944, 000		
South Carolina.....	129, 853, 000		
Tennessee.....	227, 019, 000		
Texas.....	480, 940, 000		
Total, 11 cotton States.....	2, 211, 403, 000	Total, 15 Southern States.....	3, 309, 580, 000

It is interesting to compare the value of the cotton crop and other crops grown in the South in 1910 and 1911 with the value of the same crops in 1919. The total value of the lint cotton in 1910 was \$820,407,000, and in 1911 it was \$687,888,000. The value of 12 other crops, including corn, wheat, oats, barley, rye, buckwheat, flaxseed, rice, potatoes, sweet potatoes, tame hay, and tobacco, in the 11 cotton States for 1910 was \$623 895,000, and in 1911, \$650,608,000. In 1919 the value of the lint cotton in the 11 cotton States was \$1,967,143,000, and the value of the 12 other crops, \$2,164,331,000.

In addition it might be said that since 1914 the Bureau of Crop Estimates has been estimating the total value of the entire cotton crop, both lint and seed, with the value of all other farm crops in the 11 cotton States. The value of the entire cotton crop in the 11 cotton States in 1914 was \$677,986,000, while the value of all other farm crops in these same States was \$1,020,597,000; in 1919 the value of the entire cotton crop was \$2,353,193,000, and the value of all other farm crops, \$3,016,985,000.

These figures indicate the very distinct change in the agriculture of the cotton States in spite of the very high price of cotton. At the present time the value of other farm crops in the 11 cotton States far exceeds the value of the entire cotton crop. In these figures nothing is included regarding the value of live-stock production.

AFTER RECESS.

The committee reassembled at 2 o'clock p. m., pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. You may proceed Dr. True.

STATEMENT OF DR. A. C. TRUE, DIRECTOR OF THE STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

Dr. TRUE. Mr. Chairman, do you desire that I should make any further statement as to the work in the Southern States, under item 38?

The CHAIRMAN. I think you have covered that sufficiently. Do just as you wish.

Dr. TRUE. I have the figures here, just as I gave them for the Northern States. I can put them in the record without reading them, if you desire.

The CHAIRMAN. If you have anything that has not been covered it may be inserted.

(The statement referred to follows:)

GENERAL STATISTICS REGARDING EXTENSION WORK IN THE SOUTHERN STATES.

The field force of the southern extension office consists of cooperatively employed extension workers classified as follows:

Extension directors and State leaders.....	29
Assistant State and district leaders for county agricultural agents.....	68
County agricultural agents.....	916
Negro agents.....	151
Assistant State and district leaders of home demonstration agents.....	88
County home-demonstration agents, including 51 negro women agents....	647
State leaders of boys' club work.....	32
County club leaders.....	21

Total number of cooperative employees..... 1, 952

The Federal, State, and county funds used in cooperative extension work this year in the 15 Southern States amount to about \$5,352,000. The southern extension office has a share in the administration and conduct of all the work in which those funds are used.

The following examples will partially illustrate the material value of this work as distinguished from its much broader educational value:

In 1918, 317,509 southern farmers conducted on their own farms demonstrations with the aid of the county agents and extension specialists. The largest acreage with these demonstrations was with corn, with which more than 70,000 demonstrators cultivated a total of 774,449 acres, with an average yield of 35 bushels per acre, which is more than double the average of the whole territory.

The county agents helped the southern farmers in bringing in 12,647 pure-bred dairy cattle, 10,775 pure-bred sheep and goats, and 42,864 hogs for breeding purposes. They helped the farmers in protecting 4,778,141 head of live stock against diseases. They conducted demonstrations in the proper care and saving of manure on farms, estimated to involve 10,000,000 tons, and induced 2,156 communities or organizations of farmers to purchase fertilizer cooperatively, an estimated saving of \$532,106.

They instructed farmers in improved methods of marketing and purchasing a variety of products, and the value of the articles dealt with by the farmers as the result of this work was \$17,156,232, with a saving of \$2,834,067, or about 16 per cent.

The total number of containers of vegetables and fruits put up during 1918 by southern women and girls under the direction of the home-demonstration agents was 64,604,531, valued at \$15,566,456.

The total production of the 407,540 boys enrolled in clubs in the Southern States was valued at \$12,034,271. The average yield per acre of corn grown by club members was 42.8 bushels, as compared with an average per acre for the Southern States of 19.4 bushels.

Dr. TRUE. We come next, I think, to item 39, on page 219, which is the appropriation for cooperative extension work under the terms of the Smith-Lever fund. It is commonly spoken of as the supplementary extension fund.

The CHAIRMAN. You are asking for an increase of \$59,420 in the statutory roll, and then there is the \$500,000 increase under the Smith-Lever Act.

Dr. TRUE. The increase in the statutory roll is apparent and not actual. Counting the transfers to the statutory roll under item 36, there is an increase of \$10,000 in that item.

Mr. HARRISON. The total net increase in the States Relations Services is \$62,720.

The CHAIRMAN. That is net?

Mr. HARRISON. That is the net increase. It is indicated on page 6.

The CHAIRMAN. That is in addition to the \$500,000 increase under the Smith-Lever Act?

Mr. HARRISON. That is not carried in this bill.

The CHAIRMAN. It is an increase for the States Relations Service.

Mr. HARRISON. The additional \$500,000 becomes available next year under the terms of the Smith-Lever Act.

The CHAIRMAN. I refer to this \$500,000 that you have under the Lever Act. We gave you a supplementary appropriation of \$1,500,000 last year. This year you get \$500,000 additional under the permanent appropriation. To make the appropriation the same this year as last should we not drop off \$500,000 here to make it correspond?

Dr. TRUE. The reason for keeping that at the present figure is that we have not yet by any means covered the country with this extension system. We have at present only 2,000 counties which have a county agricultural agent and a little over 800 counties which have a home-demonstration agent; so that we need considerably more money to develop the system to its completion.

The CHAIRMAN. Would it be possible to keep down some of the expenses in connection with the specialists and the work other than that of the county agents, which involve large appropriations, and still cover the field?

Dr. TRUE. We do not feel that that would be in the interest of the work.

The CHAIRMAN. Taking into consideration the present condition of the Treasury and the heavy demands upon it, the contention seems to be general in Congress that we should hold down appropriations in so far as it is possible and practicable to do so. Under the circumstances I take it that, though we might wish to increase many of these items, we will probably not be able to come up to the expectation of the department as suggested in its estimates.

Dr. TRUE. We feel, with reference to this matter, that the extension work, in its results, is adding very materially to the wealth of the country.

The CHAIRMAN. I do not believe anybody questions the value of the system.

Dr. TRUE. We have entered upon an era of peace and agricultural development in this country, and it would seem unfortunate not to go on and complete this great popular educational system. We can not do that unless from year to year for a number of years we have additional funds to enlarge the work and supply, in a reasonable time, the counties with the agents who are needed to do this work.

The CHAIRMAN. I do not think there is any question but that you are doing good work; but, taking everything into consideration, if this committee is to follow other committees—

Mr. HARRISON. You know, Mr. Chairman, there was a cut of about \$2,800,000 in the estimate of the department for extension work last year. We asked for approximately \$4,500,000 and we got only a total of \$1,700,000.

The CHAIRMAN. Yes; yet this committee was criticized for its extravagance.

Mr. HARRISON. Of course, many items may be criticized, but the question is whether they can be justified, and we feel that the committee can fully justify the continuance of this appropriation. One of the principal reasons for it, as I understand it, is the greatly increased cost of the work under the Smith-Lever Act.

The CHAIRMAN. I appreciate that.

Mr. HARRISON. I think that the States Relations Service has some statistics showing the extent to which the cost of maintaining the work in the counties has increased during the past three or four years. It may have been true that, when the Smith-Lever Act was passed, the amounts provided by it were thought to be sufficient to develop the organization as rapidly as it should be developed, but the increased cost of everything has made necessary additional appropriations.

And then, too, we were faced with the necessity of greatly extending the organization during the war, and it seemed to the department that it would be decidedly unwise and uneconomical in the long run to dismantle it at the end of the emergency period and build it up again through a series of years. I hope the committee will bear these things in mind in considering this particular matter.

The CHAIRMAN. It should be borne in mind, and I am not questioning the service. It is just a business proposition.

Mr. HARRISON. We tried to help the committee by eliminating more than \$4,000,000 from the estimates submitted by the various bureaus, hoping that it would not be necessary for the committee to make any further reductions.

The CHAIRMAN. If we are to follow other committees, it will be up to us to cut appropriations, instead of increasing them.

To how many counties do you expect to extend the service? You cut down the number; was it because of lack of funds?

Dr. TRUE. Yes; since the emergency service was withdrawn, we have lost more than 400 counties.

The CHAIRMAN. Were you not able to supply agents, or were there no requests for them?

Dr. TRUE. We could not supply them with the agents. You understand, we do not in any case pay the complete amount for the service of an agent. The counties did not feel able to contribute enough, with what contribution we might have made, to support an agent in those counties, and so the work was withdrawn.

The CHAIRMAN. The general plan is a 50-50 proposition?

Dr. TRUE. Yes; at least that; and what we hope, of course, is that in the years to come many of those counties will find themselves in a position to cooperate with us and will be able to employ agents.

The CHAIRMAN. In the current year, how many counties have been able to meet the Federal Government in appropriations?

Dr. TRUE. We have the 2,000 counties. I do not know just what I can say more than that—that we have those 2,000 counties which are cooperating with us now.

The CHAIRMAN. Have you met every demand?

Dr. TRUE. So far as I know, we have.

The CHAIRMAN. What reason have you to believe that the demand is going to increase next year?

Dr. TRUE. We expect that we will have more. It is a matter of the funds which the county government has and also a matter of the farmers themselves getting together in their farm bureaus or otherwise and making contributions to this work. That sort of thing is going on all the time, and we certainly hope that we are going to organize all the agricultural counties that ought to have these agents, after a reasonable time.

The CHAIRMAN. You were able to take care of them fairly well last year, and you will be able to do so for the current year?

Dr. TRUE. In the 2,000 counties, yes, sir.

Mr. McLAUGHLIN of Michigan. One thing that attracts my attention is the amount of money that is spent for administration. Under item 37, for \$715,720, are shown on page 217 the places that are to be filled. I suppose the higher-priced men are those employed in administration—the agriculturist and chief, the agriculturist and assistant chief, the agriculturists, extension specialists, scientific assistants, and so on down to the agents. I suppose most of those, if not all, down to the agents, are those, you might say, who are employed in the administration of the fund. Is that true? Have you in mind, now, what is shown on page 217?

Dr. TRUE. Yes; on page 217. That includes the maintenance of the northern extension office.

Mr. McLAUGHLIN of Michigan. The maintenance of the office, then, costs about \$75,000?

Dr. TRUE. As I explained yesterday, a portion of that money is for employees who are engaged in what may be called the supervisory work. Others are engaged in our field work, going out into the States to aid in the organization and conduct of the work in the counties. I think Mr. Smith has a table that shows more exactly and more clearly just what you want to know with reference to that matter.

FURTHER STATEMENT OF MR. CLARENCE B. SMITH, CHIEF OF THE OFFICE OF EXTENSION WORK IN THE NORTHERN AND WESTERN STATES, STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE.

Mr. SMITH. This table shows a total of \$751,280, and the plan for expenditures this year. This \$57,000 is for supervision. I will show you this chart here containing the items, and then will show you the details of that in the next chart.

Office of extension work, north and west—Allotment of funds for supervision and field work, 1919-20.

	In Washing- ton.	State allot- ments.
Supervision (2), 1 ¹	\$57,300	² \$35,000
Field staff:		
County agent work (6), 2 ¹	37,000	300,000
Home demonstration work (5), 6 ¹	30,215	100,000
Boys' and girls' club work (5), 7 ¹	28,180	103,825
Farm management work (2).....	8,500	36,000
Subject-matter specialists (3).....	14,260
Total	176,455	574,825
		751,280

¹ Decrease in staff over year 1918-19.

² Envelopes.

Allotments for field work in States..... 76.5 per cent

Mr. SMITH (continuing). For the field staff in our county agents' work we have now a staff of six people. That is a decrease of two during the year. The cost is \$37,000. And for the county agents' work we are allotting the States \$300,000.

Mr. McLAUGHLIN of Michigan. What is the county agents' work? What is the \$37,000 for?

Mr. SMITH. That is for the force here in Washington who deal with the county agents' work in the States.

Mr. McLAUGHLIN of Michigan. That \$37,000 is spent in Washington?

Mr. SMITH. Yes; they have headquarters here. Dr. True explained that. They are the force that keep in touch with the States and act as a clearing house of information for the States on that work, and many of them spend a large share of their time in the States.

Mr. McLAUGHLIN of Michigan. What is the meaning of the figure "6" in parenthesis there in the table?

Mr. SMITH. That means we have now a staff of six on that work, a decrease of two from the preceding year.

Mr. McLAUGHLIN of Michigan. And those people get that \$37,000?

Mr. SMITH. No; that is divided between the clerical staff and the staff that goes into the field. In the next chart I will show you the details of that.

Mr. McLAUGHLIN of Michigan. But you have carried that in the column "in Washington."

Dr. TRUE. When Mr. Smith speaks of six people, he means six scientific or technical employees who have their headquarters here, who go into the field from here and spend most of their time in the field, working with the people in the States and counties.

Mr. SMITH. You see, as we are putting \$300,000 into county-agent work and carrying that on throughout the States, we need to keep in touch with that work; we need to have some one here who is studying that work in the field and who keeps us informed as to the success of it and the progress of it in the field. You will appreciate, too, that in dealing with any group of people some take hold of the work much more efficiently than others do; and the efficient methods of one State are carried by this group to another State. They are the carrying group.

Mr. McLAUGHLIN of Michigan. Have you the figures showing the amount of money used in Washington?

Mr. SMITH. Yes, sir; I have. There is the total amount [indicating on chart].

Mr. McLAUGHLIN of Michigan. But you say that these, many of them, go outside of Washington.

Mr. SMITH. Yes, sir; and the only way I can get at the time they spend in the field is to estimate it. While these men are here they are preparing material for the use of the field staff, so that they are working for the field practically all the time.

Mr. McLAUGHLIN of Michigan. You have a large number who remain in Washington most of the time?

Mr. SMITH. I will show you that in my next chart. Let us consider this large division of the funds first. The first column [indicating on chart] shows the money spent for a staff located at Washington and the second is the amount of money that goes out into the field and is spent in the field. For supervision of home-demonstration work we have a force of 5 people here, and you will remember that they deal with the work in 33 States, an average of 1 woman to 6 States [indicating on chart].

Mr. McLAUGHLIN of Michigan. But she is out in the field?

Mr. SMITH. Yes; and this county-agent staff are out in the field dealing with those 33 States, an average of about $5\frac{1}{2}$ States for each member of the county-agent staff.

Then we have five on the staff of the boys' and girls' club work. That is a decrease of seven over our war-time work.

In our farm demonstration work we are spending \$36,000 in the field. Some 24 men, cooperatively employed with the States, spend all their time in the field.

Here are the subject-matter specialists, amounting to \$14,260.

Mr. McLAUGHLIN of Michigan. What do they do?

Mr. SMITH. They work mostly in the field. For the most part they are cooperatively employed by the various bureaus of the department. I will explain what I mean: Under the Smith-Lever Act the colleges are obligated to put up their plans for work each year to the Department of Agriculture. We will say they send in plans for carrying on their dairy work. That project comes to our office for approval. The question comes up, Is the work well planned in the States? Has it taken into consideration what the Department of Agriculture has to extend on dairying in the States? I may not be familiar with that, so we make an arrangement with the Dairy Division whereby they will lend us a man, they paying his salary, to advise us on that project. They look over that project and take into consideration what the department has to expend on that subject, and, relying on their judgment, we pass upon the project as submitted. But it is not enough just to pass upon it as a paper project.

The question is, What was done on the project in the field and to help the people; and so this department specialist who reviews the project also visits the field and studies in the field how that dairy work is organized and how is it being extended through the county agents, through home demonstration, through farmers' agencies, through extension schools, etc. He may even visit the work in the counties to see how it is being carried on with the farmers themselves. He finds out what kind of extension material is used in the demonstration work and what the publicity is, bulletin material used, and all that. Then this department specialist may go on to the next State

that may have a dairy project and studies the method of organizing and carrying on the project that they have there; and as he goes from State to State he carries with him the best practices of each for the common benefit of all. So we have an arrangement with the bureaus whereby we pay traveling expenses of those specialists on account of the services that they render the States Relations Service, which is administering the Smith-Lever Act. It sometimes happens that the department has funds from Congress to carry that work on as a subject-matter enterprise.

We look upon the Dairy Division specialist as an authority on the subject matter, while the States Relations Service is more of an authority on the conduct of the work, to see how to get it into the field through demonstration methods. So that, while funds are provided for specialists, it covers work that these men do both in Washington and in the field—out in the States. The total amount, then, that is spent for the force, with headquarters in Washington, is \$176,455, and in the States \$574,825, or 76.5 per cent in the 33 States.

Mr. McLAUGHLIN of Michigan. About that State allotment, what does that mean?

Mr. SMITH. That means that we have allotted to the States \$300,000 for county-agent work. That goes toward the employment of the leaders of county-agent work and also directly into the county itself.

Mr. McLAUGHLIN of Michigan. Each State has a director?

Mr. SMITH. Yes.

Mr. McLAUGHLIN. How is he paid?

Mr. SMITH. The director is paid entirely from State funds. This may be either college funds or State Smith-Lever or Federal Smith-Lever funds. But let us get that one point clear, that if Federal money goes into the State under the provisions of the Smith-Lever Act it becomes State money, and those men are not the employees of the Department of Agriculture. They do not have our commission. They are entirely State people.

Mr. McLAUGHLIN of Michigan. Now, we will take a State agent.

Mr. SMITH. He is paid from State funds. Under him comes a man who is in charge of the county-agent work. We cooperate—

Mr. McLAUGHLIN of Michigan. Pardon me; let me understand how that State agent is paid. I know only one of them—Dr. Mumford, in Michigan.

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. How is he paid?

Mr. SMITH. The county-agent leader is paid now \$1,500 from this direct fund to the United States Department of Agriculture and the remainder of his salary and expenses entirely from the college, which may be from any fund that they have available for that purpose.

Mr. McLAUGHLIN of Michigan. And out of one fund you contribute \$1,500 toward Dr. Mumford's salary?

Mr. SMITH. Just let me make a general statement there.

Mr. McLAUGHLIN of Michigan. Very well.

Mr. SMITH. Last spring when the emergency funds were cut off we had at that time \$500,000, and the question came up as to how we should allot that money to the States. We had two ways open to us. We could have put it all uniformly into that group of 2,000 co-

operatively employed agents out in the States. That would have given each one of them something like \$250.

That would have made a great deal of clerical work here in the Department of Agriculture. The department thought that it was best that we distribute that money in a little larger amounts and on a different plan. As a result we are contributing \$1,500 uniformly to the leaders of the county-agent work, the boys' and girls' club work, and the home demonstration work in all of the Northern and Western States, with possibly one or two exceptions.

In addition there may be assistants, as in Minnesota, where they have 83 county agents, one leader is not sufficient to keep in touch with 83 agents and give them adequate help in their work. The State leader must have assistants, and there we contribute \$1,200 toward the employment of that assistant, and the colleges pay the remainder and his traveling expenses.

You will remember that some money was given us last spring to use as a kind of balancing fund, due to the fact that the Smith-Lever allotment on the basis of rural population was not considered quite fair to the Eastern States and the Western States; and so we are contributing directly to the employment of county agents at the rate of \$600 per agent in about 300 counties.

Mr. McLAUGHLIN of Michigan. That is in addition to their funds?

Mr. SMITH. Yes; that is our fund out of this \$751,000; and those agents to whom we pay \$600 each are located in the eastern part of the country and in the western part of the country, in that territory there—all those States [indicating on chart], and in this group of States right here [indicating on map], and including New Jersey and Delaware. There is not enough money to cooperate at the rate of \$600 a county in all the counties in all States, but only in a part of them; so that, all told, both east and west, we have used around \$200,000 for agents in counties, favoring the West and the East in that way.

Mr. McLAUGHLIN of Michigan. That, you thought, was proper or necessary in view of the fact that the rural population was small in proportion to the total population?

Mr. SMITH. That was our understanding, that the appropriation was made primarily for that purpose, and we tried to handle it in that manner.

Having gone over this in a general way so that you see the distribution, I can give you now some of the details [referring to another chart, which is inserted at this point]:

Office of extension work North and West—allotments, 1919-20.

Supervision:

Salary and expenses, chief and assistant chief	\$10,600
Emergency clerical help	13,000
Regular clerical, labor, and messenger service	14,120
Freight	\$4,000
Telegraph	2,500
Telephone	500
Express	1,500
Mechanical shops	2,500
Supplies, etc.	6,580
	17,580
Reserve	2,000
	57,300

Mr. SMITH (continuing). Taking the first item we had on the other chart, the supervision, with an allotment of \$57,300, this is the way that is distributed: There are the salaries and expenses of the chief and assistant chief, \$10,600. We have traveling expenses incurred, for instance, to the States, where we take at least a week in going over in detail all the expenditures of the college on Smith-Lever money, looking over all the vouchers—

The CHAIRMAN. Where does this \$57,300 come in?

Mr. SMITH. It is a part of the \$176,455 shown on the first chart, but explained more fully. It includes an item of \$13,000 for emergency clerical help. Many of the accounts were not in on June 1, and we did not know how much that was going to cost. Some of those accounts are five and six months in getting in. So we had to set aside that amount for emergency clerical force; that is, help to straighten up the work that was not completed at the end of the fiscal year. That will not appear in this year's item at all. It will be reduced by that much. We will have that much more money going into the field work.

Here [indicating on chart] is the regular clerical force, labor and messenger force, \$14,120. Then there is freight, telegraph, telephone, and so forth. We have a reserve there of \$2,000 for emergencies. That shows you how we spent our \$57,300.

Mr. McLAUGHLIN of Michigan. Why do you have to have mechanical shops?

Mr. SMITH. For putting in electrical wires, for instance. Many things have to be paid out of that.

Mr. HARRISON. That is not a mechanical shop, Mr. McLaughlin. That means that that amount was paid to the mechanical shops of the department for the work done in it.

Mr. SMITH. No; we do not maintain the shop ourselves.

Mr. McLAUGHLIN of Michigan. What mechanical work does this extension work require?

Mr. SMITH. We have our offices here, and oftentimes we have to have lighting fixtures and water, and shelves have to be put up, and things of that sort.

Mr. HARRISON. That is here in the offices in Washington. That has reference to the ordinary upkeep of the offices here.

Dr. TRUE. The department maintains mechanical shops to do the general work that has to be done around the department in the way of repairs, electrical work, and so on. We pay our share of that.

Mr. McLAUGHLIN of Michigan. I notice that in other bureaus money is asked for similar work. For instance, in the Weather Bureau, they had either five or seven firemen over there; I do not remember which.

Mr. HARRISON. In the case of the Weather Bureau a shop is maintained specially because of the distance of that bureau from our mechanical plants.

Mr. McLAUGHLIN of Michigan. They had seven firemen over there shoveling a ton and a half of coal a day.

Mr. HARRISON. Those figures have been corrected in the record; that statement has been clarified in the record, as you will find if you will examine the corrected testimony.

Mr. McLAUGHLIN of Michigan. I have not seen the testimony.

Mr. SMITH. A part of this clerical force is transferred to the statutory roll in the present estimates.

The CHAIRMAN. The overhead charge is \$176,455?

Mr. SMITH. That is for the expenses of the force that has headquarters here at Washington, as has been explained to you.

Dr. TRUE. But, Mr. Chairman, that includes all the people, whether they do work in the field or not.

The CHAIRMAN. That includes the \$57,000; and these specialists you send out in the field?

Dr. TRUE. Yes; but the \$57,000 includes a considerable number of persons who are now transferred to the statutory roll.

The CHAIRMAN. The \$57,000?

Dr. TRUE. Yes. This coming year they will be on the statutory roll.

The CHAIRMAN. The specialists are included in the \$57,000?

Dr. TRUE. No, sir; not the specialists.

The CHAIRMAN. They should be charged to expenses—overhead charges?

Dr. TRUE. Yes.

Mr. SMITH. Part of this regular clerical work here will be on the statutory roll next year?

Dr. TRUE. All of it will be.

Mr. SMITH. I have explained the use of the \$57,300 in detail. I will now explain this field staff in detail, if you care to have it. Take the county agents' work, then, or the staff which has headquarters at Washington. We have a leader of that and five assistants, with their salaries and expenses, amounting to \$27,800, and the clerical assistance, amounting to \$9,200.

The CHAIRMAN. Here in Washington?

Mr. SMITH. Yes.

The CHAIRMAN. That is overhead, too?

Mr. SMITH. These clerical people aid in tabulating the results from the field. The leader and his five assistants work mostly in the field. In the home demonstration work there is the leader and her four assistants and the clerical assistants, making a total there [indicating on chart] of \$30,215. In the boys' and girls' club work, a leader and four assistants, \$29,180. In the farm management, one leader and one assistant, \$8,500. Then under subject-matter specialists, we have a leader and two assistants, \$9,760, and their traveling expenses, as well as the traveling expenses of specialists, who represent jointly the different bureaus and States Relations Service.

The CHAIRMAN. How much is that?

Mr. SMITH. For travel, \$4,500.

The CHAIRMAN. The total of the column?

Mr. SMITH. The total is \$119,155 for the field service. Now, take these clerical assistants that you see here this year. You recall that \$36,000 is transferred this year to the statutory roll, and our total lump-sum fund is reduced by that amount, so that that will lower this year's lump sum by that amount.

The CHAIRMAN. Is that added to or deducted from the overhead charges?

Mr. SMITH. \$119,000 is to be added for the field service.

The CHAIRMAN. What is the aggregate amount?

Mr. SMITH. The total is \$57,300 for what may be called supervision in Washington, plus \$119,155 for a staff that has headquarters here in Washington and works in the field. That makes a total of \$176,455. The remainder of it, something over \$574,000, is allotted to the States.

The CHAIRMAN. Is that to be charged to the overhead charges?

Mr. SMITH. About \$32,000 is chargeable against this item here [indicating on chart]. I do not know what the number is there. I have not that with me; but I know that our statutory roll is about \$32,000.

The CHAIRMAN. Referring to pages 212 and 213, the total of the statutory roll is \$263,260. How much of that \$263,000 is overhead expense?

Dr. TRUE. Those are all employed in Washington.

The CHAIRMAN. Then it is overhead charge, is it not?

Mr. SMITH. It includes all the States Relations Service roll, of which about \$32,000 is for the northern extension office.

Mr. McLAUGHLIN of Michigan. Where you have your boys' and girls' club work, do you have, in a number of the counties, men who are separate from the county agents?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. Who are assisting in organizing boys' and girls' clubs? Do you know how many of those you have, and in how many counties?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. I mean in the counties where you have boys' and girls' clubs, in addition to the county agents.

Mr. SMITH. Yes; we have right here 156 county club leaders on full time; that is, they are giving the full year to that work. In all, we have 394 cooperatively employed club agents, and some of those are in counties but not giving the full year to it. They may be employed merely for the summer months.

Mr. McLAUGHLIN of Michigan. Do you not think that the work of organizing boys' and girls' clubs should be turned over to the county agents?

Mr. SMITH. I wanted to complete my statement of this morning on that matter, Mr. McLaughlin. The county agent can organize clubs, and does organize them when he is the only officer in the county. We encourage him to organize those clubs, but, as you know, his work becomes very burdensome in a little while. He deals with a lot of people, and he covers 40 or more different subjects. His time is taken up. The people in the North, particularly, seem to be desirous of having assistants to handle the clubs—men who are specially trained in handling children, who can adapt the county program of agriculture to the capacities of children, so that those children will become efficient agricultural and home demonstrators.

Mr. McLAUGHLIN of Michigan. It takes a lot of money?

Mr. SMITH. It takes a lot of money, but it is worth while. I think, if you put that up to the farmers in the North you will find that they want the country club agent and are willing to pay for him. Of our money, we are putting into that work in the counties, I think, not over \$15,000.

Mr. McLAUGHLIN of Michigan. Outside of the money that the States put into it from the Lever fund?

Mr. SMITH. Yes; outside of that. The States themselves are putting in something like \$350,000, and the counties themselves, with the people, are contributing direct over \$250,000. There is, I think, no work that is more popular with the people, and particularly with bankers and business men, than the boys' and girls' club work, and they contribute very freely to that work; and our experience, so far as it goes in the Northern and Western States, is that when the State puts in a county club leader who gives his whole time to that work, the results are so much more satisfactory that the county club agent idea extends over the State just as rapidly as conditions seem to warrant and funds are available for it.

In all cases it is up to the people themselves to say whether they want that or whether they do not want it; whether the fathers and mothers want their boys and girls to have this special training and are willing to pay for it. There is no special urge for it on the part of the department or on the part of the colleges. Of course, you know they are a very efficient factor in actual demonstration work. I need not go into that.

Now, I want to show you one other chart.

Office of extension work, north and west, fund for county-agent work, 1918-19 and 1919-20.

Appropriations.	1918-19	1919-20
United States Department of Agriculture, regular	\$320,183	\$345,800
United States Department of Agriculture, emergency	1,893,000
Federal Smith-Lever	397,225	1,001,828
State Smith-Lever	547,513	1,251,342
State appropriations	202,599	89,608
College appropriations	12,089
County appropriations	1,389,431	1,640,305
All other	610,798	477,257
Total	5,372,840	4,806,142

Mr. SMITH (continuing). Here is the money that was put into county agents for 1918-19 and for 1919-20 [indicating another chart]. I think you will see where your extra \$1,500,000 went last year. We put in \$320,183 last year from this \$751,000 to the department, and we are putting in \$345,800 this year; and that emergency item of \$1,893,000 [indicating] is, of course, cut out this year; that is, we had \$1,893,000 emergency money last year which we will not have this year.

The Federal Smith-Lever fund has increased from \$397,225 in 1918-19 to \$1,001,828 this year. The State Smith-Lever fund has increased from \$547,513 in 1918-19 to \$1,251,342 for 1919-20. The State appropriations have decreased from \$202,599 last year to \$89,608 this year.

Dr. TRUE. That is extra State appropriations.

Mr. SMITH. That is extras; because a portion of last years' State amount has probably gone in to meeting offset this year.

The college appropriations have decreased. County appropriations have increased from \$1,389,431 to \$1,640,305.

Dr. TRUE. That is also the extra money which is not offset.

Mr. SMITH. Some of the county money is in the Smith-Lever fund, above. That \$1,640,305 shows the extra money which the counties have put up for the work.

Last year, while there was spent \$5,372,840 in county-agent work, this year there has been allotted \$4,806,142, a decrease of about 9 per cent in the funds for county agent work. You ask whether there is any need for this additional \$500,000 that matures under the Smith-Lever Act. In the North we have some 1,100 counties organized for county-agent work out of 1,500 counties. Our thought is that the other counties should be organized, from the fact that many of them are ready to put up their share of the money.

The women's work should be increased, and we think the club-work should also be increased.

The CHAIRMAN. You referred to specialists of the Dairy Division, did you not?

Mr. SMITH. You have brought up the word "specialist." I thought you might be interested in knowing the different kinds of work in which specialists are engaged.

The CHAIRMAN. We know what they are doing, but we would be interested in knowing how many are being sent out from all the bureaus.

Mr. SMITH. Yes; I have that.

The CHAIRMAN. Have you any idea how many are being sent out by the Dairy Division, aside from those who cooperate with you?

Mr. SMITH. Yes; in these Northern and Western States there are 16, including those in dairying, who have headquarters in Washington.

The CHAIRMAN. Do you mean 16 specialists for the whole department?

Mr. SMITH. No; 16 of these specialists, with headquarters in Washington, who are working in 33 Northern and Western States. I do not know how many are in the Southern States, but I do not think there are many who have headquarters in Washington.

The CHAIRMAN. They are included in the 776, which Dr. True stated was the total number of specialists?

Mr. SMITH. No; these 16 are in addition to the 776.

Mr. ANDERSON. Maybe I am thick about it, but I would like to understand the proposition. Do I understand that those 16 specialists are paid out of appropriations carried for the different bureaus?

Mr. SMITH. Yes.

Mr. ANDERSON. And they have no relation to the Smith-Lever funds or to the funds of the States Relations Service?

Mr. SMITH. No; excepting as the bureaus enter into an agreement with the States Relations Service.

Mr. ANDERSON. I had an impression that in almost every item for almost all these bureaus some of the money is supposed to be spent for specialists who go out to converse with the county agents, and I gathered from the number of times that we were told that that was what the money was to be spent for that there were a good many more than 16 of them.

Mr. SMITH. Let me clarify that, Mr. Anderson.

Mr. ANDERSON. I would like to get straight on it.

Mr. SMITH. There are 16 of them with headquarters in Washington, working in the 33 Northern and Western States. The bu-

reans themselves have, in addition to that, approximately 100 located out in the States, and those 100 are included in the 776.

The CHAIRMAN. The 100 are?

Mr. SMITH. Yes; they are included in the 776. These men are employed, with headquarters in Washington, because the bureaus here need to keep in touch with their field work in which their money is involved, but they have no entree to the Smith-Lever work except through the States Relations Service.

Mr. ANDERSON. Does this figure, 776, represent specialists that are paid out of the Smith-Lever funds by the colleges?

Mr. SMITH. They are paid out of all extension funds of the colleges and the department.

Dr. TRUE. Here is the proposition: The Dairy Division wants to carry on certain extension work in the States. They enter into agreements with the colleges under which the Dairy Division is to pay a certain part of the expense. That involves, usually a part or the whole of the salary of specialists. Those specialists go out into the States and make their headquarters at the agricultural college, becoming part of the State extension force in that way; they go out into the States to help the county agents and to do extension work, just like extension specialists who may be employed wholly by the colleges.

Mr. ANDERSON. Do they continue to be paid out of the appropriations for the bureaus?

Dr. TRUE. Partly. All of this is a cooperative enterprise. That is one of the difficulties we have when we come to explain it, because it has so many contacts and so much uniting of forces and of funds that any general statement that we may make has to be qualified when you get down to the details.

The CHAIRMAN. This dairy specialist tells about the bull clubs and the work being done throughout the country. Do the bureau specialists come under your supervision and direction, and are they included in the 776?

Mr. SMITH. They are included in the 776.

The CHAIRMAN. Do all employees sent out by the Dairy Division work in that way, and is what is true of that division also true of the other divisions of the department?

Mr. SMITH. Let me show you how Mr. Rawl may handle this matter. Let us say that Mr. Rawl has \$30,000 for a certain piece of work. If he pays all the salaries and the expenses of all the men engaged, he can employ only about 10 people in about 10 States. If he feels that the work needs to be carried on in more than 10 States, he may go to the colleges and say, for example, "Ought we not to increase the cow-testing or bull association work of this State? I have \$1,500 to put into the employment of a man if you can put in the remainder of his salary and pay his traveling expenses. We will locate that man here at the institution, under your general administrative direction, and working in accordance with the plans we jointly have in view."

The CHAIRMAN. So that Mr. Rawl is interested not only in 10 agents in 10 States, but in 15 agents in 15 States?

Mr. SMITH. Yes.

The CHAIRMAN. So far, he only deals with the colleges. Where do you come in?

Mr. SMITH. We come in in this way: Mr. Rawl has a specialist out there interested in extending dairy work. We have the organization through which he is going to work. We have the county agent, and the home-demonstration agent, and the club agent, and if he is going to accomplish much in dairying in that State he has got to work in cooperation with and through that group of agents. Say that Mr. Rawl puts one dairy agent in a State and there are 80 county agents to deal with; that specialist will deal with the county agents through the extension director, who represents the States Relations Service in each State.

The CHAIRMAN. Whom do you mean by the State director?

Mr. SMITH. The man at the college who is in charge of all the extension work?

The CHAIRMAN. Paid out of the extension funds?

Mr. SMITH. And paid out of any funds that the college may have, from any source. None of the money that is appropriated directly to the department goes into the director's salary.

The CHAIRMAN. Is he under your direction?

Mr. SMITH. He is under our direction only to the extent that is agreed upon in writing; and the Secretary has an understanding with all the colleges except two that they will appoint no director unless he is acceptable to the Department of Agriculture. On that consideration the Secretary agrees to do all the extension work that he has to do with these direct appropriations that you give him in cooperation with the college, providing the college appoints a director that can satisfactorily represent the department in the administration of that work in the State.

The CHAIRMAN. You do not contribute anything toward his support?

Mr. SMITH. Not a thing.

The CHAIRMAN. Except that he is supposed to know your director?

Mr. SMITH. No; he is in charge of all the extension work done in the State, whether it is done under the funds of the Department of Agriculture or of the State.

The CHAIRMAN. Where do you come in?

Dr. TRUE. He is the joint representative of the department and the college.

The CHAIRMAN. Where do you show that your bureau is represented, any more than any other bureau, if he is there representing the department? Mr. Rawl's man comes in under your jurisdiction?

Dr. TRUE. This is the situation, Mr. Chairman: By agreement between the college and the Secretary of Agriculture, the extension director is the joint representative of the department and the college for the administration of all the extension work in the State, so that when a department man, whether from the Bureau of Animal Industry or any other bureau, comes out and is located in the State at the college, he comes under the administrative direction of the extension director; and those extension directors report to the States Relations Service.

The CHAIRMAN. Does Mr. Rawl's man report to you?

Mr. SMITH. Yes; because Smith-Lever funds which are administered by the State Relations Service are involved.

The CHAIRMAN. Not to Mr. Rawl?

Mr. SMITH. He reports to Mr. Rawl also, because Mr. Rawl has \$1,500 of money appropriated for his work by Congress involved.

The CHAIRMAN. He reports to both of you?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. I gathered from what Mr. Rawl said about the man who was sent out from his bureau, speaking of this particular work of organizing bull clubs, that his man had nothing to do with the county agent. The work is work that the county agent does not do; he does not know enough, so that a man has to be sent from the dairy division. That was stated very bluntly—that they had nothing to do with county agents because county agents were not competent. I regretted very much to hear that, because I have been very much interested in county-agent work.

Mr. SMITH. I think there is some mistake in there, somewhere, because the dairymen at the college, these specialists that Mr. Rawl may cooperatively employ with the college, have general charge of that work and inspire the county agents to aid in the work of such associations in the county. You remember that in the cow-testing association work, when they finally get a group of 25 or 26 farmers to cooperate, the group hires a man of their own to do various things in connection with that work, like keeping records, testing the milk, etc. The county agents are helping very materially in that work. In fact, none of the specialists these days are thinking of organizing their work except as they do it in cooperation with the county agents. The county agents are there on the ground, they are there the year around, and the specialists are learning that, if they want to get effective work done, they should deal, and they are dealing, through the agents. That is the philosophy of good extension organization.

The CHAIRMAN. The people that are sent out, for instance, by the Bureau of Plant Industry on the black rust work, do they come under your direction?

Mr. SMITH. There are practically none that are doing extension work in the Bureau of Plant Industry.

The CHAIRMAN. During the emergency, did they not have a large extension staff engaged in investigating the rust of wheat?

Mr. SMITH. Yes.

The CHAIRMAN. Was that along the line of your educational work?

Mr. SMITH. Yes; extension work.

The CHAIRMAN. Of course, all their work is done in the States; that they do not do extension work except in accordance with the plan that is worked out with the States Relations Service. Are they included in the 776?

Mr. SMITH. They are, so far as there are any available. There are none available now. There are none doing that work now.

Dr. TRUE. I might say that there are at present one or two plant pathology specialists from the Bureau of Plant Industry doing such work in the Southern States under just such an arrangement as has been described for these other specialists.

The CHAIRMAN. What cooperation is there between the bureaus, and how many specialists are being sent out?

Mr. SMITH. At this time, as I say, there are only 16 working in the Northern and Western States with headquarters here.

Mr. McLAUGHLIN of Michigan. The Lever fund for next year will be \$3,580,000. For the year that is current it is \$3,080,000. Does the law provide that the entire amount of that money shall be distributed among the States if it is met by a similar amount from the States, or does the law provide that some portion of it may be retained by the Secretary of Agriculture for emergencies? Must it all be distributed to the States?

Mr. SMITH. It must all be distributed to the States.

Mr. McLAUGHLIN of Michigan. There is nothing, then, that remains in the hands of the department?

Mr. SMITH. Not a cent.

Mr. McLAUGHLIN of Michigan. I presume the States have different ways; I presume that altogether there are many different ways of meeting the requirements of the Lever law about duplicating the money appropriated by the Government?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. In some cases the contribution is made directly by appropriation by the legislature; sometimes the college devotes a part of its revenues; sometimes it is raised by local subscriptions and contributions by associations, and so on?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. There are many different ways, are there?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. Have all the States in the Union come under that law?

Mr. SMITH. Every State has accepted the provisions of the law.

Mr. McLAUGHLIN of Michigan. And is every State receiving the full amount of money under that law?

Mr. SMITH. I think there are some exceptions.

Mr. MERRITT. All of them are receiving the full amount under the Smith-Lever Act except one State, which has not been able to meet the supplementary fund; that is Pennsylvania.

Mr. McLAUGHLIN of Michigan. I am not speaking of the supplementary appropriation. Is each State meeting the Lever law money in full and receiving the full amount of its apportionment?

Mr. SMITH. The States are contributing to meet this money from the State funds.

Mr. McLAUGHLIN of Michigan. Each State is contributing enough to get that money, is it?

Mr. SMITH. Yes. You may want to consider the matter of extension specialists a little further, because it has been brought up here a number of times. I think we ought to clear that up if we can. I have indicated on another chart the different lines of work that the States are carrying on and the number of specialists which would be required to make a complete system.

Cooperative agricultural extension work.—Lines of work and specialists needed for complete system of extension work in agriculture and home economics for the whole United States, based on the assumption of 3,000 agricultural counties and a county agent in each county.

	Approximate number of specialists needed.
Field crops, including soils and fertilizers (1 for each 30 counties)-----	100
Horticulture (1 for each 30 counties)-----	100
Animal husbandry (1 for each 30 counties)-----	100
Dairying (1 for each 30 counties)-----	100
Poultry (1 for each 30 counties)-----	100
Forestry (1 for each 60 counties)-----	50
Vegetable pathology (1 for each 30 counties)-----	100
Veterinary science (1 for each 30 counties)-----	100
Biology (1 for each 30 counties)-----	100
Food nutrition (1 for each 30 counties)-----	100
Clothing (1 for each 30 counties)-----	100
Home health (1 for each 30 counties)-----	100
Farm management (1 for each 30 counties)-----	100
Marketing (1 for each 20 counties)-----	150
Rural engineering (1 for each 30 counties)-----	100
Total-----	1,500

Estimate 1,500 specialists at an average cost of \$4,000 each, salary and expenses, \$6,000,000.

Mr. SMITH (continuing). It is clear that the horticulturists, as the work is now developing, may not know much about—

The CHAIRMAN. Tell us about the field-crop specialist. What about him?

Mr. SMITH. The horticulturist may not know very much about poultry or about clothing.

The CHAIRMAN. How much does that man know about crops?

Mr. SMITH. All right; let us take his work and see what he will do. The county agents are pretty well up on field crops, and there are very few of those specialists employed. Take a man in agronomy or field crops; his work is to keep up with the progress in agronomy the country over or the world over, and to furnish the county agents with that information, whatever it may be.

The CHAIRMAN. Along what line would the information be?

Mr. SMITH. I might give an illustration covering a phase of corn growing. We have assumed and have been teaching that we knew a good deal about corn, and have been showing farmers how to test seed corn and how to select seed corn that will germinate well when planted. We thought if it germinated well that that was all there was to it. Talking with a Bureau of Plant Industry representative the other day, I was told that there is a rot in corn, a soft rot, that may occur and cause great loss of the mature corn. It is in the seed to begin with, and those seed may germinate perfectly, like other seed—not quite like other seed, but, so far as the ordinary person would notice, they would not see any difference but would plant that corn, thinking it was all right, whereas when it grew up the matured ear would be diseased and would not be first-class corn.

Now, the agronomist or field-crop specialist is able to show us how to detect that disease even in the sprouted seed, and so save the farmer from the loss resulting from planting such seed. I do not believe there are 20 county agents in the United States to-day who know that secret. Some one has got to teach them that thing, to

show them that thing, and the county agents are just like the farmers or anybody else; they learn best and quickest by seeing things done—by being shown. So we will get a Bureau of Plant Industry specialist to go to the States and show the forces there, if they are not already aware of it, just how to tell that thing in the germinating corn; and the specialist there in the State will take the information on out to the county agents, and the county agents will take it on out to the farmers and to the school-teachers and all those people who are engaged in testing seed corn.

Mr. ANDERSON. The thing that always rather strikes me about this proposition is that we always have to send a man out to converse with each one of these county agents separately.

Mr. SMITH. All right.

Mr. ANDERSON. In all the business institutions that I am familiar with—they are not very numerous and not very important—if they want to do anything of that sort they bring the men in once or twice a year and tell them all the developments of the business for the preceding period, instead of trying to send somebody out and hold a conversation with each one of them every week or two.

Mr. SMITH. Yes. The agents engaged in the work in the Northern and Western States have just such conferences; they have their meetings at the colleges. It is expensive to bring them all together very often. In this work, which is a relatively new enterprise, you will find when you study it that after you have had your men assembled at the conference and send them out again some of them will have been impressed with what you have said and some of them will not; and if you follow them up you will find that some of them will be 100 per cent efficient in carrying out the new thing and some of them will be only 50 per cent efficient. By following them up in the field the specialist can see how efficiently his work is getting across, and, if the county agent is not getting that information to the farmer, the specialist has an opportunity to help him straighten the thing up.

Then, in this connection, you must remember that our county-agent force changes about every year and a half; practically new people come on the job, and they need again to be taught how to organize work, and have again to be brought into contact with specialists who have knowledge along the particular lines of work. Most men on graduation from an agricultural college are not very strong in any particular line, and when as county agent they go out in the county they can keep up in some lines of work, but not in all of them; and so some specialists, we feel, are absolutely essential to success if you are going to have the best development of the entire system. How many of these specialists there shall be is another question.

Mr. YOUNG. You made one statement there that is alarming to me. That is in regard to the frequency of the changing of county agents.

Mr. SMITH. Yes, sir; the average is about a year and a half. That is about the life of the county agents in the North.

Mr. YOUNG. Why it that?

Mr. SMITH. There are so many opportunities open to them in various lines of business, and many of them also have gone out of the work during the war. That has been the history of the work up to this time. In one Western State last year and the year before there was a 90 per cent change each year.

Mr. YOUNG. Is it not very unfortunate for the farmers of the country as a whole that you have to educate men in this line of work so often and have them stay so short a time?

Mr. SMITH. It is exceedingly unfortunate.

Mr. McLAUGHLIN of Michigan. You do not pay the men enough.

Mr. SMITH. We do not pay them enough.

Mr. McLAUGHLIN of Michigan. Would it not be better to get good men and pay them more than to try to extend the work so much?

Mr. SMITH. Yes; it would be advisable to get good men and to keep them; but there, again, you enter into the whole system of salaries in the colleges and in the Federal Department of Agriculture. In the college the extension division is a part of the college, and if they are going to maintain their college they can not pay such attractive salaries in the field that all college professors will leave and go out into the extension work, so that they have to maintain a kind of level. They should raise the salaries in the colleges.

Mr. McLAUGHLIN of Michigan. The college of a State gets its proportion of the Lever money?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. The State has to match that money?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. They can use that money in any way that they please?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. They can pay such salaries as they please?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. Do you mean to say that, if they have high-class salaries—put the salaries on a high grade for the field men—it will interfere with the morale, as you might say, of the men employed in the college?

Mr. SMITH. It does; yes, sir.

Mr. McLAUGHLIN of Michigan. The men in the college never see these field men?

Mr. SMITH. They hear of their salaries, however; and they are attached to the same institutions. Some of the colleges give them titles similar to those of the men in the college.

Mr. McLAUGHLIN of Michigan. What is that?

Mr. SMITH. Some of the colleges give them titles comparable to those in the institution.

Mr. McLAUGHLIN of Michigan. They give the field men titles?

Mr. SMITH. Yes.

Mr. McLAUGHLIN of Michigan. What kind of titles?

Mr. SMITH. Assistant professor, or something of that kind. They class them as a regular part of the university staff.

Mr. McLAUGHLIN of Michigan. I have noticed these frequent changes of county agents, and I have thought it to be very unfortunate.

Mr. SMITH. It is unfortunate.

Mr. McLAUGHLIN of Michigan. And I have noticed what I should think was the difficulty of getting high-class county agents—the small salaries that they were paid. It seems to me that it would be

advisable, if you could, to pay money enough to get the right kind of a man and try to hold him.

Mr. SMITH. You are exactly right.

Mr. McLAUGHLIN of Michigan. And it occurs to me that it would be better to spend your money in getting a few high-class men rather than to spend it in employing a lot of men of indifferent ability.

Mr. SMITH. Yes, sir.

Mr. McLAUGHLIN of Michigan. In many places the work done by the county agents does not very favorably impress the people.

Mr. SMITH. Yes, sir; we agree with all of that. There is, however, that practical difficulty.

Mr. McLAUGHLIN of Michigan. In spite of the fact that you agree with that, you keep on extending the work instead of getting better men in fewer places.

Mr. SMITH. We do not have the whole say in the matter.

Mr. McLAUGHLIN of Michigan. That is arranged with the college, is it?

Mr. SMITH. Yes. At most it is a partnership arrangement, where the county agent is employed, and we do not consider that \$600 is—

Mr. McLAUGHLIN of Michigan. You do not contribute \$600. That \$600 comes out of the Lever money that is paid by the Government to the State.

Mr. SMITH. No.

Mr. McLAUGHLIN of Michigan. Do you pay an additional \$600?

Mr. SMITH. I told you that in 300 counties in the East and the West we are contributing \$600 for about 300 county agents.

Mr. McLAUGHLIN of Michigan. That is paid out of this—

Mr. SMITH. That is out of this appropriation for the extension work of the Office of Extension in the North and West. In that case we might have something to say; but the direct appropriation to the department is a comparatively small amount. Usually \$600 would be about one-fourth of the salary.

Mr. YOUNG. Let me ask you a little more about this changing of county agents. Was that accentuated very much by war conditions?

Mr. SMITH. Yes, sir.

Mr. YOUNG. What service did they render before the war?

Mr. SMITH. It would not run beyond two years.

Mr. YOUNG. That is the average?

Mr. SMITH. We have some men who have stayed beyond that; but that is the average. Then, of course, these high prices have come along, and the opportunities for those men in business have been very great.

Mr. YOUNG. I see what you are up against. It runs the same in every line. Take it in my country; I do not know how it is in the rest of the United States, but our school-teachers are possibly the worst paid people we have. Take it in a country town of 3,000 or 4,000 people; bank cashiers get \$100 or \$125; clerks in dry goods stores \$75, and so on; and we are having the same trouble in every line. People can get out of those places and make more at day labor than by school-teaching or working in a bank or in any store or in any clerical position, so that I know you are up against the same thing that we are every day.

Mr. SMITH. Yes. That the colleges are trying to meet it is shown by the fact that for the years 1914 to 1916 the average salary of the entering county agent was about \$1,800. The average entrance salary of the county agent in the North and West is now about \$2,300. We are giving \$500 more to the agent who enters on that work now than we did before the war.

Mr. YOUNG. You have the country divided into sections, the southern, western, and northern. Does the same scale of salaries prevail generally—the whole country over?

Mr. SMITH. It is somewhat higher in the North than in the other sections.

Dr. TRUE. It is considerably higher, on the average, in the Northern than in the Southern States.

Mr. YOUNG. It is the same line of work?

Mr. SMITH. Yes; it is the same line of work, but for some reason the scale of salaries is not as high as in the North. It is increasing in the Southern States. We are paying more now than we used pay, but the differences make the average showing lower for the Southern States.

STATEMENT OF DR. A. C. TRUE, DIRECTOR OF THE STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

Mr. McLAUGHLIN of Michigan. Breaking in right there I want to ask a question that occurs to me.

Since the beginning of this extension work, particularly since the passage of the Smith-Lever law, I understand you have located in the colleges some permanent scientists to carry on studies by analysis, and so on, of agricultural problems.

Mr. SMITH. I do not know of any such thing.

Mr. McLAUGHLIN of Michigan. I gathered that from something Dr. True said yesterday.

Dr. TRUE. None of these extension agents do any experimenting.

Mr. McLAUGHLIN of Michigan. Not the extension agents; but have you not located men, or are you not appropriating any part of the money to the payment of men who are located, at the colleges for the purpose of work?

Dr. TRUE. Certainly; extension men from the bureaus may be located at a college and be paid from department funds, in part, at least.

Mr. McLAUGHLIN of Michigan. You say "may be." Have you any so employed?

Dr. TRUE. Oh, yes; they are employed. But they are not doing experimental work.

Mr. McLAUGHLIN of Michigan. I do not know that I give it the right name. It is extension work, is it, such as you think is proper to be paid for out of Lever-law money?

Dr. TRUE. Yes, sir.

Mr. McLAUGHLIN of Michigan. How much are you spending in that way out of Lever money?

Mr. SMITH. Only men like Dr. Mumford—

Mr. McLAUGHLIN of Michigan. Oh, I did not get that idea at all, if it is only men like State agents.

Mr. SMITH. That is the only kind of men employed on extension funds.

Mr. McLAUGHLIN of Michigan. Are not some scientific men—some scholarly men, I mean—located more or less permanently at the colleges carrying on work there?

Dr. TRUE. I could not tell you how much of the Smith-Lever money is spent for extension agents with headquarters at the colleges. I have not that at hand and I could not tell you without looking it up.

Mr. McLAUGHLIN of Michigan. Outside of the Smith-Lever money, out of these special appropriations, are you paying the salaries of any men located more or less permanently at the colleges to do that kind of work?

Dr. TRUE. Yes.

Mr. McLAUGHLIN of Michigan. I do not mean men like the State agents, like Mumford in Michigan, are doing.

Dr. TRUE. Only in the case of farm-management demonstrations, which come under Mr. Smith's office. You will remember that from the beginning the northern extension office has used a part of its direct appropriation for farm-management demonstration.

Mr. McLAUGHLIN of Michigan. Demonstrations are largely in the field, naturally, are they not?

Dr. TRUE. Yes; but these men work out from the college. They have headquarters at the college and work out in the State.

Mr. McLAUGHLIN of Michigan. I gathered from what you said—I may have gotten a wrong impression—that in the aggregate there are a large number of men, involving the expenditure of a large amount of money for men, as I got the idea, permanently located at the college; not to work outside, but on some problems, and to conduct studies in agriculture and so on, as scientific men carry on their work.

Mr. HARRISON. When Dr. True was discussing yesterday the Hatch and Adams appropriations, he referred to the number of employees engaged in scientific and technical work at the various State experimental stations. He indicated, I believe, that approximately \$6,000,000 was available for this purpose, \$1,440,000 of which comes from the Federal Government through the Hatch Act and the Adams Act.

Mr. McLAUGHLIN of Michigan. I had an idea that it was something more than that. Under the Hatch and Adams Acts you put in the amount of money to a college for the purposes of that act?

Dr. TRUE. Yes.

Mr. McLAUGHLIN of Michigan. Then do you hire other men to go to that college and carry on that work?

Dr. TRUE. The States Relations Service has no money for that purpose.

Mr. McLAUGHLIN of Michigan. Do you hire any such men?

Dr. TRUE. Do you mean in the different bureaus? There may be money there which can be spent for investigations, and they enter into cooperative arrangements with the State colleges to carry on investigations.

Mr. McLAUGHLIN of Michigan. At the colleges?

Dr. TRUE. And in some cases they locate men at the colleges or State experiment stations to carry on that work.

The CHAIRMAN. Is it not a fact that college men are employed, and that part of the time they are paid by the college and part of the time they are paid out of this extension fund? I so understood you yesterday.

Dr. TRUE. Extensive specialists are located at the college——

The CHAIRMAN. They are college men?

Dr. TRUE. They are college people.

The CHAIRMAN. They belong to the staff of the college and are members of the faculty, are they not?

Dr. TRUE. They are members of the faculty.

Mr. McLAUGHLIN of Michigan. There is so much appropriated under the Hatch Act and so much under the Adams Act that is given to the State.

Dr. TRUE. Yes.

Mr. McLAUGHLIN of Michigan. My motion was that each college spent its own money in its own way, except that it was on the plan approved by the Secretary of Agriculture. Do you send men from the colleges to carry on that same kind of work, and do you pay them?

Dr. TRUE. A bureau may have money to do investigation, and they may enter into a cooperative arrangement with one or more colleges for work along that line. The college uses for that purpose men who are engaged in the experiment station; but this is different from the extension work. In the financial adjustment, part of the salary may be paid from department funds and part from the ordinary station funds. It does not involve any duplication of salaries or expenses. The thing is properly lined up, as I understand it.

Mr. McLAUGHLIN of Michigan. I did not think it was duplication, but I thought the money was given to the college for a particular kind of work, and then I thought you were sending men to the colleges and paying them yourselves for doing the same kind of work or work contemplated under that act.

Dr. TRUE. It may be work contemplated under the act; yes, sir.

Mr. McLAUGHLIN of Michigan. Why do you not let the States do that if the Government gives them that amount of money?

Dr. TRUE. The experiment stations do a great variety of work, and their funds are not sufficient to meet all demands for experimental work. For example, a problem connected with some particular disease of a plant may arise in a certain State. That would be a legitimate work for the experiment station to undertake, but the experiment station may not have funds to put into that work, or may have only a small amount of money, insufficient for the work. It enters into cooperative arrangements with the Bureau of Plant Industry to carry on that work as a joint enterprise; the Bureau of Plant Industry puts in some of the money and the college puts in some; and while that work is going on the investigator may have headquarters at the college or at the experiment station, using the laboratories there and going out into the State to study the disease wherever it exists.

The CHAIRMAN. Are we contributing money for the maintenance of the colleges in an indirect way? You will recall that when the Lever bill was being considered the contention was made that there was a lot of knowledge bottled up here in Washington valuable

out in the country, and that we should find some way of disseminating it.

Dr. TRUE. It never was intended, as I understand it, that the United States Department of Agriculture should withdraw from either research or extension work in the States.

The CHAIRMAN. You do research work in Washington?

Dr. TRUE. Yes; and also in the States.

The CHAIRMAN. In the agricultural colleges and in Washington?

Dr. TRUE. There never has been a time that the department was not carrying on a large amount of research work in the States.

The CHAIRMAN. That work was carried on under the Hatch and the Adams Acts.

Dr. TRUE. No; the Congress has been appropriating to the Department of Agriculture large sums of money for research work to be carried on in the States, in addition to the work that the State experiment stations carry on with the Hatch and Adams funds.

Mr. McLAUGHLIN of Michigan. I think from the very nature of the problems it is necessary to do a lot of research work, and my impression is that Congress approves it and is disposed to be very liberal—

Dr. TRUE. Certainly.

Mr. McLAUGHLIN of Michigan (continuing). With this money for research work?

Dr. TRUE. Yes.

Mr. McLAUGHLIN of Michigan. Because wonderful results have been produced by your men engaged in research work.

The CHAIRMAN. You say you pay part of the time of the men at colleges. If this money was intended to be used to disseminate that knowledge which had been gathered up in the department it should be applied to the purpose for which it was intended.

Dr. TRUE. None of the extension money is used for the gathering of information.

The CHAIRMAN. What is the research work that is being done at the colleges?

Dr. TRUE. None of the research work is paid for out of extension funds.

Mr. LAUGHLIN of Michigan. I thought it was. That was one of my criticisms of the work. I thought that some of this money appropriated, as Mr. Haugen says, to carry out the results of your work into the country, for practical work, was being used for research work.

Dr. TRUE. If there is, I do not know of it; and we are careful in our inspection of the colleges to determine what money is spent for extension work, what money is spent for experimental work, and what money is spent for teaching. We keep those things distinct, and the colleges understand that if they spend any of the extension money for research work they are acting contrary to the law. If they spend any of the experiment station money for teaching or extension work they are violating the law, and they understand that. Wherever we discover any sums that have been diverted in that way, intentionally or unintentionally, we call them to the attention of the college and insist on a readjustment of the matter.

The CHAIRMAN. An employee of the college is paid part time by the college and part time by the department. Much of the time of

such an employee in the college is spent in making out reports and other work than carrying on experiments.

Dr. TRUE. A man may be employed in the college as an experimenter and be paid half of his salary from the Hatch and Adams Acts appropriations, and he may devote half of his time to experimental work.

The CHAIRMAN. For the college, but not for you?

Dr. TRUE. Yes. Under the law, under the Hatch and Adams Acts, it is just as much for us as for the college.

The CHAIRMAN. We do not take that into consideration here. That is from the permanent annual appropriation. The colleges receive that whether we appropriate here or not. It is from the permanent annual appropriation. But here are other appropriations made, as has been stated here, for the specific purpose of disseminating the knowledge gathered by the department; not for gathering information or for study or for experiment, but for disseminating it.

Dr. TRUE. No, sir; that is extension work.

The CHAIRMAN. Simply to carry the knowledge to the people.

Dr. TRUE. That is extension money.

The CHAIRMAN. That is extension.

Dr. TRUE. And it must be used for the extension service.

The CHAIRMAN. Exactly. If it is used for extension, it is not for experiment.

Dr. TRUE. No, sir. But a man may be employed half of his time doing experimenting and half of the time doing extension work, in which case half of his salary is paid from experiment station funds and half from extension funds.

The CHAIRMAN. Then we are to understand that you do not pay him for any of his time spent in experimental work?

Dr. TRUE. Absolutely not.

The CHAIRMAN. That is paid entirely by the college?

Dr. TRUE. Yes, sir.

The CHAIRMAN. Then we understand each other perfectly.

STATEMENT OF MR. CLARENCE B. SMITH, CHIEF OF THE OFFICE OF EXTENSION WORK IN THE NORTHERN AND WESTERN STATES, STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN (continuing). Now Mr. Smith, I would like to ask you some questions. I take it when you select a county agent for the corn belt you secure one who is well up on corn and the products of that particular locality. What is he supposed to know about field crops?

Mr. SMITH. This field crop specialist is supposed to know all there is to know up to that time on field crops and to keep the county agents informed up to the minute on that.

The CHAIRMAN. Is he supposed to know how to select seed corn?

Mr. SMITH. Seed corn, and how to grow the crops, how to prepare the land, how to take care of the land, and everything in connection with the growing and harvesting of the crops.

The CHAIRMAN. In employing a man for corn you would not select some one who had particular knowledge of cotton, but you

would select some one who had a knowledge of corn and of other crops in the corn-growing section?

Mr. SMITH. A man with a knowledge of all the crops grown there—corn, wheat, and barley and the usual field crops that they grow there.

The CHAIRMAN. Can an agent go out into a field and estimate the crops, as to yield for instance—

Mr. SMITH. No.

The CHAIRMAN (continuing). And crop conditions?

Mr. SMITH. No; his judgment is worth the judgment of one man, and crop estimates are made through the judgment of many people the country over.

The CHAIRMAN. What estimate can your agents make?

Mr. SMITH. Just the estimate that any intelligent man could make.

The CHAIRMAN. Could he not do better than the average man?

Mr. SMITH. He might. It would depend on whether he had had experience. He knows whether the crop in his neighborhood is a good crop or not. In this crop-estimating work many of the States are, in their farm bureaus, appointing a committee of farmers, of whom the county agent may be one, who make a report to the State on crop conditions.

The CHAIRMAN. Your county agent drives through the county continually?

Mr. SMITH. Yes.

The CHAIRMAN. He goes over the county two or three times a year, and over much of it once a week or oftener?

Mr. SMITH. Yes.

The CHAIRMAN. Should he not have fair knowledge of the crops?

Mr. SMITH. Yes.

The CHAIRMAN. His judgment should be better than that of the man who has less opportunity to see the crops?

Mr. SMITH. Yes.

The CHAIRMAN. Should be an expert?

Mr. SMITH. He is not giving his whole thought to that thing. He is better than the average man, undoubtedly, because he has a better opportunity to see.

The CHAIRMAN. If he is interested in the welfare of the farmer and the crop owners, he could not help but observe the condition of the crop?

Mr. SMITH. That is true.

The CHAIRMAN. Is it not a fact that he would be an expert on the yields and condition of the crops?

Mr. SMITH. In a considerable sense he would.

Mr. ANDERSON. If he only lasted a year and a half in office, he would not have much opportunity for forming comparative judgments?

Mr. SMITH. That is only the average man; and we hope, now that the war is over and salaries have gone up a little bit, that the period of service may be longer.

The CHAIRMAN. If he stays there a year and a half he should have knowledge of the conditions?

Mr. SMITH. Yes; he should have as good a knowledge as anybody who has to handle 15 to 20 lines of work.

The CHAIRMAN. But he has not 15 lines of work in any one locality.

Mr. SMITH. If you are dealing with the county agent, he covers but one county, and he does not go over the State.

The CHAIRMAN. Practical men would have knowledge of the crop yields. That is one of the first things that would enter the mind of a practical man.

Mr. SMITH. In hiring county agents the matter in most cases is put up to the farmers themselves, who have a voice in selecting him. The farmers have a chance to look him over and question him before he is employed, and his record is before them. They pay the larger part of his salary, so that they are very much interested in having as practical a man as they can get.

Mr. McLAUGHLIN of Michigan. You say the farmers have something to do with the selection of the county agent?

Mr. SMITH. Yes. Each county forms a bureau composed of farmers, and they practically select the county agent. Names are submitted to them and they select.

The CHAIRMAN. They select from the list submitted to them?

Mr. SMITH. And they also suggest names.

The CHAIRMAN. If the farmers suggest a certain person, you agree to his selection?

Mr. SMITH. If he had the qualifications we thought he ought to have. That is, we think he ought to be acquainted with the research work of the State and Federal Departments of Agriculture and that he ought to have had good training in agriculture; under those circumstances we would accept him.

Mr. McLAUGHLIN of Michigan. You would not appoint a man who was objectionable to the farmers?

Mr. SMITH. We would not appoint a man who was objectionable to them; but we must feel that he is competent to extend the work of the agricultural college and of the Department of Agriculture. If we do not feel that his training is good enough for that we do not make his appointment.

The CHAIRMAN. An estimate was made for a large increase for the Bureau of Crop Estimates. Could the service of those county agents be utilized in connection with crop estimating?

Mr. SMITH. I think the county agents can be of very great service in connection with that, but I do not think that they should at all assume responsibility for that service.

The CHAIRMAN. What service are they rendering now?

Mr. SMITH. They are bringing to the attention of the farmers the importance of having accurate information on crops and live stock. They are asking the farm bureaus to appoint a committee-man in each part of the county who will work with the Government in making those reports. That committee usually meets and makes its monthly report in the county agent's office, so that he is informed as to what they are doing, and the results are sent to the States. In other words, the county agent handles the work on just about the same plan he would handle any other line of work. He gets the farmers to do it—at least, they do it—and the county agent does not assume any responsibility.

The CHAIRMAN. Could he not, without additional trouble or expense, interview the reporters, get ideas from them, and form a fairly accurate opinion as to the yields and the condition of the crops?

Mr. SMITH. If you made it mandatory on him to visit these crop reporters and get their views, I am afraid you would embarrass him in his regular work. If that was made a regular part of his duties, I am afraid that it might greatly embarrass him; and I am sure we can get practically as good results without making it more or less obligatory.

The CHAIRMAN. In my opinion, cooperation is worth a lot; and it seems to me that the two bureaus should cooperate.

Mr. SMITH. Yes.

The CHAIRMAN. I am trying to find out how much cooperation you have arranged for.

Mr. SMITH. We are cooperating now in the State of Idaho, which, as I have said, I think is one of the best organized States in the Union for crop-reporting work, in which that work is being very effectively carried on through cooperation between the county agents, the farmers themselves, and the State crop reporters.

The CHAIRMAN. Has that worked out satisfactorily?

Mr. SMITH. Very satisfactorily. I think Mr. Estabrook thinks very highly of that plan, and I do not know why it can not be adopted in practically all the States. It is being tried out now in that particular State, and we may have a fund of information to present to the other States to show how it has been worked out and to encourage other States to take it up, if it works out finally as satisfactorily as it now seems to be doing in Idaho.

The CHAIRMAN. Your bureau would be willing to cooperate with the Bureau of Crop Estimates?

Mr. SMITH. Yes.

The CHAIRMAN. And you feel you can be of great service to them?

Mr. SMITH. Yes; we do.

The CHAIRMAN. I do not think there is any question but that you can be.

Mr. McLAUGHLIN of Michigan. The Bureau of Crop Estimates is estimating for a tremendous increase; an increase of \$550,000 more than they had last year. If that work can be done by somebody already in the employ of the Government, it might save a lot of money.

I would like to ask one or two more questions about this chart which is before us. On the right hand, under "specialists," you have "100" in each column. What does that mean?

Mr. SMITH. That is just a rough estimate, if we are going to develop an extension system, of what we will need. If specialists are a part of that system, these figures indicate how many it is going to take. Your guess is perhaps as good as my guess on that.

Take the veterinary work here [indicating on chart]; if the extension veterinarian dealt with as many as 30 county agents and kept them posted on animal diseases and how to handle them and how to extend that work to the farmers, the question is, would that not be about the reasonable number of specialists to have—one for each 30 counties, say, in veterinary science; and the same thing with dairying, with its various branches? This is just a rough estimate

of possibly how many it would take, eventually, if the extension system was completed.

Mr. McLAUGHLIN of Michigan. Evidently some think that the county agents need instruction in this veterinary science, as you have termed it there, because, when it was suggested by another bureau that they must have men from their bureau go out to see about hog cholera and tuberculosis, it was asked if the county agent could not do any part of that work, and they said "No; the county agents do not know enough to do it."

Then this chart is not a statement at all of what you are doing now?

Mr. SMITH. Not at all.

Mr. McLAUGHLIN of Michigan. This is only a suggestion for the future?

Mr. SMITH. I understood there was some question as to what extent specialists ought to be employed, and I was just trying to get this more for my own information than anything else.

Mr. McLAUGHLIN of Michigan. If this plan should be carried out as outlined, it would take \$6,000,000.

Mr. SMITH. It would mean 1,500 specialists.

Mr. McLAUGHLIN of Michigan. Where would you get the money?

Mr. SMITH. The States would provide that, probably. You can see that a college which has a strong department in farm management, for example, will want to extend that work in the State and will desire an extension specialist for that. How many counties can he handle? Not more than 30, probably. If one man deals with the county agents and farm-management problems in 30 counties, he is doing a pretty good job.

Mr. McLAUGHLIN of Michigan. Has it not occurred to you that a part of your time might be well spent in suggesting to the States that the Federal Government is not going to do this, and that if it is going to be done they must get a move on and do it themselves?

Mr. SMITH. I think they have that in mind, as the States now are putting in about two dollars to the Federal Government's one. The specialists are perhaps in larger number in the North now, because when this work started they had a great many specialists to begin with and but few county agents. They have kept those specialists, and, in addition, as the county-agent work has been developed, particularly during the war, they found that they needed to have men trained in the particular subjects to keep those county agents up on all lines.

Mr. McLAUGHLIN of Michigan. When this chart was put before us I thought it would show the number of men now employed and the lines of work in which they were employed.

Mr. SMITH. I did not have time, after I thought of the matter, to make such a chart, but such a chart could be made, showing the men we have and the different lines they are engaged in.

Mr. McLAUGHLIN of Michigan. If it seems necessary to reduce this appropriation, I presume it might be reduced by not employing these special agents, but leave the work largely to the county agents, to get along the best they can during the time of short money?

Mr. SMITH. I do not know just what the colleges would do. I think they would want to be sure that those agents were competent and well supported in certain lines, and they might find it necessary

to reduce both their specialists and their agents so that they would handle those lines that were most vital to that State.

Mr. McLAUGHLIN of Michigan. Each State has signified its desire to give money under the Lever law and so far has supplied its part of the funds?

Mr. SMITH. Yes, sir.

Mr. McLAUGHLIN of Michigan. You do not anticipate that any of the States will refuse hereafter to contribute money enough so that they can come under the Lever Act simply because you or the department will not spend money for these specialists, do you?

Mr. SMITH. I did not quite get the significance of your question.

Mr. McLAUGHLIN of Michigan. Each State is now contributing the full amount of money under the Lever Act?

Mr. SMITH. Yes, sir.

Mr. McLAUGHLIN of Michigan. Do you not think they are going to continue to do that even if you do not appropriate money for sending out all these specialists?

Mr. SMITH. The States Relations Service is not sending out any of these subject matter specialists.

Mr. McLAUGHLIN of Michigan. You are sending out some?

Mr. SMITH. Yes; the Department of Agriculture as a whole is.

Mr. McLAUGHLIN of Michigan. This is a larger plan that you have in mind if you had the money?

Mr. SMITH. This contemplates what the States and departments cooperating should have when we get 3,000 county agents.

Mr. McLAUGHLIN of Michigan. We have no objection to the States spending that \$6,000,000, but my idea was that that would be the total cost to which you would contribute about one-half.

Mr. SMITH. No. It was not contemplated that the department would contribute so largely.

Mr. McLAUGHLIN of Michigan. Then this is simply a suggestion as to what the States ought to do and may do.

Mr. SMITH. Yes; showing you the number of specialists that may be needed if you have a complete and efficient extension system.

The CHAIRMAN. Would you suggest that the specialists instruct and educate each agent along that line, or would you suggest that they come together at some point for instruction?

Mr. SMITH. It would be done both ways.

The CHAIRMAN. If you send out a specialist to teach one county agent at a time you would not get very far.

STATEMENT OF DR. A. C. TRUE, DIRECTOR OF THE STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

Dr. TRUE. In this connection there is another suggestion that the committee ought to keep in mind in thinking of these specialists. It is not simply the county agents that need these specialists, but the farmers. There is an increasing demand, as I understand it, from the farmers, through their farm bureaus and otherwise, to have the service of these specialists. They want to see the people from the college and these specialists not only go out and instruct the county agents, but they actually engage in the work in the field, holding meetings and extension schools; and to cut them off

to any considerable extent would be contrary to the wishes of the farming people.

Mr. HEFLIN. If you cut them off, as has been suggested, Doctor, do you think it would help or hurt the work?

Dr. TRUE. It would hurt the work seriously.

Mr. McLAUGHLIN of Michigan. I want to say to Dr. True that I do not question the desirability of this work, even the extension that is outlined on this chart. I was just suggesting that it may be that we can not go into it for want of money. It may be very desirable, the farmers may want it, but we have got a Treasury to look after.

Dr. TRUE. I admit that it is a difficult situation, but I think, as I have said, that the interests of agriculture and the general interests of the country, the general increase in the wealth of the country, demand that this extension work as projected now should not only be kept up but should be increased in a reasonable way in order to take in more of the country.

Mr. ANDERSON. Doctor, you are two years ahead of the contemplated maturity of the Lever Act now.

Dr. TRUE. But we are several years back as far as the value of the dollar is concerned.

Mr. McLAUGHLIN of Michigan. You have not lost sight of the fact that the original idea was that these special appropriations might be cut off? You remember the idea was that as the Lever Act grew the special appropriations would be reduced. You have not forgotten that, of course?

Dr. TRUE. I have not forgotten that, but my view is that the whole condition of things has changed within the five years since the Smith-Lever Act was passed. The value of the dollar has materially decreased meanwhile, while the interest of the farming people in the developing of this system of popular education has vastly increased. The results from this system, from the money point of view, have been very large. This system has justified itself very fully, as I believe you will agree, and it seems to me that it will be unfortunate to stop the progress of the movement at this time.

Mr. McLAUGHLIN of Michigan. I am not saying that it should be stopped. I am only one on the committee. I was just reminding you that when the Lever Act started these special appropriations were in full swing, and it was thought that they could be done away with as the Lever Act increased.

Dr. TRUE. At that time it looked like a great deal of money indeed.

Mr. McLAUGHLIN of Michigan. It is a lot of money now.

Dr. TRUE. But the whole thing is changed. We look at things in a much larger way now than we did five years ago, in every line of enterprise in this country.

Mr. McLAUGHLIN of Michigan. I am afraid you will have to keep down to earth, Doctor, on some of these things.

The CHAIRMAN. What is the next item, Doctor?

Dr. TRUE. Mr. Chairman, I had prepared several tables showing the way in which these funds are used. Would you like to have those put in the record?

The CHAIRMAN. We will be very glad to have them.

Dr. TRUE. I will simply leave them for that purpose.

The CHAIRMAN. They might as well be inserted at the beginning of your remarks. Are the tables printed in any pamphlet or bulletin form?

Dr. TRUE. No, sir; most of them are new tables.

The CHAIRMAN. Then they had better go into the record.

Mr. McLAUGHLIN of Michigan. You have made a great many transfers to the statutory roll. I suppose if those were not approved they would be turned back to the lump sum, and if the lump sum is not sufficient to carry them they would be discharged?

Dr. TRUE. I do not understand that we have any authority to put those back on the lump sum.

Mr. McLAUGHLIN of Michigan. They would have to go back, would they not?

Dr. TRUE. Not if the suggestion of putting them on the statutory roll is approved.

The CHAIRMAN. They are on there now, are they not?

Mr. McLAUGHLIN of Michigan. If those transfers are not approved, these employees will remain on the lump fund, will they not?

Mr. HARRISON. Yes; unless the committee indicates that they should be dispensed with.

Mr. McLAUGHLIN of Michigan. No; Congress would say how much money would be available on the lump fund, and then you would have to cut.

Mr. HARRISON. If Congress does not make the transfers proposed, it will be necessary to keep the employees on the lump fund if their services are required to do the work.

Mr. McLAUGHLIN of Michigan. Suppose the lump sum was reduced?

Mr. HARRISON. If the lump fund is reduced, we will, of course, have to make such adjustments in the work and personnel as may be necessary. If it should appear that the services of any of the employees can be or must be dispensed with, their appointments may be terminated; or, if they are needed in another bureau, they may be transferred to that bureau.

The CHAIRMAN. How much money is involved in the transfers to the statutory roll?

Mr. HARRISON. Mr. Chairman, the figures are given in the first day's hearing.

The CHAIRMAN. For 1920 you have \$6,575,390; you estimate \$5,431,290. So you have taken off of the statutory roll over \$1,000,000—\$1,144,100. You have dropped that from the statutory roll.

Mr. HARRISON. There are 378 transfers with salaries aggregating \$450,780. There are 80 new places in the estimates, involving a total of \$113,390. There are 36 places dropped, calling for a reduction of \$27,660. There is an apparent increase, therefore, on the statutory roll of \$536,960.

The CHAIRMAN. The tables on page 290 of the Book of Estimates, total salaries, Department of Agriculture, for the current year show \$6,575,390.

Mr. HARRISON. The difference is explained, Mr. Chairman, by the fact that we suggested in the estimates that 1,402 places occupied by forest supervisors and forest guards, whose salaries amount to \$1,673,540, be transferred to the lump-fund roll.

Mr. HUTCHINSON. Have you the total number of men employed by the Department of Agriculture?

Mr. HARRISON. Yes. On the 31st of October there were 21,364 employees; now there are something like 20,900. There has been a constant reduction during the past several months.

The CHAIRMAN. Thank you, Mr. Harrison.

STATEMENT OF DR. C. F. LANGWORTHY, CHIEF OF THE OFFICE OF HOME ECONOMICS, DEPARTMENT OF AGRICULTURE.

Dr. TRUE. I would like to depart from the regular order of the items in the Book of Estimates and take up the Office of Home Economics next, if that is agreeable to the committee.

The CHAIRMAN. Very well.

Dr. TRUE. That is item 42, on page 224:

To enable the Secretary of Agriculture to investigate the relative utility and economy of agricultural products for food, clothing, and other uses in the home.

The CHAIRMAN. An actual increase of \$30,000.

Dr. TRUE. We are asking for an increase of \$30,000. That is the same amount which we asked for last year, Dr. Langworthy, who is the chief of that office, is here and, if agreeable to the committee, I would like to have him speak of some of the details of his work.

The CHAIRMAN. We shall be glad to hear him.

We inspected your work last year, I believe.

Dr. LANGWORTHY. Yes, sir. We were very glad that you did so.

Thinking that you might like to see samples which illustrate the character of our work, I have brought some. We have tried to introduce economies in the preparation of food, economies that could be practiced in the household without lowering the quality of foods, but would help the housekeeper to keep up her standards without increasing expenses, and so help her in her effort to cope with the increased cost of living, and we have found a number of things which we believe will help her.

One of them is illustrated by this sample, which shows that it is perfectly possible to make good pie crust with considerably less fat than the housekeeper ordinarily uses. It is also possible, as this sample shows, to make doughnuts and other things fried in deep fat in a way which prevents absorption of an undue amount of fat. These apple turnovers are made with a crust containing 3 tablespoonfuls of fat to a cup of flour, which is half the amount that the usual recipe calls for. To learn how to use such smaller amounts of fat successfully depends upon tests which show us the proper manipulation of the ingredients, that is, the way they are put together, and how the amount of water in the dough should be varied—for example, less water than the housekeeper is in the habit of using must be used to give the desired result.

Lessening the absorption in frying in deep fat, we have found in a series of studies, depends upon the amount of shortening that is used in the recipe and the character of the gluten of the wheat flour used. We have found that by using hard flour or diluting the flour with some mashed potatoes and diminishing the shortening the amount of fat absorbed is lessened materially. The ordinary doughnut may take up fat equaling 50 per cent of its weight before frying.

That means a product which is too rich, though it is a common type of doughnut. By modifying the recipe in the way recommended one gets what I think you will agree is a good product. In this perfectly rational way a very considerable saving in household cookery can be made.

Those samples illustrate the kind of work we are carrying on and show how our research studies can help the housekeeper to solve practical problems. Such apparently simple conclusions are based on a very considerable amount of laboratory work.

Our work is distinctly research work. We are trying to accumulate material for the extension agents which will prove of use in their home-economics teaching. While the whole Department of Agriculture contributes material relating to crop production and animal production and other phases of farming, the Office of Home Economics, which you have authorized to study the household problems, is the only branch of the Government service which deals specifically with these home problems.

Logically, as I see it, our work is justified for two reasons: The department devotes a vast amount of money to the agricultural production; that is, to the production of farm crops, both animal and vegetable. It is now devoting, through the Bureau of Markets, and in other ways, large sums to the distribution of agricultural products, which, using the term broadly, includes both manufacture and distribution. Now, production, distribution, and consumption represent three phases of any such problems. The sum devoted definitely to the ultimate consumption of agricultural products, namely, that assigned to the Office of Home Economics (for in the last analysis the consumption of agricultural products is by the individual and by the home), is not in proportion to the other two. The only reason we produce food is that mankind may eat it.

Another reason why we should help the housekeeper by such work (carried to her by the extension agent and by the department's publications) is that in her hands rests the expenditure of 75 per cent to 95 per cent of the total money spent in the United States. That is a fact, it seems to me, on which expenditure for home-economics work is justified. That the department's work is actually of use to home-economics workers, extension teachers, and housekeepers is shown by the way housekeepers turn to us for just such practical information as we are able to give them as a result of the study of individual problems by carefully conducted experiments. We have not been able to keep up as we should. The opportunity for usefulness is very much larger than our resources.

It seemed not without interest to bring a printed copy of a summary of the work of the Office of Home Economics for the year 1919, presented at a home-economics meeting last June. A list of papers reporting work of the current year is also here. It includes the following:

- Absorption of Fat by a Dough or Batter when Fried in Deep Fat.
- Use of Homemade Sweet Potato Syrup in the Household.
- The Use of Sweet Potato Flour in Cookery.
- Experiments in Methods of Cooking Dried Fruits.
- Experimental Studies of Jellies and Jelly Making.
- Comparison of Hog, Lamb, Calf, and Beef Liver, and Their Cooking Qualities.
- Miso, a Soy-bean Food Product.
- The Use of Gas in Cooking, with Suggestions for Economical Methods.

Progress Report on the Keeping Quality and Condition of Vegetables Canned in Different Ways.

Digestibility and Tolerance of Some Wheat Flours.

Digestibility of Certain Vegetable Fats—Cohune, Palm-kernel, Hemp-seed, Poppy-seed, and Capuassu.

Digestibility of Raw Cornstarch.

Digestibility of Horse, Kid, Rabbit, and Seal Meat.

Effect of Milling on the Digestibility of Graham Flour.

A Course in Home Dietetics—in cooperation with the American Red Cross.

Study of Farm Homes in St. Joseph County, Mich.—in cooperation with the Office of Extension Work in the North and West.

Energy Value and Gaseous Exchange of Some Fruits—Bananas, Pineapples, and Apples.

With regard to some of the work these papers represent, it may be said, for instance, that the department had been asked why lamb liver was not more often used. Lamb liver is certainly edible, but it is not so palatable as the other kinds of livers used, as a careful comparison showed.

The Bureau of Chemistry is particularly interested in a soy-bean product called miso, something much used in the Orient, and studies of its possible use in American cookery were needed. The results were favorable.

The study of the use of gas in cooking gave interesting results. We found, for instance, that a simple modification of many gas stoves or gas plates would save a great deal of gas. The flames were not the right distance from the bottom of the saucepan or kettle in which one cooks. Manufacturers, I feel sure, when this is pointed out to them, will be very glad to see that such adjustments are made.

The question of soft pork came up this morning. The Bureau of Animal Industry requested information on the cooking quality of such pork in comparison with other pork. We found that the soft pork (bacon) often, but not always, gave up more fat, or will fry out more when fried, than the other pork that is not called soft pork. We found that in some cases, but not uniformly, the flavor was inferior. We believe that an extension of those cooking tests will throw some light on the possible uses of soft pork in the home by improving methods of using it and help to better the market for it. The work is not completed, but it is very encouraging.

The report on the keeping quality of vegetables canned in different ways shows that progress has been made. This kind of work, which includes a study of the causes of spoilage in home canning by different methods, makes clear the importance of more investigation in order that we may avoid botulinus poisoning. That is a problem which calls for all the attention that can be given it. Commercial canners are studying it from their standpoint. It must be studied for home canning.

As one of the reports mentioned shows, the digestibility of wheat flours has been further studied. This is the old question of whole-wheat, Graham, and wheat flour, and we have new evidence which I think is of importance regarding the use which can be made of all of them.

Then we have studied the digestibility of certain vegetable fats, including among others cohune, palm-kernel, hempseed, and poppy-seed oils, which are not used any more at the present time than cottonseed oil was used 20 years ago, but which, I think, we may use

in the future, for a more abundant fat supply is surely needed, and these fats have many possibilities.

The report on the digestibility of raw cornstarch is very interesting, for it will change the usual textbook statement that raw starch is not digested by human beings. Raw cornstarch was found to be completely digested, and so was wheat starch. Potato starch was found to be less so. How other starches will turn out we do not yet know.

As regards the studies of the digestibility of meats, there was a special reason for including each kind tested. Horse meat was of interest because of the discussion about its use during the war period. Seal hams are used in the Pribilof or "Seal" Island for food and are considered good. A request was made to study their digestibility and food value, to see whether there was any possibility of adding them to the meat supply of the United States. We found the meat well digested. The flavor was distinctive.

Mr. McLAUGHLIN of Michigan. How do you study the digestibility of any food?

Dr. LANGWORTHY. We have a selected number of young men who serve as subjects. They are given a diet for a period of three days, or nine meals, in which the food studied predominates. To the first meal of the experimental period and the first meal after it animal charcoal is added, which colors the feces black. The separation of the feces pertaining to the experiment is then an easy matter. Food and feces are analyzed. The undigested residue of each food constituent subtracted from the total eaten shows the amount retained in the body, i. e., digested. The value for the food specially studied is then calculated, using factors determined in our laboratories. The technique of such experiments has been greatly improved in the Department of Agriculture. In this way we can find what man obtains from different foods. It is like determining the amount of coal one finds in the ashes from a furnace as compared with what one puts on the fire to show how well the coal is burned.

Mr. McLAUGHLIN of Michigan. Does that determine the time it takes to digest food?

Dr. LANGWORTHY. Such tests show the thoroughness of the digestion. The time of digestion is studied by other methods. We can make such studies but are not doing so. A common method of obtaining such data is by means of studies with samples of food digested in test tubes with ferments like those found in the body. By time of digestion one usually means the time the food remains in the stomach. Digestion continues in the intestine. Generally speaking a man who is in normal health and regular habits excretes every 24 hours the residue from his previous days' food. There are many exceptions, but this seems a general rule. Habit, exercise, and proper food are factors in insuring this regularity.

The CHAIRMAN. Will you tell us something about horse meat?

Dr. LANGWORTHY. We found that horse meat was well assimilated. Quality, I suppose, depends much on the age of the horse. Young animals are not likely to be slaughtered for food. The older animals are likely to be rather tough.

The CHAIRMAN. That would be true of the ox meat also?

Dr. LANGWORTHY. Yes. We found that horse meat was as thoroughly digested as other meat.

Mr. McLAUGHLIN of Michigan. You determine the digestibility of some of these foods by experimenting with the foods?

Dr. LANGWORTHY. Yes.

Mr. McLAUGHLIN of Michigan. Those foods are to be used by animals?

Dr. LANGWORTHY. These foods are studied to obtain data regarding their use by man. We work with those which for one reason or another are of some special interest. For instance, we studied rabbits because the Biological Survey of the department is interested in rabbit growing as a home industry and wanted to know whether rabbit meat was digested as well as other meat. We found it was. We also studied ways of cooking it.

Mr. McLAUGHLIN of Michigan. I gathered that some of these foods were to be fed to animals, and the digestibility of them was to be determined by your experiments.

Dr. LANGWORTHY. I did not mean to say that.

Mr. McLAUGHLIN of Michigan. I was mistaken, then.

Dr. LANGWORTHY. I may have made a slip of the tongue.

The CHAIRMAN. Do you consider horse meat wholesome?

Dr. LANGWORTHY. I think it must be wholesome and that it is generally admitted to be so. It may, perhaps, be of interest to know how it came about that the people of western Europe did not eat horses. Horses were formerly used for food there, but in the eighth century, when it was found that there was a shortage of horses for the papal cavalry, a papal edict forbade the use of horseflesh in food. As a result the use of horse meat went completely out and was forgotten, and it was not until the Franco-Prussian War, in 1870, it came into use again. This fact is very interesting to anyone who is interested in the history of food.

Mr. LEE. How many years ago?

Dr. LANGWORTHY. It was in the eighth century, when Pope Gregory III issued this edict.

The CHAIRMAN. Is it as palatable as the others?

Dr. LANGWORTHY. I do not think it is as palatable as beef and its texture seems coarser, but most of us, if it was a good cut, would, I suppose, eat it without thinking much about it.

Mr. McLAUGHLIN of Michigan. Whale meat is palatable?

Dr. LANGWORTHY. It is said to be good. I have not had a chance to try it.

Mr. McLAUGHLIN of Michigan. It is said to resemble beef very much. The lean meat is red and the fat meat is white, and it is sometimes difficult to distinguish between beef and whale meat.

Dr. LANGWORTHY. We have never been able to get any for experimental purposes. I had hoped we could, as it was much discussed during the war. It was studied in Canada, I believe, under Government auspices.

What has been said gives an idea of some of the problems which have been studied, many of them at the request of other bureaus of the department. It shows the kinds of experimenting that we are doing with foods in the digestion laboratory or in the experimental kitchen.

We have also been studying different kinds of household labor to find out how much time women devote to the different kinds of household tasks and the draft on human strength by each kind of task.

We have used the respiration calorimeter for such experiments. Different kinds of household work were carried on in the respiration chamber, and the energy expenditure measured in terms of heat—that is, in calories, a calorie being equal to 1.5-foot tons—that is, work sufficient to raise 1 ton 1.5 feet. We have found, for instance, that a woman who is sewing uses about 7 calories of energy per hour per kilogram (2.2 pounds) body weight as compared with 49 calories when she does washing or ironing or sweeps floors. In other words, regarded as muscular work, it is seven times as hard work to do that kind of work as it is to sew. Obviously, to save strength one should first strive to find good, easy methods and effective labor-saving devices for such hard work as washing, ironing, and scrubbing, rather than for a light task, in order to make housework easier.

We have also found that we can lessen the labor required for household tasks, as, for instance, by adjusting equipment to height. This table would be too low if I were to wash dishes on it, because I would have to stoop. If I could have a table of such height that when my arms are dropped to my sides and the elbows bent to a right angle, the forearm would rest on the surface of the table; it would "fit" me; for then I would not have to bend the upper part of my body up and down—that is, move weight needlessly—and I would expend less energy. That may seem far-fetched, but it is not, because it is going to mean better equipment for the future; indeed, manufacturers are now interested to make kitchen equipment with adjustable legs, so that a tall woman will not have to work with equipment suited for a woman 5 feet 4, or a short woman work at a table too high for her. So simple a thing as changing the height of the kitchen sink would save many a woman much needless work.

The clothing and textile work is of interest, too. The cotton, wool, and other fibers which agriculture produces are all used very largely in the home for clothing and household purposes. Their right use (a matter largely in the woman's hands) is a great feature of consumption, as compared with agricultural production and distribution. As we use the terms "clothing and textiles," we do not mean fashions at all; we mean the study of wearing quality, ways of cleaning and caring for clothing so as to secure the maximum of service, and such things. For lack of funds, we have been able to do little experimental work, though we have collected and interpreted some useful information which the department is publishing as opportunity offers. What it is possible to do was shown when by the large amount of valuable information brought together last summer we were able to bring to Washington for three weeks a woman, now at the home economics department of the Iowa Agricultural College who is better fitted than anybody we have heard of, to study by experimental methods such questions as they are related to home problems. Funds for such a specialist are greatly needed. If we could get such a woman as I have mentioned, she would do splendid work on such problems. These are not unimportant matters. I happen to know that manufacturers are very much interested in having the wearing qualities of cloth of different sorts determined, in order that they may make cloth that will give good wear for a given purpose.

For years we have been wanting to study those problems so that we could tell the housekeeper if she bought such and such a kind of

material for pillow cases or for table linen or for her children's clothing that she might expect that, given proper care, it would give service for so many months or years. As it is, she is not able to make such estimates for she must judge largely by appearance, and appearance is not a dependable indication of quality. Good appearance may be due to the fact that the goods has been heavily sized with starch and may not last after the material has been washed, or she may buy a piece of silk which looks all right, but which may soon drop to pieces, because it was too heavily weighted with tin or iron salts, which give "body" much as starch does. In a case I know of, the silk lining in an overcoat wore out after about two months. Pure silk will burn up and have no ash, or only a trace. A sample of this lining was burned and the ash left behind amounted to 50 per cent of the weight of the silk burned. The silk had been very heavily weighted with an iron compound. The dealer when informed took up the matter with the jobber and it was satisfactorily adjusted. Information of this character (and much can be accumulated by laboratory research) should be provided for the housekeeper to enable her to judge the probable value of what she buys.

Mr. McLAUGHLIN of Michigan. If the housekeeper or if a woman were going to buy silk, and two pieces were shown, one that was weighted and one that was not, can you teach her to distinguish between them?

Dr. LANGWORTHY. Yes, sir. It is a very simple thing to make a test which will show weighting and roughly, at least, the amount of weighting. As silk burns it seems to melt and has an odor like burning wool. Pure silk will burn up so that you have practically nothing left. If it is weighted, more or less ash will be left behind. If it is heavily weighted, the ash often retains the form of the silk before it was burned, so that one can see the weave. To cite a particular instance of the value of such a test, the wife of one of the men in the States Relations Service showed us a sample of silk and asked about its quality. We told her that it was probably weighted, as the price was low for pure silk. This proved to be the case when a test was made and she had data which would enable her to decide whether to buy the silk which looked well but would not wear very long or to pay more for a better quality which would give longer service.

Mr. McLAUGHLIN of Michigan. Is there no way of distinguishing except by burning?

Dr. LANGWORTHY. There are others, but they are not so simple. It is a simple test. Anyone can make it; if pure, the silk burns up; if not, it leaves a noticeable ash. A little weighting does no harm and may even improve the texture of the goods; but if there is a great deal the fibers break and the material goes to pieces. I believe about one-fifth of the total weight of the material is considered a safe amount. If the sample does not shrivel at all when burned, I should not buy the material.

Mr. McLAUGHLIN of Michigan. Is it an easy test to apply? Is not silk usually bought in the store without an opportunity for applying the test you suggest?

Dr. LANGWORTHY. Usually a sample will be given on request, and this can be tested at home. If a guarantee could not be obtained for

a ready-to-wear garment, I would ask for a tiny scrap from the inside of a seam, for instance, and test it for quality.

Such matters as these are perfectly practical. In a series of Thrift Leaflets published by the Department of Agriculture, cooperating with the Treasury Department, many suggestions are made which will enable a housekeeper to choose clothing and household equipment wisely, so that it will give a maximum of good service and so make our incomes go further.

Mr. YOUNG. The burning test is an old test to determine whether a piece of cloth is wool or cotton?

Dr. LANGWORTHY. Yes, sir; you can tell wool from cotton in that way, but you can not apply the test to mixed goods. However, one can dissolve the wool in mixed goods by using a caustic alkali—soda, for instance—and leave the cotton behind.

Mr. YOUNG. It is curious to note that when you go into a gentleman's furnishing store how what you take to be wool is 80 per cent cotton.

Dr. LANGWORTHY. I think the manufacturers want to do the right thing, and I do not think that goods are often knowingly sold with fraudulent intent. However, I want the housekeeper to have knowledge so she may know what she wants and buy intelligently. Manufacturer and dealer are the first to see the importance of this, I believe.

You will recall, I am sure, the work with the respiration calorimeter. It is proving of great potential value, and we want to increase it and make it really effective. Before the war we were working on the incubation of hens' eggs. With tested eggs an incubator is probably not over 55 per cent efficient on an average, while the hen hatches about 95 per cent of the fertile eggs that you give her. From the results we obtained we have good reason to think that we are on the track of the trouble with the incubator, and it is needless to say that if we succeed in solving the problem the return to agriculture would be far beyond any sum that we have spent for home-economics work or contemplate spending.

We have not been able to do all we should with the bee problems, such as the control of the wintering bees so that it may be done economically and with a minimum loss of bees. The work was done at the request of the Bureau of Entomology and the results were used but more data are needed.

The question of the nature, extent, and control of the changes that take place in fruits and vegetables in storage is attracting a good deal of attention. Our respiration calorimeter studies of such problems give very promising results and have attracted the attention of those interested in such problems and a demand for more information. Apples, potatoes, celery, pineapples, bananas, and such things are still living things when they go into storage in cars, ships, or storage plants. With the pineapple and the banana the problem is largely to keep them green until they can be gotten from where they grow to the place where they are to be used and then to ripen them. Bananas are, as everyone knows, received green and ripened by hanging where it is moderately warm, often, in the trade, in banana cellars. With a respiration calorimeter which we have devised, the nature of such changes is studied and their possible control. We are confident we can obtain information which will be of great value

in the handling and marketing of such products and benefit both the producer and the consumer.

Apparently cold-storage charges for fruits and vegetables have been based on estimates rather than on determinations of the specific heat and the heat elimination of products in storage. The Bureau of Markets asked us if it were possible to study the matter of specific heat, and especially with regard to apples. All substances retain a certain amount of heat, called the specific heat, which varies with the material. The specific heat of water is taken as 1 and the specific heat of every other substance compared with it. Information about the specific heat of apples was wanted in order to determine what part of the cost of cold storage should be charged to the withdrawal of this specific heat when the fruit is first placed in cold storage. One must also realize that the apple is a living thing. The ripening and mellowing changes mean that some of its substance is oxidized and heat is produced. Information regarding specific heat of apples and heat due to ripening changes which we obtained were appreciated, but the chief result of the investigation was the demonstration of the commercial importance of this kind of work. The specific heat of the apples was found to be 0.9 and the heat they eliminated was 0.04 calories per hour per kilogram of fruit at room temperature.

Mr. McLAUGHLIN of Michigan. What is that, (Fahrenheit)?

Dr. LANGWORTHY. About 70 degrees.

Mr. McLAUGHLIN of Michigan. You say you have worked out some of these things respecting cold-storage products. Do you know of any cold-storage people, either the owners of the plant or those who own the product, that have taken advantage of and use your methods?

Dr. LANGWORTHY. This calorimeter work represents only a beginning, but it has aroused considerable interest. The Bureau of Markets has made use of data, I understand, and that the trade is interested in the matter we have good reason to believe.

Mr. McLAUGHLIN of Michigan. You have nothing ready to give to the trade?

Dr. LANGWORTHY. We have only a little to make public, but we are getting something. The interesting thing to me is that we have proved that in this respiration calorimeter we have a device valuable far beyond our expectations for studying such distinctly agricultural problems of commercial importance. They are of interest also to the home, because they have to do with the possible market supply of food products. If the times were such that we did not have to think of economy, I know of nothing that would seem to me more promising as a profitable line of work than extended research involving considerable sums for this calorimeter work. A small increase has been asked for the calorimeter work, and I do want to speak of its value for agricultural research. You see, when it touches such a problem as increasing the efficiency of artificial incubation of hens' eggs and the economical wintering of bees; when it promises to give information which will help in estimating the actual cost of storage and which will enable us to control better the changes which take place in fruits and vegetables in storage, it is potentially a very important kind of experiment.

Regarding the work in home economics as a whole, the increase asked for would provide for a modest and logical development of the kinds of work now going on, and enable us to meet somewhat more

fully the demands that are made on us for information. I feel that I can truly state that we have used efficiently the sums that we have had, and I believe that our plans for future work are rational ones. Home economics is really science applied to the problems of the final consumption of agricultural products, and we can not get the full value of the products of our soil unless we apply science to consumption as we have applied it to production and distribution. This is particularly impressed upon us in these days, when prices have gone so high and the incomes of many families have not kept up with them. The average housekeeper needs expert help to keep up her family standard of living, just as a farmer needs expert help in producing and marketing his crops.

Mr. HUTCHINSON. When you began your statement, Doctor, you interested me with a reference to hard winter flour, hard wheat flour. Do I understand you to say that hard wheat flour would take less fats?

Dr. LANGWORTHY. The use of hard wheat flour in foods for deep fat frying means less absorption of fats, other things being equal. Apparently the gluten forms a "crust" through which the fat does not penetrate.

Mr. HUTCHINSON. What is the reason? Is there more water in the hard wheat?

Dr. LANGWORTHY. It is due to the gluten.

Mr. ANDERSON. Is it due to the character of the gluten or to the percentage of gluten in the wheat?

Dr. LANGWORTHY. To both, as I understand it.

Mr. HUTCHINSON. Then you have not gone far enough to have given a definite reason why it takes less fat for hard winter wheat than the soft?

Dr. LANGWORTHY. No, sir; not in detail. We are not equipped for the kind of chemical work which would be needed in order to give the reason.

Mr. HUTCHINSON. It has always been the custom of the housewife to use soft wheat for pastry and cakes in preference to hard wheat.

Dr. LANGWORTHY. She can get good results with either hard or soft wheat flour if she knows how.

Mr. LEE. Were these pies here made with hard-wheat flour?

Dr. LANGWORTHY. For the pies soft-wheat flour was used and for the doughnuts hard-wheat flour. The economy of fat in the pie crust depends in part upon lessening the usual amount of water and in part upon the way the ingredients are mixed. It is not a flaky pie crust such as many women like to make, but it is a tender, wholesome pie crust and means a considerable saving in the use of fat.

The CHAIRMAN. What benefit is derived from saving fat?

Dr. LANGWORTHY. An economy in the cost and, in the case of doughnuts, a product of good quality more wholesome than one very rich in fat.

The CHAIRMAN. A variety of food is required to keep the body in normal condition, which requires fat, carbohydrates, protein, mineral, and water?

Dr. LANGWORTHY. Yes, sir.

The CHAIRMAN. You take that into consideration?

Dr. LANGWORTHY. Yes, sir.

The CHAIRMAN. Then what is the gain?

Dr. LANGWORTHY. We have learned that it is a very easy matter, without taking care, to get a diet which is overrich in fat. A better balance of nutrients is secured and a saving in cost effected when such matters are given attention.

The CHAIRMAN. Your contention is that a doughnut contains too much fat?

Dr. LANGWORTHY. Not necessarily; but frequently such is the case. Usually when a housekeeper makes a doughnut which is not pretty short to start with she gets one that is breadlike and rather tough the next day. We can give her definite directions for making doughnuts which are not over fat and which are not tough the next day. This example was used as an illustration of the way in which the results of scientific study of cooking problems can be applied practically in households to give better quality, more rational food, or greater economy.

Mr. JACOWAY. How long have these been made?

Dr. LANGWORTHY. The doughnuts and the pies were made this morning.

Mr. LEE. You have bulletins on this subject?

Dr. LANGWORTHY. No, sir; not as yet.

Mr. HUTCHINSON. In the cooking of the doughnut does the time that it remains in the fat have something to do with it?

Dr. LANGWORTHY. Yes, sir; that has something to do with it, but other things being equal what has been said is true. The surface exposed to the fat, which means the shape of the doughnut, has something to do with it also. With a hole in the doughnut, the surface exposed to the fat is larger than without it.

Mr. HUTCHINSON. Then, the length of the time has a great deal to do with it?

Dr. LANGWORTHY. Yes, sir. At meetings of bakers' societies and such gatherings reports of work of this sort are received with much interest.

Mr. McLAUGHLIN of Michigan. You said that some of these things are interesting, but you are not asking an increase for those lines of work. Will you indicate for the record the lines for which you do wish an increase?

Dr. LANGWORTHY. Yes, sir; I can tell you what they are.

Mr. McLAUGHLIN of Michigan. Can you tell us how much money you wish for each branch? I thought possibly some of the work that you spoke of would appeal to the committee as necessary or proper to be extended and some might not.

Dr. LANGWORTHY. The bill as reported specifies an increase of \$30,000 less transfers to the statutory roll; this increase to be divided between the two projects under which the work is considered as follows:

(1) For studies of food, clothing, and textiles, and household equipment and management, \$24,280.

(2) For investigations with the respiration calorimeter, \$5,720.

The first of these two sums we would subdivide as follows:

(a) \$10,000 for study of food and its uses in the home.

(b) \$8,000 for study of clothing and textiles.

(c) \$6,280 for study of household equipment and household labor.

The sum for calorimeter work we have not tried to divide, but we would use it specially to study the problems of the possibility of

bettering the artificial incubation of eggs and to collect data relating to the storage of fruits and vegetables.

Mr. HUTCHINSON. Doctor, your department is a sort of fountain-head for the home demonstrations, is it not?

Dr. LANGWORTHY. Yes, sir. This is the only part of the department specifically authorized to supply such subject matter, and it is on the basis of the subject matter here collected that the school textbooks and college textbooks get most of their information on food.

Something was said to-day of nuts and their value as food. So far as I know, practically all the knowledge of nuts as food comes from the department studies of food.

The CHAIRMAN. Are you issuing any bulletins this year?

Dr. LANGWORTHY. Yes, sir; we have turned in the manuscript of five or six Farmers' Bulletins this year.

The CHAIRMAN. How many bulletins have been issued from your bureau?

Dr. LANGWORTHY. As a whole, the work has provided over a hundred Farmers' Bulletins and other popular publications, fully as many technical publications, and many more short summaries for publicity work. The amount of publicity material is comparatively large, because we regularly contribute one article a week to the department news service.

Mr. McLAUGHLIN of Michigan. Have you seen this chart behind you?

Dr. LANGWORTHY. Yes, sir.

Mr. McLAUGHLIN of Michigan. If that plan should develop, some scientists or experts from your office would go out, I presume, to assist the county agents in extension work. On what subjects?

Dr. LANGWORTHY. It would be on nutrition and clothing, and possibly we could be of some help on home hygiene also. We have occasionally been invited to some of the northern or southern extension meetings, but we do not regularly go out as experts. Of course, we would like to go out if there were opportunity, for this gives us a better understanding of what is needed throughout the country; but the home economics experts come to Washington rather frequently, and we try to meet them and talk with them. As a matter of fact, the extension offices and the Office of Home Economics together have equipped a laboratory so that we can give demonstrations of the new things if they wish when they are in Washington for any purpose. We try to reach them just as much as we can, and I will say the spirit of cooperation between the Office of Home Economics and the other offices, as well as between the States Relations Service and other departments, has been extremely satisfactory. The Treasury Department turned to us for help in their thrift campaign and drew on the information which we had.

The CHAIRMAN. What service did you render in connection with war activities? You assisted the Red Cross and others?

Dr. LANGWORTHY. Yes; we worked with the Red Cross and helped them prepare their textbooks on dietetics, and from the beginning we worked with the Food Administration.

The CHAIRMAN. You assisted them in the regulations?

Dr. LANGWORTHY. I was a member of one of the committees, the food and alimentation committee; we worked with the Food Administration just as effectively as it was possible for us to do. Our

work was naturally along the lines of food conservation. I was also a member of a district food administration committee.

Dr. TRUE. We prepared a large number of special leaflets for the Food Administration.

The CHAIRMAN. So I understood.

Dr. LANGWORTHY. We prepared a series of 24 food leaflets with them. We worked with them and got out a series of 10 lessons and 3 books for use in teaching food conservation: "Food and the War," "Food Guide for War Service at Home," and "Food Saving and Sharing." We also got out a bulletin with the women's committee of the Council of National Defense on "Agencies for the Sale of Cooked Food Without Profit," and, in cooperation with the women's committee and the Food Administration, a series of lessons for women's clubs, entitled "The Day's Food in War and Peace."

The CHAIRMAN. Is that all, Doctor? Thank you very much.

Will it take you very long, Dr. True, to complete the remaining items?

Dr. TRUE. There are three items. The large item is the item which relates to the experiment stations in Alaska and the island possessions.

The CHAIRMAN. That is the most important one?

Dr. TRUE. That is the most important one.

(Thereupon, at 5.30 o'clock p. m., the committee adjourned until to-morrow, Saturday, January 10, at 10 o'clock a. m.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Saturday, January 10, 1920.

The committee met at 10 o'clock a. m., Hon. Sydney Anderson presiding.

STATES RELATIONS SERVICE—CONTINUED.

STATEMENT OF DR. A. C. TRUE, DIRECTOR OF THE STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

Dr. TRUE. The item we want to take up now is No. 40, on page 220, "To enable the Secretary of Agriculture to investigate and report upon the organization and progress of farmers' institutes and agricultural schools." This amounts in the estimate to \$16,360, to which must be added \$3,040 transferred to the statutory roll, making a total amount for this work \$19,400. This is \$1,200 less than the appropriation for the current fiscal year, because we have dropped one clerk who has been transferred to another roll.

About \$5,000 of this amount is spent for the work relating to the farmers' institutes. On that work we employ one man called a farmers' institute specialist, and one clerk, and the work consists mainly in the preparation of lectures on agricultural subjects, accompanied with lantern slides.

Mr. ANDERSON. Does this mean field work, or is this a supervisory official?

Dr. TRUE. He spends most of his time in Washington in the preparation of publications for use by the farmers' institutes lecturers;

he also goes out to consult with the directors of the farmers' institutes in the different States to find out how their work is going on and what they want him to do to help them.

Mr. LEE. He prepares those slides?

Dr. TRUE. He prepares the illustrations and the syllabi of lectures for use in the farmers' institutes, and also the annual report showing the work of the institutes throughout the United States and the work of similar institutions in foreign countries. It was supposed that the farmers' institutes in the United States would perhaps decline greatly and go out of existence as the extension work developed.

Mr. ANDERSON. Why?

Dr. TRUE. Because it was supposed that the extension work and the meetings of the farmers held in connection with the demonstration work would supply the place of the institutes. As a matter of fact, however, the farmers desire to keep up the institutes; so that work has continued. There are still 15 States in which the farmers' institutes are maintained by the State departments of agriculture instead of by the agricultural colleges.

Mr. ANDERSON. Is it the policy of the department to discourage the holding of institutes now?

Dr. TRUE. No, sir; we do not discourage it, but we believe the institutes should operate in conjunction with the extension work and are favorable to putting the institutes under the control of the agricultural colleges.

Mr. ANDERSON. My experience has been, at least before the extension work was developed to the extent it is now, that there was a very great and constantly growing interest in the farmers' institute work and that it was a very valuable work and one which was contributed to by local people as well as by the Department of Agriculture and the colleges. I should dislike very much to see it discontinued.

Dr. TRUE. There does not seem to be any prospect of its being discontinued. All the department is trying to do in connection with that is to make the instruction more practical. There has been a tendency at times in the institute work for meetings simply to be places where there was a lot of talk without much point to it in a practical way. Where the institutes are properly managed and are linked up with the extension work, that is overcome in a large measure. The farmers seem to regard this institute work as, in a sense, an open forum for the discussion of matters by themselves and by the experts that are called in.

Mr. LEE. I think it is a pretty good thing, Doctor.

Dr. TRUE. They like that sort of a thing.

Mr. LEE. I do, too.

Dr. TRUE. A sort of referendum on the matter was taken in the State of New York not long ago, and the farmers voted very decidedly in favor of continuing the institutes, and in that State the institutes were transferred to the agricultural college by the legislature.

Our records show that in 31 States which reported to us in 1918, 6,941 institutes were held, which were conducted by 2,000 lecturers and had an attendance of about 2,000,000 persons.

The remainder of this fund, about \$15,000, is spent on the work relating to the agricultural schools. The force employed on this work prepares publications and illustrative material in suitable form for immediate use in the schools where agriculture is taught. It is through this office that the department has its outlet to the agricultural schools and puts material for the schools in suitable form for immediate use. These publications are, of course, based mainly on the results of the work of the department and the experiment stations.

Mr. McLAUGHLIN of Michigan. I wonder if it would be convenient for you to let the committee have a sample of each of your publications, so that we can see just what they are?

Dr. TRUE. Yes; we would be glad to give you a set of them, of course.

Mr. McLAUGHLIN of Michigan. A great deal of money is being spent in publications, and there is a difference of opinion in some quarters as to the wisdom of some phases of that kind of work. I do not know enough about your kind of work to judge, although I know something about it.

Dr. TRUE. I shall be very glad to furnish the committee with them. Do you want those not only with reference to agricultural education but to all the work of the service?

Mr. McLAUGHLIN of Michigan. I think so. Just a sample of what goes out from your bureau.

(Mr. Haugen took the chair at this point.)

Dr. TRUE. We also have, through this appropriation, an opportunity to carry out the provision of the vocational education act, which provides for cooperation between the Federal Board for Vocational Education and the Department of Agriculture in studies relating to agricultural education, with special reference to schools in which the Smith-Hughes vocational education money is used. Examples of our work in this office are leaflets showing teachers how to use certain Farmers' Bulletins. These are also lessons on dairying, potatoes, etc., for the elementary schools. A good many of the States now require teaching of agriculture in the elementary schools, and it is difficult for them to obtain the properly qualified teachers for this work. So we endeavor to partially help out this situation by giving these teachers publications showing them definitely how they can give simple elementary instruction in agriculture.

Mr. McLAUGHLIN of Michigan. Is the expense of printing all this matter relating to your bureau, and all you have spoken of, charged against the bureau and carried in these estimates?

Dr. TRUE. No, sir; the printing is paid out of the general printing fund of the department.

Mr. McLAUGHLIN of Michigan. You carry nothing for that; your estimates carry nothing for printing?

Dr. TRUE. Nothing for printing. One thing we have done recently in cooperation with the Federal Board for Vocational Education has been to prepare a course of study in agriculture, particularly crop production, for the Negro schools which receive the benefits of the vocational education act. In carrying out this work, we prepared a bulletin and took it down to the Hampton Institute last

summer, where the teachers of the Negro schools in the Southern States congregate for short courses, and there we went over this bulletin with the teachers and gave them instructions on it, and also gave them information on this matter in order that we might make the publication most useful to those Negro teachers.

We are now engaged in cooperation with the college of agriculture and the State department of education in Arkansas in the preparation of a course of study in agriculture for the elementary schools of that State.

That is all I need to say about that item unless there are some questions.

Dr. TRUE. The next one is item 41, on page 220, "to enable the Secretary of Agriculture to establish and maintain agricultural experiment stations in Alaska, Hawaii, Porto Rico, the Island of Guam, and the Virgin Islands of the United States," for which the estimate this year is \$230,000. This is an increase of \$15,000, which is brought about in this way: There is an increase of \$15,000 for the Alaska stations and \$5,000 for the station in the Virgin Islands, and there is a decrease of \$5,000 for the station in the Island of Guam. These stations engage in research and extension work, but are not connected with colleges. They are wholly Federal stations; the general business connected with their administration as Federal institutions is conducted through our Office of Experiment Stations, and the expense of this administrative work is borne by the appropriation for that purpose. It is not included in this item which we are explaining now. This work has been explained to the committee from year to year, but, if you desire me to go into this as regards the individual stations, I shall be glad to do so.

Mr. ANDERSON. I do not know about the rest of the committee, but I would like to know particularly with reference to what has been done in the Virgin Islands. I read a short article some time ago in regard to the work being done down there and it rather interested me. I would like to know a little more about what has been done. It seems to me the work was very satisfactory to the people there, at least.

Dr. TRUE. Dr. Evans, who has charge of this work, can explain that.

STATEMENT OF DR. WALTER H. EVANS, CHIEF OF THE DIVISION OF INSULAR STATIONS, STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE.

Dr. EVANS. The station in the Virgin Islands was taken over January 1, 1919, just a year ago. It had been established by the Danish Government and was located about 3 miles from the principal town on the Island of St. Croix, which is the largest island of the group. The staff consisted at the time it was taken over of one man, who was scientist, manager, and everything else. The tract embraced about 235 acres, 170 acres of which are in cultivation and pasture. The principal income of the station has been for some time from the produce that was grown, largely sugar cane, which was sold to some of the sugar mills. The receipts from the sugar cane, from pasturage, and from other crops that were grown constituted practically the only source of income of the station prior to January 1, 1919,

when we took it over. Having such a limited income, the station had run down very materially and a large amount of work was necessary in the way of repairs to buildings and additions to the equipment, so that a considerable portion of our appropriation for the past year was devoted to the building up of the station. We have added an entomologist and zoologist to the staff, who is making a study of the insect and other pests. The former director was retained, and he is engaged in plant breeding and plant introduction work.

The principal lines of work that are being conducted are cultivation and fertilizer experiments with sugar cane, cotton, corn, and various forage crops, and some work has been done with coconuts. The agronomist is carrying on plant-breeding work in connection with the sugar cane and in addition to cultivation and fertilizer experiments, and has developed a variety of cane which he calls "S. C. 12/4," which is very productive and has a considerably higher sugar content than any variety that has been grown previously on the island. This he has distributed to the other plantations and has also sent some of it over to Porto Rico, where it is doing very well.

Mr. McLAUGHLIN of Michigan. Normally, what is the sugar content as compared with the crops in Cuba and Louisiana?

Dr. EVANS. The sugar content in the cane in St. Croix, as far as my information goes, is about the same as that in Cuba and a little higher than it is in Louisiana.

Mr. McLAUGHLIN of Michigan. Have you gone far enough with that to determine whether you can increase the sugar content?

Dr. EVANS. No. The sugar content of this cane is 2 or 3 per cent higher than the average of the cane cultivated in the Virgin Islands. Of course, this variety has not yet been established long enough to get in general cultivation, but it is grown on a considerable scale on one or two plantations, and the probabilities are that at the end of the present season there will be enough to plant several hundred acres.

Mr. McLAUGHLIN of Michigan. There is nothing to interfere with its being brought over to this country for use in other places?

Dr. EVANS. Not if adapted. I do not know whether it is adapted to Louisiana conditions or not. Of course, there is a Federal quarantine on all sugar cane at present, but for scientific purposes it can be brought in.

Mr. LEE. Do they have to plant the sugar cane every year down there?

Dr. EVANS. No; the cane is ratooned, and that is one of the problems we are working on. Where they ratoon the cane—that is, cut the cane down to the ground and let it sprout up again—if they follow that too long it becomes a question of the adjustment between the cost of replanting and the net profit.

Mr. LEE. In replanting, do they just lay the stalk in the row, or do they plant the seed?

Dr. EVANS. The stalk is generally cut in sections of about three or four joints, and these sections are planted in a row right down the field.

In addition to the cane breeding which I have just described, work is in progress with cotton, and there has been produced a very fine type of Sea Island cotton that has a long fine lint and gives a very good yield for that type of cotton. This cotton has been under

observation for several years in the Virgin Islands, and early last spring some of the seed was sent to the department and it was tried out last summer in connection with the work that the department is doing with the Egyptian type of cotton in Arizona. It proved to be a cotton requiring too long a season for that region; it did not mature, and they have taken some of the best plants, removed them to the greenhouses, and expect to keep them going this winter and will use them next year in some hybridization work. The gentleman in charge of the work for the department in Arizona told me there were some features in the cotton that looked very favorable to him and he wanted at least to run the thing far enough to see whether it could be adapted to Arizona conditions. It probably would not be adapted to the coast regions in South Carolina, Georgia, and Florida, for the reason that the rainfall in St. Croix is very low. There are no high mountains on the island and consequently the clouds pass by and the rainfall is very low, more comparable with the conditions in Arizona; so it is thought that that would be the best place to test the cotton out.

Mr. McLAUGHLIN of Michigan. Who is doing this work in Arizona?

Dr. EVANS. That is being done by the Bureau of Plant Industry in cooperation. Mr. Kearney has charge of that work.

Mr. McLAUGHLIN of Michigan. In cooperation with whom?

Dr. EVANS. It is regular Bureau of Plant Industry work. I furnished the seed and asked them to test it.

Mr. McLAUGHLIN of Michigan. It is cooperation with you?

Dr. EVANS. Yes, sir. Another line of work being carried on there is with corn. Corn furnishes one of the principal foods of the people of the Virgin Islands, and there is quite a lot of work going on in developing better varieties. While corn is generally supposed to have originated in the tropics, as a matter of fact there are not very many tropical varieties of corn that yield highly. The best varieties of corn are produced in regions considerably removed from the tropics, and work is now in progress to try by the ear-to-row selection to secure some variety of corn that will yield more highly. Dr. Smith has succeeded in getting one strain, which is grown to a considerable extent, that yields about double what is the average crop of the island. This corn used to be formerly ground in a mill at the station and sold to the people on the plantations, the laborers and others, and the sales from cornmeal were quite an appreciable item in the former maintenance of the station. He introduced, also, from Barbados a variety of sweet potato that has been extensively planted throughout all the Virgin Islands. It is much more prolific and has now practically supplanted all the varieties that were previously grown.

Mr. ANDERSON. How recently was that?

Dr. EVANS. That was brought over from Barbados about four years ago.

Mr. LEE. There is a Porto Rico sweet potato which is a very excellent potato.

Dr. EVANS. It is quite similar to the one grown in Barbados but not the same variety.

Mr. LEE. What is the yield per acre down there?

Dr. EVANS. I really could not say; I have no information on that. Incidentally, I will say that all the statistics that have been

collected from the Virgin Islands, until the census was taken a year and a half ago, were very, very vague and very indefinite.

The CHAIRMAN. Can you give the amount of revenue derived from the crop on the Virgin Islands?

Dr. EVANS. The appropriation for that station is \$15,000.

The CHAIRMAN. Do you sell the crop?

Dr. EVANS. That all goes into the Treasury.

The CHAIRMAN. How much is turned into the Treasury?

Dr. EVANS. I have not the exact figures, but for the period of the year from January 1 to July, it amounted to in the neighborhood of \$3,000, I think.

Mr. LEE. Your principal income would be between those months?

Dr. EVANS. No; the sugar income is later than that.

The CHAIRMAN. Can you approximate the amount that is turned into the Treasury as a result of these appropriations?

Dr. EVANS. From all of them?

The CHAIRMAN. Yes; from all of them.

Dr. EVANS. For the past year it amounted to \$4,727.56.

The CHAIRMAN. From all the stations?

Dr. EVANS. Yes; from all the stations.

Mr. McLAUGHLIN of Michigan. Are you doing anything there in the way of directly advising and assisting the people in agriculture; anything like extension work, I mean?

Dr. EVANS. That is one of the things we wish to take up under the increase we are asking for. We want to put on another man who shall be a trained horticulturist and who would probably make his headquarters on the island of St. Thomas. His business will be to carry on horticultural investigations and to travel around to other places in the principal islands, acting as a sort of a county agent in giving advice to the people, not only as to horticulture but as to the other matters pertaining to agriculture. We will want, also, a plant pathologist to study some of the diseases which are very prevalent and very troublesome.

Mr. McLAUGHLIN of Michigan. I thought you had a man like that; what did you call him?

Dr. EVANS. He is an entomologist; he is working on scale insects, the corn borer, and two or three grubs that occur in the soil and cause a great deal of loss to the sweet potato crop, and things of that kind. The entomologist is working on those problems.

Mr. ANDERSON. Are those bugs down there all new?

Dr. EVANS. They are not new, so far as I am acquainted with them, but there are problems in connection with their control that are new.

Mr. McLAUGHLIN of Michigan. Do you need a man for each of those lines of work?

Dr. EVANS. It is almost impossible to get a man trained both as an entomologist and pathologist these days. All the institutions have so narrowly specialized their men that you can hardly find a man now who is conversant with both subjects.

Mr. McLAUGHLIN of Michigan. Would it later be necessary for an expert in each line to go from the department to look over the work frequently?

Dr. EVANS. In the event we got a good man, if the department sends an expert, he will not have to go at the expense of the station but at the expense of the bureau. He will go more as an advising

visitor than as an investigator. The probabilities are that the plant pathologist would not be added to the station for some time, but rather a chemist who should take up some of the questions of chemistry in connection with fertilizing and cane-sugar manufacturing, which would be, perhaps, the more urgent just now. But we do want a man to act as agricultural advisor for all of the islands. Travel is rather difficult between the different islands, and with only two men on the staff of the station to look after the work, which is going on on 170 acres, you can not do very much in the way of traveling from place to place.

Mr. McLAUGHLIN of Michigan. Have you an estimate of the arable land in these islands?

Dr. EVANS. That is given in the census report. I do not have the figures with me.

Mr. McLAUGHLIN of Michigan. I have seen it but I have not the faintest idea what it is. Don't you recall it at all?

Dr. EVANS. It was given in the census report, but I do not recall how much the arable land amounts to.

Mr. ANDERSON. What is the population?

Dr. EVANS. About 17,000.

Mr. ANDERSON. That is, for all the islands?

Dr. EVANS. The three populated islands.

Mr. McLAUGHLIN of Michigan. Do you travel to all these outlying stations?

Dr. EVANS. From time to time; I try to visit them as often as I can.

Mr. McLAUGHLIN of Michigan. How often have you been able to do it?

Dr. EVANS. The last trip I made was three years ago when I went to the Hawaiian station.

We are asking for an increase for the Alaska station that I should like to discuss, if the committee desires to hear me on the matter.

The CHAIRMAN. How many people have you in Alaska?

Dr. EVANS. In the station work?

The CHAIRMAN. Yes. Can you give the number employed there by the department altogether?

Dr. EVANS. I do not know how many the Forest Service has, but we have 11 regularly employed; that is, commissioned employees.

The CHAIRMAN. How many stations have you?

Dr. EVANS. Five.

The CHAIRMAN. Scattered over the Territory?

Dr. EVANS. Scattered over the whole Territory. One is at Sitka, in southeastern Alaska; one at Fairbanks, in the Tanana River Valley; one at Rampart, in the Yukon Valley; one at Matanuska, in the Matanuska Valley, through which the new railroad is being built; and the fifth is at Kodiak.

The CHAIRMAN. You were stationed in Alaska at one time?

Dr. EVANS. I made two preliminary surveys of the Territory.

The CHAIRMAN. You are familiar with the country?

Dr. EVANS. Yes.

The CHAIRMAN. What can you tell us about the reindeer up there?

Dr. EVANS. The reindeer are mostly on the Seward Peninsula, in the vicinity and to the north of Nome, quite a distance from any of our experiment stations.

The CHAIRMAN. Is the industry prospering?

Dr. EVANS. Our department, of course, has nothing whatever to do with the reindeer industry. That comes under the Bureau of Education. The information I have is that they are prospering very materially.

The CHAIRMAN. It has been suggested that that work should be transferred to the Department of Agriculture—that it could be better taken care of by the Department of Agriculture than by the Bureau of Education. Would that be handled in connection with your work up there?

Dr. EVANS. I very much doubt it, as the nearest station we have is at least 600 miles from the reindeer country.

The CHAIRMAN. You would not have to have a station?

Dr. EVANS. It would necessitate the establishment of another station in order to do that.

The CHAIRMAN. Would it be necessary to have a station to take care of it?

Dr. EVANS. There would have to be some one there to direct it and take care of it.

Mr. HARRISON. I might say that Mr. Nelson has prepared a rather detailed letter for the information of the committee explaining the situation and indicating just what would be necessary.

The CHAIRMAN. My understanding was that Dr. Evans was familiar with the situation.

Dr. EVANS. I have never been in the reindeer country.

The CHAIRMAN. You have been through the country?

Dr. EVANS. I have been through the country to the east of that.

I would like for a few moments to explain the necessity for the increase we are asking for the work in Alaska. We are asking for \$15,000 for buildings. When we began work at Fairbanks in 1907 a man was sent up there and built a two-room log house from the spruce trees on the tract he cleared for beginning operations. Later he built another two rooms, bringing it up to the side of the original two and making that a four-room house. That was built in 1907 and 1908. The house was built of green spruce logs. Those have rotted now to such an extent that we need a new house. We have nothing there in the way of a dwelling except this original log house that was built by the first man we sent there.

Mr. ANDERSON. Where is this?

Dr. EVANS. At Fairbanks.

Mr. LEE. At what cost?

Dr. EVANS. The cost of the log house?

Mr. LEE. Yes.

Dr. EVANS. I could not tell, because it was built by the man who worked there when he was not doing anything else. In a similar way he built a barn. We now have about 90 acres under cultivation and have added another man to the staff, and it is necessary that this man should live in the house with the superintendent and his family. The superintendent's family has increased until now he has five children, and the superintendent is complaining very much about having to have another man in a four-room house with him. So we desire to have an appropriation to secure the material for another house and also material for a barn. It is explained in the note under item 41 that the appropriation will merely supply the material.

The house will be built, as in the past practically all of our buildings in Alaska have been built, by the regular people engaged in experimental work. It so happens that the men we have in connection with the station are very ingenious men and can perform carpenter work, cement work, or anything of the kind. What we want at the Fairbanks station is a new house to serve as an office and laboratory and also a dwelling for the superintendent. Then this former four-room log house will be fitted up and made habitable for the assistant. The same condition is true at Rampart, where we have but one house with no other place for anyone to live on that side of the river, as it is on the opposite side of the Yukon from the town of Rampart. In that case, also, the assistants have to live in the house with the superintendent.

At Kodiak we want to replace the old silos, built in 1907, by new concrete silos. It is estimated that about \$800 will be required for the material. The work will be done by the men during the season when they are not engaged on other work.

Mr. McLAUGHLIN of Michigan. How large are they?

Dr. EVANS. About 150-ton silos.

Mr. LEE. For the two?

Dr. EVANS. One hundred and fifty tons each. For the stock we have at Kodiak, it requires in the neighborhood of 250 tons of silage a year.

Mr. McLAUGHLIN of Michigan. Won't you have to hurry to build two silos of that capacity with \$800 in that locality? But you say the work is all supplied; I did not have that in mind.

Mr. LEE. It is rather cheap for the material.

Dr. EVANS. This estimate was made by Dr. Georgeson nearly a year ago, and I imagine cement has gone up with everything else and that it would be difficult for him, perhaps, to come within the estimate that he gave at that time.

Mr. McLAUGHLIN of Michigan. It could not be built in the city of Washington for that.

Dr. EVANS. No; I think not. But this is only for the material. Of course, the sand is to be had right there on the beach and the main expense will be the cost of the cement.

Mr. McLAUGHLIN of Michigan. A wood silo is just as good; could not you get the wood up there—lumber?

Dr. EVANS. No; all the lumber has to be shipped. There is not a mill anywhere near there. The nearest lumber supply is from Seattle and Puget Sound, and the silos we put up there, both of them, have very seriously decayed, so they probably won't last more than a year or two longer.

The CHAIRMAN. Is it not cold up there for a silo; would not a cement silo freeze up solidly?

Dr. EVANS. I do not think it would freeze any harder than a wooden silo. The weather on Kodiak Island is not so cold.

The CHAIRMAN. Is there anything else?

Dr. EVANS. Not unless there is some question about the work of the other insular stations.

The CHAIRMAN. The work is going along about as it has in the past and is making progress, I suppose?

Dr. EVANS. We are making decided progress. We have carried on some rather special features in connection with the work of the

different stations related to war activities, and the work in Hawaii, Porto Rico, and Guam has, in the main, continued about the same.

The CHAIRMAN. Are the people in Porto Rico prosperous?

Dr. EVANS. They seem to be; as far as exports of crops would indicate, they must be in a prosperous condition.

Mr. McLAUGHLIN of Michigan. We are told that the population of Alaska is getting smaller; that it was greatly reduced during the war.

Dr. EVANS. During the war it was quite materially reduced, I am informed, but there is beginning to be quite a large movement of people that way, if we can judge anything by the requests we are receiving from individuals regarding homesteads in Alaska. We get a great many inquiries, particularly from the returned soldiers. I have had a great many inquiries regarding homesteads in Alaska.

Mr. McLAUGHLIN of Michigan. Have you been able to inveigle any of them into going up there?

Dr. EVANS. I have sent them the information we have; I have given them any advice we have.

Mr. ANDERSON. I had several requests of that kind recently in regard to homesteads in Alaska. I suppose there are plenty of them there?

Dr. EVANS. There have, as a matter of fact, been 503 homesteads taken upon there in the last few years, embracing about 130,000 acres. A large portion of them are in newly developed regions along the railroad, contiguous to the Matanuska station, which is being developed very rapidly and very satisfactorily. The only thrashing machine in the Tanana Valley is owned by the Fairbanks station. In a recent report of the cooperative work in that region, it is stated that there had been thrashed in 1919 for farmers: Wheat, 1,000 bushels; oats, 2,037; and barley, 120, with probably 500 bushels of grain still unthrashed. The station crop of grain for 1919 was: Wheat, 300 bushels; oats, 775; and barley, 125.

Mr. McLAUGHLIN of Michigan. Are the men in charge of your stations up there and in your employ generally natives of Alaska, or did you have to take them from down below?

Dr. EVANS. The superintendents of all the stations have been brought from other regions. We generally want some one who has had training in an agricultural college and that you can not get in the average individual who has gone to Alaska. The others employed there are secured locally.

Mr. McLAUGHLIN of Michigan. How much are these superintendents paid?

Dr. EVANS. The superintendents are paid——

Mr. McLAUGHLIN of Michigan. I see you have one at \$3,720.

Dr. EVANS. That is an estimate for the one in charge. He has charge of all the stations.

Mr. McLAUGHLIN of Michigan. He is located up there?

Dr. EVANS. He is located at Sitka and travels around to the different places. His present salary is \$3,500. The superintendents who are in charge of stations at Fairbanks and Rampart get \$2,820. The one in charge at Kodiak gets \$2,500, and the one in charge at Matanuska gets \$2,280.

Mr. McLAUGHLIN of Michigan. Is that the list we find on page 222?

Dr. EVANS. That is taken from the list I prepared. You will find that in the second column, "expended in 1918." They are all called agents, to conform to the civil service regulation that we can not appoint, except as an agent, any one without an examination; so they are designated as agents. In the second column are given the number employed during 1919, and those estimated for 1921 are given in the first column, headed "estimated for 1921." It is expected that we will have to promote every one of these men. The cost of living in Alaska, like every place else, has gone up and the men are seriously complaining that they can not meet their living expenses with the salaries that they now have.

Mr. PURNELL. How does the cost of living in Alaska compare with the cost of living here?

Dr. EVANS. For most things, I would say it would cost very nearly what it does right here in Washington. For many things they have to pay much higher. For provisions, particularly in the interior, that have to be shipped there, in many lines, they are much higher than they are here, even.

Mr. LEE. Clothing would be higher, too?

Dr. EVANS. Clothing and general supplies like furniture would be higher. Furniture is very, very high there.

Mr. PURNELL. Furniture has to be shipped from here?

Dr. EVANS. It has to be shipped from the west coast, and, of course, the ocean and other freights add materially to the cost.

Mr. McLAUGHLIN of Michigan. I see at the Guam station you have two animal husbandmen in charge.

Dr. EVANS. That is merely a statement of the expenditures in 1919. We had one husbandman in charge. We will have one in charge in 1921, and it is proposed to pay him to \$3,000 instead of \$2,700. The column headed "expended, 1919," gives the number and designation and salary of the individuals employed in that year. In the column headed "estimated, 1921," it gives the number, designation, and proposed salaries for 1921.

Mr. McLAUGHLIN of Michigan. Guam is not a very large island, is it?

Dr. EVANS. Guam is not a large island, but if we are going to carry on work along the lines that have been inaugurated we will have to have five or six men to do the work. The animal husbandman has general charge of the station and also the animal husbandry work. The agronomist carries on all the field crop work and has general charge of the agricultural and horticultural work, with one assistant. Extension work was begun last March; it is being continued, and we plan continuing it just as it has been with a slight increase to the man in charge.

Mr. McLAUGHLIN of Michigan. Do you remember the area of the island?

Dr. EVANS. The area of Guam is about 250 square miles. There are nearly 20,000 people on the island and the population is increasing. The last figures indicated that the population was increasing, and it is the desire of the governor of the island, as well as others who have made a study of the situation, to get the people into agricultural pursuits again rather than to depend, as they did for a while, on working for the Navy Department. We have just shipped (the boat sailed last Monday) some additional live stock to Guam. We

sent two more Ayrshire bulls, some Berkshire pige, and an additional lot of poultry. We are having exceedingly good results with the live-stock introduction.

The extension work that was begun in Guam in March, 1919, is carried on through the station cooperating with the educational department and the island government, and the number of enrollments in boys' and girls' club work, which consists largely of corn and pig clubs, is 499. That was up to the end of June—practically 500 in four months. There has been organized school garden work in connection with the schools throughout the island, and 377 boys have engaged in this work. Since that time there have been in process of organization poultry clubs, in which the girls are taking quite an active interest.

Mr. PURNELL. Do you know whether there is a shortage of teachers in the schools?

Dr. EVANS. In Guam?

Mr. PURNELL. Yes; or in Alaska; generally.

Dr. EVANS. There is a shortage of teachers everywhere.

Mr. PURNELL. I was wondering if there was any particular shortage there. The reason I ask the question (it is hardly in line with this) is that I have had a number of requests relative to information for positions in Alaska for school-teachers and I have not yet been able to get any information.

Dr. EVANS. I do not know specifically about it, and I could not give you any information. The Bureau of Education has charge of the schools and could furnish you with the information.

Mr. PURNELL. I have made no request of the Bureau of Education.

Mr. LEE. What type of people have they in Guam?

Dr. EVANS. The people in Guam are a somewhat composite race. They are probably of Malaysian origin, with a considerable Spanish mixture. It was a Spanish colony for several hundred years, and there is a large Spanish element of the population.

Mr. LEE. Are there any well-to-do or wealthy people on the island?

Dr. EVANS. There are really no rich people on the island and no very poor people. They have small areas where they carry on some of their planting work, and the men, to a large extent, work for the Navy Department in road building and things of that character. So there are neither any very rich people nor any very poor people. They did suffer very materially after the typhoon of July 6, 1918, when practically all the crops were destroyed. At that time the governor, acting through the experiment station, commandeered practically all the crops that were left on the island for seed purposes, and our station men went around and selected and took charge of everything in the way of a crop plant that looked as though it would mature enough to ripen its seed for planting purposes. They took charge of the seed, put it in large galvanized-iron containers, and kept it until the planting season, when it was planted. It happened that the best corn of the island was on the station. It was in some experimental work we were carrying on. The corn was needed to plant, and the governor commandeered the whole supply; and while it terminated a rather promising experiment, it enabled the people to have seed corn for planting in time to get it in before the next rainy season.

Mr. McLAUGHLIN of Michigan. What proportion of the total area of the island is devoted to agriculture?

Dr. EVANS. A very large proportion was formerly devoted to agriculture, but with the large demand for labor in building roads, the people gradually drifted away from their plantations and went to work on the roads. That condition became so serious that in 1908 the then Governor of Guam succeeded in interesting the Navy Department in securing, through the Secretary of Agriculture, an appropriation to investigate the subject of establishing a station and trying to see if it was possible to get the people back on their ranches. A station was established. A large number of improved crops have been introduced and are being widely disseminated; the live stock in the island is being gradually improved; and the general condition of the island, as reflected by the information from the station men and from the governor's report, is that the condition of the people has in 10 years very materially improved.

Mr. PURNELL. What is the population of the island?

Dr. EVANS. It is about 20,000. During the last few years it seems to be increasing rather than decreasing. There was a time that the population was decreasing.

Mr. PURNELL. What is the total area?

Dr. EVANS. About 250 square miles.

Mr. LEE. What is the rainfall?

Dr. EVANS. It varies. At the particular point where our station is located it is nearly 100 inches a year.

Mr. McLAUGHLIN of Michigan. The total area of the island is only about six townships. It would look to me as though the work of the Government was carried on there at considerable expense.

Dr. EVANS. There is nothing comparable to the work that is being done in that region. They are isolated, and if you are going to carry on any work it would be rather an expensive thing. It is expensive to carry on experimental work anywhere, and if you are going to have it carried on in an isolated region like that it will require a considerable provision.

Mr. McLAUGHLIN of Michigan. I see you are employing 25 men; that is the entire roll?

Dr. EVANS. That is the laborers' roll, the day laborers.

Mr. McLAUGHLIN of Michigan. Oh, no; that includes all of them.

Dr. EVANS. It is altogether, but it includes 20 day laborers.

Mr. McLAUGHLIN of Michigan. Yes, all together. There is an animal husbandman, an agronomist, and extension agents.

Dr. EVANS. There are 5 of what might be called scientific men and about 20 laborers. We have, where the main station is located, about 60 acres of land, a large portion of which is under cultivation. In addition to that we have, in another part of the island where we are trying to develop the live-stock industry, about 1,700 acres. It was bought from an estate some years ago at an almost nominal figure. I think it was only \$2,000, and when it was surveyed we found we had considerably more than we thought we were buying.

In connection with both those places it will take about 20 laborers to keep the work going.

Mr. LEE. Have they grazing the year around?

Dr. EVANS. Yes; there is a marked dry season in Guam and grazing during that season is very, very poor. One of the first things

we did was to introduce some forage plants, and the plants we have introduced have very materially improved the grazing possibilities of the island. The natives are very anxious to get those grasses we have for distribution to put out on their ranches.

Mr. McLAUGHLIN of Michigan. Besides the men employed there, these experts, our experience is that we have to have somebody to go out and look after each one, and then for each one of the employees in the field it takes several in the department to look after their work, and so on. It looks to me as though that is a pretty expensive proposition.

Dr. EVANS. I do not know of anyone having been sent from the department to Guam since I went there in 1908 to look over the situation and establish the station. The cost of their administration in Washington is very, very small.

The CHAIRMAN. Thank you, Dr. Evans.

AFTER RECESS.

The committee met pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

STATEMENT OF DR. A. C. TRUE, DIRECTOR OF THE STATES RELATIONS SERVICE, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN. We will take up the next item.

Dr. TRUE. The only other item is No. 43, on page 225, for the general administrative expenses connected with the States Relations Service as a whole, including the office of the director, the chief clerk, the officers in charge of publications, library, accounts, records, supplies, and property and for miscellaneous expenses incident thereto.

The CHAIRMAN. You are asking for an increase there?

Dr. TRUE. We are asking for an increase there of \$10,000 in all. This item is intended to provide for the general expenses of the service as a whole, which ought not to be met from other items. The expense of that work, which includes such things as salaries of general administrative officers, stationery, traveling expenses, equipment, and material for the general use of the service, telephone and telegraph service, and things of that sort, has materially increased necessarily. It is just another matter in which the high cost of living figures. The present appropriation is inadequate to provide for the things that ought to properly come under an item of this kind.

The CHAIRMAN. This covers the administration of all the activities of the bureau?

Dr. TRUE. Yes, sir; this covers the general activities of the bureau.

Mr. ANDERSON. Is this an administrative proposition?

Dr. TRUE. Yes, sir.

Mr. ANDERSON. I notice in your statement of persons employed under that item you have an agricultural physicist and five or six scientific assistants. I supposed this was an administrative and not a scientific proposition.

Dr. TRUE. You will notice that those people are employed on part time. From our point of view, that is the most economical arrangement. Take the first man there: He is in charge of all the editorial work of the service. At the same time, he participates in the inspec-

tion of the experiment station work and in the preparation of the Experiment Station Records. That is an arrangement we have had for a long time. That secures for us the employment of a high-grade man to look after the matters relating to our publications; at the same time we have his services for part of the time, and have had for the last 25 years, in connection with the work that we do for the stations.

Mr. ANDERSON. He has enough work of that kind so that it is reasonable to keep him employed on the lump-sum roll?

Dr. TRUE. Oh, yes; he is a scientific employee and the work he has to do requires such a person. He has to be responsible for the accuracy of our publications from the general point of view of the service; he has to be sure that the publications are right and in proper form for the printer. A similar arrangement is made for several other employees who are scientific assistants.

The CHAIRMAN. What is the salary limit of the clerks?

Dr. TRUE. Any clerk?

The CHAIRMAN. Is there any other limit than the \$4,500?

Mr. HARRISON. There is no other limit than the \$4,500, Mr. Chairman.

Dr. TRUE. But, as a matter of fact, we do not pay the clerks anything like that.

Mr. ANDERSON. You take them in through the Civil Service Commission under circumstances whereby their salaries are fixed; do you not?

Mr. HARRISON. To a certain extent; but there is no limitation upon their promotion up through the various grades. A clerk may come in at \$1,200 and may be promoted through the various clerical grades, for instance, to the position of chief clerk of a bureau.

The CHAIRMAN. You suggest one here at \$2,400.

Dr. TRUE. That is the highest one we have.

The CHAIRMAN. What does he do?

Dr. TRUE. He is the chief accountant.

The CHAIRMAN. What does the chief accountant do?

Dr. TRUE. Takes care of all our accounts.

The CHAIRMAN. In your bureau?

Dr. TRUE. Yes, sir; in our bureau. Our chief clerk is getting only \$2,000, which, in my judgment, is a very inadequate salary for the services performed.

The CHAIRMAN. Is that all, Doctor?

Dr. TRUE. Yes, sir. I have had prepared, Mr. Chairman, a brief table which shows the amounts allotted to each of our projects, with an indication of the increase or decrease. I think that might be useful to the committee, and I will submit it as part of the record.

The CHAIRMAN. You will also furnish the other tables that have been requested?

Dr. TRUE. Yes, sir.

The CHAIRMAN. Thank you very much, Dr. True.

(The table showing activities of the States Relations Service under lump-fund items follows, the other statistical matter referred to being incorporated in the discussion under item 37, "for farmers' cooperative demonstrations outside of the cotton belt":)

Activities under lump-fund items, States Relations Service.

Project.	Allotment, 1920.	Estimate, 1921.	Increase.	Decrease.
Relations with agricultural colleges and experiment stations:				
(a) Colleges (administration of extension act).....	\$31,100	\$39,600	\$8,500
(b) State experiment stations (administration of Hatch and Adams Acts).....	36,400	37,900	1,500
(c) Supervision of insular stations.....	2,100	2,100	
	69,600	79,600	10,000
Farmers' cooperative demonstrations outside of the cotton belt:				
(a) Supervision.....	57,300	56,220		\$1,080
(b) County agent work.....	353,000	353,000		
(c) Boys' and girls' club work.....	142,005	142,005		
(d) Home demonstration work.....	138,215	138,215		
(e) Farm management demonstration work.....	46,500	46,500		
(f) Extension specialists.....	14,260	14,260		
	751,280	750,200		1,080
Farmers' cooperative demonstrations in the cotton belt:				
(a) Supervision.....	42,040	42,040		
(b) County agent work.....	357,763	357,763		
(c) Boys' club work.....	34,629	34,629		
(d) Home demonstration work.....	210,608	210,608		
	645,040	645,040		
Farmers' institutes and agricultural schools:				
(a) Farmers' institutes.....	5,000	5,000		
(b) Agricultural schools.....	15,600	14,400		1,200
	20,600	19,400		1,200
Insular experiment stations:				
(a) Alaska.....	75,000	90,000	15,000	
(b) Hawaii.....	50,000	50,000		
(c) Porto Rico.....	50,000	50,000		
(d) Guam.....	25,000	20,000		5,000
(e) Virgin Islands.....	15,000	20,000	5,000	
	215,000	230,000	20,000	5,000
Home Economics investigations:				
(a) Respiration calorimeter investigations.....	15,000	20,720	5,720	
(b) Studies of food, clothing, and household equipment and management.....	31,280	55,560	24,280	
	46,280	76,280	30,000	
General bureau administration.....	14,180	24,180	10,000	
Total.....	1,761,980	1,824,700	62,720	

¹ Includes \$8,100 transferred to statutory roll.

² Due to transfer of 1 fireman, at \$1,080, to statutory roll of the Secretary's office.

³ Includes \$34,480 transferred to statutory roll.

⁴ Includes \$10,240 transferred to statutory roll.

⁵ Due to transfer of 1 clerk of class 1 to statutory roll of the Division of Publications.

⁶ Includes \$3,040 transferred to statutory roll.

⁷ Includes \$1,980 transferred to statutory roll.

⁸ Includes \$1,580 transferred to statutory roll.

AFTERNOON SESSION.

MONDAY, JANUARY 12, 1920.

The committee reassembled at 2.10 o'clock p. m., pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. The committee will come to order. The members of the executive committee of the National Land Grant College Association desire to appear before the committee to discuss, I believe, certain matters in connection with the extension work, increased appropriations for research work at the State experiment station

under the Adams-Hatch Act, and other matters. It is suggested that we hear the committee the first thing to-morrow morning.

Mr. HARRISON. It is the executive committee representing all the land-grant colleges.

Mr. RUBEY. We had better hear them, I think.

The CHAIRMAN. Without objection, we will hear the committee at 10 o'clock to-morrow morning.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Tuesday, January 13, 1920.

The committee met at 10 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. We have with us this morning members of the executive committee of the National Land Grant College Association, composed of representatives of a number of agricultural colleges. We will be glad to hear you first, Dr. Pearson.

STATEMENT OF DR. R. A. PEARSON, PRESIDENT OF THE IOWA STATE COLLEGE OF AGRICULTURE AND MECHANIC ARTS, AMES, IOWA.

Dr. PEARSON. The committee asked me to present the matter to you briefly, and then I think it might be well to have the different members of the executive committee supplement my statement.

The CHAIRMAN. We will be glad to have you proceed, Dr. Pearson.

Dr. PEARSON. The committee, Mr. Chairman, that has come here this morning is the executive committee of the National Land Grant College Association. There are five members of the committee here, with our secretary, making six. The committee membership includes President W. E. Stone, of Purdue University; President W. M. Riggs, of Clemson College, S. C.; Dean H. L. Russell, of the College of Agriculture at Madison, Wis.; Dean A. R. Mann, of the College of Agriculture at Cornell University, N. Y.; and myself, president of the Iowa State College of Agriculture and Mechanic Arts; and our secretary is Dr. J. L. Hills, dean of the College of Agriculture, Burlington, Vt.

I want to say, first, that we appreciate the privilege that you have given us of coming here and talking with you for a little while about some matters in which we are deeply interested, and we know that you are interested as well.

We conceive that we appreciate the difficulty that confronts all of the congressional committees this year, particularly in reference to appropriations, and we have not come here with the idea of trying to force anything, even though we thought it were possible, through the committee or through the Congress. We have come here with the idea of presenting to you gentlemen some facts which are constantly coming to our attention in the progress of our work—facts which we think will interest you—and we are confident that when you have these facts, with the countless facts coming to you from other sources, your final judgment in the matter will be right.

We are, of course, interested in all phases of agriculture. The land-grant colleges are all teaching agriculture. They are carrying on experimental work, and they are conducting the extension work; but I will not attempt this morning to cover more than a very few points which we would like to emphasize particularly.

EUROPEAN CORN BORER.

In a preliminary way, let me say that yesterday we conferred with the Secretary of Agriculture for the purpose of learning something of his plans in reference to combating the corn borer which has recently established itself in this country. A great deal of alarm is being felt, throughout the corn belt particularly, Mr. Chairman, and I am sure you are as well posted as I am in reference to the possible dangers of this pest. The corn borer has recently become established in Massachusetts, more recently in New York, and still more recently, we are told, in Pennsylvania. Nobody knows in just how many parts of the country it is now established. Thus far it has not done extreme damage to field corn, because apparently it has not been restricted to any section where only field corn is grown. It prefers to work on sweet corn, and, if sweet corn is in the vicinity, I am told that it particularly concentrates its attention on that crop instead of the field corn, although it does not neglect the field corn. We know something about what some pests do when they find themselves free from their natural enemies, and the natural enemies of the corn borer seem to be conspicuous by their absence. Some of the most practical entomologists I know are very much alarmed about the possibilities of this insect in the field corn districts in Indiana, Illinois, Iowa, Kansas, and other States with a crop running high in the billions of dollars in value, and we can realize the loss that would result from even a small percentage of damage by this insect.

Mr. Chairman, we would like to have you know that we are very earnestly interested in that subject and very hopeful that Congress will see its way clear to appropriate from half a million to a million dollars, making some or all of it available immediately, so that before the next crop season begins arrangements for the study of the corn borer may be started. We need to know, first of all, where it is, and, secondly, we need to do some experimental work upon methods of control. That kind of information is fundamental. If you should appropriate a hundred million dollars to-day for this work, of course the men who are best informed would be at a loss as to how to use the money; but they do need a small amount with which to devise ways and means to take care of this pest, which now threatens to become very serious.

The CHAIRMAN. In what States has the corn borer been located?

Dr. PEARSON. It is in Pennsylvania, New York, and Massachusetts. I have been told that it is only recently in Pennsylvania.

The CHAIRMAN. Has it also been located in Illinois?

Dr. PEARSON. No; only in New York, Massachusetts, and Pennsylvania, so far as we know.

FARM MANAGEMENT AND CROP ESTIMATES.

Of all the very many items which the Secretary of Agriculture is bringing to you, there are two others that I want to refer to very briefly, and those are the items relating to the Office of Farm Management and the work of the Bureau of Crop Estimates. If these subjects have already been presented to you, I ought not to take the time to dwell upon them, because I would probably only repeat what you have already heard; but I do want to say to you that our committee and the colleges that we represent feel that one of the most backward developments in agriculture at this time is that relating to the business of agriculture, the question of costs, and the whole line of subjects related to that question. The Secretary of Agriculture, after a great deal of difficulty, has devised a plan which promises fine results, and if he can secure the financial support to put that into effect we are satisfied that it will be very beneficial to agriculture.

Then, again, the development of the work of the Bureau of Crop Estimates is a matter in which farmers everywhere are tremendously concerned. You, of course, well know that farmers now decide on what they shall plant merely by the way they happen to feel, by how things were in their own locality last year, and how prices are at the moment, with very little else to guide them; and it frequently has happened that the farmers in one section of the country, quite ignorant of the developments in another section, have gone forward and produced a crop and then found, to their great disappointment, that they had been anticipated somewhere else, with the result that they have made little or nothing on their crop. If the Bureau of Crop Estimates can give us a good estimate of acreage and of available supplies at any one point in the country on a given date, and in time for action, it will enable the farmers of the country to plan their work in a very much more definite and constructive way.

RESEARCH WORK.

But the two points, Mr. Chairman, that we are particularly anxious to take up with you are the questions of research and extension. I took the liberty of writing you in behalf of the executive committee a few days ago with reference to the work in agricultural research, not knowing that I would have this opportunity of appearing before your committee so soon. Of course, every member of this committee knows that this work is supported now in every State of the Union by Federal appropriations provided by the Hatch Act and the Adams Act, each State receiving \$15,000 per year under each of these acts, making \$30,000 for each State experiment station. When the Adams Act was passed, as is frequently the custom, they provided for a small appropriation the first year, then a slight increase, and another slight increase the next year, until finally it reached its maximum. The maximum was reached many years ago, but since that time the changes in costs affecting the work of the experiment stations have served practically the same as a reduction in the appropriation by nearly 50 per cent would have served if that had occurred five or six days ago, before this great increase of prices

came upon us. It is costing about 50 per cent more than it did six years ago to maintain our help in the experiment stations. We can not do better than that. Commercial enterprises everywhere are looking for the kind of men who are employed in the experiment station work. These men are on work relating to practical problems. In our own station in Iowa we have lost in the last six weeks three men, who have accepted employment elsewhere at an average salary increase of about \$1,000 a year. One of them went to a big mail-order house in Chicago, to become their fertilizer expert.

The cost of laboratory materials—acids and alkalis and reagents of all kinds and classes—has gone up and up until now it is from two to six times what it was before the war.

The result is that experiment station research is being slowed down. We are appealing to our men to stand by their work and to be loyal to the institutions, and we are accomplishing a great deal, in rather a temporary way, in that manner. We could name dozens of men who could leave their experiment station work tomorrow at such increases in salary as I have mentioned—\$1,000 or more a year—but they are interested in their work and are confidently hoping that conditions will change. They would rather do that work than do something else. If it were not for their loyalty, Mr. Chairman, I think I can say truthfully that the experiment station work of the country would have collapsed by this time.

What is the result? The result is that the natural run of problems is continuing; we are getting new problems in agriculture requiring investigation every year (it seems as though they come every month), and we are not able to keep up with them.

These new problems come with the years of settlement of a country. When a country has been settled 20 years it will not have as many serious problems requiring search in agriculture as it will have when it has been settled 30 or 40 or 50 years. The longer the soil is in use the more the chemical composition of the soil is changing, the more its bacteriological flora is changing, and the more problems there are arising in reference to crop production. The same is true in reference to animals and in reference to disease and other handicaps that have to be overcome. Then, too, there are new lines of investigation coming up, and the result is that it has not been possible to keep up with the lines of progress.

The very strength of agriculture, in this Nation or any other nation, is the research which is being carried on constantly in every State in the Union, in every typical agricultural section, with a view to recognize as promptly as possible the new problems that have arisen, or are about to arise, and to tackle them before they became too serious.

I referred to the corn borer. Some of our experiment stations right now are not in shape to do what they ought to do, and what the farmers of the State say they want them to do, in relation to that problem; and I could go right down through the list of fungous diseases and so on until you might become tired of listening.

The CHAIRMAN. Has a remedy been found for the corn borer?

Dr. PEARSON. No; that is a phase of the problem that must be studied. We must find some remedy for the corn borer. Whether we will be able to control it through the use of some natural enemy,

or parasite, or through some treatment of the soil no one now knows, but experiments ought to be started in various parts of the country under various conditions, with all the methods which may be suggested, so that we may determine which one will be the most effective.

We do not want to mention to you, Mr. Chairman, a definite amount for the support of the research work of the State stations. Your wisdom will arrive at that better than we could do it. But we would like to emphasize the fact that the cost of maintaining our agricultural experiment station work in the last six years has increased from 75 to 100 per cent. The Federal Government is now providing \$30,000 annually for each State for this work, so that, in our judgment, it is merely a matter of computation to determine the amount which would offset these increased costs.

Mr. TINCHER. Since you do not belong to any one of the departments here in Washington, perhaps it would be appropriate for you to suggest to the committee, should we agree with you that this appropriation ought to be doubled, how we could economize in some other line, in view of the fact, as we have been advised, that we are not going to have income enough next year to run the Government, even if no increases at all are made in the appropriations. We might ask you to suggest to us what expense we could lop off.

Dr. PEARSON. I wish I could do that. If I were more familiar with the countless items going through the hands of these committees I would feel more free to attempt it. I do feel, however, that if the many items which you are working on could be weighed on their merits, you would agree with us that this is one of the most important.

Mr. TINCHER. I do; but the proposition is how to get the money.

EXTENSION WORK.

Dr. PEARSON. Now, gentlemen, a few words in conclusion with reference to extension work, and after I have finished speaking I hope some of the members of the executive committee will supplement what I have said with points which I might have overlooked.

You all know of the very comprehensive program for agricultural extension work which was adopted by Congress, the development of which has been started throughout the whole country in cooperation between the Department of Agriculture and the State agricultural colleges. This work has not been fully developed. The original plans were to have it reach all the agricultural districts of the country and to enable people in agriculture everywhere to get to a reasonable extent the advantages which they might wish to secure from the experiment stations and from the colleges. It has been referred to as the most comprehensive step ever taken in popular education, and I believe that is a correct characterization of it.

This work has been growing rapidly, and it has become immensely popular with the farmers of the country. No better proof of that needs to be furnished than the tremendously rapid organization of farm bureau, and then, in turn, State organizations, and recently a Federal organization for the express purpose of cooperating along these lines and furthering the work of the extension staff.

The extension work, Mr. Chairman, has been interfered with in its development because of the increased "cost of living," the same as has the investigational work; but, realizing the immediate importance of extension work, Congress provided special emergency appropriations to overcome these increased costs and even to more than overcome them, so that during the war we developed the extension work much more rapidly than had been the original plan under the Smith-Lever Act. In some States every county was organized with a farm bureau, with a county agent, and even with a home-demonstration agent, and with suitable and very effective work with boys' and girls' clubs.

We would like to leave with you this special suggestion, that the United States Government could not appropriate money more effectively to combat the high cost of living than would be done through the extension work.

Farmers themselves are not so greatly interested in increasing agricultural production; we all know that. Increases of agricultural crops frequently mean nothing but more work for the farmer—not a larger income. We could give you any quantity of figures to show how it has paid the farmer in total income to have a smaller crop, because he got a much higher price per unit for it.

When the war was on there was pressure for more food, and when the call went out from Washington, from the President, to the whole country to produce more food, the extension people, backed by the Department of Agriculture here and the colleges in every State, supported loyally by the farm bureaus, got into the work, with the result, as you know, that the number of bushels of food crops was increased by more than 1,000,000,000 in one year over the average five-year production immediately preceding. That was a piece of work in which the extension agencies played a very important part. I do not know where we would have been if it had not been for that food. I think that wheat, instead of being \$2.50 a bushel, would more likely have been \$7 or \$8 a bushel, and potatoes would have been \$5 or \$6 a bushel.

Mr. JONES. What will they have to produce in order to bring the cost down to where a man can afford to buy them?

Dr. PEARSON. Potatoes?

Mr. JONES. Any of these farm products.

Dr. PEARSON. They will have to produce enough so that we will be able to have a sufficient quantity to feed ourselves and to take care of some of these people in other countries who are absolutely starving and who are urgently appealing to us for a little help. When hogs were worth 5 cents a pound and wheat was worth 50 cents a bushel we then had enough to feed ourselves, and more than enough, and that was why the price was so low. Ever since those years, 20 or 25 years ago, the amount of food produced has been decreasing rapidly in proportion to the number of mouths to be fed, and the result is that the prices have gone higher and higher.

Mr. JONES. But you say that during the war the farmers responded to the call to increase production and that they produced far more than they could use; and yet the cost went up.

Dr. PEARSON. It would have gone very much higher if they had not produced as much as they did.

Mr. JONES. Probably so.

Dr. PEARSON. But our exports absorbed a great part of that increase. The farmers of the country are now confronted with a great difficulty. The agricultural emergency is not past, by any means, with the signing of the armistice. I do not need to emphasize that point. The farmers have difficulties along labor lines. They have the high cost of their supplies to meet and they have exceedingly great difficulty in getting their stuff to market. Gentlemen, you all know that the farmers are very much discouraged on account of these things, and the reports are at this moment to the effect that they are decreasing their production in various parts of the country. Whether they are doing that thoughtfully or thoughtlessly, I do not know. The fact is that food production in the United States is decreasing. If food production is going to decrease very much, the Lord help us on the high cost of living.

Mr. JONES. What is your answer; what is your remedy for that?

Dr. PEARSON. The answer is a great increase in production.

Mr. JONES. I understand that that is the desideratum, but how would you bring about an increased production?

Dr. PEARSON. The very best and most effective way to increase production is to maintain on a strong basis the extension work in the Nation which I am now discussing. It was the extension work more than anything else that secured the volume of production during the war.

Mr. JONES. Will your extension work decrease the cost of producing?

Dr. PEARSON. Yes.

Mr. JONES. Will labor work for less if the extension work is extended?

Dr. PEARSON. The decrease in the cost per unit will decrease the labor cost. Of course, there is an endless circle there.

Mr. JONES. Of course.

Dr. PEARSON. If we can produce more food, and if the prices of food fall, we hope that the prices of labor will fall, and that will come back and affect the prices of food and other supplies. But I repeat that there is not one way by which the United States Government could take a more effective step toward reducing the cost of living than by maintaining extension work on a strong basis.

Mr. YOUNG. I would like to ask a question on that cost-of-living proposition. I do not know whether you mean to convey this impression or not, but the impression that I have gotten from what you have said is that you wish to have cheaper prices for production on the farm so that the cost of living can be reduced. I am from a great agricultural State, and I know something about agricultural conditions in that State. As I see it, the people in my section of the country are leaving the farms for better opportunities of making money in the towns and cities. They are going from Texas away to Detroit, Mich., to work in automobile-manufacturing establishments, because a boy can make more money there than he can on the farm.

I venture to say that that condition is true all over the United States, in every section of the agricultural belt. What has happened back on the farm is that the farmer has been compelled to raise his wage scale in order to hold labor to cultivate those farms, and he has reached the point in his labor scale when the laborer can not earn the wage that the farmer is forced to pay. If you were to give him everything he could produce on some of our farms at the present

wage scale, the resulting crops would not pay the labor charges. The farmer can not compete with those industries, and the result is that people are leaving the farms; and men with their families are working just as much of their land as they can work. That is true in my section of the country.

Dr. PEARSON. It is not true there alone.

Mr. YOUNG. Then if you hold out to the farmer the statement that we are going to reduce the cost of living, and have that apply to the farmer's crops, he is going to be a still worse discouraged man than he is now. That is the way that I see it, representing an agricultural constituency.

Then, in turn, the cost of living comes back on us as farmers. We are paying probably two and a half times as much for a farm wagon as we formerly paid. We are paying three and a half or four times as much for shoes as we formerly paid. All along the line the actual necessities that the farmer must have in a farming section to produce these crops, the high labor scales and conditions in these other sections, are reflected back to us. I do not see how you can ever hold out any hope that the cost of living to the people is going to be lowered by reducing the price of farm products when we have got this circle in which everything the agricultural section needs must be paid for at multiplied prices.

Dr. PEARSON. In the first place, I would like to state the case perhaps a little more clearly. In my judgment, the best way to meet the high cost of living problem is by maintaining the extension work. I am not actually sure that we are going to decrease the cost of potatoes or wheat per bushel for some time to come.

Mr. YOUNG. Do you think it would be wise to even suggest that we hope ultimately to ever get back to conditions where wheat is going to be worth 50 cents a bushel and cotton 5 cents a pound?

Dr. PEARSON. Decidedly not.

Mr. YOUNG. If wheat is going to 50 cents a bushel again, I am going to quit farming. I do not want anything more of that in mine.

Dr. PEARSON. I hope I have not said anything from which it could be inferred that I wanted that. The actual reduction is going to come very largely, if at all, through improved methods which reduce the cost of producing the unit. It is going to come through substituting a better strain of seed which will increase the number of bushels per acre and without increase of labor; it will result through increases of that kind which come about through educational effort. I do not think we are going to see cheap food in this country for a long time to come, if we ever see it again; but I think we are going to see food a whole lot more expensive than it is now unless reasonable steps are taken to check that tendency. I do not know whether I have answered your thought. I am very glad that you spoke as you did.

Mr. PURNELL. May I suggest another thought right along that line? I do not know whether your department is doing anything with it, or contemplating anything, but 4,000,000 men went out of the homes of America, many of them from the farms, into concentration camps, where they had the friendly association with their fellows.

Keeping in mind the necessity of morale on the farm as well as in the Army, I know, representing as I do an agricultural district, that there is an increased feeling among those returned soldiers who formerly were on the farms that they have lost that companionship and association, and that they want more than ever to concentrate in the cities and to get away from the farms to where they will have the bright lights, and music, and the association of their friends. Does your department contemplate any campaign of education or any organized effort to make those boys satisfied rather than dissatisfied with the farm?

Dr. PEARSON. Yes, sir; the extension service is doing a great deal along that line. It is the most effective agency for meeting the situation along that line. The efforts of the extension forces are directed to making farm work more profitable, and therefore more interesting.

Mr. PURNELL. It seems to me that we are going to have to think more of some form of community entertainment, or something. I am not familiar enough with it to know what it shall take, but I know from actual experience, having gone back into my district, of hundreds that I found here, there, and yonder who have come home and seen the folks and stayed a few days and have become dissatisfied and have gone back to the East or to Chicago, Detroit, or some other cities, looking for work. The principal reason for this exodus was not so much the question of salary (which is a great factor, of course), but the desire to hunt up again the old friendships and associations, find the crowd, rather than to become isolated on the farm, with its drudgery.

Dr. PEARSON. Yes; you have brought up another one of the factors that the thinking farmers who are anxious to keep up food production to the requirements of the United States have to contend with.

Mr. PURNELL. I think that is one of the greatest problems we have to deal with now.

Dr. PEARSON. Yes.

Mr. PURNELL. It is one of the greatest things standing in the way of the progress of the country.

Dr. PEARSON. It is, and there is no influence that is combating that more than the extension work.

Mr. McLAUGHLIN of Michigan. You think that this extension work will help to increase the production of farm products generally, do you not?

Dr. PEARSON. I do; and we need some increase; but, still more important, it will help to decrease the cost.

Mr. McLAUGHLIN of Michigan. What do you think of the suggestion from some in high places to the effect that there should be a smaller production of wheat next year?

Dr. PEARSON. Do you mean a smaller production than the maximum war-time production?

Mr. McLAUGHLIN of Michigan. That is, producing less this year than we did last year; and that the farmers should reduce their acreage?

Dr. PEARSON. Without doubt, it would be safe to reduce the acreage of wheat to some extent from what we were planting in war time. We were then figuring on sending enormous quantities of wheat to

the Allies. Of course, they will not now need that to the extent that they did, and some reduction in the wheat acreage should be expected, I think. But, looking upon the whole subject of food production as one subject, I think we can say that food production needs to be generally maintained—always with the reservation that peculiar conditions exist in different parts of the country which will have to be dealt with there by the people who are confronted by them.

When the war was on we were asking people to put in wheat regardless of whether it would ever pay them or not, and lots of them did it. We asked farmers to turn over their fine pastures. The chairman knows how valiantly they did it in his section, and I presume every member of the committee who comes from a rural section knows how they did it in his section of the country. We were asking for production almost regardless of cost at that time. Naturally, such a request will not be made now.

Mr. McLAUGHLIN of Michigan. Is that entirely true, that we were asking for production of wheat regardless of the cost of production, inasmuch as there was a guaranteed price for all the wheat that the farmers could produce?

Dr. PEARSON. Yes; because, although there was a guaranteed price on wheat, there were other crops that could have been raised on the same land which would have given better returns to the farmers, but they willingly gave up that better return to raise the wheat, just because the Government asked them to do so.

Mr. Chairman, I will detain you only a few minutes more. The purposes of the Smith-Lever Act have not been accomplished. We have not a county agent in every agricultural county in the United States. A great deal of work remains to be done. If we look at the map to-day showing the present status of extension work, we will find that the map is badly spotted. It seems as though it would be a hardship to some counties that want the county agent to be told that they can not have one because there are not funds enough. The cost of the county agents and the cost of living have gone up to such an extent that the original Smith-Lever appropriations, which were provided with our eyes open and with very generous thought for the future, even as supplemented by the items in the bill, are not sufficient to provide a county agent in every county.

Mr. McLAUGHLIN of Michigan. Are you familiar with the methods of expending the extension funds, and do you know what proportion is used for administration?

Dr. PEARSON. Yes, sir, I think I am.

Mr. McLAUGHLIN of Michigan. Do you think that that portion of the money is properly spent, and do you agree with the criticism of some that too much is spent for administration?

Dr. PEARSON. Mr. McLaughlin, we have almost sweat blood on that question in my State. The director of extension in our State reports directly to me, and I have spent a great many hours with him in going over that matter. I know something of the methods in other States, and, honestly, I do not see how the proportion of the money spent for administration purposes could be materially reduced and yet maintain our extension work on a high standard.

We had a little difficulty in a corner of our own State (pardon me for referring to our State so often, but it happens to be the territory

that I know best), when the Hessian fly got in. The county agent was absolutely lost. He did not know what to do for the Hessian fly except in a very general way. He knew more than the farmers knew. But there were more than a \$1,000,000 worth of crops imperiled, and he wanted expert help so he sent to the college, and the wires were hardly fast enough to get his message up there. He wanted an expert to come down there. If that county agent had been sufficiently well informed to deal with that problem himself, he would not have been a county agent; he would have been an entomologist drawing a pretty good salary somewhere else, because that kind of man is altogether too hard to find. We sent an expert to that part of the county, and he was more than welcomed. He spent a few days there, made his inspection, and gave his advice—gave the county agent some outstanding points that he would need in order to handle the problem on some other farm—and returned home.

I find that the farmers are very anxious to meet specialists nowadays. They like to talk to a man who can tell them about protein and phosphorus and about fungous disease; and farmers generally know what those things mean. When the problem becomes acute they want this specialist to come in. Oftentimes the county agent is comparable with the local doctor. In a general way he knows how to treat agricultural problems, and he handles those matters very well; but the moment some special difficulty arises he wants special expert help and information up to the very latest date, if possible.

MR. TINCHER. On the subject of the Hessian fly, was there any thing in the world that that expert could do on the ground there that he could not have written the county agent to do?

DR. PEARSON. Yes; he spent several days making special investigations; he advised that some fields be plowed up so as to get rid of the fly, and in other cases that the crop be taken off of it before the fields were plowed up. But he could not advise the county agent by letter.

MR. TINCHER. What time of the year was it that he advised that the crop be plowed up for Hessian fly?

DR. PEARSON. I do not know. The wheat was not very large. It was, of course, early in the spring.

MR. TINCHER. They found the fly in it early in the spring?

DR. PEARSON. They knew that it was there.

MR. TINCHER. From the year before?

DR. PEARSON. Yes; of course.

MR. TINCHER. But they could not find the fly at that time of the year?

DR. PEARSON. No.

MR. TINCHER. Any ordinary farm man may have had experience with the Hessian fly, and I just wondered what the expert could do by going there that he could not accomplish by writing.

DR. PEARSON. Kansas farmers are mighty nearly experts on the Hessian fly.

MR. TINCHER. That is the reason I wondered what an expert could do on the ground that he could not do by writing.

Dr. PEARSON. Farmers are so familiar with that problem that they know a great deal about it without realizing that they know a great deal about it.

Mr. TINCHER. There is not a thing that they can do to help a crop that the fly is in, is there?

Dr. PEARSON. No, sir.

Mr. TINCHER. There is no way of determining, either, whether the fly is in the crop until it is headed out, and whether it will pay to plow it up or not? There is only one treatment to eradicate the fly, and that, it seems to me, could have been imparted in a letter to the county agent.

Dr. PEARSON. And yet, the advice of the county agent was not to plow up their fields without the advice of the expert.

Mr. TINCHER. His guess was practically as good as that of anybody else. That was the spring of the year, and the wheat had not headed out?

Dr. PEARSON. I do not know when that was. The wheat was in such form that he could form some judgment about it.

Mr. TINCHER. The experts say that the only treatment is to wait until after the eggs of the fly are hatched and then sow the wheat. That will eradicate the fly—if they wait until late enough in the fall to sow the wheat.

Dr. PEARSON. The purpose of the agent there, of course, was to prevent further spreading, so as to not get further infection.

Mr. RUBEX. Suppose your agent had written a letter to this county agent and set out in that letter the things that it was necessary to do; is it not possible that the farmers whose wheat was affected would have said, "Yes; we called on the Government for help, and instead of sending a man down here to help us they sent us a letter"? And would not that at once have put the Agricultural Department in a bad light with those farmers and with the county agent and with the people who were expecting help from the Government?

Dr. PEARSON. Yes; they would have been very much disappointed. As I said, the wires were not fast enough to bring the message to us asking us to send help.

Mr. Chairman, the Smith-Lever bill when originally written and passed by Congress would have provided for the development of extension work throughout the whole United States. Conditions have very radically changed since that time, and I suppose we must answer the question as to whether we want to carry out the intention of that measure which obtained at the time Congress passed it or whether we now feel that our plans should be modified on account of increased cost for doing everything. If we intend to carry it out, of course, additional funds will be necessary to enable us to do so. In going over these appropriations I notice that Congress provided very liberally for supplementing the extension act while the war was on. The appropriations for last year—the emergency appropriations—amounted to \$6,100,000. The corresponding appropriation for this year is \$1,500,000. We have cut off 75 per cent of the funds available for this most important work to agriculture, when the problem itself has hardly been reduced at all.

Mr. McLAUGHLIN of Michigan. I do not understand how you reach that 75 per cent.

Dr. PEARSON. The emergency appropriation for extension work available a year ago was \$6,100,000.

Mr. McLAUGHLIN of Michigan. Oh, yes; I understand.

Dr. PEARSON. For the present year it is \$1,500,000. That is a very severe cut on an industry which is so fundamental and so important.

The CHAIRMAN. There is also an increment under the Lever Act of \$500,000 to be added.

Dr. PEARSON. I do not count that, Mr. Chairman, because that is used merely to carry out the very carefully worked out plan of Congress of several years ago. That merely accomplishes its purpose, and it ought not to be counted in these emergency funds.

The CHAIRMAN. Last year we appropriated in the regular appropriation bill \$751,280 and \$645,040, and \$1,500,000, or \$2,896,320 in addition to the \$3,080,000 under the Lever bill.

Dr. PEARSON. Yes.

The CHAIRMAN. This year the estimates are the same, but there will be an increase of \$500,000 under the Lever Act. This will give over \$5,000 to each of the 2,000 counties.

Dr. PEARSON. Yes; it is a large amount of money, to be sure; still, we find here and there a county which is not provided with this work and can not be under the funds that are now in sight. We wonder if it would be wise to stop our developments when they are only partially accomplished.

The CHAIRMAN. I believe this is very important work, and it has been so considered by the members of the committee, but the condition of the Treasury must be taken into consideration.

Dr. PEARSON. Yes. Summing up, then, I will say merely that the benefit of the extension work to the farmer comes in showing him how to produce his crops more cheaply, and to the public it is a great benefit, because it is the best way of meeting the high cost of living problem. The cost of living is going up and not down. We want to encourage the farmer to keep up his production now rather than to have him discouraged and let it decrease too much. I thank you, Mr. Chairman.

The CHAIRMAN. We are very grateful to you, Dr. Pearson.

Dr. PEARSON. Will you hear President Stone, of Purdue University?

The CHAIRMAN. We will be glad to hear him.

STATEMENT OF DR. W. E. STONE, PRESIDENT OF PURDUE UNIVERSITY, LA FAYETTE, IND.

EXTENSION WORK.

Dr. STONE. I would like to say just a few words in a general way on this proposition. The remarks of members of the committee indicate that you gentlemen are quite sensible of the situation, and I can not give you very much information on that; but is it not true that we all realize that conditions are pretty bad in the world at this time? There is scarcity of food, there is unrest, dissatisfaction, and discontent, and the world apparently looks to this country for some assistance and relief.

What are we going to do? It is very true that the burdens on our people are very great and the problems before us are many, but we

have got to face those problems and do the best we can to get some results to improve these conditions. It may be that those results come from lessening taxes; it may be that they come from increasing expenditures; that is quite possible. If a man is sick with an acute disease, his first thought is to remedy that disease and not to count the cost.

I believe that improvement of agricultural conditions and the production of food are fundamental things in this country which are going to help relieve this situation. They are not going to be a cure-all for everything. There is no one thing that is going to relieve the condition. But, wherever we can see the way to help in this, it is our duty to do it.

We, gentlemen, do not come here seeking appropriations for ourselves. We have a certain responsibility at home, to our communities, with regard to carrying on this work of helping improve agricultural conditions. You gentlemen, too, have some responsibility in that connection, and we have come up here to talk this thing over and to try to get a better viewpoint of the whole situation. Whatever helps the farmer to meet his problems, which consist of a scarcity of labor, the high cost of all of his supplies, and some other discouragements that he has had to meet, helps in the direction of what we desire. The farmer is apt to feel these days that it is not worth while to push very hard. He is willing to dig in on his farm and do his best to make a living, but as to helping feed the United States, helping to feed the world, and all that kind of thing that he was asked to do during the war, I think he is less interested now than he was. He ought to be more interested, because, in my judgment, the problem is just as acute to-day as it was a year or two ago. People are starving in the world; people are discontented right here in our own country; and there is nothing that will help a man who is unhappy and discontented more than a full stomach and satisfied hunger, and it is the farmer's job to supply these needs.

The purpose of this extension work is to try to educate the farmer to better methods and to improve the conditions of his life so that his children are not going to leave home, if it is possible to do that. That is one of the purposes—trying to increase the production of food. It is a hard job. I do not know that we are going to be able to help very much, but wherever there is any prospect of helping on this problem I think it is our duty to try that, and stick to it.

The means at our disposal for doing this work are less to-day than they were last year, even though we have the same amount of money to do it with. You know how it is in your own families. The costs mount up for everything that is used in this enterprise, and the men that we depend upon to do the work are being drawn off into better-paid positions, so that it is a very difficult thing to maintain an organization with which to do this work at this time. If we have the same amount of money available to meet the expenses of this work this year, we shall hardly be able to do as much or as good work as we did last year. That is the condition, gentlemen, in which we face the effort to help along in the solution of these world problems. The situation is perfectly evident to all of you. There is no argument more convincing than a knowledge of the facts.

So we come here to bring to you our testimony and to ask you to consider the situation and not to withhold funds from us, because

that means that the work will suffer. Help us, if you can, to strengthen this work and to make it more effective and more far-reaching—that we may have more results. That is the problem. You know how much money can be spent for this, and whatever you give us we will take it and do our best with it. That is our duty, and we are alive to that. But we feel very earnestly that this work is fundamental in helping to solve some of these very puzzling problems before us. We want to do our part, and we hope you will help us to do it.

Mr. McLAUGHLIN of Michigan. You spoke of the trouble with labor. What is the trouble?

Dr. STONE. Farm labor is very high priced. Farm labor is not very abundant. I suppose that same condition prevails elsewhere.

The CHAIRMAN. What are the average wages on the farm now?

Dr. STONE. I saw the statement the other day that the farm hand was expecting from \$60 to \$75 a month.

The CHAIRMAN. And board and lodging?

Dr. STONE. Yes, sir. It may be that the farmer can pay that and make a profit, but he is unaccustomed to doing that. He does not think quickly. He prefers, perhaps, to farm less and hedge in on his enterprise.

The CHAIRMAN. It is also a problem to get the labor?

Dr. STONE. Yes; that is the large problem—to get any labor at all. Take it in specialized industries like the dairy industry, where you require intelligent labor to cooperate in the work; the work can not be done by machinery; it must be done by hand. The condition in our State is that it is almost impossible to get dairy help at all.

Mr. YOUNG. Is not this one reason for the difference in the viewpoint of the farmer—that he must be a successful business man in order to be a farmer? The manufacturer, say, of cotton goods, of course has a highly organized body of men to transact his business. He knows his market. Under his system of business he places his contracts to furnish this, that, and the other jobber with certain supplies. Under his system of organization his product is, in a way, already placed and he knows what he is going to get for it. So he adjusts his labor scale and his overhead charges to meet his contracts and can see his profits—

Dr. PEARSON. Absolutely.

Mr. YOUNG (continuing). Before the stuff is actually produced. That is their system of business. The farmer, on the other hand, is confronted with the problem of betting against the season and the insects, and his turnover comes only once a year, so that, when he figures at the beginning of the season this year on planting so much wheat, naturally he is alarmed at these high wages because he does not know what his wheat is going to bring him when it is produced and put on the market several months afterwards; and it is the same way with every other farm product. You speak of \$60 or \$70 a month being paid for farm labor. Down in my country, where the general crop is cotton, the tremendous expense comes in the picking. The cotton has to be picked by hand. Formerly we paid 50 cents a hundred pounds for picking. I am at this date paying \$3.50 a hundred to try to save the little remnants of cotton. That is what the farmer is up against everywhere.

Dr. STONE. Yes.

Mr. YOUNG. How are you going to meet those kind of conditions? If the farmer goes ahead and plants all his acreage, and he meets this high labor scale, if he overproduces he pays eternally by not getting anything for what he produces. We are up against that very kind of problem.

Dr. STONE. Yes; that is true. There seems to be almost unsolvable problems.

Mr. YOUNG. They are very alarming.

Dr. STONE. And that seems to make it very much more necessary that we exert every effort to meet these conditions in the best way we can. If we know that a thing is worth doing and is sound in principle, that is the thing that we ought to be doing. We really face these emergencies, and we must take into account the result which we want to attain, and that is to get the conditions in the life of our people stabilized and sane and safe again. A part of that problem is to feed people; that is the farmer's job, and we want to help him if we can, just now.

The CHAIRMAN. We are very much obliged to you, Dr. Stone.

May I ask you, Dr. Pearson, what the situation is in our State as to farm labor?

Dr. PEARSON. In general, there is a little shortage. Wages, of course, are high—\$75 to \$80 a month in some parts of the State.

The CHAIRMAN. Board and lodging in addition?

Dr. PEARSON. Yes, sir.

Mr. McLAUGHLIN of Michigan. Dr. Pearson, have you thought of the effect on agriculture of this extensive road-building program that is provided for and may be carried out? Congress appropriated \$200,000,000 last year. A portion of that will be available this year. Many of the States have made very large appropriations and projects are being put up to the Department of Agriculture and to the State highway departments. There is evidence that some of the contracts are very, very high. Material is put in at an immense price and labor is provided for at a very high price. It would seem as though some of those in authority feel that they have to approve these contracts, regardless of the prices, because the money is there and must be expended. A great deal of labor will be necessary. Where is it to come from? In the cities and towns labor is paid satisfactorily, and it would be difficult to induce labor from those places to take up this road-building work. The only labor that is loose and can be induced to leave its present employment is that on the farms.

Dr. PEARSON. I suppose it is a question whether the drawbacks which the farmers will suffer, from that point you mention, would exceed the benefits that they would enjoy in having the roads available for their use. By good roads they are greatly benefited in their farm operations and marketing and in their feeling toward country life. Certainly, the points that you have mentioned are great disadvantages. I am sorry that I can not answer on that point more perfectly.

Mr. McLAUGHLIN of Michigan. Do you agree with the idea advanced by some that Government improvements in general should not be undertaken in times of high prices and abundant opportunities for profitable employment of the people, but that they should be undertaken only during slack-times and in order to furnish employment for the people?

Dr. PEARSON. I think that is a fine theory. I would dislike, however, to see it carried out to the limit. I believe we have suffered now by holding back some of our Government improvements for too long a time.

Mr. McLAUGHLIN of Michigan. Some of the people whom I have heard express themselves looked with a good deal of fear on the present situation, on the ground that some of these Government contracts are practically fixing the prices very high for a great many commodities and that the labor to be employed must come from the farms, farms which can not afford to lose their labor.

Mr. HEFLIN. I was going to point out in that connection that in some of the States they employ convicts to work on the roads.

Mr. McLAUGHLIN of Michigan. I know they do that in some States but not in many of them, I think.

The CHAIRMAN. Dr. Pearson, are there any others whom you wish to be heard?

Dr. PEARSON. I suggest we hear from Dean Russell, of Madison, Wis.

The CHAIRMAN. We will be very glad to hear Dean Russell.

STATEMENT OF DR. H. L. RUSSELL, DEAN OF THE COLLEGE OF AGRICULTURE, UNIVERSITY OF WISCONSIN, MADISON, WIS.

EXTENSION WORK.

Dr. RUSSELL. Mr. Purnell spoke about a matter that I think is worthy of attention, and that is the question of dissatisfaction on the farms. He says that the soldier boys in his district are not going back to the farms. Primarily, the reason for that is that until very recently the farm has not been profitable enough to induce them to go back. They have got in their minds the prewar conditions rather than those which obtained during the war. We are not going to have much improvement in rural conditions, so far as I can see, until, first of all, the farm is made profitable for the farmer. Then we are going to have improvement in these social conditions. It is true that the extension service is very materially improving the social relations by the organization of farmers' clubs and the organization of these boys' and girls' clubs.

I think that one of the best pieces of work that the United States has ever fostered has been the aiding of the boys and girls to get them in touch with the economic problems of the farm. I went down into our stock division the other day and saw the baby beef show that was pulled off by the boys' and girls' clubs. There were 85 fat animals that had been fed by those youngsters, and I talked with those youngsters and with their fathers and with some of those who had come to the agricultural college and had gotten interested in the work of the agricultural college. I found that those boys had been imbued with the spirit and love of farm life through the medium of having a calf, for instance, for a year. That interested them in a way in which nothing else would have interested them. You can not take a youngster of that age and in an abstract way talk to him about the desirability of life on a farm; but, if you can point out to him that he can make some money—that

he can become a man (and every boy wants to ape his father)—he realizes that if he can get into something where he has a man's job it is worth while. And so the interest on the part of these youngsters relative to farm life was a revelation to me. Every year, when we have been having these contests, that is the type of work that has been fostered and developed. That is the type of work through which these Smith-Lever funds have been variously expended. That work is largely along the lines of home extension. This work is something that is going to become of the greatest importance for years to come. It is going to change the attitude of the youths of the Nation with reference to farm practices, because it is going to direct their attention along these economic lines; and, as many a father told me in regard to his boy, "This thing has kept my boy on the farm. He is going to stay on the farm."

After that the lure of the Great White Way has no attraction for that boy at all. He has gotten hold of the economic aspect. He is helping his father, and the work of the farm is not simply a round of drudgery out of which he gets nothing. I want to emphasize this extension work as being one of the most fruitful things that the Nation has yet backed up.

The question was raised here, I think by Mr. Young, with regard to the possibility of overproduction and the possibility of lowering the price. It does not take very many per cent over and above consumption in order to have a surplus which will reduce the price of food. Generally speaking, the margin between production and consumption is measured by less than 10 per cent. How is that margin going to be raised? It is going to be raised not by growing more acres. Mr. McLaughlin spoke about the question of the acreage of wheat. It would be a mistake, gentlemen, for our farmers to grow as many acres of wheat this year as they grew last year, for the reason that under the extraordinary stimulation of prices by the guaranteed minimum, and under the urge of patriotism, acres were put into wheat last year and the year before which were unprofitable. Why extend the acreage of wheat where the rainfall is only 8 or 10 inches? Manifestly, the handicap there is so great that even at \$5 a bushel you could not make a profit. In many places in Montana they did not get their seed back.

The Government put \$1,000,000 into the purchase of seed for the farmers. It went in as a part of our war game. It would not be thought of under peace-time conditions. Also, under peace conditions, the thing is going to come back to where we can grow these crops with a fair degree of safety.

I think it was you, Mr. Young, who spoke about the advantage which the manufacturer has as compared with the farmer; the certainties of the one as against the uncertainties of the other. That is a thing which we have always to keep in mind. The farmer can not tell anything about what the opportunities are going to be for him to sell his crop at a profit at the end of the harvest, as the manufacturer of shoes, for instance, can be sure of the price at which he is to sell his shoes. The manufacturer of shoes buys his leather and makes it up, and he knows beforehand what his prices are going to be—just what he is going to do about selling those shoes. We know that we have to pay higher for shoes because of the high price of leather.

How about the farmer? He can not tell until he gets his crop in what he is going to be able to get for it, and a difference in supply of 5 per cent below consumption means a high price on account of shortage; and a difference of 5 per cent above consumption—that is, if production is 5 per cent over the amount of consumption—means that there is a surplus, an excess, and the demand is not so great under those conditions and the price goes down.

RESEARCH WORK.

I want to say just a word or two in regard to this experiment station work, because I feel that the experiment station is in the most hazardous condition of any of our agricultural institutions. Every agricultural college is full of students at the present time. The rebound has been simply tremendous with regard to agricultural education since the war is over, and there is a heavier and heavier burden being put on the agricultural college to take care of its students. The extension work is popular. I am frank to say that that does not need a Moses half as much as the experiment station does, because the people themselves are going to attend to that. The people themselves are going to appeal to you to support the extension work, because they are the direct recipients of that work; but the experiment station work is a type of work for which there is no popular Moses.

There has got to be somebody on the job watching the development of the research work, because, gentlemen, sooner or later we will not have much to extend if we do not continue the work of the experiment stations; and the conditions under which the experiment station now labors are so much more difficult than they have been that that is the thing which it seems to me ought to commend itself to your most careful consideration.

I just want to give you an illustration: Three or four years ago one of our men working on animal nutrition discovered a condition in milk and eggs which showed that there was something in milk and in eggs—something in those two substances, particularly—that was able to stimulate the growth of animal life in a way that meats or other products did not do. Therefore, the chemist had told us that there were in certain kinds of foods so much of each of the different elements of nutrition, in this so much protein, and in that so much of carbohydrates, and so forth; and that was all there was to it. In other words, it was claimed that you could feed an animal in that way on the basis of a test tube. This discovery showed that you could not do that; that there were particularly stimulating substances in eggs and milk (called vitamins, to give them a name) that were not contained in other products. First he found them in eggs, and then he found them in milk; and it was perfectly natural to say, because of that, that the Lord put them there, because those are the substances that are designed by nature to nourish a life at its very beginning—animal life on the milk and bird life in the other case.

They extended that and found out that upon certain plants these vitamins were present. It was found particularly in the leafy portions of plants. That is one reason why the Italian gets along without butter. It is because he eats so much salad. He eats the

leafy portions of vegetables and salad plants, and that supplies to him these vitamins. Cows eat great quantities of the green, leafy portions of plants which we can not eat, concentrates it in her body, and gives it to us in the shape of milk. The fundamental discoveries can only be made by a long series of experimental work. That sort of work requires weeks of study and experimentation.

We have another lead along that line. Accidental discovery was made of the fact that there was something in yellow corn essentially different from white corn. The old farmer always thought that there was something about yellow corn that made it better than white corn; but if you analyze them chemically you can not find any difference at all. One of our men, however, following up these experiments on rats, fed a batch of rats on white corn, and, lo and behold, they did not do the way they ought to have done according to the formula. So he said, "What the dickens is the matter with them? I have tried this a number of times, and this is the first time this thing has worked out this way." He scratched his head, and finally said, "I wonder if it is possible that yellow corn has something in it different from what is in the white corn."

Then he took one batch of rats and fed them on white corn and another batch and fed them on yellow corn, and the ones that were fed on yellow corn went on and developed, while the others did not. He was on a new lead. What caused that? He argued that it was something associated with the coloring matter in plants (because this yellow in the corn is nothing but a pigment). He followed up that lead. Next he tried rutabagas and carrots. Carrots are rich in these vitamins. Rutabagas are not. Carrots are full of color and rutabagas are not. Now, if you went into the laboratory at an experiment station and you saw those rats there, you would probably say, "What kind of a fool business is this? They had better spend their time in the fields than fool around with white rats in the house here." But the work must be done under those conditions in order to get at the facts.

Having found out that there was something in these pigmented substances that was different, having found out that they contained these vitamins, it is easily possible to transfer that on to higher types of life. Six weeks ago we started a bunch of pigs on an experimental feeding test, and at the present time the pigs that are being fed with yellow corn are doing much better than the pigs that are being fed with white corn.

Experimental work of that kind can not be done in a day. It often requires years of continuous effort along one little line. In addition to the \$30,000 which the Federal Government gives us annually for experimental work, the State of Wisconsin is putting up \$125,000 for this purpose. Under existing conditions the cost of every one of these operations is practically double what it was under prewar conditions. The result is that we have been obliged, perforce, to curtail our experimental work simply because of the fact that we can not stretch a dollar and make it cover as much as we could in 1914. If we are compelled to drop these lines of work we will lose entirely the effect that should flow from them and lose that which the extension service is taking out into the field to disseminate to the farmers; because the object of all this research

work is to discover the laws of nature and to so control and hedge about existing conditions that the practical results can be taken to the farmer and applied by him on his own farm. That is the reason we have to support this experimental work. If the \$30,000 which was given by the Government, which started this work in 48 States, is inadequate under present conditions to properly support the work, it ought to be possible to increase those funds.

I believe that the suggestion which has been made, that any increment to that should be met by equivalent amounts from the States along the lines of the Smith-Lever Act and along the principle developed in the Smith-Hughes Act, would be wise, because I do not believe it should be the policy of the Federal Government to throw money into the States and say: "Take this money and spend it if you can, but do not match it with a dollar." But if you say to the State when you put down one dollar that if the State will put down another dollar alongside of it it may spend both dollars, then you put it up to the States, on their own earnest conviction, whether they want to support that work or not; and if the Federal Government will make a liberal provision for the work of the agricultural experiment stations under the Hatch and Adams Acts, with the requirement that the States must supply a dollar for every dollar you give, I believe that would be one of the wisest and most beneficial ventures that could be carried out by the Government.

Mr. McLAUGHLIN of Michigan. With regard to the extension work, the situation appears to be that there is not money enough to supply each county with a county agent, whereas in some of the counties—many of them in the aggregate—there is a county agent, a man, a woman for the home demonstration work, somebody to organize boys' clubs, and somebody to organize girls' clubs. Do you think it advisable to spend the money for these four Federal agents in some of the counties, that is, to so use up the money that the other counties can not even get a county agent?

Dr. RUSSELL. I do not know how generally true that is. I can only speak for my own State, and that is not the case in a single county in Wisconsin. So far as this boys' and girls' club work is concerned, we have furnished a man who organizes the counties and have asked the counties to carry their own burdens, so far as local factors are concerned in the counties. The college supplies what you might call the pedagogic oversight of the organization. I would say to the county representatives, "Gentlemen, if you want a county agent, or a woman agent for the home demonstration work, or a boys' agent and a girls' agent, you can only get them when you go down into your own jeans and furnish a large part of the cash to carry out the project." If the county met that sort of a proposition, then, certainly, it ought to receive careful consideration on the part of the college. But I think it should be contingent, in large measure, upon the county itself furnishing the major part of the support. We have no such cases as you mention, Mr. McLaughlin. The most that we have got is where we have a county agent and a woman agent. The woman agent concerns herself with the farm home and not with the farm, and that, of course, is one of the factors which is of very, very great importance in this question of general dissatisfaction which obtains under rural conditions. Why is it that the wife is so quickly responsive to a suggestion to leave the farm and go to town when she

gets along in years? It is simply because she has been a drudge for so long; simply because the farm barn is supplied with water, while she is lugging water from the well.

Facilities for labor-saving devices obtain in the barn, but do not in the home. The function of the home demonstration agent is to see that there is introduced into the farm home these labor-saving devices. That means quite as much working on the man to get him to open up the pocketbook as it does working with the woman.

Mr. McLAUGHLIN of Michigan. I think there is no difference of opinion as to the value of these different lines of work. I simply wanted your opinion as to the advisability of using that money for those extra lines of work, as you call them, in many of the counties, while at the same time other counties do not even have an agricultural agent.

Dr. RUSSELL. In some places the demand for county agents would not be so sharp and keen. In Wisconsin we have two or three counties that are substantially mining counties, which devote comparatively so little attention to farming that the agricultural possibilities are very small for a county agent. Milwaukee, an urban county, would not have a county agent. I should put that upon the ground that, where the people themselves were willing to support the work, and asked for it, the State authorities, in conjunction with the States Relations Service here, ought to decide where the money can be most wisely used.

Mr. McKINLEY. What proportions do the State and county pay for those agents?

Dr. RUSSELL. With us, we are having the county pay \$1,500 per county unit. The budget runs up from \$1,200 to \$2,000, but it averages around \$1,500. When the county makes its contribution, the State automatically appropriates another \$1,000. The amount we get from Federal sources enables us to put in from \$600 to \$800 extra. We must bear in mind, too—

Mr. McKINLEY. Is the Federal proportion only about one-fourth?

Dr. RUSSELL. About one-fourth, I should say, in our case, at the present time. That percentage is growing smaller rather than larger because the number of counties is growing more rapidly than the funds grow, and hence the funds have got to be spread out over a larger part of the State.

Mr. McLAUGHLIN of Michigan. You spoke of the large attendance at the agricultural colleges now. Does that represent a desire or intention of the young people to engage in agriculture after leaving the college?

Dr. RUSSELL. I think the percentage of our graduates who go into practical forms of agriculture is steadily growing right along.

Mr. McLAUGHLIN of Michigan. That is a little inconsistent, is it not, with the statements we have been hearing as to the desire and intention of the young people to leave the farms.

Dr. RUSSELL. Yes and no. The boy who can see the chance for the kind of life he wants to live on the farm is likely to stay. The boy wants to leave the farm because he does not see anything in it. You take the breeders—the sons of the breeders—and those boys do not leave the farm. The son is following in the footsteps of the father. It is the farm on which the life has been drudgery, where it has been brawn rather than brains that has been used, that they

want to leave. The boy wants to get off that kind of a farm, and I do not blame him. It is true that it might have been the boy's fault more than anything else. More likely, however, it is the father's fault for not bringing up the boy in the right way. If the father who is a farmer would give his boy a calf or a pig or something else to rear and give him the product of it when he sold it—not take it away from him—and so give him an incentive for doing these things, you would not find the boy wanting to leave. The upper stratum of the farmers find out that you must give boys an interest in things. If you do not get a boy interested in things you can not educate him. You can educate him through this economic sense quicker than in any other way, so far as my experience goes.

Mr. McLAUGHLIN of Michigan. I may over-estimate the difficulty that we may experience on that road-building proposition to which I referred awhile ago. What do you think of it?

Dr. RUSSELL. I do not think you do. I think it is a very serious problem. I have already taken it up with our State highway commission, and they are going to take the attitude that they are not going to spend this money just because we have got it. We have the Federal appropriation, and the States are supplementing that with an equal amount, but we are not going to let these contracts at a price per unit that is abnormally high. It is true that, in the main, the labor used on those contracts is of a type that does not come from the farms. It is the so-called rough labor that is gotten out of the cities. In the more remote regions, and on small contracts, they will draw some labor from the farms. The evidence for Wisconsin shows that there are 14,000 laborers at the maximum and the highway commission says that they are not going ahead and lay out these funds under these high costs. They will simply do a part of the road building and let the rest go over. I do not understand that the money reverts, does it, if it is not used up? Anyhow, the counties are going ahead with bond issues, and they voted a program running for six or eight years; and for the State of Wisconsin, if they were to carry out their maximum program, it means 14,000 laborers to go on the road work.

Mr. McLAUGHLIN of Michigan. And you think those will not largely come from the farms?

Dr. RUSSELL. Not in my own State.

The CHAIRMAN. Those engaged in teaming will largely come from the farms?

Dr. RUSSELL. Yes; and for every team of that sort we have to have three or four other men that are working at the shovel.

Mr. YOUNG. Of course, where you have a condition such as we have in my State, where the population is almost wholly agricultural, that labor will come from the farms.

Dr. RUSSELL. Yes; but in Wisconsin we have the cities, and there we get this flow of transient labor on all of that contract type of work. We built our cantonments with the same type of labor.

Mr. TINCHER. If this money is left available, some of the States will use it and some will take the broader view and try to economize.

Dr. RUSSELL. You are referring to the road work?

Mr. TINCHER. Yes. It would take some action on the part of Congress to equalize the work, at any rate.

Dr. RUSSELL. I should suppose that the Bureau of Public Roads would give due attention to problems of that sort; they will doubtless see that that money is not wasted; because, the Lord knows, we have not got any money to waste, even in these days.

Mr. TINCHER. There is no place where a man who wants to build a home or a barn can pay a dollar a barrel for cement if the road contractors are paying \$2.70 a barrel for it, is there?

Dr. RUSSELL. Cement has not gone up since last year. We are not paying substantially more than we did a year ago.

Mr. TINCHER. What is the price?

Dr. RUSSELL. I do not know the price, but I was told that by builders.

Mr. MCKINLEY. Cement now sells for \$3 a barrel, whereas six years ago it used to be about a dollar.

Dr. RUSSELL. Oh, yes; but I mean recently. Of course, it will undoubtedly cost more, but the question involved in the road-building program resolves itself into what that means in lowering the cost of distribution; and that is the thing that has got to be weighed, and is being weighed, by the State highway commission.

Mr. McLAUGHLIN of Michigan. It seems to me that the policy pursued in Wisconsin, as you have stated it, is the proper policy—not to approve the contract merely because you have the money, where prices may be outrageous. Do you know whether that policy has been suggested to the Department of Agriculture?

Dr. RUSSELL. No; I do not; but I would presume that the department would be conversant with the facts. Mr. MacDonald, who is in charge of the Bureau of Public Roads, is a thoroughly competent business man, as I understand, and from my contact with him I do not think he is going to let problems like that slip by him. But that is where, naturally, it ought to be done; the actual controlling factor will be the Department of Agriculture.

The CHAIRMAN. Are the counties first supplied with an agent?

Dr. RUSSELL. Generally speaking, yes; because there is more demand for the county agent than there is for the other types of work.

The CHAIRMAN. And a woman home worker?

Dr. RUSSELL. Yes; on account of local pressure in the county, which you must take into consideration. If the county wants this it must go down into its own pocket and tax itself for it.

The CHAIRMAN. It is left to the county?

Dr. RUSSELL. Yes; it is left to the county.

The CHAIRMAN. Do you exercise any discretion in the matter?

Dr. RUSSELL. It is left to the discretion of the county; and then we appoint the man. The appointment has to be viséd by the Board of Regents of the college. That is not left entirely to the county.

The CHAIRMAN. It is left to the county to choose whether they desire an agent or the experts?

Dr. RUSSELL. Do you mean by the experts those men with headquarters at the college?

The CHAIRMAN. Yes.

Dr. RUSSELL. A considerable amount is used for experts. I do not know that the overhead would be in that. I know in our own case that we have three men who are supervising 45 county agents; that is, 1 to 15. I do not regard that as a high overhead. In fact, I

think we are undermanned rather than overmanned, so far as executive oversight is concerned.

Of our Smith-Lever money which we are getting from Congress, we are using, I should say, roughly, from 65 to 75 per cent in the counties themselves, the other 25 per cent being used for specialists at the college and overhead expenses. The overhead for those 45 men would consist of 3 men. For the boys and girls we have one man and for the home demonstration we have one. With the department specialists who are backing up these county agents and working with them, we have perhaps a dozen, but not more than 25 per cent of the entire amount would be used for executive overhead and the specialists at the college.

Mr. TINCHER. How much do you get per county from the Government that you expend?

Dr. RUSSELL. We do not get so much a county at all. We get a lump appropriation of so much.

Mr. TINCHER. What does that figure out to the county, where you have the agents?

Dr. RUSSELL. We have \$80,000 in the State of Wisconsin, and we have 71 counties. Fifty of those counties have county agents.

Mr. TINCHER. That would be \$1,500 to a county?

Dr. RUSSELL. Yes; including salary and expenses.

Mr. TINCHER. What do we appropriate for a county?

The CHAIRMAN. On an average, over \$4,000 to a county last year.

Mr. TINCHER. Outside of your business expenses, you say you get about \$800 to a county?

Dr. RUSSELL. I would have to make an analysis of the figures to get the proportion. I see what you are trying to get. Your idea is that on the average each county gets \$4,000 of Federal money.

The CHAIRMAN. Yes; if distributed in that proportion it would average that.

Dr. RUSSELL. I expect that the representative of the States Relations Service could state how much of that actually goes into the respective counties, how much into the State overhead, and how much is spent here in Washington. I have never figured that.

The CHAIRMAN. How much is expended for the county agent's work and for the specialists?

Dr. RUSSELL. I should say that we are spending three-fourths for the county agent work and 25 per cent at the college for specialists and overhead.

Mr. TINCHER. How many of these experts are sent out from Washington?

Dr. RUSSELL. Generally speaking, we do not need an expert from Washington if we have a field that is already covered by a man on the ground, because he is more familiar with the local conditions than a Washington man can be. We are making more and more cooperative arrangements with the Washington men in connection with certain lines of work which we do not have in our college, whereby the men are paid partly by Federal money and partly by State money and are located at the college, carrying out this work cooperatively between the two. Take, for instance, bees, on which we have a man now, Washington paying three-fourths of the expenses and we one-fourth. We would not be able to carry on this work if it were not for this cooperation with Secretary Houston.

The CHAIRMAN. You match the money we appropriate with the local funds, doubling the amount, which makes available on an average more than \$4,500 for each county.

Dr. RUSSELL. The State pays half of it.

The CHAIRMAN. I understood you to say that you paid only \$1,800 in to the county. What becomes of the other \$2,700?

Dr. RUSSELL. That I cannot answer, because I have no knowledge of what the Federal figures are. We could not say that we receive \$4,000 or \$2,000 per county from Washington, but we get a certain amount based on our rural population, which for Wisconsin was \$80,000 last year. That \$80,000 has got to go for all our Smith-Lever work, of which, as I say, roughly, 25 per cent is work carried on at the college for these specialists and for administrative overhead. The other 75 per cent is spent for the men located in the counties; and maybe three-fourths of that, in round numbers, would be about \$60,000 that is actually spent in the counties.

Mr. HEFLIN. How many counties have you?

Dr. RUSSELL. Seventy-one.

The CHAIRMAN. The \$80,000 pays the expense of specialists sent out by the department, which, it seems to me, is an extraordinarily large amount in comparison with the sum paid to the counties.

Dr. RUSSELL. Of course, an analysis of that ought to be submitted to you by the Secretary's office. I have no knowledge as to that.

The CHAIRMAN. We are told by the department that all the specialists are assigned to the colleges and that the work is done and managed directly from the colleges. It seems to me there is a discrepancy between the amount that is made available and the amount that really goes through your hands.

Dr. RUSSELL. I would be very glad to help analyze that problem. It is an important one from your point of view, as I can see.

Mr. RUBEY. You get \$80,000?

Dr. RUSSELL. Yes.

Mr. RUBEY. And you have 71 counties?

Dr. RUSSELL. Yes.

Mr. RUBEY. So that you only get a little over \$1,000 to a county. That would make an average of about \$1,000 to a county if all the counties had agents. If you have 50 counties out of the 71 which have agents, that would make it about \$1,600 on the average in each of the 50 counties in operation.

Mr. TINCHER. What does the State pay toward the work in each one of those counties?

Dr. RUSSELL. We pay from \$1,800 to \$3,500. If a man's salary is from \$1,800 to \$3,500, that is made up from a contribution by the county—

Mr. TINCHER. From the local county?

Dr. RUSSELL. From the county taxpayers. That is local. That comes from the county. Then the State gives \$1,000 for each county, and the balance is furnished by the United States through the Smith-Lever Act and the direct appropriations to the department.

Mr. TINCHER. What is the amount that goes to the county agents from the Smith-Lever funds?

Dr. RUSSELL. On the average, \$60,000 out of the \$80,000 goes to the county agents in the State.

Mr. TINCHER. That would be \$1,200 apiece?

Dr. RUSSELL. Yes; \$1,200 apiece, on the average. That varies. In the counties where the agent gets \$1,800 it is not as large, of course, as in the counties where the man gets \$3,500. I am certain that we can make an analysis of that thing for you, with Mr. Harrison's aid, that ought to clear up that matter.

Mr. YOUNG. About what is the attendance at your agricultural college?

Dr. RUSSELL. About 1,300.

Mr. HEFLIN. Mr. Chairman, Dr. Riggs, from South Carolina, is here, and I suggest that we hear him briefly.

The CHAIRMAN. We will be glad to hear him. Dr. Pearson has the matter in charge; whatever he suggests.

Dr. PEARSON. I intended to call on Dr. Riggs next.

The CHAIRMAN. You may proceed, Dr. Riggs.

STATEMENT OF DR. W. M. RIGGS, PRESIDENT OF CLEMSON AGRICULTURE COLLEGE, CLEMSON COLLEGE, S. C.

Dr. RIGGS. Mr. Chairman, I see no particular reason for appearing, unless it is because of the fact that I am from a section of the country that has not been heretofore represented. I come from South Carolina. In the South this extension work has existed longer than in any other section. In my State each county has a county demonstration agent, and these agents are backed up by the necessary specialists, so that we have a well-rounded organization.

I think probably the conditions in the South best show the great importance of demonstration work. If this work had been begun soon enough I feel sure that a large part of the losses that we have suffered would not have come about at all. If we had had such an organization earlier it probably never would have come about.

We have in the South some problems along research lines which are exceedingly important. The Government only recently published a ruling to the effect that no fertilizers could be sold in this country which contained more than one-tenth of 1 per cent of borax, unless that fact was stated on the goods. The fertilizer manufacturers declined to make such a statement, on the ground that if people know that a fertilizer contains borax, nobody will buy it. That illustrates the lack of research. Nobody knows anything about the effect of borax upon crops. There is not even a satisfactory chemical method of determining the percentage of borax in mixed fertilizer; or there was not until this question came up. Here is a brand new field in which research must be undertaken. In many States soil and climatic conditions are different. We, as an agricultural college in South Carolina, are confronted with the problem of investigating the effect of borax on crops. It is impossible for us to undertake that research because of a lack of funds. That is merely illustrative of the condition that exists all over the country; and we are having that condition to meet. You must not forget that these land-grant colleges are very poor colleges; and they are not merely colleges in the sense that that word is ordinarily understood, but they are called upon for all kinds of service. If we are to meet that demand, that means that we must have the necessary funds.

I feel that the people will never relinquish that which they have become accustomed to and upon which they have been accustomed to rely. In our State all we can do is to use such funds as have been provided by State authority and to put the responsibility upon Congress and the State legislature if the funds are not appropriated in the degree necessary to do the work. We feel that we are not coming before the Congress or legislature as suppliants in any sense but are asking for money to do necessary service, leaving the responsibility with the State legislatures and Congress as to whether those funds are available. That is my attitude as a southern college president. We are in a State where the farm-demonstration work has been most completely developed; I believe our people need more than ever before a liberal support for extension work, and I know that they need more than ever before a liberal addition to the funds which are available for agricultural research. I believe that is as much as I have to say, because these gentlemen who are agriculturists have spoken to you. I am an electrical engineer and could not answer agricultural questions if they were asked me. That is all that I want to say—that these colleges occupy a peculiar and unselfish relation to this work, and that these appropriations are intended to extend the service of the college to your constituents at home on the farm.

MR. ANDERSON. May I ask you how much money is spent for extension work in the average southern county?

DR. RIGGS. I would have to answer in terms of my own State, because very often we college presidents are not familiar with the financial conditions that obtain in our own colleges, let alone in other States. I understand that during the war we had 45 counties. I believe our overhead expenses must have run 10 per cent. The rest was spent on home-demonstration work, boys' and girls' club work, and so on.

MR. ANDERSON. That is about \$6,000 a county?

DR. RIGGS. Yes.

MR. TINCER. How much of that was Federal money?

DR. RIGGS. The amount from the Smith-Lever act was \$77,000 last year. The appropriations from other Federal sources amounted, I think, to something like \$130,000 to \$140,000, from various emergency appropriations and from various bureaus.

MR. HEFLIN. Altogether, you say, it was about \$130,000 or \$140,000?

DR. RIGGS. Yes; I think so.

THE CHAIRMAN. You had \$77,000 of Federal money altogether?

DR. RIGGS. \$77,000. I am not speaking from actual figures now. I have not the actual data in mind. I think probably South Carolina is one of the most typical States because of the complete development of the work in that State. It extends to every single county.

THE CHAIRMAN. We are grateful to you, Dr. Riggs.

DR. PEARSON. May I have one word more?

THE CHAIRMAN. Certainly.

DR. PEARSON. Dean Mann has asked to be excused because of the time having been taken up. I want to leave with you as a matter of record the fact that the extension directors have been considering

the amount of money that they could use to the best advantage, and they very ardently hope that this committee will see its way clear for next year to increase the supplementary Smith-Lever appropriation from \$1,500,000 to \$3,000,000, and they have prepared a statement of the way that that money could best be used. I would like your approval of the filing with you of a statement in regard to this and a further statement in regard to the station funds. We are very much obliged to you.

The CHAIRMAN. We are very grateful to you, Dr. Pearson, and to all of you gentlemen.

The committee will now recess.

(Thereupon at 12.10 o'clock p. m. the committee recessed until Wednesday, Jan. 14, 1920, at 10 o'clock a. m.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Saturday, January 10, 1920.

The committee met at 10 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. Mr. Harrison, whom will we hear next?

Mr. HARRISON. We will take up the estimates of the Bureau of Public Roads. Mr. MacDonald, chief of that bureau, is here, and he will make a general statement and then proceed with the discussion of the individual items.

STATEMENT OF MR. THOMAS H. MacDONALD, CHIEF OF THE BUREAU OF PUBLIC ROADS, DEPARTMENT OF AGRICULTURE.

Mr. MACDONALD. Mr. Chairman, and gentlemen, I think it will not be necessary for me to take much of the time of the committee in discussing our estimates, because they differ in only a few items from those of preceding years.

Like all governmental bureaus, we are passing through a period in which we are picking up the loose ends and reestablishing the lines of service largely disrupted by the war. During the period of the war about 42 per cent of our engineering and technical force went into the military service.

By reading the reports of the hearings of preceding years, I have learned that a pledge was made by the director of the bureau, Mr. Page, that if the money that was appropriated by the Congress was found to be unnecessary during the war, it would be turned back into the Treasury. I therefore wish to report that for the fiscal year 1918 we turned back into the Treasury \$80,000, and for the fiscal year 1919 we turned back \$64,000.

The work of the Bureau of Public Roads is divided into three main lines of activity: First, the Federal-aid road work, which we administer; second, tests, research, and economic investigations related to highway construction; and, third, agricultural engineering, dealing with the engineering problems directly affecting agriculture. It is proposed by the department to refer all the engineering problems originating in and pertaining to agriculture to the Bureau of Public Roads.

I wish to devote most of the time allowed for the hearing by this committee to the discussion of this third phase of our work—that is, the engineering problems relating to agriculture. The Federal-aid work, the first division of our work, is provided for entirely under the Federal-aid road act and is not dealt with in the estimates which are before you. We are allowed 3 per cent of

the Federal-aid fund for administrative purposes, and none of that fund is involved in these estimates before you. Therefore you have only to consider the two phases of our work, the test, research, and economic investigation work as related to highways, and the agricultural engineering work, consisting of irrigation, drainage, and the rural engineering problems of a more mechanical nature.

Mr. McLAUGHLIN of Michigan. That is, 3 per cent of the \$200,000,000?

Mr. MACDONALD. Yes, sir; \$6,000,000.

Mr. HARRISON. That is over a period of three years, Mr. McLaughlin.

Mr. McLAUGHLIN of Michigan. Are the men employed in your office or anywhere in connection with your work, and paid out of that percentage, engaged in any other kind of work in the bureau?

Mr. MACDONALD. No, sir. No; absolutely not.

Mr. McLAUGHLIN of Michigan. They give their time exclusively to that?

Mr. MACDONALD. Exclusively, but some of the men employed on the other rolls—in testing and research work, for example—give part of their time to Federal aid work; that is, they test the materials used in the work. You understand, however, that the 3 per cent referred to is 3 per cent of the Federal funds. As the Federal aid funds are met by more than an equal amount by the States, our administrative fund is actually less than $1\frac{1}{2}$ per cent of the amount which we must administer and to the expenditure of which we must extend general supervision.

Mr. HEFLIN. We provided for the use of war machinery, motor trucks, and other machinery to be used on the roads in the various counties. What are you doing on that now?

Mr. MACDONALD. This bureau is acting as the distributing agency. We have assigned a section of the division which handles the Federal aid work to this duty. The Federal-aid money is the only money we have that could be used for the necessary administrative expenses. Our solicitor advised that this work, being part of the same general plan of Congress, the Federal-aid funds could be used for distributing this equipment, such as the motor trucks and other road-building machinery, to the States.

Mr. HEFLIN. You have distributed it?

Mr. MACDONALD. Up to the 1st of last July we had distributed from twelve to fifteen thousand motor trucks—I do not have the exact number—and will distribute, all told, about 27,000 motor trucks and a considerable amount of other road machinery.

Mr. ANDERSON. When you make distribution is it of a character which gives complete title to the State highway commissions?

Mr. MACDONALD. It is not under the present law, which prescribes that the allotted material must be used on roads constructed in whole or in part by Federal aid, but we have recommended that complete title be given to the States. Such a recommendation was included in a bill introduced by Congressman Kahn, of the House Military Affairs Committee. I believe that complete title should be given to the States.

Mr. ANDERSON. Without any limitation at all as to the uses to which it should be put?

MR. MACDONALD. No, sir; I think it should be strictly limited to use for road purposes.

MR. ANDERSON. It seems to me the one proposition is inconsistent with the other; that is to say, if you give complete title, I do not see how you are going to limit the uses which go with that title.

MR. MACDONALD. That question came up in the Senate Military Affairs Committee, and I am simply passing along the legal opinion that came from one of the Senators there that it was not inconsistent for Congress to tie a string to gifts, if it desires so to do.

MR. ANDERSON. I think that is true; but when you tie a string to the gifts, you do not give an absolutely unqualified title.

MR. MACDONALD. We believe that all of this equipment can not be used to advantage by all the State highway departments, and that some of it could be better used by the counties for local road construction. Moreover, the present law provides that the equipment may be used on Federal-aid road work only. While it is possible, under that provision, for some of the States to distribute the equipment among the counties, because in those States the Federal-aid work is carried on through the counties, in other States it is unlawful for the State highway department to release any of the State's share of the equipment to the counties, because Federal-aid road work is performed solely by the State. Our recommendation was intended to give authority to the State to use the equipment for public-road purposes, not limiting it to use on Federal-aid road projects exclusively.

MR. PURNELL. What is the basis for distribution?

MR. MACDONALD. The same as we use in making the Federal-aid allotments. Each State's proportion depends on the relation which its population, area, and mileage of post roads bears to the total population, area, and mileage of post roads in the United States—the same factors which are used in distributing money are used in distributing trucks. We try to adhere to a value basis, but there have been enough units of each particular kind to enable us to distribute by units rather than value.

MR. HEFLIN. Do the counties desiring this machinery make application to you?

MR. MACDONALD. The counties desiring this machinery make application to the State highway department.

MR. HEFLIN. And the State highway department makes application to you?

MR. MACDONALD. Yes, sir. And there is that condition in the States that some of the States can distribute these trucks to the counties, because they work entirely through counties. I think I make that point plain—that they do no work directly. In Missouri, as I recall, the State highway department is not in direct charge of road work; they also work through the county boards in Kansas and Iowa. In Illinois the State highway department does the work itself, and not through the medium of the county, so that they have these trucks tied up. The counties are not able to use them and they are clamoring for their use. I think that by simply extending authority to the State departments to permit the use of these trucks by the counties on other than Federal-aid work they may be made of broader service to the States.

MR. ANDERSON. Mr. MacDonald, I understood from your preliminary statement that you did not intend to go into this road business

in detail. I think the committee would be interested in knowing something about the organization, the machinery for the distribution and the expenditure of the Federal-aid road fund. While it is not particularly a part of this bill, unless we get it in these hearings we won't get it at all, and I imagine a good many questions will be asked of the chairman of the committee in regard to the machinery that has been set up for the distribution of this fund.

Mr. MACDONALD. As to our road work, we have the Federal aid funds to administer under the first division. The States—all of them—have met the Federal aid funds more than half way. We are giving, on the average, not more than about 40 per cent of our last estimates, the States paying 60 per cent, and they have over-subscribed the funds. That is sufficient to show that there is great interest in the building of roads; and we want our administration of the expenditure of the large sums which have been subscribed in 48 States to be such that we may feel that we have wisely discharged the responsibility placed upon us by Congress. But, to discharge that responsibility with wisdom means that we must now revise many of the standards which we had set up prior to the war. In a way, the war ended one period of our road history and inaugurated another—the era of the motor truck. Prior to 1915 the production of trucks was very limited. The whole production up to that year from the time the first trucks were manufactured in 1900 was little more than one-half as great as the production during the year 1918 alone, when 250,000 were manufactured. Many of these vehicles which now use the highways are far heavier than any which the roads had been called upon to carry before the war; and they have had a most damaging effect upon the highways built according to the old standards. Indeed, we are now facing the necessity of practically reconstructing our whole road system to carry this heavy truck traffic. To do so will call for the expenditure of vast sums of money, including, undoubtedly, much of the money appropriated by Congress for Federal aid. But before we enter upon so vast a program I feel that it is vitally important that we study the existing situation very carefully to the end that whatever standards we set up to replace the outgrown standards of the pre-war period may be scientifically designed to meet the requirements of the new situation.

That brings me to the work which we have laid out for our testing, research, and highway economics divisions. Without going largely into details of that work—we can go into them as far as you desire—the work we have planned is to find out how much traffic there is on the roads, the types of vehicles which compose the traffic, the weights we are going to carry, the amount of products moved, the distance they are going to be hauled on the roads, and the maximum size of loads to be carried, and, from these figures, to determine what kind of work we will have to do on the roads, or what kinds of roads we will have to build. That means very detailed and very scientific investigations. For instance, I have here a pressure gauge. It looks like a rather intricate machine. It is designed for the purpose of determining the intensity of pressure produced under our road surfaces on the subgrade by the known wheel loads of vehicles on the surface. We can determine, through

the use of this little pressure gauge, the effect which the weight of a heavy truck, as distributed throughout the road crust, will have upon the subgrade below, and that is one of our great problems.

I call your attention to some of the effects of the heavy traffic that has broken down road surfaces. For instance, I am pointing out in this photograph a concrete road broken up by heavy truck traffic. We believe that it is rather a matter of drainage underneath than any fault in the road surface itself. But there have been failures in all types of road from gravel up to the very highest types. Here [exhibiting photograph] is a failure of a very high-class brick surface, due to the heavy truck traffic. That brick surface was maintained prior to the war, and we expected, when it was put down, that it would be useful for at least 15 or 20 years. As you see it was a brick road on a 4-inch concrete base, and it was destroyed by the heavy truck traffic that came upon it.

In that connection, one of the most interesting experiments has been to find out just what the trucks do to the roads, and it has been necessary to make measurements of the blow struck by a moving truck wheel. I do not want to go too much into the details of some of these matters, but they are all of very great interest and value to us. For instance, here is a copper cylinder [exhibiting] half an inch in height and half an inch in diameter, a standard copper cylinder, heat treated by the same method that is used at the Frankford Arsenal for preparing similar cylinders to determine the recoil of the gun mechanisms. This illustrates how the blow of the heavy truck wheel is delivered through a plunger [indicating] to the copper cylinder, and that is the same cylinder after the truck has passed over it [indicating]. By the difference in the height of the cylinder before and after the truck has passed over it we can measure the intensity of the blow which the moving wheel delivers to the road. We have found that one wheel of a loaded 5-ton truck moving at 10 miles per hour and falling upon the measuring device from a height of only one-quarter of an inch will deliver a blow to one of these cylinders equivalent to a static load of more than 20,000 pounds, or a dead load of practically 10 tons. If you can imagine the weight of one of these big road rollers—a big three-wheeled steam road roller—concentrated upon an area of the road's surface no larger than one of these small cylinders, you may get some conception of the blow that one wheel of a 5-ton truck running at 10 miles per hour repeatedly delivers to a road. Of course the speeds and weights of trucks vary greatly and there is a corresponding difference in the effect they have upon the roads. It is to determine this and other equally important facts about truck traffic that we are asking in the estimates an increase of \$30,000 to carry on research work. That is the first increase we are asking.

In the third line of work—agricultural engineering—we have the drainage work, irrigation, and rural engineering—that is, investigations of the mechanical problems related to agriculture.

We have a map which I would like to have the committee look over with Mr. McCrory, our Chief of Drainage Investigations, which shows the different activities relating to the reclamation of swamp lands, and a map showing the swamp and overflowed lands that we now have, which, through the application of proper reclamation

measures, can be made available for agriculture—good lands, that with reasonable expenditures can be made available. We have prepared a chart to show the different areas in which those activities exist.

As far as irrigation is concerned, Mr. Teele, who has been connected with that work in California, but who is now with the Census Bureau, on leave from our bureau, is here, and I will ask him a little further on to present to you the case of the reorganization of the old irrigation districts in the West. In some of the first irrigation districts that were formed they have now found that through the wasteful methods of using water, the poor ditches, and the duplicating system of distribution which they have built (like Topsy, they just grew from time to time), they are now facing the necessity of entirely reorganizing and revamping the distribution system in order to have enough water to carry on their work and provide for the natural expansion of their cultivated area. This condition exists in many of the oldest irrigation districts.

Sometimes the question comes up as to the relation of the irrigation work of this department to the irrigation work of the Reclamation Service. The land that has been put under the Reclamation Service is only a very small fraction of the total area irrigated. So far as I know, the Department of Agriculture is the only department giving any help to the farmers on the other irrigated lands.

We deal entirely with the agricultural problems after the water is placed on the land by the Reclamation Service. We do not place the water on the land. Many of these private and old-established irrigation districts are now facing the necessity of an entire reorganization of their whole system in order to supply enough water to provide for extending their irrigated areas. It is one of the most serious problems I know of in the West, so far as irrigation is concerned, and I am hoping the committee will hear Mr. Teele on this point.

So far as the rural engineering work is concerned, a very important single point with reference to that work is the testing of tractors, and for the development of this work, and with this particular point in mind, we are asking the largest increase of any, \$75,000.

Summarizing our requests, Mr. Chairman, we are asking a \$30,000 increase for testing and research work; that irrigation be placed back on the prewar basis by an addition of \$20,000 over last year's appropriation; that drainage work be given \$10,000 more than the prewar appropriation; and that the appropriation for rural engineering be increased by \$75,000. All of these increases, with the exception of \$30,000, are for purposes directly related to the application of engineering principles to agriculture.

Among other things which I feel that the department has accomplished along the line of working out the mechanical problems related to agriculture is the successful completion of the dusting machine for the prevention of the boll weevil in cotton.

This photograph shows the machine for spraying the dust over the cotton plants to prevent the boll weevil. This machine has been developed by the Bureau of Public Roads, through the rural engineering division, in cooperation with the Bureau of Entomology in the Department of Agriculture. An interesting thing about this

machine is that we have to fit it up with lights, so that they can operate at night. The dust can only be used when the crop is damp.

Mr. PURNELL. What is the approximate cost per acre?

Mr. MACDONALD. Mr. McCormick, can you answer that?

Mr. McCORMICK. The machines have not yet been manufactured commercially. That work is just being started. The machine will cost in the neighborhood of \$300 or \$400, and one machine will take care of from 25 to 30 acres.

Mr. PURNELL. I wondered what the approximate cost per acre for doing that kind of work is, the spraying part of it.

Mr. McCORMICK. I can not give the exact figures for that. Each application requires five pounds of calcium arsenate per acre, and there should be four or five applications per season. The arsenate costs from 22 cents to 30 cents per pound, making the cost of material from \$1.10 to \$1.50 per acre per application. The labor will vary with the wages paid and the type of machine used.

Mr. ANDERSON. Is it a dry spray?

Mr. McCORMICK. Yes, sir.

Mr. WILSON. Is it the idea for the department to purchase large quantities of these machines?

Mr. McCORMICK. Not to purchase any machines. We have designed, developed, and made a working model, a full-sized model.

Mr. HARRISON. It has been made for use in the experimental work which we are conducting in connection with the efforts to control the boll weevil.

Mr. McCORMICK. Some eight manufacturing companies are now studying this problem with the view of manufacturing the machine and putting it on the market.

Mr. YOUNG. What material is used in the spray?

Mr. McCORMICK. Arsenate of lime.

Mr. MACDONALD. That illustrates simply one of the lines of activity of the Division of Rural Engineering in the application of engineering and mechanical principles to agriculture.

Mr. YOUNG (referring to photographs). Is that the machinery that is being used in the Louisiana experiment?

Mr. McCORMICK. Yes, sir.

Mr. HARRISON. The Bureau of Entomology, of course, is conducting the experiment, and the Bureau of Public Roads has merely aided it in designing this machine.

Mr. MACDONALD. We take care of the mechanical and engineering feature only. The problem of the proper spray to use is outside of our province. They say what they want to use, and we help them with the design of the proper mechanical apparatus for using it. We are encouraging manufacturers to make those machines—not one manufacturer only but a number—so that the cost will be reduced to the lowest possible figure to the farmer.

I think you will not be inclined to criticize the machine for being overelaborate, either.

The CHAIRMAN. Is this an engine on the wagon?

Mr. MACDONALD. No, sir; it is a blower operated from sprockets on the wheels. There is no engine in connection with it. The larger one has an engine.

The CHAIRMAN. It is a blower?

Mr. MACDONALD. It is.

Mr. WILSON. Why do you say you have to work with electric lights?

Mr. MACDONALD. We have to work when the field is wet with dew.

The CHAIRMAN. Do you generate electricity?

Mr. MACDONALD. We are getting carbide lights.

The CHAIRMAN. Let us take up your estimates item by item. What is the first item?

Mr. MACDONALD. Page 227.

The CHAIRMAN. That is the statutory roll. If there are any changes you may point them out.

Mr. MACDONALD. There is no change in that.

The CHAIRMAN. Item No. 2. One editor, \$2,500, is changed to one chief clerk, \$2,500.

Mr. MACDONALD. Mr. Chairman, that item was discussed before your committee a year ago, and that place has been vacant ever since. We are now asking that the title of the place be changed to chief clerk so that that officer can be transferred to the vacant place.

The CHAIRMAN. The next is No. 9, seven clerks, class 3, increase of one by transfer from lump fund for road building and maintenance. That is a transfer from the lump-sum roll?

Mr. MACDONALD. Yes; that is a transfer from the lump-sum roll.

The CHAIRMAN. No. 11, three clerks at \$1,500 each, an increase of one by transfer?

Mr. MACDONALD. There is no change, I think.

Mr. HARRISON. The committee would like to have you refer to each item in which there is a change and indicate what it is so that the facts will appear in the record. The next item is No. 36, on page 278.

Mr. MACDONALD. One mechanic, by transfer from lump fund for road building and maintenance, \$2,100.

Mr. HARRISON. The next is No. 40.

The CHAIRMAN. One skilled laborer or mechanic is transferred from the lump fund.

Mr. MACDONALD. Yes; from road management.

Mr. HARRISON. The next is No. 42.

The CHAIRMAN. One telephone operator by transfer from lump fund?

Mr. MACDONALD. That is a transfer from the lump sum for road building and maintenance, and that fund has been reduced by that amount.

The CHAIRMAN. I believe that is all.

Mr. HARRISON. Those are all the changes on the statutory roll.

The CHAIRMAN. What is the next item?

Mr. MACDONALD. The next item in which any change appears is item 53, which shows a reduction.

The CHAIRMAN. You may care to comment on item 52.

Mr. MACDONALD. That is the introductory paragraph to the items under General Expenses.

The CHAIRMAN. Then the next item is No. 53.

Mr. MACDONALD. In item 53 the amount of the previous appropriation has been reduced by the transfer of one skilled laborer and one clerk. That is the only change in that item.

The CHAIRMAN. A decrease of \$2,040.

Mr. MACDONALD. And the same is true of item 54, a decrease of \$5,920, due to transfers to the statutory roll.

The CHAIRMAN. Kindly state which is the item for investigations of the best methods of road making.

Mr. MACDONALD. Item 54, for the investigation of the best methods of road making, especially ordinary sand, clay, and dirt roads, and the best kinds of road-making materials, and for furnishing expert advice on road building and maintenance; \$138,220 in the last appropriation, reduced to \$132,300 in this appropriation.

Mr. MACDONALD. Item 55, "for investigations of the chemical and physical character of road materials." This language is new: "for conducting laboratory and field experiments, and for studies and investigations in road design, independently or in cooperation with State highway departments and other agencies." The former appropriation was \$47,020, and we are asking an increase of \$30,000, making \$77,020. That is the work to which I referred as the field and laboratory work necessary to solve the physical and chemical problems which we encounter in the design of roads to carry the modern truck and automobile. The change in language is for the purpose of enabling us to work in cooperation with State highway departments. We propose to work largely through the State laboratories.

Mr. McLAUGHLIN of Michigan. Why can you not do that under your percentage appropriation, under the Federal-aid road act?

Mr. MACDONALD. In the first place, it is not sufficient to allow work of this character to be done and, in the second place, that percentage can not be expended for work of this character. That can only be expended for the administration of the act. I will discuss that point when we reach it; but of the amount that we are administering we have less than 1½ per cent for administrative purposes, and it is not possible to expand our organization to carry these other problems.

Mr. McLAUGHLIN of Michigan. Do you mean you can not carry on studies and investigations in road design with that percentage money?

Mr. MACDONALD. The men who are assigned to the construction of Federal-aid roads can, of course, as an incident to their principal work, do some of this research work. But a part of the appropriation we are asking under item 55 would undoubtedly have to be used to defray the special expenses of this incidental work. We expect, eventually, to learn a great deal from the construction of the Federal-aid roads, but, naturally, our observations of these roads will not reveal much information of value until they have been in service several years. For our immediate information we must do a considerable amount of laboratory work in the way of designing instruments with which to make accelerated tests of the various types of pavements, and in making the tests themselves.

Mr. McLAUGHLIN of Michigan. I do not remember the words of the law in regard to the percentage for administration, but, if you will pardon me, it seems to me it is putting a narrow construction on that, much different from the construction made by other bureaus of this department in analogous cases.

Mr. MACDONALD. I do not wish to place a narrow construction on the law.

Mr. HARRISON. Mr. McLaughlin, section 4 of the act reads this way: "That so much, not to exceed three per centum of the appropriation for any fiscal year made by or under this act as the Secretary of Agriculture may estimate to be necessary for administering the provisions of this act shall be deducted for that purpose, available until expended."

The CHAIRMAN. Why can you not do this better under item 54, which is the fund for the investigation of the best methods of road making? Sand-clay roads are included in the road-building act, are they not?

Mr. MACDONALD. Yes; we are building a large number of them through Federal aid, but we use the money we receive under item 54 to assist the counties and townships.

The CHAIRMAN. Outside of that?

Mr. MACDONALD. Outside of the Federal-aid road act. The fund under item 54 is the only fund from which we can give assistance to the counties and townships other than the assistance which is given on roads built by Federal aid, which will constitute a very small percentage of the roads.

Mr. JONES. Why can not the same information which you obtain from the investigations which you make out of the appropriation in the Federal-aid act be given to the townships and counties for the construction of their roads which are not State roads?

Mr. MACDONALD. We do not make any experimental or investigational studies with the Federal-aid funds. They provide only for the administration of the act. The States have presented to us plans and specifications which we have approved as general and standard specifications and plans, and our administration of the act is confined to the building of roads under these standard plans and specifications.

Mr. HUTCHINSON. Does not the Government have agents in each State department to supervise the roads?

Mr. MACDONALD. The Federal-aid roads?

Mr. HUTCHINSON. And other roads, too.

Mr. MACDONALD. No, sir; the State, county, and township funds are administered by the State highway department, or by the county supervisors, or by the township officials.

The CHAIRMAN. What is the next item?

Mr. MACDONALD. There is no change in item 56.

The CHAIRMAN. This refers to road materials?

Mr. MACDONALD. Yes, sir; it continues work which we have been doing in connection with the investigation of the results of field experiments in the use of different kinds of road materials and different methods of construction. We propose to carry on this work in connection with the Federal-aid work.

Mr. McLAUGHLIN of Michigan. Do you propose to construct any buildings? This provides for the erection of buildings. Have you any in mind?

Mr. MACDONALD. We have no buildings in mind. There is a laboratory building provided for in another appropriation, but we do not expect to go ahead with that until prices are cheaper. It is impossible at this time to get a laboratory for the money that has been provided.

Mr. HARRISON. The appropriation for the building, \$75,000, carried in the act for 1918, Mr. McLaughlin, and we deferred construction on account of the prevailing high prices. The money is available until expended.

Mr. ANDERSON. You are doing some work over there with respect to testing cement and other materials?

Mr. MACDONALD. Yes. All the experimental work conducted under item 55 has been carried on there. The language of this item as revised will enable us to carry on part of the work through the cooperation of the laboratories of State highway departments and educational institutions. It is the same class of work that we have been doing over at Arlington Farm. The character of the work is illustrated by the tests which we have been making on the effect of the action of heavy wheels on various kinds of road surfaces. I would like to make it clear to the members of the committee that it is the accelerated tests such as we conducted at the Arlington laboratory that we can not carry on under the Federal-aid road act. But the information that we get from these tests, especially from the accelerated tests, is of great value in designing Federal-aid and other highways.

For instance, on this machine [exhibiting photograph] each wheel weighs a thousand pounds, and we move it back and forth for a long period over different classes of surfaces. This process is what we call an accelerated test. We have already broken up some of the road surfaces which have been laid and which up to the present time we had thought were very good construction. You see, by the use of this machine we accelerate the normal action of heavy-rolling loads, so that we are able, in a short time, to produce an effect which normally would result only after a long period. The work of testing the impact of truck wheels, in connection with which I showed you the use of these copper cylinders, is also of this class of semifield and semilaboratory work. All information of this sort is used directly in the design and construction of the Federal-aid roads.

FEDERAL-AID ROADS.

The CHAIRMAN. Are you ready now to take up the Federal road act?

Mr. MACDONALD. Yes, sir.

The CHAIRMAN. Can you state the amount available and how much you expect to expend?

Mr. MACDONALD. Under the Federal-aid act of 1916, a total of \$75,000,000 was appropriated for Federal-aid road work. The appropriation available for the fiscal year 1917 was \$5,000,000; for the fiscal year 1918, \$10,000,000; for the fiscal year 1919, \$15,000,000; for the fiscal year 1920, \$20,000,000; and for the fiscal year 1921, \$25,000,000.

Under the post-office appropriation act of February 28, 1919, an additional amount of \$200,000,000 was made available, of which \$50,000,000 was immediately available; \$75,000,000 was available on the 1st of last July; and \$75,000,000 is to be available on July 1, 1920, for the next fiscal year. There will then be \$100,000,000 due the 1st of next July, which is the last of the total appropriation of \$275,000,000.

Up to the present time, therefore, there has been made available \$175,000,000 for expenditures through the Federal-aid acts and on the 1st of next July there will be an additional \$100,000,000. The latter amount will be available for use at any time during the two-year period following the 1st of July, so that construction will be continued at least through this two-year period. During the war expenditure of this money was stopped almost completely, partially by direct action on the part of the States and the Federal Government in refusing to go ahead, and partially because of the impossibility of going ahead with the work on account of a lack of labor and materials. A large part of the personnel of all the highway organizations went into military service, and the expenditure was cut down very materially. During the fiscal year 1918 only \$425,445 was paid to the States, while the amount paid the year previous to that, which was the first year we did any work, was \$2,702,247.

The CHAIRMAN. How much is available now and how much unexpended will be available the 1st of July?

Mr. MACDONALD. I will have to give you those figures by the fiscal years.

The CHAIRMAN. Have you the total amount available?

Mr. MACDONALD. The unexpended balance on the 1st of July, 1919, was \$74,472,306. The new appropriation for this year was \$95,000,000, so there was on that date a total available to the States of \$169,472,306.

On the 1st of next July another \$100,000,000 will be available. Construction from that date will run over at least two years, and may run even longer than that. I think, Mr. Chairman, in that connection, we shall have to extend the period during which this money is to be available, or some of the States will lose some of their pro rata because of their inability to expend it.

Mr. McLAUGHLIN of Michigan. Have the States provided the money, or can they find no way of expending it? Is that what you mean?

Mr. MACDONALD. The States have provided the money to meet the Federal-aid fund in excess of the requirements of the law. That is, we have only participated to the extent of about 40 per cent of the total cost, but in a number of these States materials and labor and contractors are not available to do the work. The counties are, in some instances, carrying out a big program outside of the State program, especially counties in which large cities are located, like Wayne County, Mich., so that, while the money is available, it will probably not be expended during the two-year period. We shall have to extend the period of its availability. None of the States have failed to meet the allotments by more than the amounts required.

Mr. Chairman, I think you would be interested in a statement of the types of road that we have approved for projects. During the fiscal years 1917, 1918, and 1919 we have executed projects, on which we propose to pay at most 50 per cent of the cost, as follows: Earth roads, 1,790 miles; sand-clay, 7.1 miles; gravel, 1,740 miles; macadam, 234 miles; macadam, mat-top, 185 miles; bituminous macadam, 142 miles; bituminous concrete, 127 miles; concrete, 643 miles; brick, 120 miles; and miscellaneous, 49 miles; so the earth, sand-clay, and gravel construction, located largely in the States of the South, in the Mississippi Valley and the far West, total 74 per cent of the miles approved.

That is nearly three-fourths of the total mileage approved. The in-between types, macadam and macadam, mat-top, total 7 per cent. The higher-type roads, such as bituminous concrete and Portland cement concrete, constitute 18 per cent, and the undetermined 1 per cent.

Mr. JONES. What was the percentage of water-bound macadam?

Mr. MACDONALD. That was 4 per cent.

Mr. JONES. That is just 4 per cent more than it ought to be, I presume.

Mr. MACDONALD. The protection of that type is falling off now very rapidly. Still there are some places where we have constructed macadam over heavy fills in order to carry the traffic until the fills have settled and become stable enough to support a surface of a higher type. I should be very glad to send the members of the committee this statement, which gives in a rather concise tabular form all these percentages and mileages. The information in this statement differs slightly from that which is contained in my report to the Secretary of Agriculture for the fiscal year ended June 30, 1919. Since the date of that report definite decisions have been made in the cases of several roads, the type of which had not then been determined, and the mileage of such roads is, in this table, added to that of the various types as given in the other table. I shall be glad to answer any other question.

The CHAIRMAN. Thank you, Mr. MacDonald. It is now after 12 o'clock, and the committee will stand in recess until 2 o'clock.

(Thereupon, at 12.10 o'clock p. m., a recess was taken until 1.30 o'clock p. m.)

AFTER RECESS.

The committee met, pursuant to taking recess, at 2.15 o'clock p. m., Hon. Gilbert N. Haugen (chairman) presiding.

STATEMENT OF MR. THOMAS H. MACDONALD, CHIEF OF THE BUREAU OF PUBLIC ROADS, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN. The committee will come to order. Are you ready to proceed, Mr. MacDonald?

Mr. MACDONALD. Yes, sir. You brought up the question, Mr. Chairman, about the organization to handle Federal aid.

The CHAIRMAN. Are you through with your general statement about Federal aid for roads?

Mr. MACDONALD. Yes, sir; I have nothing further.

Mr. ANDERSON. I understood that you would take up the organization of the force which dealt with the distribution of the Federal-aid fund, and particularly the method of presenting the projects, and how they were dealt with by the forces in charge of this distribution.

Mr. MACDONALD. The organization which deals with the distribution of the Federal-aid fund consists of a general organization headed by the chief engineer in the Washington office and 13 district engineers in charge of the work in 13 groups of States. The districts vary in size. One embraces only one State, California; others include

four or five States; the largest one includes eight States. Projects for Federal aid are initiated by the States. As the first step, a statement is forwarded to the district engineer in authority, announcing, in effect, that the State proposes to build a piece of road of a certain type and length in a certain location. This statement we refer to as the project statement, and it is always accompanied by an approximate estimate of the cost of the proposed construction. The project statement is examined by the district engineer with the purpose of determining whether the project complies with the Federal-aid road act. If, in his opinion, it does, he forwards the statement to the Washington office with his recommendation. It is there examined by the chief engineer and his assistants, and, if the chief engineer concurs in the recommendation of the district engineer, the project is placed before the Secretary of Agriculture, with the recommendation of the bureau, for his approval. Until the Secretary has signified that the United States will cooperate, no further action is taken by the State. If the Secretary approves, the State is so notified, and it then proceeds to prepare detailed plans, specifications, and estimates for the work. These are examined in the field by the district engineer and his assistants and are passed from the district office to the Washington office, where the examination is completed by the chief engineer and his staff. In the preparation of the detailed plans and specifications the State is guided by certain standards which have been previously agreed upon between the bureau and the State. By standards, I mean typical plans and specifications, prepared with great care, for the various types of construction. They define, in a general way, the materials, methods, processes, and proportions of each general type of construction and are used as guides in preparing the special plans and specifications for particular projects. If, therefore, in the preparation of the plans, these standards are adhered to, the State has the practical assurance that the details of the proposed construction will meet with the approval of the Secretary.

Mr. ANDERSON. Does the Secretary or your office exercise any control over the type of road to be built or give approval of the type of road, or is it merely a matter of routine so far as the Secretary is concerned?

Mr. MACDONALD. It is not entirely a matter of routine. There have been cases in which the Secretary has not approved the type of road proposed by the States.

The cases in which this action has been taken have generally involved what may be called the in-between types; that is, types which are neither low-cost nor high-cost roads—compromise types—that are not proving successful now under any conditions.

We believe that there are only two general classes of roads which it is wise to build; either a low-cost road, such as earth, sand-clay, or gravel, on the one hand; or a high-cost pavement, on the other. It is our opinion that the in-between types of roads are the most expensive roads that we can build. If we build a sand-clay or a gravel road, we get good service out of it while the traffic is light; and if at any time the traffic becomes heavy enough to warrant a more substantial surface, we have the foundation ready, and we have not expended money that is thrown away. On the other hand,

we are developing a traffic near the larger cities which nothing but a very substantial pavement will carry; and, where that condition is to be met, it is foolish to experiment with a road of macadam construction or one of the halfway types which are breaking down generally under such traffic. We are recognizing these conditions and adjusting the type of road to the traffic, so that, to that extent, we do exercise control. We prefer to build a cheaper road rather than to build a high-cost road of the in-between type. We have no objection to approving an earth, gravel, or sand-clay road, and do approve more of them than any other type.

Mr. ANDERSON. All right. Go ahead now on the plans and specifications.

Mr. MACDONALD. After the plans and specifications are prepared by the State, they are submitted to the district engineer and are examined by one of his representatives. Generally, this representative goes over them with the State highway officials; very often he does not wait until the plans are completed but goes over the road to be built with the State highway engineers, pencil profile in hand; and he is often able in this way to suggest changes in the plans as contemplated, which facilitate their approval when they are completed. When they are approved by the district engineer, the contract may start. There may be minor adjustments and changes to make in the plans before they are sent to the Washington office; but, in the meantime, the State goes ahead with the letting of the contract and with the construction. Generally speaking, the States do not wait for the plans to come to Washington and pass through the routine here.

The procedure in awarding the contract is fixed by State laws and, consequently, some differences exist among the States. In general, however, two methods are followed. In those States in which the State highway department is in direct charge of road construction, the contract is awarded by the State department. The project is advertised at the State capitol, bids are received there, and the State highway department lets the contract. In other States, where the law places the counties in charge of road construction, and gives to the State department supervisory powers only, the county boards advertise for bids, the bids are taken locally, and the contract is awarded by the county board, with the approval of the State. Generally, a representative of the State department is present when the bids are awarded.

Mr. ANDERSON. Are these contracts approved by your office or by the Secretary?

Mr. MACDONALD. Yes, sir.

Mr. ANDERSON. What is the purpose of that approval? What I am getting at is this: It seems to me that there would be a great lack of uniformity because of the differences in the plans and on account of the different materials used in road construction. What I want to know is whether or not any supervision is exercised at this end of the line regarding the securing of uniform construction prices for materials, and so forth.

Mr. MACDONALD. Such supervision is exercised through the district engineer's office. The estimated cost is approved at the time the project agreement is made.

Mr. ANDERSON. Then your project agreement, or whatever it is, includes an estimate?

Mr. MACDONALD. It includes an estimate as to the cost; yes, sir; an estimate based on the average prices for labor and materials prevailing in the community. If, after the bids are taken, the prices are out of line with those estimates, presuming there is no reasonable explanation, the bids are rejected. In that way we are exercising supervision all the time on all the construction.

Mr. ANDERSON. You do not have any rule that the bids must be within the estimates?

Mr. MACDONALD. Yes; there are some States in which that is the case. It is the law in Indiana that bids must come within the estimates, and they can let no contracts in which the bids run over the estimates. I am not in sympathy with that, because I think it breeds a tendency to make the estimates rather high. I should prefer to use the estimates simply as a check upon the bids, allowing some latitude for the exercise of judgment as to whether or not the bids should be rejected in case they are high. Ordinarily, the bids do not vary materially from the estimates. I should say that we would allow a variation of 5 or 10 per cent, but we would not allow 50 per cent or any such amount.

Mr. ANDERSON. I would like to get down to a concrete proposition. Let us suppose that you have a road that you propose to build in Minnesota, and a road in Ohio of similar construction, and let us suppose that when the project statement for Minnesota is brought to the district engineer's office your office finds that the contract price for cement or for some other material is relatively high, or more than it ought to be as compared with what it is in Ohio. What do you do in cases of that kind?

Mr. MACDONALD. We always investigate such cases further. A similar proposition has been up recently, out in Colorado, where we thought the prices of cement were out of line. We conducted an investigation and succeeded in getting a slight reduction in the price of cement. In that case the cost was reasonably explained—that is, if you can reasonably explain the price of cement at all.

Mr. ANDERSON. I think there would be a question about that.

Mr. MACDONALD. Illinois furnishes a concrete example of what it is possible to do by way of regulating the prices of materials.

The State contracts for all of its cement at once, and last spring, by buying in very large quantities, they were able to get the most favorable price, so far as I know, which is being paid for cement by any of the States.

Mr. ANDERSON. I was interested in knowing, and I think probably the committee and the House is, just what authority the department feels that it has to check up these contracts with the view of keeping reasonable uniformity in prices of the ordinary materials used in large quantities and to what extent it exercises that authority.

Mr. MACDONALD. We feel that we have full authority in that field, and next year we expect to go considerably further than we have gone up to the present time. Every month since the close of the war has seen a new economic condition, you might say. There have been continual readjustments, but during the next season we have been contemplating issuing a bulletin as frequently as at weekly intervals, giving prices for work let during the preceding week.

Mr. ANDERSON. Now, my impression is that the total program in dollars for next year amounts to something over \$600,000,000.

Mr. MACDONALD. That is the estimated amount that will be available.

Mr. ANDERSON. Has the department given any consideration to the probable effect of this road-construction program on farm labor, and particularly on farm tenants?

Mr. MACDONALD. Yes, sir, we have; the types of roads in the construction of which there may be a demand for the kind of labor the farms can supply are the inexpensive types, such as earth, sand—clay and gravel. But I do not believe it follows that the construction of such roads will draw necessary labor from farm work, because the character of roads of these types is such that the construction can be carried on in the farmers' slack seasons. The tendency in building roads of the higher type is to use machinery that does away with labor of the commoner kind. The men who are employed for such work are relatively skilled mechanics. It is the in-between types, to which I have previously referred, such as macadam with or without a mat top, which are most likely to draw seriously upon the supply of farm labor. Machinery has not been extensively used in the construction of roads of this character; in fact, machinery which will perform many of the operations involved in such construction has not been developed. Comparatively large forces of unskilled labor are required to handle such work. But, as I have said, we are discouraging such construction whenever it is possible. I think it fair to say that the larger contractors are not drawing their labor from the farms but rather from the mechanic classes. We have eliminated a large part of the hand labor in these larger building operations and are depending to a greater extent on road machinery.

Mr. ANDERSON. I have seen some of this road construction, and, as you say, it is really surprising how few men they sometimes use. I am rather under the impression that that machinery becomes more automatic as time goes on.

Mr. MACDONALD. Yes, sir.

Mr. ANDERSON. And the amount of labor constantly grows less.

Mr. MACDONALD. Yes, sir; that is true. Within the last year machines have been placed on the market that have done away with a large amount of expensive hand labor in connection with the building of the higher-type roads.

Mr. ANDERSON. I take it that it requires the construction of a considerable stretch of road to justify the use of machinery of that kind; does it not?

Mr. MACDONALD. No; not so much, on the higher-type construction. We do not think it is advisable at present to expend too large an amount on machinery, but contractors are justified in using a full equipment on a five or six mile contract, and with a small crew that length of road would provide a fair season's work. I believe we are going to come more and more to the use of automatic machinery and perhaps let the contracts in larger units as a result of that tendency.

The larger part of the organization of the bureau handling Federal-aid matters is in the field. In fact, the greater part of the organization of the whole bureau is outside of Washington. We have here a total of 73, in the Federal-aid highway work, including, in fact, those traveling out of Washington, whereas there are over 300 people

in the field. That includes all the road work which is being done by the bureau in the national forests for the Forest Service.

Mr. ANDERSON. Are these district field officers usually located in the offices of the State highway commissions?

Mr. MACDONALD. No, sir; they are either located in offices of their own in nearby office buildings or in one of the Federal buildings, if available, in the same city. That is the case in Minneapolis. We have quarters in the post office building. We take offices in Federal buildings wherever we can to avoid paying rent.

Mr. ANDERSON. Is any part of the Federal-aid funds used for the payment of expenses of State highway commissioners?

Mr. MACDONALD. No, sir; none whatever. We have a very concise statement of the way we distribute that 3 per cent fund. Capt. Wilson, have you that before you?

Capt. WILSON. We divide the 3 per cent fund as follows: For the field work on the project statement stage, of which Mr. MacDonald was just speaking, we allow four-tenths of 1 per cent. Then, for the field work on the project agreement stage—that is, the field examination of the completed plans—six-tenths of 1 per cent; for the field inspection of work under construction, which is the larger portion of our work, we allow $1\frac{1}{2}$ per cent. For the field inspection of maintenance we allow one-tenth of 1 per cent; and then for the Washington office and for the people traveling out of Washington, Mr. MacDonald and others, four-tenths of 1 per cent. These added together make up the 3 per cent. We are not expending, and have not expended up to the present time, all the amount which is available. Indeed, so far we have expended only sixty-three hundredths of that part of the 3 per cent fund which under this calculation we assume to be available for expenditure. You remember the law states that not to exceed 3 per cent can be set aside for this purpose.

The CHAIRMAN. In other words, about 2 per cent of the amount available has been expended?

Capt. WILSON. Less than that. We allot it pro rata, considering the relative values of the work.

Mr. ANDERSON. It is the administrative part of the bureau, and no proportion of that at all is paid to the people who are employed by the States?

Capt. WILSON. No, sir; the local inspectors on the work are paid out of the joint funds for the purpose.

Mr. ANDERSON. They are a part of the construction force, I suppose?

Capt. WILSON. They are part of the construction force; and charged to the construction work on the particular job.

Mr. MACDONALD. Does that answer the question?

Mr. ANDERSON. I think that covers what I had in mind. I was just wondering whether this matter was handled the same as Federal aid for extension work and other work of that kind, where I understand that part of the salaries are frequently paid by the State and part by the Federal Government.

Mr. MACDONALD. We do not do that. There is one point I want to make. As you will notice, there is a large part of the 3 per cent fund which we are not using in the preliminary work and in examinations made in advance of construction. We hold this part of our ad-

ministrative percentage to apply on the construction stage. In that connection, in Hennepin County, we recently refused to participate in paying for a considerable stretch of pavement because the work did not conform to the specifications for that project. Our inspector had been over the work frequently enough to know that the construction company had not been putting cement enough in the base. We, therefore, refused to participate with the Federal-aid funds for that stretch of road. In the next contract, in which the same company was interested, there was no difficulty whatever in getting the work entirely in accordance with the specifications. We went over that case with the State highway department and had its full approval in deducting the amount.

There is one other point that should be made; that is, I think we will have to expend the remaining portion of this percentage in inspecting these Federal-aid roads from time to time to see that they are maintained in accordance with the provisions of the law. The law provides that if the roads are not maintained we shall refuse to participate in further assistance from the Federal-aid fund in the State until the roads are placed in proper condition. It is the only method that we have of assuring proper maintenance. To keep in touch with the condition of the roads built we will probably have to spend the balance of the 3 per cent.

Mr. ANDERSON. Do you feel that your experiments have gone far enough now so that your knowledge is sufficient to secure the construction of roads which will stand up under heavy traffic?

Mr. MACDONALD. I believe that we are building the best road surfaces in the world to-day and that they will come as near meeting that condition as any roads that are being built in the world. We have not the solid old grades that France has. The system of roads that France built under Napoleon, which proved so successful during the war and carried the heavy traffic imposed upon them, was successful only because of the great depth of stone which had been built into them in the many years since their construction. As a matter of fact, we are building better road surfaces in the United States than the roads which carried that traffic. Some of those old grades were constructed of 42 inches of stone and foundation stone (one of our men actually dug through 42 inches of stone), so that it is possible to understand why those roads held up under any load placed on them, but the surfaces went to pieces rapidly. On the road from Bar-le-duc to Verdun—the one that saved Verdun, I believe—it is said they used in maintaining the surface one man for every 20 feet; that is, one man was stationed on every 20 feet of the road to maintain the top surface while it was carrying that tremendous traffic. But the traffic could always get through because the base held up.

We can build tops that will support present traffic. We know that; but we are pretty sure that these tops are being put on some bases that will not hold up. That is why we are asking for some of this experimental money. In these days we can't afford to build roads 42 inches thick. We want to learn how to build much lighter foundations that will be so well drained that they will be proof against frost; that is, we want to get the water out of the roads and keep it out. If we can do that, after that there is no doubt that we can put on a top surface that will support these loads.

In every one of the failures of the better type of roads, illustrations of which I showed you this morning—not the old roads, which were not built for the heavy loads we have now, but the brick and concrete roads—there have been no failures with the exception of foundation failures. We want to begin all over again teaching and instructing people to build grades for the roads; and we really think that there will be more progress made along that line than in the improvement of surfaces. That is one reason why we do not favor the placing of high-cost pavements on new grades of some types of soil, such as heavy clay. We prefer to build, at first, a gravel or a sand-clay road or some other road of that type which will last for a number of years—two, three, four, or five years—and will give some service to the public in wet weather and good service in dry weather. Such a road can be maintained during the time the grade is seasoning, and, ultimately, when the grade has settled, if the traffic warrants, we can build a higher type of road.

Mr. ANDERSON. How long do you think you will have to continue this work?

Mr. MACDONALD. Continuously.

Mr. LEE. That is—

Mr. MACDONALD (interposing). That is, assuming that the Federal-aid program is extended along the same lines, we would have to continue the supervision.

Mr. LEE. I think that is a good idea. I think the most serious thing in road building is maintenance.

Mr. MACDONALD. And so do I. In one or two cases it has been necessary to threaten to cut off further allotments in order to get repairs made. But our organization is not only cooperating with the State departments in building roads; we are also doing everything we can to develop the idea of highway engineering as a profession and to encourage the development of efficient highway organizations in the States. We are limiting our organization in the States and trying to develop State initiative by not doing anything that can be done by the State organizations. In some States we need more inspectors, but we have only one man that we call a senior highway engineer, who deals directly with the State officials. In the larger States these men have one or two assistants to watch the progress of Federal-aid work. Our intention is to work as intimately as possible with the State highway departments through a limited number of engineers of the higher class, who will be able to advise and bring real engineering experience to the general supervision of the work. We expect the States to furnish adequate organizations of their own to handle the detailed supervision. The States employ men such as rodmen, chainmen, transitmen, and the inspectors, so that our organization is very small as compared with the organization that the States have on the work.

Mr. ANDERSON. Do you find that the organizations in the States are usually pretty efficient, a pretty efficient body of men, and that they are able to carry out the work satisfactorily?

Mr. MACDONALD. The efficiency of the individual State highway departments depends to some extent upon the length of time it has been organized, and to a very large extent upon its support funds. In general, the State highway departments have developed very much

as an individual does, and all of the older established departments are giving excellent service and are composed of high-class men. Some of the younger departments must develop better organizations as a whole, but practically all the States are placing first-class engineers at the head of their engineering forces, and these are the men with whom we deal principally in the Federal-aid work. There is a serious lack of qualified inspectors, and it will be necessary to develop a large number of young engineers who are qualified to handle field work and to take over the work of inspection on construction.

MR. ANDERSON. To what extent is it possible to check up and correct any defects in efficiency that may exist in the work?

MR. MACDONALD. First, the plans, specifications, and estimates for road work on which Federal aid is asked are checked by the district engineer and his assistants. In practically all cases this consists of an examination, usually in company with a representative of the State department, of the road proposed for improvement when the proposed plans are nearing completion, and a check in the office of the completed plans to ascertain the general accuracy of the work and the estimates which have been made of the quantities on which the contractors will submit bids.

MR. ANDERSON. Do the State highway departments have good engineers?

MR. MACDONALD. In general, the State highway departments either have now or are building up a force of competent engineers. Many of the State departments are large and well supported, and the States in general are pursuing a more liberal policy in advancing the scale of salaries for competent engineers than the Federal Government. In fact, States and counties both are in many places attracting by much higher salaries very competent men from our own forces. As an illustration, our district engineer for the eighth district, which is composed of the entire States of Tennessee, South Carolina, Georgia, Alabama, Mississippi, and Florida, has resigned a position with this bureau which paid a salary of \$4,000 to accept a salary of \$7,500 as engineer for a single parish in Louisiana.

In my judgment, the Federal-aid law has given the States the best possible incentive to pass advanced legislation providing for highway improvement and excellent engineering services in the conduct of the work. The financial aid, while it has been a great stimulus, is not the greatest help the Government has given the States through the Federal-aid legislation. The greatest benefit consists in the better highway laws that have been passed in conformity to the requirements of the Federal-aid act and in the ideals of highway engineering which are being rapidly set up for the country as a whole. When the Federal-aid act was passed there were a number of old, well-established highway departments which had brought highway engineering to a high plane; in their own States they were rendering an excellent service, and their influence was extending to other States. But the growth was slow. There were many States in which the highway departments were small and poorly supported and were, in fact, fighting for existence against influences which sought to destroy their effectiveness. In a considerable number of States there were no State highway departments. These conditions are now generally changed. If the Federal-aid act had accomplished nothing else than the estab-

lishments of the better control of highway matters through the State highway departments and the strengthening of these departments, it would have been well worth while.

I feel that the highway situation in the United States is being rapidly composed, so that the men who render honest and efficient service in the State highway departments will not be displaced through political preferment, and that tenure of office will be decided by the character of the services which they render the public. I believe that among the men who are connected with the State highway departments the Federal-aid act is generally considered to have been of the greatest assistance possible to them in placing the work on a firm and substantial foundation. It must be remembered that up to the present time there has not been an opportunity to accomplish a great deal of actual road construction, but neither has any considerable part of the money been expended. In fact, under the terms of the act, it can not be expended except for actual road construction. There is a very large amount of the preliminary work out of the way; the States are generally ready to let contracts as fast as it seems desirable; and I anticipate that this next year will show a very marked result in the building of serviceable highways all over the United States.

Mr. RUBEY. I want to ask some questions along that line that may have already been covered. I did not come in until after the opening of the hearing after lunch. There are many people that seem to think that the work would have to be done in order to receive all the money from the Federal-aid appropriation, and consequently the States won't be able to use all their quota. Have any of the States used up the quota which has been allotted to them?

Mr. MACDONALD. The State of Washington is fully up to its program; that is, by the 1st of next July it will have expended every cent of Federal-aid money and really more.

Mr. RUBEY. What is the condition of the State of Missouri?

Mr. MACDONALD. The State of Missouri has not—

Mr. RUBEY (interposing). The point I want to bring out is this: My State is just beginning to wake up, and nearly every week some county votes bonds or some road district votes bonds; and in my own district, within the last two or three months, five or six counties have voted from two hundred and fifty to four hundred thousand dollars' worth of bonds; and a great many of the road districts, which under our law have authority to do this, have voted bonds. It is going to take a good deal of time for them to get under way. They have got to sell the bonds, and they are doing that very readily. They have got to survey the roads and have the approval, and they have got to go through a lot of routine work, and it will take a number of months to do that. The question that occurs to me is this: May not a good many of these States get in a position where, when they are really just coming around to the work, they will have voted the bonds and done all of the routine work and all of that sort of thing, and yet won't be able to use the money on the roads until the 1st of July comes around and it may lapse?

Mr. MACDONALD. The Treasury takes a rather liberal view of that situation. If the county, or the State, has definitely set up a project, and the money is appropriated to it, the Treasury con-

siders it expended; so they actually do not have to do the physical work.

Mr. RUBEY. You do not have to build the roads, then?

Mr. MACDONALD. No.

Mr. RUBEY. That is the point I wanted to get at.

Mr. MACDONALD. That actual work, in many of the States, is really about two years behind. You see, we lost two years during the war, and we had about a normal program provided for, so that I believe we will have to move ahead the period during which this money is available for one or two years.

Mr. RUBEY. I have had some letters from my people and some letters from the State highway commission expressing the fear that, as the people are voting bonds and getting ready for the work of building hard roads, they are going to use up their quota; we are getting many letters from Missouri, and other Members of Congress are getting letters from other States requesting us to see that Congress continues the appropriation.

Mr. MACDONALD. That matter can be arranged so as to make the Federal-aid money available for some time in the future, perhaps until year after next. We can provide for the continuance of the Federal-aid program. The States should know what money they are going to have available at least one year before it is available, in order that they may make necessary preparations for its expenditure. We do not need any more money to spend during this fiscal year, and there are only a few States that could use much more during the next fiscal year; but they ought to know what they are going to have so as to be able to make plans and specifications and be ready for the year after next, and I think, if the money could be made available for a year from next July, that that should be done, and that would be in time for most of the States.

The CHAIRMAN. If a county votes down hard-surface roads, will they be deprived of the Federal funds as well as the funds obtained from automobile licenses?

Mr. MACDONALD. Of the first 5,000 miles of project executed, 74 per cent are either earth, sand-clay, or gravel roads.

In certain special cases we have said, where the traffic is very heavy, that we would not approve a gravel road or a sand-clay road, because they would be torn up by the traffic. As a general proposition, however, we have approved more miles of low-cost roads than we are approving of the most expensive roads.

The CHAIRMAN. Then it is safe to say that the department has not committed itself as to any particular road?

Mr. MACDONALD. Absolutely.

The CHAIRMAN. That, generally speaking, is left to the discretion of the people in the localities where the roads are to be built?

Mr. MACDONALD. Yes, sir. The record, as I see it, is a very good one in that respect. By the way, I have here a very detailed statement as to the exact number of miles of each class of roads which each of the States has proposed for construction in each fiscal year—if you desire to have it in the record. We are not committed to any type, and we are trying to rely entirely on this one requirement in the law—that the road must be substantial. We consider the construction of earth roads, under certain traffic conditions, as substantial construction.

The CHAIRMAN. Will you give us some details as to the type of gravel, sand-clay, and earth roads required?

Mr. MACDONALD. You want the description of about the maximum and minimum requirements?

The CHAIRMAN. In a general way, what would be required if you had an application to contribute funds to the building of a road in the country?

Mr. MACDONALD. May I ask Mr. James, the assistant chief engineer, to give you the maximum and minimum widths, thicknesses, etc.? He has those better in mind.

The CHAIRMAN. We will be pleased to hear Mr. James.

Mr. MACDONALD. Tell about the requirements of our standards, Mr. James, if you please.

**STATEMENT OF MR. E. W. JAMES, ASSISTANT CHIEF ENGINEER,
BUREAU OF PUBLIC ROADS, DEPARTMENT OF AGRICULTURE.**

Mr. JAMES. Each project, Mr. Chairman, is originated in the State highway department; they not only make their own selection of type but furnish us, in the application, the data on which they base that selection. In other words, they come to us with a justified application.

The CHAIRMAN. First, the counties make application to the State?

Mr. JAMES. Yes. That is a thing of which we do not always have complete cognizance, because we deal directly with the State highway departments; but after the counties make application to the State, the State reviews the whole matter, and it comes to us with a definite recommendation.

The CHAIRMAN. If the State approves the project, it comes to you?

Mr. JAMES. Yes, sir; it comes to us, thoroughly justified in ninety-nine cases out of one hundred.

The width of earth road, which predominates, is from 22 to 30 feet between ditches. Occasionally there are widths that are narrower for some particular purpose. There is a road that I have in mind in California that was made narrower, for instance, because it connected directly with a forest road which we are building. It connected it with another part of the road built under the State, and there was no particular reason why there should be a difference in the widths of the roads, as the traffic inside and outside the national forest was practically the same. There are a few cases where grades are wider than 30 feet.

The crown of an earth road will be from three-fourths of an inch to 1 inch to the foot; that is, a crown that can be built with the ordinary earth-road working machinery, machine graders, elevating graders, etc., that are used. As far as possible we design the cross sections so that the grading machine can cut the ditches.

The CHAIRMAN. Just what do you mean by ditches?

Mr. JAMES. The side ditches, for drainage purposes. Of course, the work, in addition to the mere construction of a grade, varies a great deal. Take the work in Iowa. Very often on earth roads they will install very substantial drainage—subdrains, you call them; tile drains for subdraining the soil. That is done in cases where they contemplate putting expensive surfaces on the grades at

a later date, just the same as under city pavements they will lay gas mains and carry them to the curb, in order to be prepared for future pavements that they wish to put in. The drainage structures under such roads are usually made permanent under an earth road just the same as though it were a higher type, such as concrete or vitrified brick; and all bridge structures also are put in as nearly as possible in permanent form.

When we come to the surfacing of earth grades, the conditions are controlled very largely by the immediate traffic and the prospective future traffic. There are conditions, for instance, in Minnesota, where 1,200 yards a mile are quite uniformly specified on their gravel-road projects. That provides only about 4 inches of gravel on those roads. But they have a pretty well organized system of construction there, and they reduce the rolling necessary by laying 4 inches of gravel this year, and as soon as necessary thereafter an additional 800 or 1,200 yards to the mile as maintenance work. The Government does not cooperate in any of that additional work. Those roads have from 4 to 8 or 9 inches of gravel.

The CHAIRMAN. All put on at one time?

Mr. JAMES. About 4 or 5 inches at a time. We use two courses for a greater depth.

The CHAIRMAN. Is it an advantage to spread it thin?

Mr. JAMES. Yes, and let it compact. That is the reason why the Minnesota commission adopts their scheme of placing 4 inches the first time and letting it come down under traffic and solidify well before putting on the next course.

The CHAIRMAN. Then they use a King drag?

Mr. JAMES. Or the grading machine. That is better controlled, has a larger wheel base, and is truer in its operation.

The CHAIRMAN. What are the most important factors in building a sand-clay or gravel road; has drainage anything to do with it?

Mr. JAMES. For an earth or gravel road the drainage is the most important factor, because you practically have no surfacing at all on an earth road.

The CHAIRMAN. You can not build a good road without drainage?

Mr. JAMES. You can not; and it is the whole thing in an earth road; for, even if you moisten an earth road with a bucket of water, you create a mudhole.

The CHAIRMAN. How much of a drain is required in the average country?

Mr. JAMES. That is a question that can not be answered by any definite statement. There are sections of the country where we have a great deal of trouble in getting them to do adequate drainage, because they are not familiar with tile draining for agricultural purposes. As I recited a moment ago, Iowa subdrains her roads quite generally in every place where the engineers see any need of it. In the Southern States, where they seldom use tile on the land, they do not realize the need of it on the roads.

The CHAIRMAN. What do you do where they neglect the drainage?

Mr. JAMES. We do all we can to get them to install it.

The CHAIRMAN. Would you reject a project if no drainage was provided?

Mr. JAMES. We would insist that the plan be revised to include those features. Our procedure arranges for such things. Where

necessary, we go over the drainage areas and see that the culverts are properly sized and that subdrains are put in of proper size and design.

The CHAIRMAN. You require them to bring it to a certain grade?

Mr. JAMES. Yes. That certain grade can not be set by rule of thumb. It varies with the location—with the topography of the country.

The CHAIRMAN. You decide that?

Mr. JAMES. Yes; that is gone over very carefully. Recently we have had a number of our projects where the review of the grade line has been an extremely important matter, where we have gone across marshes and swamps, where our men have felt that the grade was a little too high, and that the expense could be reduced by lowering the grade. Very often, on the other hand, it is a question of raising the grade.

The CHAIRMAN. Do you approve projects where the roads are to be surfaced with gravel?

Mr. JAMES. Yes; we have even approved projects that are dirt roads, but in practically every case, and in every case since the middle of last summer, I think, we have had a definite showing from the State authorities of the conditions surrounding that particular construction. In the first place, they undertake to make it substantial and permanent as far as it goes and give us some indication that they are going to provide a better surface or some surface at a later date. For instance, a great many of those cases are where they expect to put down very substantial surfaces, expensive surfaces, that should not be placed on heavy fills until the fills have been thoroughly compacted and settled during a winter or two—not simply artificially compacted by rolling but settled under the weather. In those cases, of course, we are glad to approve the projects as earth projects. But we must have a reasonable showing from the State or county that they will come through with the revision of the project, adding the new surface at a later date.

The CHAIRMAN. When you speak of a revision, does that require a new application?

Mr. JAMES. No; it does not. We have arranged to expedite and reopen a project by simply a letter and a revision of the estimate.

The CHAIRMAN. You specify as to the culverts and bridges?

Mr. JAMES. We do not specify. They have their own typical specifications.

The CHAIRMAN. You require certain standards?

Mr. JAMES. Yes; but we have not undertaken to impress uniform standards on all the States. That is a condition that would create friction. Our country is too large to standardize. You could not make things uniform from California to the Atlantic coast.

The CHAIRMAN. Do the States regulate it?

Mr. JAMES. The States regulate that in most cases.

Mr. MACDONALD. That statement ought to be made clear. In every State we proceed under certain standards, but those standards may vary between the States. There is no arbitrary standard that we have adopted.

The CHAIRMAN. Then it is really up to the locality to determine what type of road shall be built, although in some certain instances, of course it is necessary for you to exercise discretion in the matter?

Mr. JAMES. In the thousandth case we have to exercise an arbitrary decision.

The CHAIRMAN. Thank you, Mr. James.

STATEMENT OF MR. THOMAS H. MACDONALD, CHIEF OF THE BUREAU OF PUBLIC ROADS, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN (continuing). Mr. MacDonald, you said something about the price of cement in Illinois.

Mr. MACDONALD. \$1.70 was the contract price last year—that is, net price—and they have let it at the same price this year.

The CHAIRMAN. At the factory?

Mr. MACDONALD. At the mill.

Mr. LEE. \$1.70 a barrel?

Mr. MACDONALD. Yes, in cloth sacks; and that is the mill price; probably the average cost, delivered on the work, would be a little above \$2 net.

The CHAIRMAN. What is the price in Indiana?

Mr. MACDONALD. About 10 cents higher in Indiana; but the contractors have absorbed most of that difference, apparently, because we do not find any marked difference between the contract price for the same character of work in the same months. In fact, the Indiana prices have been a little lower in some instances than the Illinois prices in the same month.

The CHAIRMAN. How does that price compare with the price in Iowa?

Mr. MACDONALD. The price in Iowa has been a little higher; in fact, so high that they have rejected some bids recently.

The CHAIRMAN. In the projects the estimates are made on the price of cement and gravel?

Mr. MACDONALD. Yes, sir; and labor.

The CHAIRMAN. If you find them in excess of the prevailing prices, do you reject the projects?

Mr. MACDONALD. Yes, if there is no reasonable explanation of the variation from the estimate. As a general proposition our prices for road work have increased less than the general prices of commodities. We still have some difference between the level of road prices and the level of other commodities. I have been expecting to see us reach that level this coming year, but our contracts so far have not shown a rise equal to that of the index of commodities.

The CHAIRMAN. In other words, we may safely state that every project is carefully checked up?

Mr. MACDONALD. Yes, indeed sir. We frequently find criticisms that the road costs are very high, and I think there are some specific instances where they have been high. We are building roads out in Washington that will cost nearly \$40,000 a mile for grading through the mountains.

The CHAIRMAN. About what is the average cost now of the ordinary surfaced road of the various types?

Mr. MACDONALD. The average estimated cost of the cheapest type of Federal-aid road planned in the projects executed up to the present time is \$4,096.

The CHAIRMAN. Is that one-half or the total cost?

Mr. MACDONALD. That is the total cost.

The CHAIRMAN. \$4,000?

Mr. MACDONALD. Yes, sir.

The CHAIRMAN. That is a surfaced road?

Mr. MACDONALD. No, sir; that is an earth road; but the cost includes all drainage structures. It includes the grading, tile drains, culverts, and all bridges exclusive of those of more than 20 feet span.

Sand clay, \$4,241. You will note that there is very little difference between the dirt and sand clay, because in the sand-clay type we generally do not move as much dirt; gravel, \$3,692; macadam, \$11,152; macadam, mat top, \$7,501. The explanation of the difference is that the mat top, in many cases, has been placed over the old macadam roads. In those cases the cost does not include the cost of the base. Bituminous macadam, \$24,618; bituminous concrete, \$24,874; Portland cement concrete, \$30,783; brick, \$42,578; and miscellaneous, \$5,018.

The CHAIRMAN. Is the construction of roads drawing heavily on farm hands?

Mr. MACDONALD. It is my judgment that we are not drawing farm hands from the farms for this work; but we propose to watch that phase of the subject very carefully during the coming year. It is my belief that the building of roads is going to do more to keep a supply of labor on the farm than any other one thing that we are doing now in a public way.

The CHAIRMAN. That is in reference to the future, but during construction how much is a man and team paid?

Mr. MACDONALD. For a man and team about \$8 a day.

The CHAIRMAN. Not \$12 a day?

Mr. MACDONALD. \$8 a day—\$7 to \$9. I know of no cases where contractors have paid as high as \$12. Indeed, there is a growing tendency to abandon teams altogether and resort to the use of motor trucks.

The CHAIRMAN. I have been told that in certain sections some renters were contemplating giving up their farms to work on the road; that they could make more (from \$8 to \$10 a day) on road work than from working a farm on shares.

Mr. MACDONALD. I know that they have had to reject some contracts in Iowa because the prices in the bids were too high. I believe that we will not be able to build as large a program of roads as there is money to build, and I do not believe we should force the program there if the prices are too high. I think, however, that the condition we have there results from a general lack of labor in the State.

The CHAIRMAN. I take it that conditions are much the same in all localities.

Mr. MACDONALD. We do not find it so. Pennsylvania seems to have plenty of labor this year, and, in fact, I believe we have had more difficulty in a few of those Middle Western States than in any other States so far as labor is concerned.

The CHAIRMAN. What has been your experience with the hard surfaced roads? Do they last longer than the gravel and sand-clay roads, with the same expense in keeping them up?

Mr. MACDONALD. Yes; they do.

The CHAIRMAN. We have a hard surfaced road between Washington and Baltimore, which went all to pieces in places during the winter. What would have happened with a properly drained gravel road?

Mr. MACDONALD. It would not have carried the traffic. But there are only sections of that road that did go to pieces. It is really surprising that some sections held up as well as they did under the traffic, for one of our engineers has found the surface to be not more than 3 inches thick in places.

There were sections of that road where our engineer tells me that they were continually placing gravel or broken stone and were still unable to hold the surface under the traffic. They have now laid a concrete surface, or are planning to do so. The average maintenance on that road has been about \$1,000 per mile per year. I presume that the annual maintenance cost of the concrete sections is not over \$50 per mile. Do you have any figures on that, Mr. James?

Mr. JAMES. Not on the surface alone, but I think it is probably not over that.

Mr. MACDONALD. There are sections of concrete on that road where we estimate that the expense of maintaining that concrete surface is not over \$50 per mile per year, while the general average cost for the whole road, most of which is macadam with tar surface treatment, is about \$1,000 per mile.

The CHAIRMAN. Then the breakage in many instances is due to the construction, is it?

Mr. MACDONALD. Yes, sir. This road is, for the most part, of the "in-between" type, which I have referred to before as generally unsatisfactory for modern traffic, and the crust is not heavy enough to carry very heavy traffic. The destructiveness of the traffic, you see, is measured not so much by the number of units as by the maximum weight of vehicle. For example, a truck going over a road may put it in such condition by breaking the top crust that every lighter load that comes over it will help to destroy it.

The CHAIRMAN. In your opinion, then, what is the best constructed road, and what material would you suggest for a hard-surfaced road?

Mr. MACDONALD. My answer to that would be governed by the conditions which prevail locally. Every road engineer has to adjust his road construction to the conditions which prevail in the community in which he builds his roads. If he has hard rock and cheap cement to use, and can build a concrete road cheaper than any other type of first-class road, he naturally would select that type. If he has a low rate on asphalt and a suitable grade of stone, he might decide on bituminous macadam or bituminous concrete; or if brick is manufactured nearby and consequently is cheap, the brick road might be the type he would recommend.

It all depends, Mr. Chairman, on the conditions prevailing locally. Any of the standard pavements, placed on a well-drained, well-graded earth road, in my judgment, will carry the traffic we have now, if properly regulated. But you can not run a 7-ton truck equipped with solid tires, at a tremendously high speed, over any of the roads we are now building and expect them to stand it. Even the best constructed railroads would be sorely taxed by the traffic that some of the

manufacturers want to put on the highways. I think we may come, presently, to national regulation of the weight of trucks which we shall allow to use our highways. But, under all reasonable traffic, any of the standard pavements, such as asphalt or bituminous concrete on a good base, or Portland-cement concrete, or brick, will give good service, if properly built; and the local conditions governing the cost will determine the selection of type if everything is honest and aboveboard. If it is a question of promotion, almost any type may be expected to prevail.

The CHAIRMAN. And the matter of drainage?

Mr. MACDONALD. Yes, sir.

The CHAIRMAN. I have preached drainage so long that I can not get away from it.

Mr. MACDONALD. Mr. Chairman, I think we shall have to preach drainage under some other title so that people will think it is new.

The CHAIRMAN. I wish you would get them to see it.

Mr. MACDONALD. Every road engineer in the country when he writes a paper begins with the statement that drainage is the most important thing, and then he goes out and builds a road that does not have drainage.

The CHAIRMAN. You suggested that eventually road builders may manufacture their own material.

Mr. MACDONALD. I think so.

The CHAIRMAN. Can you approximate the cost?

Mr. MACDONALD. A good many of the cement mills, I imagine, cost at least \$1,000,000.

The CHAIRMAN. Is that the cost of building them?

Mr. MACDONALD. Yes. Really it is a serious question.

Mr. VOIGT. Did I understand you to say that it would take a million dollars to erect a cement plant?

Mr. MACDONALD. Some of the plants have cost about that, but it is pretty hard to estimate what the cost would be now. I would have to get more recent figures than I have, but it would probably cost \$500,000 even for a small plant; that is, for a 1,000 or 2,000-barrel plant. You see, cement, in order to be manufactured commercially, has to be manufactured in large quantities. It is like coal or any of the other very heavy commodities in which you are dealing with low-cost raw materials. You have to handle a large number of units at a low amount per unit, in order to keep down the cost of your manufactured product.

Mr. VOIGT. If you were able to turn out only 100 barrels a day, it would be a losing proposition, would it?

Mr. MACDONALD. It would not be practicable. It would cost you \$10 or \$15 per barrel.

Mr. ANDERSON. The unit cost would be so high?

Mr. MACDONALD. Yes. I think I can make that clear. The raw materials, clay and rock, are very inexpensive materials, worth usually less than \$1 per ton. But it is only after they have been dried and ground and burned together in proper proportions to make cement, and then reground, that they have value. To do this, very heavy and expensive machinery is required; and it requires about the same machinery to turn out 100 barrels as it does to make 1,000 or 2,000 barrels.

Mr. VOIGT. You have got to have the clay and the rock at one point to make it successful?

Mr. MACDONALD. Yes, to make the cement economically, although there are a great many plants that are operating and shipping one material some little distance. I know of some plants that are shipping stone perhaps 30 or 50 miles. But such a condition does not make for low cost.

The CHAIRMAN. I think we have gone over this matter pretty thoroughly. We will take up the next item.

Mr. MACDONALD. The next item is the irrigation item. I am very anxious for the members of the committee to hear Mr. Teele on that item. Mr. Teele has taken leave from the bureau to take charge of some of the irrigation investigations for the Census Bureau. I have asked him to come over and point out some of the problems in the work, because there are some problems that we feel are so serious as to justify us in asking that the appropriation be placed, at least, on the prewar basis.

The CHAIRMAN. Did we cut this item last year?

Mr. MACDONALD. Year before last.

The CHAIRMAN. We rejected the increase?

Mr. HARRISON. You cut \$20,000 out of it in the appropriation for the fiscal year 1919.

The CHAIRMAN. Did you estimate an increase last year?

Mr. HARRISON. No, sir.

Mr. MACDONALD. We believe we have been very modest on that item, Mr. Chairman.

The CHAIRMAN. You or Mr. Teele might state briefly what you have in mind.

STATEMENT OF MR. R. P. TEELE, IRRIGATION ECONOMIST, BUREAU OF PUBLIC ROADS, DEPARTMENT OF AGRICULTURE.

Mr. TEELE. Mr. MacDonald suggested this morning that the reconstruction of irrigation systems in the West was, perhaps, the most important field—

The CHAIRMAN. You are now discussing item 57, "for investigating and reporting upon the utilization of water in farm irrigation," etc.?

Mr. TEELE. Yes, sir. That needs one preliminary statement. You may be familiar with the fact that in the West there is an unlimited supply of land which is fertile and tillable except for the lack of a water supply, and that for that reason most of our efforts have to do with economizing the water supply and making this supply go further. There is an unlimited supply of land with a very limited supply of water. Reconstruction, of which Mr. MacDonald spoke, consists in advising communities as to rebuilding and reorganizing their irrigation systems, which involves every line of work which is specified in the law providing for the work of this division. The historical development has been the building of small ditches along the river bottom, a multiplicity of them, still higher up on the benches, more but larger ditches, and still above that other ditches, so that in a typical river valley we have several parallel ditches. The lower land has become swampy in many cases. These

ditches are all controlled by different organizations, so that there is a lack of cooperation there. The laws perhaps encourage that situation, so that the reconstruction involves every phase of the work which is enumerated in the appropriation law.

The CHAIRMAN. Do you tell the farmer how to do it?

Mr. TEELE. It is a community affair, because a very large part of the irrigated land is served by a works which waters more than one farm.

The CHAIRMAN. Do you go where you are called?

Mr. TEELE. Yes; but we do not deal in this particular work with the individual, except as he is a member of the community, a member of an organization.

The CHAIRMAN. How many will be needed to make up the number required?

Mr. TEELE. They run all the way from little ditches watering one farm to ditches watering thousands of farms. In southern California we have one ditch that serves 500,000 acres.

The CHAIRMAN. There are smaller ones?

Mr. TEELE. A great number of smaller ones. Probably 90 per cent of the ditches, in number, are small ones that water from one to three or four farms. In acreage they do not represent a very large percentage.

The CHAIRMAN. Do you tell them how they can make use of the watershed at a saving?

Mr. TEELE. In this reorganization work the procedure is a good deal like this: We go into a community and look into the existing conditions, find the swamp lands and the multiplicity of ditches with antagonistic organizations and rights, and attempt to show them that they will be better off to unite and rebuild their works, eliminate the duplication, and build modern, up-to-date works, draining their lowland and transferring the water to the highlands. That is largely a matter of making surveys and giving advice, and it involves a great deal of persuasion in getting people into this. In some places it involves a revision of the legislation—in every case a revision of the organization—to get this multiplicity of organizations into a single organization. If we can make arrangements to get the water from the swamp lands up onto the higher lands there is a great economy, as this makes available the surplus water for new lands.

The CHAIRMAN. Do you give advice as to flooding land?

Mr. TEELE. We do that as another feature of our work, advising individual farmers as to irrigation.

The CHAIRMAN. Do you go on the premises to make a survey of the watershed?

Mr. TEELE. We have done that in typical cases. We do not make a survey of every man's farm. We go into different communities and work with the men of the States Relations Service to advise them in their meetings as to irrigation practice. We do make surveys of individual farms, because we find under their systems of distribution there is very great waste in applying the water in the wrong way.

The CHAIRMAN. Is there any benefit or advantage in flooding the land in the spring after the melting of the snow?

Mr. TEELE. In many cases they can raise one crop of hay or grain by that type of irrigation.

The CHAIRMAN. Is that done much?

Mr. TEELE. Yes; many of the streams have a large flood flow early in the season, and later a limited flow, and in such cases they can do that type of irrigation.

The CHAIRMAN. They dam up the stream and in that way flood the land along the sides?

Mr. TEELE. They run ditches out in a general direction, paralleling the river for a considerable distance, and flood the land in between.

This map [indicating] shows the territory where we are working.

The CHAIRMAN. Kindly mention the States so that they will be in the record.

Mr. TEELE. Arizona, California, Colorado, Idaho, Kansas—

The CHAIRMAN. The Western States?

Mr. TEELE. It covers all the Western States.

The CHAIRMAN. West of the Missouri River?

Mr. TEELE. Yes; including Oklahoma and Texas.

The CHAIRMAN. Do you do anything in the Dakotas?

Mr. TEELE. We have done; yes.

The CHAIRMAN. Both in North and South Dakota?

Mr. TEELE. North and South Dakota; yes.

The CHAIRMAN. Have you done anything east of the Red River?

Mr. TEELE. No; we have nothing east of the Red River. I will say this, that the Drainage Division is doing some irrigation in the East.

The CHAIRMAN. You operate only in the semiarid districts?

Mr. TEELE. The Drainage Division has been doing it in the East to some extent.

In addition to this revision work—

The CHAIRMAN. That map indicates that you are operating in practically every State west of the Missouri River?

Mr. TEELE. Yes, sir. We have taken up large reorganization projects such as I have mentioned in California, Utah, Nevada, and Colorado. In addition to that, we have what we have put on this map as pumping investigations. In a great many of these States there is a very large area, running into millions of acres, in which there is much tillable land, but it has no available water from surface supply, and, if the land is irrigated at all, it must be by pumping from wells. We are working in those sections to develop methods of pumping, methods of sinking wells, strainers which will keep the sand out of the wells and let the water in, and showing what can be done in reclaiming those very large areas which have no surface water supply.

The CHAIRMAN. Have you found it practicable to pump water from wells?

Mr. TEELE. Yes, sir.

The CHAIRMAN. What distance can the water be lifted?

Mr. TEELE. In southern California, for the orange orchards, they are lifting water 300 or 400 feet. For hay and grain growing it can not be lifted more than 20 or 30 feet, depending on the prices of fuel and prices for hay and grain.

The CHAIRMAN. How much would lifting water 15 or 20 feet cost per acre?

Mr. TEELE. That varies, of course, very largely with the local prices for fuel.

The CHAIRMAN. Say \$3 for coal.

Mr. TEELE. And also the quantity of water that you are using. They are almost all using gas or oil engines or, as in southern California, electric power which they buy from power companies. They are spending in southern California in some places as high as \$150 an acre a year for water—just for one season.

The CHAIRMAN. What would it cost if you had to lift the water 15 feet?

Mr. TEELE. That could be done for \$3 or \$4 an acre for a single irrigation.

The CHAIRMAN. And furnish an adequate supply to the land for growing alfalfa and grain crops?

Mr. TEELE. That depends, of course, on how many irrigations you give it; it depends on the rainfall and also on the underground water conditions.

The CHAIRMAN. Say 11 or 12 inches of water?

Mr. TEELE. That would be put on in two or three irrigations. It would cost all the way from \$3 or \$4 to \$10 an acre, according to the local prices. Of course that makes possible the growing of two or three crops of hay.

The CHAIRMAN. We were told some years ago that you were boring wells in one of the Dakotas.

Mr. TEELE. No; our bureau has never bored any wells.

The CHAIRMAN. Fifteen or sixteen years ago the department told us of sinking some wells in one of the Dakotas.

Mr. TEELE. I do not recall that our department ever sunk any wells in Dakota.

The CHAIRMAN. Do you sink wells?

Mr. TEELE. We never have been engaged in sinking wells. I do not recall any since I have been in that work.

Mr. HARRISON. The Geological Survey is doing that work, Mr. Teele.

Mr. TEELE. The Geological Survey has an appropriation for that work.

Mr. HARRISON. There was a provision inserted in our appropriation bill in the Senate three or four years ago, but we told the committee that it did not belong there.

The CHAIRMAN. For irrigation?

Mr. HARRISON. For irrigation purposes, to discover underground sources of water supply and use the water for irrigation.

Mr. TEELE. There was a discussion in the Senate that Mr. Harrison refers to, and there was a good deal of uncertainty as to the intent of the law—as to whether the work was to be done by the Department of Agriculture or by the Geological Survey.

Mr. HARRISON. The Geological Survey has an appropriation, I believe, of something like \$150,000 for that purpose.

Mr. TEELE. That is for actually sinking the wells. It is not for the purpose for which we are doing this work—demonstrating or determining the feasibility of that type of development—but with the purpose of encouraging the local interests to go ahead and do the work.

The CHAIRMAN. Where land is worth from \$15 to \$50 an acre, would it be feasible to lift the water several hundred feet?

Mr. TEELE. The feasibility, of course, depends on the crops you are going to raise and the value of the crops.

The CHAIRMAN. You can buy land in other localities for less than it would cost you to install the irrigation plant; could you not?

Mr. TEELE. It would depend on local conditions. In the West prices for products are higher than in the East, so that they can stand a higher cost for growing these crops.

The CHAIRMAN. Take Montana. It would not be practicable there to undertake to dig wells—to lift the water to irrigate in Montana?

Mr. TEELE. Not if they continued to raise grain and hay as they have been doing. You can not raise those crops with expensive water. They must be grown with cheap water, water you get from streams.

The CHAIRMAN. Is this money to be used largely where you have been operating in the past?

Mr. TEELE. Yes; it is just an extension of the work.

The CHAIRMAN. You ask for an increase?

Mr. TEELE. Yes; a restoration to the prewar figure.

Mr. MACDONALD. I would like to get this statement into the record at this point: There are 17,500,000 acres in this country actually irrigated; and of this area less than 7 per cent was irrigated in 1919 under Government Reclamation Service projects; and a very large sum has been expended in these Government reclamation projects—about \$118,000,000.

Mr. TEELE. The report of the Reclamation Service for this year places their figures at almost exactly 1,000,000 acres that they have irrigated out of the total of 17,500,000 acres irrigated.

Mr. MACDONALD. That estimate of the acreage irrigated may be changed after we get the census figures, but that, we think, is approximately correct. That means that over 90 per cent of the people who are living on the irrigated lands have received no assistance from the Government except such as we give them through the Irrigation Division of the Bureau of Public Roads of the Department of Agriculture.

Our contact is with the producer on the farm. I want to bring out the point that we are not trying to encroach on the fields of the Reclamation Service or the Geological Survey, but that we are devoting our attention to the application of engineering to the farm and to farm improvement.

If you are through with that item, I would like to have Mr. McCrory, the chief of the drainage work, make a brief statement about the next item, No. 58, in which we are asking for the restoration of the prewar figure, plus an additional amount of \$10,000.

In further reference to our activities, I want to say that we are placing all the activities of the Bureau of Public Roads on a strictly cooperative basis. Our Federal-aid work is handled with the State highway departments of each State. Our drainage work we are extending through cooperation with the States through the colleges; and the same is true of the irrigation investigations in the West. We hope to conduct practically all our rural engineering investigations and the mechanical features of the work through cooperation with the various State colleges.

The CHAIRMAN. In cooperation with the State colleges?

Mr. MACDONALD. Yes, sir. We are trying to place all our work on a cooperative basis. I believe in that as a principle of operation.

The CHAIRMAN. When you speak of cooperation, do you mean that they contribute an equal amount?

Mr. MACDONALD. In Utah and Colorado, in the irrigation work, I believe they contributed about three dollars to our one. But that is the principle, Mr. Chairman, that the States contribute along with the Federal Government; yes, sir.

The CHAIRMAN. They are doing that now?

Mr. MACDONALD. Yes, sir.

The CHAIRMAN. We will be glad to hear Mr. McCrory.

STATEMENT OF MR. S. H. McCRORY, CHIEF OF DRAINAGE INVESTIGATIONS, BUREAU OF PUBLIC ROADS, DEPARTMENT OF AGRICULTURE.

The CHAIRMAN (continuing). You are discussing what item?

Mr. McCRORY. Fifty-eight.

The CHAIRMAN. That is "for investigating and reporting upon farm drainage and upon the drainage of swamp and other wet lands"?

Mr. McCRORY. Yes, sir. I have prepared this map [indicating] which shows the area of swamp, wet, and overflowed lands in the States east of Colorado. The large, yellow rectangle indicates the area of such land in each State, the red square the area of which the Drainage Division of the Bureau of Public Roads has made reconnoissance examinations; while the black square in the corner shows the area of which actual surveys have been made. The most recent data that we have collected indicate that there are approximately 166,916 square miles of swamp, wet, and overflowed land in the United States. Of this area the Drainage Division, since it was established, has made reconnoissance examinations of 28,702 square miles and surveys of 11,494 square miles.

The work of the Drainage Division may be divided into two general classes: Our investigational work and our work with communities and individuals. On this map [indicating] I have indicated the principal technical investigations which the Drainage Division has conducted. One of the large problems confronting the drainage interests of the United States to-day is the problem of maintaining the drainage ditches. The bureau has begun investigations on this subject in Iowa, in the lower Mississippi Valley States, and in the Atlantic coastal plain region.

Another line of technical investigation that has met with great favor among the engineers engaged in drainage work are the hydraulic investigations relating to the rate of run-off from drained areas and the coefficient of roughness in drainage ditches. We are receiving more requests from the drainage engineers of the country for additional work of this character than for any other class of work that we are carrying on.

Investigations are also in progress in regard to the subsidence of muck, the durability of concrete tile, the drainage of tillable lands, and the efficiency of drainage pumping plants in various parts of the United States.

We are also working with individuals and communities throughout the eastern part of the United States on a number of different lines of work. On this map [indicating] I have indicated by symbols the States in which different lines of activity have been carried on. Our farm drainage work is indicated by this triangular symbol [indicating]. This work has been done mainly in cooperation with the county agents. The same is true of our terracing work, which is also carried on in cooperation with the county agents. It is our idea that a county agent should be able to handle the simple problems in farm drainage and terracing. When he has a difficult problem he should be given assistance by an engineer.

Mr. ANDERSON. You will have to back up there, because there is no county agent that knows enough to do that, according to the testimony of every other division of the Department of Agriculture. [Laughter.]

Mr. McCrory. I do not agree with that. I have a rather intimate acquaintance with the county agents, and a great many of them are doing very fine work along this line. Take, for instance, the terracing work that was started in Missouri several years ago. That work was initiated by a county agent, Mr. Cook. He knew that the farms in Missouri were being badly washed and gullied and that their value was being largely destroyed, but he did not know how to prevent this. He took the problem up with the State leader and asked for help. They asked the bureau for assistance, and we sent our engineer from North Carolina, Mr. Lynde, to Missouri. The State leader had worked up an interest in three or four counties; only Mr. Cook, however, succeeded in persuading a farmer to let Mr. Lynde build some terraces on his farm. That was three or four years ago. The last report I had from that work was that over 180 farmers had built terraces on their farms in Missouri. One of the big problems all over the United States is to control and prevent erosion of the farm lands.

The CHAIRMAN. How do you control it?

Mr. McCrory. On certain kinds of land it can be controlled almost completely by the construction of the right type of terraces. We are recommending several types of terraces—the bench terrace and the broad-base terrace, either with a uniform grade, variable grade, or level. The broad-base type of terrace, which is cultivated and which can be crossed by farm machinery, has given very good satisfaction. It is used extensively throughout the South and within a few years, I imagine, will be used in the North also. The people of Missouri are taking to it very rapidly, and during the past year we have built some in Pennsylvania; they have, so far, proved successful. We had an interesting letter from the gentleman in Pennsylvania on whose farm we built these terraces last summer. He wrote that there had been a very heavy rain and that he had gone out and observed conditions during the rain. He said that the water that came off the terraced field was practically clear, while the water from the portion of the same field that was not terraced was very muddy. That has been the general observation of farmers with properly constructed terraces.

The CHAIRMAN. Do you build the terrace on the side of the hill?

Mr. McCrory. Yes; on the hillsides. The arrangement depends on the slope of the land. We put them from 3 to 6 feet apart vertically,

and from 30 to 100 feet apart horizontally, depending upon the slope of the land. The terraces look like a series of ridges thrown up across the field. It looks as though they would spoil the field; that is what the farmers think when they first see them; but, instead, they find that they are able to cultivate the terraces, which keep the land from washing away. If you will recall, when you have a heavy rain in western Iowa, the water runs down the corn rows and washes away the soil between the rows during the corn plowing season in summer, and the water is very muddy. By terracing the fields a large part of the erosion might be prevented. I was in Nebraska last spring just after a heavy rain. As I rode along the railroad from Sioux City to Norfolk, Nebraska, in many of the grain fields it looked as though big furrows had been plowed down the hillside. They were simply channels that had been washed out. Such erosion can be very completely controlled by terracing. There are types of gullying and washing for which different methods of control must be used, but on a properly terraced farm the gullying or washing would never be allowed to start. The use of the terrace can do wonders in controlling soil washing.

The CHAIRMAN. When you build a terrace, does the water percolate through the terrace?

Mr. McCrory. The water is held behind the terrace, which is given a gentle slope, and is carried off the field to an outlet of some kind, such as a strip of grass land, an open ditch, or a tile drain.

The CHAIRMAN. They are constructed so that they can be farmed and harvesters run over them?

Mr. McCrory. Any modern machinery can be used on a properly constructed broad-base terrace.

You will recall that several years ago the investigation of irrigation in the humid region was transferred to the Drainage Division for convenience of supervision. We are carrying on a certain amount of work with certain types of irrigation, especially in Florida and along the Atlantic coast in the vicinity of New York City. In addition to that, we are doing a great deal of work with community drainage projects, or drainage districts, throughout the eastern part of the United States.

These, gentlemen, are the principal activities that we are carrying on.

Mr. Anderson. Do you have any connection or relation with the large drainage projects, such as take place, for instance, in the swamp and cut-over lands in northern Minnesota?

Mr. McCrory. Yes, sir; we are working on one project in Minnesota now.

Mr. Anderson. What is your connection there?

Mr. McCrory. That work was initiated at the request of Representative Helgeson and a number of other gentlemen several years ago. We started work on the Red River project, embracing parts of Minnesota, North Dakota, and South Dakota, about a year and a half ago. The progress report on part of the work should be available next month.

Mr. Anderson. Is that a drainage project or a flood-control project?

Mr. McCrory. It is primarily a drainage project. Flood control is only incidental to securing drainage. A certain amount of flood-

control work will be necessary in order to insure the drainage of certain parts of the land. It is a very complicated drainage project, for the river flows north and the headwaters thaw out first and the ice below interferes with the passage of the water from above.

Mr. ANDERSON. What I wanted to know, particularly, is what your contact was and how you got into it; what you had to do with it?

Mr. McCrory. There is a Tri-State Flood-Control Association that was very active at one time in getting the work started, and the work was also requested by Representative Helgeson and the governor of North Dakota.

Mr. ANDERSON. To get at what I want, let me ask this question: Does your man work directly with the drainage organization up there, whatever it is, in cooperation with the State?

Mr. McCrory. At the time we started the work none of the States were in a position to cooperate. The situation in the Red River Valley was this: The War Department had a certain appropriation there to make final surveys. Nobody had any money to make preliminary surveys, and the War Department could not go ahead without a preliminary plan. The Tri-State Flood-Control Association and Representative Helgeson had been trying to get something done up there. I went out to the Red River Valley, went over the situation, and met a number of the interested people. We wanted some local cooperation, and there was a long time during which this was under discussion and arrangements for funds were being made. It was finally arranged that certain counties in Minnesota and North Dakota should furnish the required amount of money, and the department went ahead with the project when those funds were made available.

Mr. ANDERSON. All right.

The CHAIRMAN. Where is this project?

Mr. McCrory. It extends from Lake Traverse to the international boundary.

The CHAIRMAN. Is that all?

Mr. McCrory. I have nothing more to say.

The CHAIRMAN. Thank you very much, Mr. McCrory.

What is the next item, Mr. MacDonald?

Mr. MacDonald. The next item, Mr. Chairman, is page 235, No. 59, where the largest increase of any is requested. That is an increase of \$75,000, of which \$50,000 should be immediately available. Practically the only object in requesting an increase in this item is to allow us to establish the testing and rating of farm tractors. Mr. McCormick, chief of the division, will give you some explanation of this particular item and what is proposed to be done if the increase is granted by this committee. A recommendation for the increase was carried in the Secretary's estimates for last year, and there is a very considerable demand both from the manufacturers of farm tractors, from a number of the farm owners, and from a number of the States for this department to take up this work. The State of Nebraska has already passed a law that no tractors shall be sold within that State that have not been tested and certificate granted. It is our proposal to put this on a national basis rather than a State basis, though in cooperation with the States. It is quite probable that if this increase is

granted, a considerable part of our work will be done in Nebraska or in the district where the tractors originate. We have plotted a map showing where the tractors are largely produced to-day. We do not expect to develop that work in Washington, but rather to work it out in connection with one or more of the State laboratories. Mr. McCormick will make a statement on the item.

STATEMENT OF MR. E. B. McCORMICK, CHIEF OF DIVISION OF RURAL ENGINEERING, BUREAU OF PUBLIC ROADS, DEPARTMENT OF AGRICULTURE.

The CHAIRMAN. We will be glad to hear Mr. McCormick again. You will speak on item No. 59, page 235, "for investigating farm domestic water supply and drainage disposal, the construction of farm buildings, and other engineering problems involving mechanical principles."

Mr. McCORMICK. The work of the Division of Rural Engineering includes farm and domestic water supply, drainage disposal—that is, the disposal of the house and farm wastes, not the drainage of the land—the construction and grouping of farm buildings; and mechanical principles involved in the application of engineering to farm work. Included under the latter are questions arising regarding farm machinery of all kinds, farm lighting, and farm heating. During the past year the division has had turned over to it the work in farm-implement control that was handled during the war by a special office and the work in the conservation of grain during thrashing that was handled by the Food Administration. Those are both activities that were handled under the food-control act. They are still in existence. The implement-control work, fortunately, is a very small project at present. The thrashing work carried on last year was done without special appropriations.

The work that has been done in the past has been in connection with the water supply, drainage disposal, house wastes, and construction, design, and grouping of farm buildings. A small amount of work has been done on farm lighting, some publications gotten out, and a certain amount of work conducted in connection with farm machinery problems; that is, we have issued instruction books on the operation and care of various implements. We have designed the machine you saw this morning for the application of poison for the cotton boll weevil. We have designed apparatus for the prevention of, and some for extinguishing fires in, grain separators, due to dust explosions, which were proven out and worked successfully; and certain special apparatus have been developed for use in investigational work.

The increase, if granted, will be used for the most part in carrying on the work of testing farm tractors. The application of power to the farm has grown up rapidly in the past few years, so that it becomes practically necessary for a farmer who is operating a farm of any size to select his machinery now with the view of operating it in conjunction with other machinery. That is, he does not buy a single piece of machinery and after that operate it with horses. He must have his separator and engine to run it, and, in many cases, run feed grinders, so that he uses some form of mechanical power.

This machinery has been produced in different places and has been assembled by the farmers, and in many cases it fails to operate properly in conjunction with other machinery, due in part to insufficient power; at other times due to lack of proper speeds. The tractor, being the largest and most expensive piece of farm machinery, is the one for the testing of which there is the greatest demand at the present time. As matters now exist, there is no standard rating for the tractor. The manufacturer may state that his tractor has such and such a horsepower. There is no way of confirming or successfully disputing that statement. The purchaser has no way of judging except possibly by looking at the size of it and guessing. There are seven or eight different formulæ for working out the horsepower of a gas engine, and applying those to the various tractors will give results varying between 50 and 75 per cent.

We have felt for some time, and I think every one familiar with the tractor industry realizes, the need of such tests. Last year there were 132,000 tractors built in this country; that is, in 1918, the actual figures were over 132,000, of which 96,000 or over remained here, the remainder being exported. The manufacturers estimated for 1919 a production of 315,000, and actually produced about 175,000. There are at present in this country in the neighborhood of from 325,000 to 350,000 tractors. These tractors will approximate probably between four and five millions of horsepower of the average size tractor. But, as I say, at the present time there is absolutely no standard for designating or determining the horsepower. The farmer or anyone purchasing a tractor has no conception of what he is getting excepting what is based on his own experience. If he has no experience he has to buy it through the purchase of a tractor. Several States are contemplating, I understand, the establishment of laws similar to that recently passed in Nebraska, which requires every manufacturer to secure an official test from the State university before he can receive a license to do business within the State. There are other conditions as regards carrying repair parts and giving certain kinds of service. But the basis of it is a comprehensive test of the University of Nebraska giving each tractor a rating, either what the manufacturer claims or something below that if the tractor falls down.

Mr. VOIGT. Would the rating apply only to horsepower?

Mr. McCORMICK. To the horsepower of the tractor, both the belt and the drawbar.

Mr. VOIGT. You do not give any certificate as to the serviceability of the tractor?

Mr. McCORMICK. They can not very well do that without wearing the tractor out, and that would mean an endurance test beyond anything that has been figured on yet. The university is contemplating an endurance run. Just what it will be they do not know themselves yet, but they expect to give the tractors severe continued usage and then take them apart and observe the effect on the various parts of the mechanism and judge from that as nearly as possible what the useful life of each tractor should be.

Mr. McLAUGHLIN of Nebraska. What other features will there be in the test?

Mr. McCORMICK. Fuel consumption will be one important feature, as the university is contemplating.

Mr. LEE. Have you discovered anything very important along that line of fuel consumption?

Mr. McCORMICK. We have made no fuel-consumption test.

Mr. LEE. I run a tractor and I would like to know.

Mr. RUBEY. Is it operated by gasoline?

Mr. LEE. Yes.

Mr. McCORMICK. We have found, as the result of questions sent out throughout the country to the tractor users and operators, that the consumption varies with the machine, with the locality, and with the individual operating it.

Mr. McLAUGHLIN of Nebraska. That Nebraska law was passed at the last regular session of the legislature, was it not?

Mr. McCORMICK. Yes, sir. They have not officially tested any tractors yet. They have gotten tractors and have put one or two through, but no results have been given out, and they probably will not give those results out until late in the summer. I have recently gone through their methods and the plans that they are contemplating for the test and have studied their equipment very closely and know it pretty well in detail.

Mr. McLAUGHLIN of Nebraska. Then the law has not really gone into effect yet?

Mr. McCORMICK. There are about 80 applications for tests now in, and until such time as the university is able to turn out tests they are issuing temporary permits for the manufacturers to do business. The law is effective after July 1, 1920, I believe.

Mr. McLAUGHLIN of Nebraska. The Nebraska tests are carried on by the University of Nebraska?

Mr. McCORMICK. Yes, sir; but they are published and the licenses are issued by some other State board, in accordance with a proviso of the law.

As regards the nature of the work of the Rural Engineering Division and its distribution throughout the country, I have prepared a chart, as shown here [indicating], which shows the various States in which assistance has been rendered in one of the following subjects: Refrigeration, heating installations, electrical installations, mechanical problems, building plans distributed, thrashing schools and conferences, and water and sewage disposal systems.

From the chart you will readily see that work has been done in every State in the Union, the amount varying a great deal with the needs of the section of the country. For instance, in one State—Kansas—it seems at first glance that we have done the most. We held there last year seven thrasher schools, and have done work on each one of our projects in that State, or rendered assistance to others doing work in that State. That assistance may be rendered to other engineers or to groups of farmers or to architects—anyone that calls on us for it.

In regard to our building plans we have gotten out designs, which are now ready for distribution, of some 125 different structures, including residences, rural school houses, barns of all types, hog houses, dairy buildings, exclusive of barns, buildings for crop storage, and a large number of minor structures. We have also shown how these can be grouped on the various types of farms having various facings.

Mr. LEE. Have you gotten out a bulletin on that?

Mr. McCORMICK. We have not a bulletin of plans. We have simply a Yearbook article in regard to that, because in the past two years we have been paying particular attention to houses suitable for both the married and single farm laborer—that is, simple bunk houses and small houses. We only send these plans out on request. If a man writes in and wants us to send them we send him a list showing what we have and a brief description of what each plan is suited for, and from that he selects the one that most nearly fits his condition. During the past 12 months, on these individual requests, we sent out over 7,000 of these plans.

The **CHAIRMAN.** How much are you going to do on that this year?

Mr. McCORMICK. I should like to continue that work by getting out some of the houses and farm buildings for which our correspondence shows there is demand.

The **CHAIRMAN.** Is there a necessity for that? Do not many contractors and lumber companies send out blue prints and specifications? I have here a calendar sent out by a lumber company which furnishes blue prints and plans and specifications for practically every kind of farm building. It seems to me that they are well supplied, without the Government spending money on the same work.

Mr. McCORMICK. The man who is at the head of the company that sends out that calendar has been to our office to confer with us and gone over our plans, and has stated very emphatically that he considers that our work should go on; that the work that they were doing was commercial, and that all of those companies were doing that commercially.

The **CHAIRMAN.** They furnish the plans and specifications without obligation?

Mr. McCORMICK. No, sir; they furnish plans and specifications, but they furnish them to lumber companies, who, in turn, furnish them to private individuals, with the expectation that the lumber will be bought from that lumber company.

The **CHAIRMAN.** Any lumber company can handle it?

Mr. McCORMICK. The plans that are gotten out are necessarily produced in large quantities, with very little attention to the needs of the farm. We try to get ours out after having studied the problem in conference with other bureaus in the department that have anything to do with the subject.

The **CHAIRMAN.** You could use a greater variety of plans than that?

Mr. McCORMICK. I believe we get out plans that include the latest technical knowledge on the uses to which those buildings are to be put. For instance, the dairy barns; we get the latest knowledge extant as regards the size of stall required for the different types of cows and breeds of cattle, the sizes of which vary according to the breeds. We accordingly must make our plans to fit, because the stall that will do for the Guernsey will not do for the Holstein; and there are other similar variations to be met.

The **CHAIRMAN.** I believe it was stated here that some of the mail-order houses were making use of your plans? There is no question but that the work is good, but have we not gone far enough without spending more on the item?

Mr. McCORMICK. Personally, I do not believe so.

The CHAIRMAN. How much have you spent?

Mr. McCORMICK. I have that figure here.

The CHAIRMAN. The principal sum would be used for tractor work?

Mr. McCORMICK. For the tractor work.

The CHAIRMAN. Are you going to standardize the tractor?

Mr. McCORMICK. No, sir.

The CHAIRMAN. You are going to test it?

Mr. McCORMICK. We are going to test it. A certain tractor will produce a certain power at the belt or flywheel and a certain power on the drawbar. We hope to go further than that and tell them that on any particular type of soil the average horsepower required to pull a 14-inch bottom will be so much, to tell the power required to operate an ensilage cutter of a given size and type, and to issue similar information relative to all farm implements and machines.

The CHAIRMAN. Are you also going to tell the cost of fuel consumption?

Mr. McCORMICK. We hope to tell the amount of fuel required.

The CHAIRMAN. Anything about the construction of the tractor?

Mr. McCORMICK. The care and operation. We expect to issue instructions on that as we have done with the grain separator, with the plow, and with several other implements.

The CHAIRMAN. Has any of the work been done by the department?

Mr. McCORMICK. Yes, sir; and has been published by the department.

The CHAIRMAN. Have any reports been issued recently?

Mr. McCORMICK. In Farmers' Bulletins. The thrasher bulletin was issued last July, I think just about the opening of the thrasher season. We are sending those out to a list of about 90,000 thrasher users.

The CHAIRMAN. Have you made tests of tractors used for plowing and for general farm work?

Mr. McCORMICK. No, sir.

Mr. ANDERSON. Most of the automobile manufacturers issue an instruction book along with the automobiles in which they tell you how and where to oil, and how to take care of it, and things of that sort. Do the tractor people do the same thing?

Mr. McCORMICK. Yes, sir.

Mr. ANDERSON. Can you tell us any more about that? Have you ever looked these things over and tested them out more than the people who manufactured them have?

Mr. MACDONALD. We may be able to tell them some things that the manufacturer would not tell them.

Mr. McCORMICK. We can, as a result of the proposed tests, tell them more about the power than the majority of the manufacturers know.

Mr. ANDERSON. You were speaking about the care of the motors.

Mr. McCORMICK. No, sir; I have stated that we can emphasize the need of proper care, and it is possible that we will bring out some points, or emphasize some points, that the manufacturer has failed to emphasize properly. But it is a fact, and manufacturers themselves have so stated, that the publication of the material we have

gotten out in connection with the grain separator and other machines has had far more weight with the public than the publications gotten out by the manufacturer himself. In all of this we are emphasizing the need of the owner or purchaser studying the manufacturer's directions and following them. There are certain general directions that we can give. One manufacturer has brought out something that we did not think of. He says, We have given a name to every part of the machine, a name that is in common use in at least some sections of the country. In other sections other names are used. One big benefit that will result from that bulletin will be the tendency for everybody to use the same name. In ordering repairs by telegraph the owner of the machine can use that name and get the repairs. The manufacturer will know what is wanted. We do not intend to replace the manufacturer's instructions but to supplement them.

Mr. ANDERSON. I suppose it is true, to some extent at least, that more weight is placed upon a document which is supposedly disinterested and comes from official sources than upon documents coming from the manufacturer; at least, that would be true with reference to such literature. I am not so sure that it would be so true with reference to literature that had to do with the actual operation and care of machines.

Mr. McCORMICK. I believe it is true that the Government publication does carry more weight. That is not saying that it deserves to, but it does carry more weight and is referred to more frequently.

Mr. ANDERSON. Do you think there is under present conditions—I was about to say deception, but I will say misinformation—misinformation in regard to the actual horsepower of farm tractors and their actual ability in performance?

Mr. McCORMICK. I believe a great many purchasers have no idea at all what they are really getting. There are some manufacturers who honestly do not know what power they are producing, but think they are producing a certain power. There are others that know they are producing all that they claim, and possibly there are a few who know quite accurately just what the machine can do; but the latter are in a very decided minority.

Mr. ANDERSON. If the farmer is disappointed because his tractor does not meet his requirements, is that due to the fact that it does not produce what he expects it to do, or that he has not sufficiently stated his requirements?

Mr. McCORMICK. It might be either one. Of course, if a man can not handle a tractor, he is not likely to get satisfaction.

Mr. ANDERSON. As a matter of fact, there is not much information as to what tractors will do?

Mr. McCORMICK. No, sir; not what there should be.

Mr. ANDERSON. A sound horsepower test, I take it, is fundamental to determine the ability of the tractor in performance. Consequently, the first thing you will have to do to get at this tractor business at all, I take it, is to establish some standard of performance, either in the laboratory way or in the field-test way, as a basis of comparison upon which you can determine the relative performance of tractors. Is that correct?

Mr. McCORMICK. Yes, sir; we must have something by which to measure the machine.

Mr. ANDERSON. For the information of the committee and for my own information, I would like to ask you whether or not the technical methods by which the horsepower rating of the tractors can be determined have been reasonably well worked out?

Mr. McCORMICK. I believe that certain of the technical methods have; yes, sir. We have prepared designs of apparatus in our division which, we believe, based on our experience with other testing apparatus, will make those tests accurately. There are certain studies that must be made in the way of comparing the performances of a tractor out in the field and a tractor in a shed or a laboratory so that we can make the laboratory test intelligible.

Mr. ANDERSON. That is to say, before you can make a satisfactory laboratory test you have got to be able to know what the actual test is in the field to reproduce the conditions to a certain extent in the laboratory?

Mr. McCORMICK. You must determine a certain constant relationship between the two.

Mr. MACDONALD. Mr. Chairman, this map [indicating], which has no legend to explain it, was plotted for our information to show the producing area where tractors are manufactured, and the center of gravity of that area, that is, as to quantity, would fall around Rockford, Ill. That is approximately correct. That is on a total yearly production of about 132,000 tractors.

Mr. McCORMICK. This year, 175,000. That center, if you will pardon me, is not based on quantity production, but on the number of factory locations.

STATEMENT OF MR. THOMAS H. MACDONALD, CHIEF OF THE BUREAU OF PUBLIC ROADS, DEPARTMENT OF AGRICULTURE—Continued.

Mr. ANDERSON. It is assumed that it is desirable to install the apparatus for testing these tractors at a point having relation to the location of production?

Mr. MACDONALD. Yes, sir; most assuredly; that has been our idea. Of course, the establishment of a laboratory in Nebraska might modify our ideas in the beginning of this work. That is to say, they have already gone ahead and have their plant practically completed, and with the pressure coming up from the manufacturers to get this work done, it might be advisable to go somewhat outside of the actual center of gravity in the beginning of this work; but eventually I believe we ought to have a laboratory in the vicinity of Chicago.

Mr. ANDERSON. It is my impression that the Society of Agricultural Engineers at the meeting in Chicago recently took some action relating to the testing of tractors, or passed some such resolution.

Mr. MACDONALD. They passed a resolution memorializing Congress to give the Bureau of Public Roads the money that we are requestin to do this work; that is, to increase the appropriation.

Mr. Chairman, I do not want to unduly prolong the discussion on this point, but this is the largest item in which we have asked an increase and, as I stated in the beginning, it is part of a program of farm-power investigation that the department proposes to carry on,

which, I assume, Dr. Taylor and Dr. Rommel have already presented to your committee. We believe that farm power is the one thing that perhaps is giving the farmer most concern right now. We propose in the department to carry on a very extensive study of the kind, amount, and utility of all forms of farm power, or power which is available in application to the farm, and we have asked for the increased appropriation in this item so that we could rate tractors and start the study of tractors as a source of power on the farm.

The CHAIRMAN. Mr. MacDonald, is this work invading the territory of the Bureau of Standards?

Mr. MACDONALD. I would say in that connection that I do not think we are getting into the territory of the Bureau of Standards, but they might be getting into ours. For instance, we are applying engineering principles to the farmer's needs, and I think we know more about the needs of the American farmer in the Department of Agriculture than anybody else does.

The CHAIRMAN. I agree with you on that, but the Bureau of Standards contends that it should do all the standardization and testing. However, we are doing some standardization work in the Department of Agriculture, and I think very properly so.

Mr. MACDONALD. We had that up—that idea of standardization—at the Chicago conference, at which the leading manufacturers of farm tractors were present, and they wanted it very clearly understood that we are not trying to make them standardize their product or to force them to put out the same type of machines. That is not the character of work we have in mind in testing their machines.

The CHAIRMAN. You will necessarily have to standardize the different parts of machines in order to advise the farmer which is the superior?

Mr. MACDONALD. I think, Mr. Chairman, that there will be a considerable amount of work developed by this appropriation.

The CHAIRMAN. You expect to be able to point out the superiority of one over the other, do you not?

Mr. MACDONALD. Indirectly; yes.

The CHAIRMAN. The best type?

Mr. MACDONALD. Indirectly. We give the fuel test, and the draw-bar test, and the brake test, and the belt test.

The CHAIRMAN. Is that not practically what the Bureau of Standards is doing at present?

Mr. MACDONALD. They are not doing any of that.

The CHAIRMAN. They are engaged on other lines?

Mr. MACDONALD. I do not know of a single instance.

The CHAIRMAN. Are you not going to get into trouble with the manufacturers when you tell them that one make is superior to another make?

Mr. MACDONALD. Mr. Chairman, I have a little different idea on some of these subjects than a lot of other people do, but I am not so convinced of the actual selfishness of many of the manufacturers and business men as a great many people are, and I believe that at the end of any period of years, say a 5-year period or a 10-year period, that we will make more progress if we work with the manu-

facturer through their voluntary acceptance of our recommendations as we work them out in the field or in the laboratory than through regulatory measures or through any attempt to standardize their product in the beginning.

The CHAIRMAN. Your purpose is to work with the manufacturer, which indirectly will benefit the farmers?

Mr. MACDONALD. Exactly, sir. I believe that it is going to take some one that knows more about farming. That is, our fundamental idea is to improve the farm, to work out the best tractor, and the department has more interest in that than the manufacturer has simply as such. That is, we go back eventually to the farm.

The CHAIRMAN. Did I understand you to say that the manufacturers were interested in the request for an increase in this item?

Mr. MACDONALD. Yes. At the Chicago conference a number of our leading manufacturers were present, and I have no doubt they would appear before this committee to indorse this request, because they do not want single State legislation. They do not want single State tests.

The CHAIRMAN. They want a uniform test?

Mr. MACDONALD. Exactly. They say it would be a blow below the belt, if you will pardon the expression, if they should have to have tests conducted by all the States in which they sell.

I think that practically closes the items, Mr. Chairman. There are no other items except the administrative item, which remains the same.

I would like to place in the record the list of the projects of the bureau which you requested, I believe, to be furnished, but the work under the different projects has already been more or less fully explained.

The CHAIRMAN. Is that incorporated in the project book?

Mr. HARRISON. The statement to which Mr. MacDonald refers is merely a list of the projects or lines of work under each item, the amount allotted this year, the estimate for next year, and the increase.

Mr. MACDONALD. If my time is not entirely up, I want to emphasize this point: That the Bureau of Public Roads, operating as a part of the Department of Agriculture, is working for the farmer in the building of roads, the improvement of machinery, and the application of engineering to the farm. I do not believe that there will be any one line of activity in the next decade that will do more for the farmer than roads and the improvement of farm machinery and the building in which the farmer dwells, including all the modern improvements; and I want to leave before the committee this thought, that we believe in the fullest cooperation with the States and are going to try to establish cooperation with the States not only in the road work but also in our irrigation, drainage, and engineering work and not do any of the work which the States can do better for themselves.

The CHAIRMAN. The proper place for the work seems to be in your bureau, but I believe we should have some understanding with the Bureau of Standards so that the work will not be duplicated. We hear so much about duplication, and I want it made clear that there is no duplication.

Mr. MACDONALD. Mr. Chairman, I am very willing to tell them to stay out of our field in this matter.

The CHAIRMAN. You may take it up with them. We will give that item consideration. Thank you very much, Mr. MacDonald, for your testimony. If there is no objection, the committee will now adjourn until 10 o'clock Monday morning.

(Thereupon, at 5.15 p. m., the committee adjourned to meet again at 10 o'clock a. m., Monday, January 12, 1920.)

Activities under lump-fund items, Bureau of Public Roads.

Projects.	Allotment, 1920.	Estimate, 1921.	Increase
Road-management investigations:

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Monday, January 12, 1920.

The committee met at 10.30 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

BUREAU OF MARKETS.

The CHAIRMAN. The committee will come to order. We have with us this morning representatives of the Bureau of Markets.

Mr. HARRISON. We will take up next, if it is agreeable to the committee, the estimates of the Bureau of Markets which appear on page 238. Mr. George Livingston, acting chief of the bureau, is here and will present them.

The CHAIRMAN. We will be very glad to hear Mr. Livingston.

**STATEMENT OF MR. GEORGE LIVINGSTON, ACTING CHIEF OF THE
BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.**

Mr. LIVINGSTON. The items begin on page 238, Mr. Chairman, but before taking them up, I would like to make a very brief general statement with regard to the work of the bureau as a whole. I hope the committee will keep in mind, during the consideration of these several items, the fact that the Bureau of Markets is engaged in pioneer work in a new field. For a great many years the Federal Department of Agriculture, State colleges, and experiment stations have been devoting considerable time and money to solving the problems of production. This work has dealt with the production end of farming, while the Bureau of Markets is engaged in solving the farmers' selling problems. The Bureau of Markets does its work in somewhat the same manner as the agencies dealing with the production end of farming, except that they deal with technical and scientific questions, whereas we deal with questions of economics and business. The work coming under its jurisdiction is primarily interstate business, since marketing problems are not confined to local communities nor are they confined to geographic boundaries. As an illustration, grain grown in the grain-producing sections of the United States comes into competition, not only in the markets of the United States, but in the markets of the world.

The various items to which we particularly desire to direct your attention have been arranged on this chart for the benefit of the committee in three major subdivisions: (1) Investigational and demonstrational work, (2) service work, and (3) regulatory work. The appropriation for the year 1920 is \$2,811,365, and estimates carried

for the year 1921 are \$3,023,395, or a total net increase is recommended of \$212,030.

Under investigational and demonstrational work we are asking a net increase of \$48,830. We are requesting \$15,000 for carrying on wool-marketing work, \$30,000 for preservation of fruits and vegetables in transit and storage, and \$26,650 for State cooperation in marketing. We are dropping from this general subdivision rural organization work to the amount of \$19,580 (which is being transferred to the Bureau of Farm Management) and statutory salaries to the amount of \$3,240, making a total net increase of \$48,830.

Mr. ANDERSON. Do those increases take into consideration the transfers to the statutory roll?

Mr. LIVINGSTON. Yes, sir. In the service work the appropriation this year is \$986,286, whereas the estimate for 1921 contemplates \$1,134,846, or a total net increase of \$148,560. That increase is to be divided between three lines of service work, \$50,000 for market news service on fruits and vegetables, \$50,000 for market news service on live stock and meats, and \$50,000 for butter and hay inspection work. We have decreased the expenditures under those funds by \$1,440, which is to be dropped from the statutory roll.

For regulatory work during the fiscal year 1920 we had \$1,076,728, while for the next year we request \$1,091,368, a total net increase of \$14,640. Increases are asked for the following items: \$1,000 for enforcement of standard container act, \$79,720 for the cotton-futures act, and \$45,000 for the warehouse act. This subdivision is being reduced by \$75,000. The subdivision covering regulatory work which I have been discussing, \$75,000, which has been appropriated for stockyards regulation, is to be dropped, as is the case with \$35,000, which is now available for war-industries wool work and statutory salaries amounting to \$1,080. The total net increase for the entire bureau, therefore, is \$212,030. This is arrived at by taking into consideration items for which an increase has been asked and items which have been either transferred to other parts of the department or dropped entirely.

The CHAIRMAN. Has the wool work been completed?

Mr. LIVINGSTON. No, sir; it is not completed as yet.

The CHAIRMAN. You do not estimate for the work?

Mr. LIVINGSTON. We have not made an estimate for money to continue it beyond the fiscal year. We hope to have it finished at that time. It may not be finished then, however, and if it is not we will have to consider submitting a supplementary estimate. The items in which increases are involved are listed here for the convenience of the committee.

Mr. JONES. Name them so as to get them in the record.

Mr. LIVINGSTON. Item 80, marketing and distributing farm products, \$45,000; item 81, market news service on fruits and vegetables, \$50,000; item 83, market news service on live stock and meats, \$50,000; item 88, food-products inspection, \$50,000; item 91, State cooperation in marketing, \$26,650; item 93, standard container act, \$1,000; item 95, cotton-futures act, \$79,720; and item 97, warehouse act, \$45,000.

That closes my general statement, and I would like to take up the statutory roll.

Mr. JONES. Why do you have a decrease in rural organization of \$19,000?

Mr. LIVINGSTON. That is an item which has been transferred from the Bureau of Markets to the Office of Farm Management; therefore it is a decrease as far as the Bureau of Markets is concerned.

Mr. JONES. It is added to another bureau?

Mr. LIVINGSTON. Yes; but it does reduce the amount of money available to the Bureau of Markets; and in order to make our sheet balance, we must show it as being transferred elsewhere and charge it up to the other bureau.

Mr. JONES. What did you say as to the stockyards regulation?

Mr. LIVINGSTON. That will be discontinued as soon as the \$75,000 has been expended, which we contemplate will be in the course of a month or six weeks.

Mr. JONES. That is a real decrease?

Mr. LIVINGSTON. Yes; that is a real decrease.

Mr. JONES. Do the same conditions exist as to the War Industries Board wool work?

Mr. LIVINGSTON. Yes, sir.

The CHAIRMAN. Why do you discontinue the appropriation for the regulation of stockyards?

Mr. LIVINGSTON. The stockyards supervision work is carried on under the authority contained in the food-control act and consequently is war work. We have no authority to continue it after the declaration of peace; therefore the item is being dropped.

Mr. HARRISON. You might explain, Mr. Livingston, that the increase of \$79,000 in the item for the enforcement of the cotton futures act is only an apparent increase, and that it is in reality a reduction below the funds available for that purpose this year.

Mr. LIVINGSTON. The wheat price guaranty act of March 4, 1919, carried an amendment to the cotton futures act. Of the money appropriated under it, \$100,000 was set aside by the President to carry out the provisions of the amendment to the cotton futures act. That money will not be available next year, so an estimate is made for \$79,720 as being necessary to continue the work which is being carried this year under the allotment mentioned. That item, therefore, shows an apparent increase, but in reality it is not an increase so far as the money available to the bureau is concerned.

Mr. McLAUGHLIN of Michigan. I did not get what you said about the money that is available under the wheat guaranty act. Will you kindly repeat what you said about that?

Mr. LIVINGSTON. Yes, sir. The wheat price guaranty act carried an amendment to the cotton futures act. In order to carry out the purposes of that amendment—

Mr. HEFLIN. Passed last February?

Mr. LIVINGSTON. Passed March 4. In order to carry out the provisions of that amendment, \$100,000 was set aside by the President and assigned to the Bureau of Markets.

The CHAIRMAN. Kindly state what the amendments are.

Mr. LIVINGSTON. Very briefly, the amendment is to inspect and classify cotton tendered for delivery on future contracts and to start a price reporting service. Mr. Murph will be before the committee a little later to speak relative to the details of that item and will give you full information at that time.

Mr. McLAUGHLIN of Michigan. You say that the stockyards regulation work for which you used \$75,000 was authorized by the Food Control Act; under what particular provision of that act?

Mr. HARRISON. Section 5 of the Food Control Act, which authorizes the licensing of agencies engaged in the importation, manufacture, and distribution of food products and other necessities.

Mr. McLAUGHLIN of Michigan. And the issuing of licenses and the looking after them as they related to stockyards cost \$75,000?

Mr. HARRISON. \$75,000 during the current year. The appropriation is made in this bill and we will come to the discussion of it later. Congress provided the money for continuing the work after July 1, 1919. Prior to that time it was financed by the allotment from the President's special fund.

The CHAIRMAN. You might take up the estimates item by item, beginning with the transfers to the statutory roll.

Mr. LIVINGSTON. I will say, Mr. Chairman, that there are no increases provided for in the statutory roll, all items being transfers from the lump sum to the statutory roll without increases.

The CHAIRMAN. Kindly indicate the transfers.

Mr. LIVINGSTON. The first item affected is No. 5, one administrative assistant at \$2,100, which is a transfer from the lump fund for State cooperation in marketing.

The CHAIRMAN. Is there one administrative assistant?

Mr. LIVINGSTON. Yes.

Mr. ANDERSON. How large an increase was there in the appropriation for the Bureau of Markets last year; was there an increase or decrease?

Mr. LIVINGSTON. An increase in the permanent fund, but a very large decrease with respect to the total of permanent and war emergency funds.

The next item in which there is a change is No. 7, four executive clerks at \$2,000 each, an increase of 2 by transfer from lump funds for market inspection of perishable foods and collecting and distributing market information.

The next item affected is No. 8, two clerks at \$2,000 each, an increase of one by transfer from lump fund for cotton futures act.

The next is item No. 13, 16 clerks of class 3, an increase of 2 by transfer from lump funds for collecting and distributing market information and grain standardization.

The next is item 14, one clerk by transfer from lump fund for market reports on live stock and meats.

The next is item 17, two clerks at \$1,380 each, an increase of one by transfer from lump fund for marketing and distributing farm products.

The CHAIRMAN. Kindly tell us about item 16.

Mr. JONES. That is a decrease.

Mr. LIVINGSTON. Yes. Item 16, 35 clerks, class 2, decrease of 1 by transfer to statutory roll, Bureau of Farm Management and Farm Economics, and one new place, making no change in the number of places.

When the term "new place" is used, it refers to a clerk carried on the appropriation of \$100,000 which I mentioned a while ago as having been allotted to the bureau for carrying out the provisions of

the cotton futures amendments. It is a new place so far as the Agriculture appropriation bill is concerned, but the position is now existing and the clerk is now paid out of funds appropriated in the wheat price guaranty act.

The next item affected is No. 20, 193 clerks, class 1, increase of 32, 29 by transfer from lump funds as follows: Two from marketing and distributing farm products, 7 from collecting and distributing market information, 4 from market reports on live stock and meats, 2 from dairy and poultry products, 1 from grain, hay, feeds, and seeds, 3 from market inspection of perishable foods, 1 from State cooperation in marketing, 1 from cotton futures act, and 8 from grain standards act; and 3 new places; also a decrease of 2 by transfer to the statutory roll of the Bureau of Farm Management and Farm Economics; making a net increase of 30 places.

Those new places are the same as those referred to a moment ago. They are positions carried under the wheat price guaranty act for carrying out the provisions of the amendments to the cotton futures act.

The next item in which there is a change is No. 22; 78 clerks at \$1,100 each, increase of 38, 37 by transfer from lump funds, 2 from marketing and distributing farm products, 8 from collecting and distributing market information, 1 from market reports on live stock and meats, 2 from dairy and poultry products, 3 from grain, hay, feeds, and seeds, 1 from food supply investigations, 1 from market inspection of perishable foods, 1 from cotton testing, 1 from State cooperation in marketing, 1 from grain standardization, 2 from cotton futures act, 14 from grain standards act, and 1 new place.

The new place is carried in the \$100,000 allotted to the bureau under the wheat price guaranty act.

The next item in which there is a change is item No. 23, 101 clerks at \$1,000 each, increase of 13 by transfer from lump funds as follows: Three from marketing and distributing farm products, 5 from collecting and distributing market information, 2 from dairy and poultry products, 1 from food supply investigations, 1 from market inspection of perishable foods, and 1 from grain standards act.

Item No. 29 drops two clerks at \$720 each.

Item 30 is an increase of one custodian at \$1,200 by transfer from lump fund for grain standardization.

The next is item 34, one laboratory aid at \$840, dropped.

The next item is No. 35, one laboratory aid at \$720, dropped.

The next item is No. 49, one draftsman at \$1,000, by transfer from lump fund for grain standardization.

The next item is No. 53, one map tracer at \$600, which is dropped from the roll.

The next item in which there is a change is 56, 13 machine operators at \$1,000 each, increase of 12 by transfer from lump funds—1 from marketing and distributing farm products, 1 from collecting and distributing market information, 8 from market reports on live stock and meats, and 2 from dairy and poultry products.

Mr. McLAUGHLIN of Michigan. What do these machine operators do?

Mr. LIVINGSTON. They cut stencils and make mimeographs to get out mail reports.

The next item in which there is a change is 57, eight machine operators at \$900 each, by transfer from lump funds—three from marketing and distributing farm products, two from collecting and distributing market information, one from dairy and poultry products, one from cotton-standards investigations, and one from grain-standards act.

The next is item 59, three skilled laborers at \$900 each, increase of one by transfer from lump fund for grain, hay, feeds, and seeds.

The next is item 65, three messengers at \$900 each, by transfer from lump funds—one from marketing and distributing farm products and two from collecting and distributing market information.

The next item in which there is an increase is 66, two messengers at \$720 each, increase of 1 by transfer from lump fund for dairy and poultry products.

The next item in which there is a change is No. 67, 10 messengers at \$540 each, changed to 10 messenger boys at \$540 each.

The next item in which there is a change is No. 68, 1 messenger at \$480, changed to 1 messenger boy at \$480.

The next item in which there is a change is No. 69, 10 messenger boys at \$600 each, increase of 4 by transfer from lump funds for market reports on live stock and meats, dairy and poultry products, market inspection of perishable foods, and grain-standards act.

The next item in which there is a change is No. 70, 15 messenger boys at \$540 each, increase of 10 in lieu of 10 messengers at \$540 each.

The CHAIRMAN. What are these boys doing? Are they employed in Washington?

Mr. LIVINGSTON. Some are in Washington; a number are in field offices.

The CHAIRMAN. How many have you?

Mr. LIVINGSTON. There are 47, of whom 33 are in Washington and 14 in the field. That is in the whole service. You will remember, Mr. Haugen, that we have our offices scattered over the city here in eight buildings, and we have to have messenger service from one building to the other.

The CHAIRMAN. How many buildings do you occupy?

Mr. LIVINGSTON. Eight buildings in all; we have parts of eight buildings.

The CHAIRMAN. Where are they located?

Mr. LIVINGSTON. Mr. Bailey can give the location of these buildings better than I.

Mr. BAILEY. These buildings are located at 1358 B Street SW.; 220 Linworth Place SW.; 221 Linworth Place SW.; Thirteenth and C Streets SW.; a group of temporary buildings between Sixth and Seventh Streets SW. and B and C Streets SW.—I do not know the official names for the buildings. Tempo No. 8 on D Street between Seventeenth and Eighteenth Streets. Then we have space for storage, old files, and things of that sort. There is storage space at Thirteenth and B Streets and in the terminal storage warehouse at Eleventh and D and E Streets SW.

Mr. LIVINGSTON. These messenger boys work in the mail and file room, on mimeographs, and carry packages and mail from and to these various offices and buildings. We will be glad to insert in the

record a statement showing the number of people served by each of these messengers.

The CHAIRMAN. Without objection you may insert that. (The statement referred to follows:)

MESSINGER FORCE OF THE BUREAU OF MARKETS.

There are 47 messenger boys now in the employ of the Bureau of Markets, 33 in Washington and 14 in the field. There are 7 vacancies on the statutory roll at the present time. Two places at \$480 will be filled in the near future, but, on account of the difficulty of securing messengers, the places at \$420, \$360, and \$300 probably can not be filled.

The following table shows the messenger boys both in Washington and in the field, their salaries, and the number of people they serve:

	Salary.	City.	Number of persons served.
2 messenger boys	\$600	Washington...	23.
9 messenger boys	540	do	128.
2 messenger boys	540	do	Entire bureau. ¹
17 messenger boys	480	do	304.
2 messenger boys	480	do	Entire bureau. ¹
1 messenger boy	480	do	Detail ed to Rec'as- sification Com- mission.
2 messenger boys	600	Philadelphia..	32.
1 messenger boy	540	do	9.
2 messenger boys	600	Chicago	36.
1 messenger boy	540	do	9.
2 messenger boys	600	New York....	21.
1 messenger boy	600	Kansas City...	6.
1 messenger boy	600	Buffa'o	1. ²
1 messenger boy	540	Boston	16.
2 messenger boys	480	do	16.
1 messenger boy	540	Cincinnati....	6.

¹ These messenger boys work in the te'egraph section, the library, and in mails and files, and serve the entire bureau.

² All of the messenger boys in the field, with two exceptions (the exceptions being the messengers in the grain offices at New York and Chicago), are in branch offices issuing market reports. These boys are engaged in regular messenger work but a small portion of the day. Their chief duty is to assist in the machine rooms, operating the mimeograph, addressograph, and fo'nding and sealing machines. It is necessary to use messenger boys for this work because it is impossi'ble to secure and retain machine operators at the sa'aries that can be paid—\$720 to \$1,200 per annum. As an example of the duties these field messengers perform, each of the three boys in the Phi adelphia joint office spend one-third of the day at the te'ephone switchboard.

Mr. LIVINGSTON. That completes, Mr. Chairman, the changes that are provided for on the statutory roll.

The next item is No. 80, "for acquiring and diffusing among the people of the United States useful information on subjects connected with the marketing and distributing of farm and nonmanufactured food products and the purchasing of farm supplies independently and in cooperation with other branches of the department, State agencies, purchasing and consuming organizations, and persons engaged in the transportation, marketing, and distributing of farm and food products."

We are asking for a net increase of \$45,000, \$15,000 for wool marketing and \$30,000 for the preservation of fruits and vegetables in transportation and storage. I would like to have the committee hear Mr. Hall with respect to the \$15,000 increase requested for wool marketing.

The CHAIRMAN. We will be glad to hear Mr. Hall.

STATEMENT OF MR. L. D. HALL, SPECIALIST IN CHARGE OF LIVE STOCK AND MEATS DIVISION, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.

Mr. HALL. Mr. Chairman and gentlemen of the committee, the Bureau of Markets is doing some work along the lines of wool marketing at present on funds allotted from this general fund. We are spending this year at the rate of about \$12,000, this money being used for reports on wool stocks in the hands of the dealers and manufacturers and wool consumed from month to month by wool manufacturers. We also started last May, during the previous fiscal year, to report on wool-market prices, but were obliged to discontinue that the 1st of July on account of the reduction in our appropriations.

The principal need for this \$15,000 at this particular time is brought about by the fact that the Bureau of Markets is in possession of a large number of wool samples which were turned over to us through the courtesy of the War Department. You will recall that the War Department took over the 1918 wool clip completely, and samples were taken of every lot of wool purchased by the War Department. They had something like 8,000 or 9,000 of these samples, and we realized that it was the greatest opportunity that ever had existed for a thorough-going study of the quality and grades of wool from the different sections of the United States.

I presume the members of the committee, most of you at least, realize that the marketing of wool at the present time is at very loose ends. There are no centralized markets for wool in this country, and just as a farmer who has a hide or a few hides to sell, he is largely—in fact, almost entirely—at the mercy of the dealer who comes out from Boston or Philadelphia to his place in Iowa or Wyoming. The farmer usually, or the wool grower, does not know within 5 or 10 cents a pound, or even more than that, what his wool is actually worth, and since there are no standards of any kind, no uniform ways of classifying or grading wool, the farmer is absolutely in the dark, and even the large Western wool grower who clips a large band of sheep is not very much better off, because he is several thousand miles removed from the Atlantic seaboard, which consumes practically all of the wool that is produced in this country.

The CHAIRMAN. Do you instruct how to treat and grade the wool?

Mr. HALL. We have not been able yet, Mr. Chairman, because funds have not been available to develop these standards.

The CHAIRMAN. Is the purpose of the bureau to standardize?

Mr. HALL. That is the particular purpose of this particular item, although, as you will notice in the Book of Estimates, it is proposed to carry on some work along the lines of price reporting and developing cooperative methods of marketing along the lines that Congressman Osborne mentioned a few moments ago with reference to fruits. There is no farm product or range product in America the producers of which labor under greater difficulties in getting their product to the markets and getting their fair share of the dollar of the consumer.

The CHAIRMAN. Kindly tell us about the alleged frauds and what you are doing to detect the frauds.

Mr. HARRISON. That will come under another paragraph—the item carrying \$35,000 for the completion of the work of the wool section of the War Industries Board.

We are dropping the appropriation from these estimates, but when it is reached I imagine the committee will wish to know what progress has been made on the work.

The CHAIRMAN. You may proceed in your own way, Mr. Hall.

Mr. HALL. As I said, the War Department officials were so considerate as to turn over to us some 7,000 samples of wool which they collected last year in the purchase of the entire wool clip, and there never before in the history of the world was such a collection of wool samples or such a rare opportunity to make a thorough study of wool standards and develop something similar to the United States cotton standards. I assume this committee is familiar with that. Just to give an idea of the possibilities of that sort of thing with regard to wool, here is a set of samples furnished by various woollen manufacturers and dealers at our request, which our wool specialist has mounted [indicating] to show you the immense range in diameter, length, and quality of wool, running from the finest of merino to the coarse braid or Lincoln wool.

The CHAIRMAN. Is the longer fiber superior to the shorter?

Mr. HALL. It depends somewhat on the use. This [indicating] is suitable for braids and carpetings and that sort of thing; while this [indicating] is used for the finest of clothing purposes. I am not a wool specialist, however.

The CHAIRMAN. Do you propose to standardize as indicated by these samples?

Mr. HALL. Along these general lines, yes, sir; it is in a very preliminary stage yet.

The CHAIRMAN. Is the standardizing done in the same way you standardize cotton?

Mr. HALL. Yes, sir; and you recall it took many years to develop the United States cotton standards. It would take some little time—I do not know how long—before we can make the same progress with wool standards that has already been made with cotton.

The CHAIRMAN. How many samples have you here before us?

Mr. HALL. Eighteen samples, representing the extreme high, low, and medium qualities of wool in each commercial grade.

Mr. HEFLIN. How many grades of wool are there?

Mr. HALL. The United States Government has not fixed any definite number as yet. That remains to be worked out. I have with me a number of copies of the quarterly report of the stocks of wool, which we issue, which shows the six grades generally recognized by the wool trade. The grades are fine, three-quarter blood, half-blood, three-eighths, quarter-blood, and low. We also are reporting each grade as domestic and foreign.

Mr. HEFLIN. There are five or six that equal the cotton used in the commercial trade.

Mr. HALL. There are six commercial grades of wool, and then there is an infinite number of gradings of wool, according to the custom of the particular section of the country concerned.

Mr. WILSON. You mean there are six classes of grades in the commercial world?

Mr. HALL. Yes, sir. If you multiply six by two it means that each of these grades is divided into combing and clothing wools. It makes a maximum of about 12 grades so far as diameter and length of staple is concerned.

The CHAIRMAN. If you make it quarters it would be four times that, or 24.

Mr. HALL. I am not a wool expert. I think something around 12 grades—or rather 6 grades and 12 classes—is about as far as it would be feasible to go in establishing official standards. I should say, on general principles, that the fewer the number of grades that can be fixed the better, as in the cotton standards where the number of grades has been held down to a comparatively few.

The CHAIRMAN. Thank you, Mr. Hall. The next increase under item 80 is \$30,000 for extending the investigations regarding the preservation of fruits and vegetables. We have present Mr. Crane, who represents a number of fruit shippers' associations, who would like to be heard on this matter.

STATEMENT OF MR. WILLIS CRANE, REPRESENTING THE INTERNATIONAL APPLE SHIPPERS' ASSOCIATION, THE NATIONAL LEAGUE OF COMMISSION MERCHANTS, AND THE WESTERN FRUIT SHIPPERS' ASSOCIATION OF AMERICA.

Mr. CRANE. Mr. R. G. Phillips, as secretary of the International Apple Shippers' Association, had requested that he be heard to-day in connection with this matter, but he was unable to reach Washington, so he has asked me to read a short statement to the committee. The three associations on whose behalf this statement is made ship over 100 different food commodities, including all of the perishables, and the three organizations represent the largest shippers and receivers of fruits and vegetables in the United States. Mr. Phillips's statement is addressed to the chairman, and dated January 10, and reads as follows:

INTERNATIONAL APPLE SHIPPERS' ASSOCIATION,
Rochester, N. Y., January 10, 1920.

HON. GILBERT N. HAUGEN,
Chairman Committee on Agriculture,
House of Representatives, Washington, D. C.

DEAR SIR: I regret that I am not able to appear before your committee personally, but it will be impossible for me to be in Washington Monday or Tuesday. I understand that the hearings will close on the Agricultural appropriation bill on Tuesday, and I am therefore writing you and the committee briefly.

We are, and have been, vitally interested in the investigations and experiments conducted by the Department of Agriculture with respect to the transportation, refrigeration, protection, and storage of perishables. We regard the work which has been done as of the utmost value from a practical standpoint and urge as earnestly as it is possible to urge that a sufficient appropriation be made to take care not only of domestic but also export investigations.

I assume that it is not necessary to go into details with the committee as to the work which has been done. The committee is undoubtedly familiar with the work of such members of the Department of Agriculture as Dr. Pennington, H. J. Ramsey, V. W. Ridley, A. W. McKay, C. W. Mann, and many others, and their real practical contributions to the better handling, transportation, and conservation of perishable food products.

The work of the department in connection with the transportation of eggs, poultry, fish, meats, fruits, and vegetables has been worth a great many times its cost from a practical and economic standpoint. As a result, methods have

been improved and a standard refrigerator car worked out which, if built and operated, will materially assist in reducing waste and encouraging production. Light has been thrown on this complex subject which has benefited the whole industry, including the transportation companies. Specifications for proper storages have been worked out and a great deal done by way of experiment to indicate the best methods of handling in transit.

Much, however, remains to be done. It would be most unfortunate to stop now. We are at a turning point and where the best results can be had only by going on.

Take the fruit and vegetable field alone: I am absolutely certain that if the department is allowed to proceed and conduct the necessary experiments hundreds of thousands of dollars can be saved to producers and consumers in avoiding loss and waste and in the saving of ice and refrigeration charges through the development of the salted car and improvements to present equipment.

The work ought not to be allowed to lapse. Last year the appropriation was so small that even the maintenance of a small staff was in doubt. At that time this association, in conjunction with the California Fruit Growers' Exchange, the National League of Commission Merchants, the Western Fruit Jobbers' Association, and the American Fruit and Vegetable Shippers' Association, appealed to Congress for a sufficient fund, but we were turned down.

I have just been through a long fight before the Interstate Commerce Commission in which the carriers proposed to increase icing charges all the way from 28 to 150 per cent over previous costs, and which, if permitted, will saddle production or consumption with increased costs amounting to many hundreds of thousands of dollars per year. In that fight the facts which had been developed by the department and as contained in official bulletins were of great value to producer and shipper.

In the interest of adequate production and conservation this whole work should be continued. It is for the benefit of every producer and consumer.

I therefore appeal to you and your committee for an adequate appropriation. In addition to the domestic field is the export. This export field is vital and especially for apples. Without it production would be very seriously threatened. In a normal year our exports will run to an equivalent of from 2,000,000 to 3,000,000 barrels. The export outlet is the safety valve for the United States from a production standpoint.

Under present conditions losses from handling on the piers, in the holds, improper stowage, inadequate refrigeration, and ventilation are very great, probably 25 per cent at least. Boats from United States ports are on a less efficient basis than from Canada, where the Government, by investigation and experiment, has brought about better methods. The United States is Canada's competitor in the export of apples and should be at least as favorably situated.

We therefore urge that at least \$25,000 be specifically appropriated for export investigation and experiment.

Very truly, yours,

INTERNATIONAL APPLE SHIPPERS' ASSOCIATION,
By R. G. PHILLIPS, *Secretary*.

Mr. LIVINGSTON. Mr. Chairman I would like to have Mr. Marshall, the assistant chief of the Bureau of Markets, discuss the item just referred to by Mr. Crane, as he has charge of the details of that work.

The CHAIRMAN. Thank you, Mr. Crane. We will be glad to hear Mr. Marshall.

STATEMENT OF MR. HERBERT C. MARSHALL, ASSISTANT CHIEF OF THE BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.

Mr. MARSHALL. I shall discuss only that part of item 80 which pertains to the preservation of fruits and vegetables in transit and storage, for which an increase of \$30,000 is requested.

This particular matter, Mr. Chairman, I believe, has never been discussed before the committee—at least, not in recent years. I will therefore attempt to give a little outline of the work.

There are a number of different lines of work involved in this item of preservation of fruits and vegetables, and last year and during the war times the allotments and appropriations for it were quite large. The actual expenditure in the year 1918 was about \$117,000; in 1919, about \$182,000; for the current year, about \$30,000, and this year we are asking for an increase of about \$30,000 over last year. In consequence of the diminution from last year of \$182,000 to some \$30,000 this year, the number of technical employees has been diminished from 69 to 6. Accordingly, very little work has been done this year, and I shall tell you something about the sort of work that was done when we were following it up with the greatest activity in order that you may understand in a general way what the expansion will be like.

One of the earliest lines of activity of this sort was in the handling of fruits, particularly the California fruits. The members of the committee undoubtedly are acquainted with the blue mold of the orange. Ordinarily, if an orange is decayed it has a blue spot. For some years when the shipments first began that was not understood. It was in the Department of Agriculture that it was first discovered that that particular fungus which caused this decay could not act unless there was a break in the skin, and through a considerable time spent on the study of the subject it was finally discovered that very minute punctures in the skin, usually due to careless handling of the fruit, perhaps the trimming off of the stem, had caused a slight incision, and, in consequence, decay occurred. That is a very simple proposition, still it was not discovered for some years, and in that case it was through the activity of the department that it was discovered, and in the last 8 or 10 years there has been a saving of about one and a half million dollars per year to the citrus fruit industry, due to that particular discovery.

The CHAIRMAN. Who made that discovery?

Mr. MARSHALL. It was made in the Department of Agriculture, in the Bureau of Plant Industry.

The CHAIRMAN. How long ago?

Mr. MARSHALL. Eight or ten years ago.

Mr. JONES. How was the saving accomplished? How is the information given out?

Mr. MARSHALL. It was done by the issuance of bulletins on the subject and their distribution and the distribution of information through the various channels that we use. It was also demonstrated extensively in the packing houses.

That work is largely past history, but there are other elements in the matter of handling that we now have under consideration. I have some photographs here; this one [indicating] shows canteloupes packed, or, rather, loaded in cars in approved form. Before I take that up I will show you this chart [indicating] for illustration, showing the method of circulation of the air in the cars in all of this work.

Air circulation is an important element in all these matters, whether it be saving the fruit from freezing in cold weather, or

saving it from decaying by the heat in summer. Accordingly, it is one of the problems constantly studied. When you want to reduce the temperature you have ice in the ends of the car and air circulating by descending through that ice and rising near the middle of the car. When you want to heat the car, you place a heater in the middle of the car and have the current of air pass upward in the middle of the car and down at the ends.

The picture we now have before us shows how the packing of the crates is effectuated. They are packed in solid to the end of the car. Then, as I said a moment ago, it is necessary to have a circulation of air, so it is essential that the different packages should not fill up the entire car from side to side. It is essential that there should be air passages between the rows of crates and that cleats should be nailed across the tops of every second or third tier of these crates. It is necessary that they be packed well, the ends evened up and braced in the middle. You have here [indicating] an illustration of bracing. Another little element that was overlooked at the start and had to be taken care of was the extending of some braces up to the roof of the car. Such a minor matter as these cleats running across the car, clear to the other side, is one of the details that have been worked out, and they have to be explained in their uses to the individual shipper.

The CHAIRMAN. Is there an air space provided between each row of cases?

Mr. MARSHALL. Yes; that has to be taken care of. You have here an illustration in these photographs of the result when you do not have careful packing. Here [indicating] are packages of sweet potatoes which have fallen down because the packing was not good; here [indicating] are apples.

Answering a question asked a little while ago, the way in which we present this information to the trade is in a considerable measure by posters, such as the one I am now showing. The cost of a large number of these posters was some \$600 for 15,000 of them. They were distributed and asked for in large numbers throughout the sections of the country where they would be the most serviceable.

The poster I am now showing you shows baskets of grapes that because of the improper loading have fallen down and broken. In the first place, the shipper should load these baskets solid and when he reaches the sides of the car place them diagonally in order that there shall be no vacant space and that there shall be no slipping. In the case of these particular packages the air space between the rows is not essential because the baskets are rounded at the corners, and the air will work its way through.

The CHAIRMAN. How do you propose to use this appropriation?

Mr. MARSHALL. For the investigation of methods of loading to some extent in the matter that I just mentioned.

The CHAIRMAN. What other suggestions have you on shipping?

Mr. MARSHALL. That covers pretty well the particular item.

The CHAIRMAN. Is it practically all in the packing and providing an air space?

Mr. MARSHALL. And regarding the matter of handling. Then there is the matter of refrigeration. The question of refrigeration is a more serious matter.

The CHAIRMAN. Who discovered the use of salt instead of ice, as suggested in Mr. Phillips's letter?

Mr. MARSHALL. We have, at least, developed the necessity for that.

The CHAIRMAN. Is there anything new about that?

Mr. MARSHALL. Yes. I think it will be better, Mr. Chairman, if I give in some little detail just what the department has done in that respect. There are at the present time perhaps 90,000 refrigerator cars in use in this country. Of those there are perhaps 2,000 that are built in the form that the department considers the most approved.

Mr. TINCHER. Were they built by the packers or by the car companies?

Mr. MANN. By various companies; not by the packers. Those cars were for the shipment of fruits and vegetables.

Mr. JONES. Is it the latest construction of cars—in the case of these 2,000?

Mr. MANN. They are constructed according to the plans the department has worked out.

Mr. JONES. They are the latest constructed cars?

Mr. MARSHALL. They are all recent. Two years ago there were only 400; there are perhaps 2,000 at the present time.

The best grade of cars have a cork lining of about 2 inches. The refrigeration arrangement is in the end of the cars with a bulkhead that is insulated. The older system that this displaces had ice baskets in the end of the car with openings passing through from the ice into the parts of the car immediately adjacent.

In order to make a statement for the record, the illustrations we now have before us show the improved type of refrigerator car, according to the plans developed in the Department of Agriculture, and the old type of car. In this old type the space is open between the ice and the fruit. In consequence, the air passes down into the ice bunker and then passes out immediately through these openings and returns. As a result, the fruit in the middle of the car is not affected at all.

Mr. ANDERSON. How do you arrive at the movement of these currents of air in the car?

Mr. MARSHALL. By experimentation; by knowledge, in the first place, of what would happen by using our best intelligence as to how the air would work.

Mr. ANDERSON. I have heard a whole lot about human intelligence and how air would work. Unless you have made very careful tests about the process you do not know anything about it.

Mr. MARSHALL. I will show you what we have done. Those older cars did not have a false floor. They had ice bunkers arranged as I told you. In the improved cars the ice is in the end of the car as before, but they have an insulated bulkhead between the ice and the fruit so that the fruit will not be frozen. I told you about the false floor. The air passes along this floor and up through the openings in the floor and distributes through the car.

Mr. JONES. How do you know it does not come up through your first opening instead of the middle openings?

Mr. MARSHALL. That is exactly what we need the money for. By actual tests we have our men start with loads of fruit from, let us

say, California, some cars of the old type and some of the new type; they have thermometers distributed all through the cars and take readings, perhaps, every four or five hours during the entire trip. They find in the old type that the temperature falls near the ice while it remains high near the middle of the car and the fruit decays; while under the new type it is found that the cooling is evenly distributed throughout the car, and, Mr. Anderson, it brings out what you have suggested, that people know little about it. It is only by experimentation that we get results. I think that makes another matter clear that the air must be distributed all through the car and forced to pass along and come up in the middle through the openings.

Mr. JONES. That is the point I am raising. How do you force it along between the false floor and the main floor?

Mr. MARSHALL. There is an air space and it works along and works up, as it naturally would.

Mr. JONES. What is the philosophy that carries the air along to the middle of the car rather than for it to go out of the first opening at once?

Mr. MARSHALL. That is one of the matters we have to take up. If the ordinary man who did not have the time to work these things out were to attempt it he might go entirely wrong on it, so it is only by careful experiments and sending shipments through that the matter can be worked out.

Mr. JONES. What is your testimony from the people who have used this car as to its efficiency?

Mr. MARSHALL. The sort of testimony that was presented in the letter that the young man read at the opening of the day here is the kind of testimony we get. We have received a great many letters asking if we are not going to take up work again, and when Mr. Phillips wrote in again we frankly said he should take it up with the committee and he has done so.

Mr. JONES. The hot air rises and the cold air falls?

Mr. MARSHALL. Yes.

Mr. JONES. Would it not be better to start the cold air from the top of the car and throw it out at the bottom. That is the usual way with heating plants.

Mr. MARSHALL. But you would not want to let any of the air escape because then you would not have as good control. The desire is to have the car as tight as possible and keep a circulation of air in it.

Mr. JONES. To keep a circulation in the car?

Mr. MARSHALL. Yes. If the car were passing through the desert from southern California, where the fruit comes from, you would lose a great deal of efficiency in the melting of the ice with such a construction as you have referred to. The chairman asked a question about the salt.

The CHAIRMAN. Did somebody in the department discover this method?

Mr. MARSHALL. Yes; in the department.

The CHAIRMAN. Does it require special construction of the car?

Mr. MARSHALL. The special construction is what I mentioned to you, that the ice bunker in the first place should be wire so that the air will pass down rapidly; in the second place, there should be

an insulated wall between the ice and the fruit, and there should be a false floor.

The CHAIRMAN. To give it circulation?

Mr. MARSHALL. Yes.

Mr. WILSON. Is that patented?

Mr. MARSHALL. No; I do not know really whether it could be patented. If patentable by the Government, everyone would be able to use it.

Mr. WILSON. The first refrigerator cars were very valuable patents.

M. MARSHALL. Yes.

The CHAIRMAN. Will you tell us something now about the salt?

Mr. MARSHALL. The question of salt causes more or less difficulty; if you use it and do not understand just what you are doing, you are likely to freeze some of the fruit, and it is absolutely essential that you have a perfect-working car. One of the lines of experiments which we wish to continue and which we have done work on is to start the car with salt and cause a rapid decline in temperature before the car actually starts, with the hope that the icing of the car before it actually leaves the shipper will carry it through to destination. At a definite time the cars require icing all along the route.

Mr. HEFLIN. You mentioned that you have to ice the car all along the route.

Mr. MARSHALL. Yes.

Mr. HEFLIN. What do you mean by that? How far can the car go before they have to ice it again?

Mr. MARSHALL. There are icing stations all along the route. Can you tell, Mr. Mann, about how many times a car is iced between California and New York?

Mr. MANN. About every 12 hours.

Mr. WILSON. Does not the weather have a great deal to do with it?

Mr. MANN. The weather has a great deal to do with icing. Sometimes cars will require only 20 per cent of their capacity at any particular station and do not have to be entirely refilled.

Mr. WILSON. Icing has been done away with in the shipment of fruit from California—practically done away with.

Mr. MARSHALL. Will you let me develop that?

Mr. WILSON. What is the saving in the car?

Mr. MANN. It requires icing every 12 hours.

Mr. WILSON. Does that have anything to do with the new process? I have been told by representative fruit growers in California that the icing is practically done away with and that there is a big saving.

The CHAIRMAN. Kindly start with the time that the fruit is picked from the trees.

Mr. MARSHALL. Under the old system they would simply put it into the car and put ice in the bunkers. As I stated a moment ago, in the old system it would require icing every 12 hours, which would result in two things: First, delay; and, second, expense. With this new system less icing is required. We are experimenting with precooling before it starts, with the thought of having the temperature down before it actually leaves the station. It is hoped that under that system there will be brought about just what the chairman has mentioned—that the cars will go through without reicing, but that has not been fully developed.

Mr. McLAUGHLIN of Michigan. What is this experiment in the use of salt?

Mr. MARSHALL. Just the same as in the ice-cream freezer. You bring the temperature down very low, and you can safely do it in a car like this because the air will be distributed, and so it will cool it throughout rather than freeze the fruit near the ice.

Mr. McLAUGHLIN of Michigan. Then you start by putting in salt with the ice?

Mr. MARSHALL. Just as in the ice-cream freezer. It is hoped we can work it out to do that before the car starts, and we hope that the ice will melt less rapidly and that the car will go through from shipping point to destination without any reicing along the way.

Mr. TINCER. I understand there are these two ways of icing the car. Are there refrigerator cars that do not use ice?

Mr. MARSHALL. No. All refrigerator cars use ice. In the old cars that I told you about the ice is in open bunkers, while in the improved cars there is an insulated solid bulkhead between the ice bunkers and the fruit immediately adjacent.

Mr. TINCER. The California fruit now comes through without ice. That is an entirely different system, is it not?

Mr. MARSHALL. There is very little fruit shipped without ice clear across the continent. If you go by the northern route, you can get it through under ventilation, but not near so well.

Mr. JONES. I was misinformed. I was informed that they had a car which did not require ice at all.

Mr. MARSHALL. It would depend somewhat on the route you followed and the time of year. Of course, at this time of the year you have no ice. You have a heater.

Mr. JONES. I guess I did not understand it. I understood there was a system of cooling cars without ice.

The CHAIRMAN. Mr. Mann, can you tell us about treating fruit before loading it?

STATEMENT OF MR. C. W. MANN, POMOLOGIST, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.

Mr. MANN. The point Mr. Marshall was trying to make is that first the fruit is precooled, which does away with at least part of the icing en route. The shippers have this in mind: If they can precool the fruit themselves and put in ice enough to get it well started at a low temperature, it will carry through to the market without reicing on the railroad. This saves delay and expense. If the railroad receives the fruit before it is precooled and has to reice the cars en route, they have an additional rate for that.

Salting is another proposition. It hasn't been used with oranges to any great extent. The first icing with salt results in a rapid drop in temperature. More ice is required when the bunkers are refilled 12 hours later than otherwise. That practice at the present time has been objected to by some of the railroads because the salt affects the rails, bridges, and culverts. It is something that should be thoroughly tested in connection with peaches, pears, grapes, and highly perishable fruits.

Mr. JONES. You spoke something about precooling the fruit; what is that?

Mr. MANN. The method is used by the citrus growers in southern California; they have built their own precooling warehouses.

Mr. JONES. How do they do it?

Mr. MANN. In the Citrus Fruit Exchange of California the fruit is handled altogether under the supervision of the associations. They have their own pickers. They bring the fruit in and it is graded into various grades and then it is packed. It goes from the packing room into the precooling room. As a rule these precooling houses have from 6 to 10 rooms and the fruit is cooled there for from 24 to 48 hours.

Mr. JONES. How is it cooled?

Mr. MANN. By mechanical processes. It is cooled to about 40° and then it goes into the car, the bunkers of which are filled with ice furnished by the shipper. This shipment the railroad accepts, at a certain freight rate. There is no further treatment required. At the present time and since that practice has been started they have been experiencing a good deal of decay in some of the fruit shipped in that way, so that the California Fruit Growers' Exchange last August took it up with the department.

Mr. JONES. Is it a fact that the decay is larger under that method than it was before?

Mr. MANN. Probably the decay is largely due to the handling of the fruit. The questions that remain to be solved are largely questions of refrigeration—the shipment of fruit under refrigeration. It has meant a very great saving, but certain features are still to be worked out. The question needs a careful investigation to see whether or not the percentage of decay in these shipments is due to the method of refrigeration and whether the temperature rises after the fruit has been on the road four or five days is the cause of the decay. So there is still some question as to whether the practices have been permanently established.

The CHAIRMAN. After you ascertain the loss by decay you investigate the cost of refrigeration?

Mr. MANN. Yes, sir. Some one asked the question as to how that is done. We take the actual temperature of different parts of the car. That is done by using electrical thermometers. They are connected with the top of the car and can be read on the outside.

Mr. JONES. What is the total percentage of the decay at present?

Mr. MANN. It varies from a few tenths of a per cent decay when the fruit is loaded in good condition, when the weather is cool, up to 30 and 40 per cent decay in extreme cases.

Mr. JONES. What is the percentage of the decay when the fruit is pre-cooled and put in the car?

Mr. MANN. It varies, depending on the different commodities.

Mr. JONES. Use the same thing—oranges, for instance.

Mr. MANN. In the new car? The citrus fruit that goes into that car in sound condition shouldn't show more than 2 or 3 per cent of decay.

Mr. JONES. You say it is about 5 per cent with the use of this pre-cooled process that you have?

Mr. MANN. I would not want to state that as an average, but I just merely wish to indicate that there is a certain amount of decay. We haven't the complete total record on the percentage of decay.

The CHAIRMAN. Will you please state how the salt is applied?

Mr. MANN. It is put in the ice—that is, cracked ice. First the commodity is loaded, we will say, peaches in crates, and then the bunkers are filled with ice. After the car is iced it is placed on the siding and loaded. The bunkers are again filled with ice up to this point [indicating] and then three or four hundred pounds of salt, coarse salt, is thrown in on top of the ice in both end bunkers, and then the car is ready to move.

Mr. TINCER. What is that salt put in for?

Mr. MANN. It is to lower the temperature of the air that passes down through the bunkers. It produces a lower melting point of the ice.

Mr. TINCER. Is it to save the ice?

Mr. MANN. To cause a more rapid melting of the ice and lower the temperature. When 25 per cent of salt is added to the ice, a temperature of 4 degrees below zero results.

Mr. WILSON. In other words, ice is cooled at the melting point?

Mr. MANN. That is true.

Mr. TINCER. Have any experiments been made with working out a mechanical refrigerating process?

Mr. MANN. That is something that hasn't been worked out fully. They have used it in France, but in the United States conditions are quite different; our distances are so much greater.

Mr. JACOWAY. Do you always precool this fruit in warehouses, or how?

Mr. MANN. In the warehouses. Following the experimental work in 1904, the railroads built their own precooling plants. They forced cold air in with fans, circulating it through the bunkers, and they found that that was not the most successful method of doing it, and since that time the growers have built their own warehouses for precooling in southern California; so that at the present time practically all the precooling is done at the growers' warehouses or in commercial warehouses. The use of salt has an advantage. If you can precool a commodity like peaches, if it can be done while the cars are en route you are reaching the market that much sooner, 24 to 48 hours sooner. That is still to be worked out.

Mr. JONES. The whole thing is to conserve the fruit from the public standpoint and be an economical proposition from the shipper's standpoint?

Mr. MANN. Yes, sir. It increases the food supply. This car has been adopted by the Railroad Administration as a standard refrigerator car. It has been recommended to all the railroads for the building of a standard refrigerator car.

Mr. RUBEX. When they speak about shipping a carload of fruit through without the use of ice, do they not mean without the use of ice in transit after it leaves a point?

Mr. MANN. No; I rather think not. I believe they mean a ventilated shipment. The shipping of it through without ice is taking the same car and opening the hatches and letting it go clear through to market without any ice. It is what is called a ventilated shipment.

Mr. RUBEX. Is much fruit shipped in that way in warm weather?

Mr. MANN. Not in extremely warm weather; no, sir. Not in California, after about the 1st of March.

Mr. RUBEX. They ship without ice only in cool weather?

Mr. MANN. Yes, sir; that practice is very largely used on the northern railroads in the Northwest, with apples.

Mr. MARSHALL. There is another phase of the matter, the heating of the cars in cold weather to prevent freezing, which is in a way reversing the process and perhaps it would be well to tell you briefly about that. There has been only one car of approved form constructed, and that was before the close of the last fiscal year. The system consists in placing an oil stove under the middle of the car. The old system would be to put an ordinary coal stove up inside the car.

The CHAIRMAN. You heat the bottom of the car?

Mr. MARSHALL. Yes; under the new system. I thought I could probably show you a picture of the old car, with a stove placed inside in the middle of the car. The method that is recommended by the department is to place the heater below the car, in the middle of the car, either an alcohol or oil stove (the oil seems to work the best). In the system devised by the department the hot air passes from the stove into the car by one system of ducts, and the cold air comes back to the stove by another route, as it is shown in this diagram we have before us. Here we do not have a false floor with openings, but rather a solid false floor, because it is desirable that the hot air should not come up through the floor until it gets to the end of the car. As far as our experiments have gone it seems best to heat the bottom of the car and raise the temperature of the entire car in that way. When the air is heated around about the stove, it passes through certain channels under the floor of the car (it is solid in this case) to the ends. The cold air comes back by other channels to this pocket around about the stove and is heated and starts on the same journey again.

Mr. RUBEX. According to that, you have got to have a different set of cars, one for winter weather and another for summer time.

Mr. MARSHALL. You can use the same car.

The CHAIRMAN. The same principle is involved here as in the case of dry-air furnaces, is it not?

Mr. MARSHALL. Yes, sir.

The CHAIRMAN. How do you get the stove under the car to heat it?

Mr. MARSHALL. It is under the car here [indicating]. It is not intended that the air should come in from the outside. You keep the air circulating within the car, but the air does come down in the pocket about the stove, which is located below the floor of the car. Under the old system the stove is put inside the car, which would not be so effective.

Mr. TINCHER. You have one car which is a summer car?

Mr. MARSHALL. Yes, sir.

Mr. TINCHER. Would that car be suitable for winter use?

Mr. MARSHALL. It is not equipped for winter use.

Mr. TINCHER. Don't you think as a proposition of real benefit it would have been better not to have given out any advice at all until you had devised a car that could be used both winter and summer, rather than to have started building a special car for summer use and a special car for winter use? Then you could advise the proper use of that particular car. Don't you think that would have been better?

Mr. MANN. As a matter of fact, this car can be used in both summer and winter. It is a refrigerator car. The idea is to install a heater to provide a combination refrigerator and heater car.

Mr. TINCHER. I understood that you had built an ideal car.

Mr. MANN. The same sort of car is used in both summer and winter, but the equipment is different.

Mr. TINCHER. Under this system, where they say no car is ideal, did that come up to standard and could it be used in all seasons of the year?

Mr. MARSHALL. This [indicating] is a regular refrigerator car used for summer shipments. Of course, the cork lining would be the same. In the winter you keep the heat in, in the summer you keep it out. We have had no funds to continue that work this year, and that is one of the lines of work we want to take up the coming year and carry those experiments forward.

Mr. MANN. The particular car shown here has been in service constantly. It is a refrigerator car used for summer shipments. The whole idea of the work is to develop a car for use in summer and winter.

Mr. TINCHER. Mr. Marshall says it has no ice bunkers.

Mr. MANN. He merely referred to the fact that the ice bunker was temporarily taken out of the car. It has an ice bunker in it at the present time. It is a refrigerator car used for summer shipments, as you can see.

Mr. ANDERSON. If you are working on a combination refrigerator and heater, why did you take the old bunkers out?

Mr. MANN. It was merely an incident in the installation of the floor. That gives a wrong impression, because the bunkers were in the car except while the car was being remodeled. It was first built as a refrigerator car and then was adapted for heating purposes also. The point is there are millions of dollars lost every cold winter from the freezing of fruits and vegetables in transit.

Mr. MARSHALL. I think that explains the entire matter fully. You see the practice involved, and the current year we have had only six men who could devote their time to work of this sort. You have some indication of the demand for it from the letter that has been read here.

Mr. ANDERSON. Is it intended to carry on more of the same kind of experiments with the same men; do you intend to continue your investigations along the same lines?

Mr. MARSHALL. It would be continuing the same line of work, Mr. Anderson.

Mr. ANDERSON. That is an expression used here a million times every year; what does it mean?

Mr. MARSHALL. It means, as I said at the outset, that if the ordinary person were to take up these cars at the outset they would make all sorts of mistakes. We have to make all sorts of experiments. I can illustrate it by stating that we send these shipments through from California and see what happens to them. The same is true with a heater car. We have the same sort of an experiment, placing thermometers all through the car and seeing what happens, by following it through to destination.

Mr. ANDERSON. Do you use a different set of men for these different experiments?

Mr. MARSHALL. No, sir; the same set of men would work on both experiments.

Mr. ANDERSON. What do you want with the additional money?

Mr. MARSHALL. Just for our expenses like that; for the expenditure of money in improvements on the car—changes in the car; and it would be very largely for the expenses of men in following these shipments through; also for development work.

Mr. ANDERSON. Do you mean to make more shipments?

Mr. MARSHALL. Yes.

Mr. LIVINGSTON. May I say that the results related here this morning have referred primarily to work with oranges, peaches, and a few vegetables. There are various other experiments we want to conduct with fruits and vegetables. Possibly it may be necessary to make some relatively slight changes in cars to make them uniformly satisfactory to all kinds of vegetables and fruits. But there are other phases of the work that still remain to be discussed.

Mr. ANDERSON. Have you any reason to believe that you require a different kind of car to ship grapes than to ship oranges?

Mr. LIVINGSTON. Not a different kind of car, but possibly some slight arrangements to better adapt them for different kinds of vegetables and fruit and also to find out whether or not the present method of icing can be improved.

Mr. ANDERSON. I still don't see where the additional expenditure comes in.

Mr. LIVINGSTON. As Mr. Marshall pointed out, the additional money would be used very largely in following through these shipments. The shipments have been mainly with oranges, apples, and peaches. We need to go into various shipping districts throughout the country with various kinds of fruits and vegetables and follow them through with this type of equipment. Also, we wish to take up the work described in the note on page 244 of the Book of Estimates.

Mr. ANDERSON. How much will you expend on it this year?

Mr. LIVINGSTON. Approximately \$25,000, including statutory salaries.

Mr. ANDERSON. How much are you asking for?

Mr. LIVINGSTON. Approximately \$55,000.

Mr. ANDERSON. Then, you are approximately counting on doubling up—

Mr. LIVINGSTON (interposing). I don't know whether you were present when Mr. Marshall mentioned that during the war a much larger amount of money was spent on these investigations than we have available this year. This is to continue the work along that line, namely, whether or not this equipment and these refrigeration methods are adapted to other kinds of fruits and vegetables, following the shipments through to the market, and to develop other work that has not been discussed.

Mr. ANDERSON. I suppose you couldn't have a very materially different type of car to ship grapes in than for shipping oranges?

Mr. LIVINGSTON. That is true; but we want to find out whether this car and the refrigeration practices are adapted to these other kinds of fruit. If not, certain improvements may be desirable which will add to its usefulness. There are some fruits and vegetables that decay at one temperature and others that will decay at another temperature. It is just as important to get our fruit and vegetables to market in good condition as to produce them.

Here is a photograph that is shown to illustrate another feature of the work. This takes up the question of storage of just one of these products—sweet potatoes. The losses are exceedingly high in case of the storage of sweet potatoes. This is the method used since they began to grow sweet potatoes in the South. Some of you who have lived in the South have seen these banks built this way above the ground, covered over with palms or straw, and then covered over with earth. The estimates indicate that the losses in these banks amount to 50 per cent or over.

The CHAIRMAN. On what does your covering rest?

Mr. MANN. On palm branches, straw, or on cornstalks. A conservative estimate shows that the losses amount to 50 per cent of the potatoes stored in this way. There are probably 50,000,000 bushels of potatoes stored in this way. There are probably 50,000,000 bushels of sweet potatoes stored in the South in this way. The Department of Agriculture, under the war-emergency fund, took this matter up. The refrigerator-car work was also done under the war-emergency fund. We couldn't have done it under the appropriation this year or under the appropriation before we had the war-emergency fund. We have assisted growers in building in the last two years approximately 500 of these houses. This is the smallest type of house. The department has prepared plans and specifications for these houses holding 500 bushels, 2,500 bushels, 5,000 bushels, and 15,000 bushels. The losses which were reported in these houses last season were not more than 2 per cent.

Mr. WILSON. You say you have assisted growers in the construction of 500 of those within the last two years?

Mr. MANN. Yes, sir; the farmers built them. We had last year under the war-emergency fund 20 men in the Southern States working with these men who were storing the potatoes. This photograph [indicating] is a farm storage, a small house suitable for farm needs.

Mr. JACOWAY. When you get that little house stored full of potatoes, can you go into it again from time to time?

Mr. MANN. Yes. There is an aisle in it. The sweet potato is a peculiar product. It is necessary to put it through a curing process. The potatoes are put in there in hampers or baskets, or bins, and then the temperature is run up to about 85° and kept there for about 10 days. These potatoes give off about 10 per cent of their weight in moisture, so that they are cured, and if you break one in two the section is dry. When they reach that condition they will keep without very much decay—perhaps 1 or 2 per cent.

Mr. JACOWAY. In these bins do you just put the potatoes in solidly?

Mr. MANN. Yes.

Mr. JACOWAY. Isn't there a tube in each bin that runs up through it?

Mr. MANN. That it done quite often. In the center a perforated tube is run up, which aids in curing and ventilation.

Mr. JACOWAY. Is that beneficial?

Mr. MANN. Yes; undoubtedly it is.

Mr. JACOWAY. How do you cure potatoes in a house that will hold only 500 bushels?

Mr. MANN. In this house [indicating] there are four bins, and potatoes are put in to a depth of about 3 or 4 feet, and sometimes

there are two tiers. The bins are constructed of slats made of 1 by 4 inch boards, so that air circulates around them freely. A stove is placed here. It is a wood stove as a rule in the South. Ventilators under the floor are opened, and after the house begins to heat there is quite a rapid circulation of air through the house.

Mr. JACOWAY. Don't you have fans installed to make the air circulate?

Mr. MANN. No. Air is exceedingly hard to handle. With a fan it is difficult to get uniform heating.

Mr. JACOWAY. In my town there is one of those storehouses that holds 40,000 bushels of sweet potatoes. They are successfully using fans—electric fans.

Mr. MANN. The fans have been used. We find that fans are not usually necessary. Fans were tried last year, but we think it has not yet been demonstrated that they are necessary.

Mr. JACOWAY. Don't they let the air current come now from the center instead of from the sides?

Mr. MANN. Yes; it does in a house of this size; and in fact, in a house of any size it comes from a certain point. The air in this house [indicating] would come from the center. It is brought in here and circulates through.

Mr. JACOWAY. Suppose you put potatoes in this house that have been cut or mashed or bruised. Is your curing process such that it will cure that sort of wound or bruise?

Mr. MANN. Yes. Quite a high per cent of those potatoes actually become dry and hard and the decay doesn't develop. As a matter of fact, though there is quite a percentage of cut and broken potatoes that do decay—that is, when the decay has started, every one doesn't rot by any means.

Mr. JACOWAY. Does putting them in these special storage houses retard the decaying process very much more than the others?

Mr. MANN. Yes; very much more. You have forced curing in these houses which prevents the decay. Stored in an earth bank a cut potato is almost certain to decay, but under this method it is often avoided. Then there are other causes of decay than is the case with cut potatoes. That is almost entirely avoided in a house of this kind.

Mr. JACOWAY. Is not the secret of the process to keep the temperature at a given point for a given time?

Mr. MANN. Yes, sir.

Mr. JACOWAY. If that temperature rises or falls, do you not run the risk of losing your potatoes?

Mr. MANN. Yes, sir.

Mr. HEFLIN. Don't they use steam-heated pipes in some of the houses?

Mr. MANN. They may do that.

We have had two of our very best investigators working along that line to see whether or not fans can be used in the large houses. They probably can not be used in the small houses, but in the large houses of 40,000 or 100,000 bushels they may be used effectively.

Mr. JACOWAY. The best thing that I have seen in our part of the country is that of putting that tube in the bin to give the air circulation.

Mr. MANN. That is an old idea which has been used for white potatoes in Maine for a good many years.

Mr. WILSON. That was developed by the Agricultural Department, was it?

Mr. MANN. You mean that method of ventilation? No.

Mr. JACOWAY. But you didn't use it in your house three years ago?

Mr. MANN. In that particular house?

Mr. JACOWAY. Yes, sir. You didn't use this system of ventilation through the individual bin. Two years ago you got air from the side. Now, you have reversed your position.

Mr. MANN. That has been altogether a matter of development. The ventilator in the middle of the bin wasn't used in these sweet-potato houses till two or three years ago.

Mr. JACOWAY. I understood that the Department had also developed a machine, whereby, if you had a particularly wet year you could go out and get three or four pounds of potatoes from over your field, crush them up, press the water from them like you do in making cider, and in that way you could tell the grower how many days his potatoes would have to be heated in order to cure them.

Mr. MANN. That is in process of experiment.

Mr. JACOWAY. What will cure them this year won't cure them next year. How do you account for that?

Mr. MANN. You put them in the very best possible state for storing, and when they reach the right stage of maturity so as to get more effective curing.

Mr. JACOWAY. Isn't it a fact that a great deal of difficulty is found in trying to cure potatoes on which a heavy frost has fallen?

Mr. MANN. Yes; those potatoes should not be shipped.

The CHAIRMAN. Is there anything more on this item, Mr. Marshall?

Mr. MARSHALL. Since you are considering the ways in which the money is to be expended, we probably ought to mention the apples in the Northwest, where the principle is just the same. There have been some very heavy losses from shipments recently from the Northwest. I have before me an item appearing in the New York Packer, which says that some two or three thousand cars of apples from one of the districts in Washington were damaged recently and the extent of the damage was about 126 boxes to the car. That means something like 300,000 bushels of apples were frozen. That shows the necessity of developing these systems we have just been telling you about. This last year there has been such shortage of cars to ship from all western points that they had to hold the apples over longer than ordinarily.

Mr. ANDERSON. You have a lot of subitems under this \$30,000. Would you mind giving us an idea as to the amount you expect to spend on each of the projects under this \$30,000? That is paragraph (b), on page 244.

Mr. LIVINGSTON. You refer to refrigerator and heater cars?

Mr. ANDERSON. Yes, sir. Would you estimate these propositions?

Mr. LIVINGSTON. If it would be satisfactory, Mr. Anderson, we can insert it in the record.

Mr. ANDERSON. You can look it up and give it to me later.

Mr. LIVINGSTON. Very well.

The CHAIRMAN. It is now nearly 1 o'clock. The committee will recess until 2.30 p. m.

(Thereupon, at 12.50 p. m., the committee took a recess until 2.30 p. m.)

AFTER RECESS.

The committee met at 2.30, pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

BUREAU OF MARKETS—Continued.

The CHAIRMAN. Are you ready, Mr. Harrison?

MR. HARRISON. Mr. Chairman, when we adjourned for lunch we were discussing item No. 80, on page 243. We are conducting our foreign market investigations under this item, and while we are not asking for any increase for that work, it is a matter in which the members of the committee are interested, and I think they would like to know something about our activities in the field. The Secretary is also very much interested in the project and he would like to see it developed as rapidly as possible.

The CHAIRMAN. It is a very important matter.

MR. HARRISON. Mr. David Harrell, of Texas, was appointed live-stock commissioner for the department last summer and was sent to South America to study the possibility of developing markets there for American pure-bred live stock. He returned to this country a short time ago and will be glad to tell the committee some of his experiences and some of the very fruitful results of his work.

The CHAIRMAN. We shall be very glad to hear Mr. Harrell.

STATEMENT OF MR. DAVID HARRELL, LIVE STOCK COMMISSIONER TO SOUTH AMERICA, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.

MR. HARRELL. Mr. Chairman and gentlemen, as Mr. Harrison says, the Secretary of Agriculture sent me down to South America to investigate the possibilities of the exportation of live stock from North America to South America, and to stimulate interest in that business, and accompanied by Mr. Morgan, assistant in the Bureau of Markets, I made the trip to South America. I had been in Spain and in Europe for a year and a half as the representative of the War Trade Board, and being familiar with the Spanish language and the customs of the people, and being a stockman and breeder of pure-bred cattle I thought it was an opportunity to be of some unselfish service, so I made the trip to South America, landing in Brazil, going through Brazil, Uruguay, Paraguay, Argentina, and then over the Andes to Chile.

In Brazil I found a country as large as the United States with just about, you might say, looking at it from a cattle standpoint, about where Texas was 35 years ago—a very large number of cattle and all unimproved, and the other live-stock interests are not being paid much attention to, but the Government is very much interested in the improvement of their live stock. It is a very wide field for some one to get a good trade in pure-bred live stock in the improve-

ment of the cattle of Brazil, which is a wonderful cattle country—and some one is going to develop it. The English, I found, are very active there now following their usual custom. Some of you will recall that the United States was at one time the backbone of their pure-bred trade. Later they developed the Argentine, which has more recently become the backbone of their trade. Now they realize the immense possibilities of Brazil as a cattle-raising country to be the backbone of their trade in the future, and if we don't develop it, somebody is going to do it. In fact, we had not been in Brazil over three weeks, representing the Department of Agriculture and making our investigations before two live-stock secretaries were attached to the British Embassy, investigating the importance of that industry in that country.

In Brazil we made a trip some 3,000 miles overland and into the interior where the cattle breeding grounds are, with conditions, as I say, very much like old Texas, where they raised their cattle out in the open and drove them from 200 to 1,000 miles over the prairie to market. We made that trip down through the States of Sao Paulo, Parana, Santa Catharina, Rio Grande do Sul, to Uruguay. There we found the live-stock interests very much more improved, and we also found a very receptive Government. They thought a great deal of the United States and of everything that we had done. There are great possibilities there for the improvement of live stock.

Over in Argentina they have the wonderful influence of the Palermo show, one of the greatest cattle shows in the world. At the auction sale of cattle that were shown in the Palermo show—they were all sold at auction after the show—823 Shorthorn bulls were sold at auction at an average of 6,353 pesos, money nacional—that is, Argentine money. That is about \$3,000 gold. Eight hundred and twenty-three shorthorn bulls were sold. One hundred and four Herefords averaged \$2,000. The dairy cattle averaged about \$1,200; the hogs averaged about \$375, and the sheep about \$300 in gold.

From there we went over the Andes to Chile for a short stay there and then started on our road home.

I want to say first, that before I left here the officials of the department, realizing that they could be of a great deal of value to the breeders of pure-bred cattle by making this investigation, advised that before I left for South America I call the breeders of pure-bred stock in the United States, and the secretaries of all the associations, to meet me in Chicago to take stock of what we had and get their ideas, and I don't think I have ever seen a more enthusiastic lot of men over the idea that the Government was taking some step to further their interests. As you know, and as was stated here this morning by one of the other men, export trade is the safety valve of overproduction. It is a stimulant to production, it is a stabilizer of prices, and when you open the markets of the world to any one of your vital interests, you are improving and doing something for the producer of that interest. They were very much interested, all of them, the sheep men, the hog men, the cattle men, the dairy men, and stated that they would give all the cooperation that was necessary. More than that, when I got to South America I found that they knew more about the general activities of the Department of Agriculture than I did. I had never been connected with any department before, and being a representative of the Depart-

ment of Agriculture was, I found, an open sesame wherever I went, in every Republic of South America. They believed that it was the last word in Government cooperation in assisting the producer in marketing activities, and we were asked at every place for a plan of organization for their departments. Every secretary of agriculture received us with open arms, and you know in Latin America and in all that southern country most everything that is a big business has some governmental work, so that through that department I was able, as the representative of the Department of Agriculture, to get a large amount of information to enlist the aid of the Government, and through them all, the rural societies, the agricultural societies, and all the breeders, I found wherever I went that the rating of the Department of Agriculture was AA1, and it was very gratifying to me, because I was trying to do an unselfish service and was only doing it from a breeder's standpoint.

Having gone there to investigate the possibilities of the trade, I found that the possibilities were wonderful. It is the most wonderful cattle country almost in the world. It extends from the Temperate Zone of Brazil, from the subtropics down to Uruguay, which is about the size of Missouri, and then on into Argentina, which is about equal to one-third of Europe, leaving out Russia. You can raise cattle and all kinds of live stock in the open 12 months in the year. It is a wonderful live-stock country. The agricultural and live-stock exportations of Argentina are about 80 per cent of the total exports, 90 per cent of Uruguay, and 87 per cent of Brazil. They export their coffee and rubber from Brazil, and in Argentina wheat, cattle, hides, and wool. In Uruguay it is the same way, so there is a wonderful chance for the pure-bred breeders to furnish new blood to improve the live stock of that country, particularly in cattle and hogs. They are in a very receptive mood. The Governments of all those countries have taken notice of it. Brazil has passed a law that on all pure-bred stock shipped they will refund the freight, where they bring the registration papers. They are going through a great many things that we went through in Texas when we got out the Longhorn down there and improved it with the pure-bred animal.

I came home with recommendations made after careful first-hand knowledge on the ground from the breeders, from the cattleman's, and the live-stock man's standpoint. The men in the department here have the technical knowledge and things of that kind which I don't know much about. I only know the practical end of the business, and I went over for the purpose of seeing the possibilities there, and what we need is personal contact between the breeders of North America and the breeders of South America. That personal contact can be furnished better by the Government than by any other means, because not only coming from the Department of Agriculture which stands so well, but having the stamp of approval of the Government will give you an entre and the moral support of each one of the Governments of South America, if the personal contact which is very necessary—absolutely necessary to establish a trade—is made by the Government. Then if the Department of Agriculture and the Bureau of Markets wishes to be of benefit to our great interests, to our great live-stock interests of America, they should furnish that personal contact. If you should visit our trade commissioners and consuls

and embassies throughout the world, over on the other side, you will not find very many of them that are live-stock or agricultural men. They are lawyers, doctors, merchants, manufacturers, and everything of that kind, and they are not—not in any place that I found—competent or have the time to give that personal contact that is necessary to be furnished by the Government. The balance of it, of course, will have to be done by the private interests, the interests of the breeder; therefore there will have to be some one to furnish that contact for which I am coming before you now to ask that you give, some one that will be a live-stock agricultural man, that will understand his business from that standpoint; that will know the language of the country; and that will know agriculture and live stock, that would furnish the personal contact.

The recommendations that I brought home are that there should be established—attached to the embassies, preferably the embassy in Brazil at Rio de Janeiro—a live-stock agricultural attaché, whose duty it shall be to furnish the contact between breeders of all classes of live stock here and the breeders over there; another at Buenos Aires to cover Argentina and Uruguay.

I have asked the department how much that would take and they said about \$25,000. That will furnish a good man, his traveling expenses, and the necessary means to carry on those new activities. Of course we could take in Chile and other places to work, but the places now that looked the most inviting, in which the possibilities are greatest, are Brazil in its undeveloped state, Uruguay with its partially developed state, Argentina with its very fully developed state. The sole business of these men would be to furnish the personal contact with the cattle business, to furnish information, to help with the advertising, to be the representative of the Department of Agriculture just as the trade commissioner is the representative of the Department of Commerce. He should be a good man, a nonpartisan man. He would not be a Shorthorn man or a Hereford man; he would not be a Duroc man nor a Poland-China man; he would not be a sheep man, but he would be a Government man first, and an expert in agriculture and live stock.

I came home so late that those recommendations, of course, were not included in the recommendations of the Secretary. I discussed the matter with him and told him the situation, and he agrees with me that to get any benefit from the trip we have taken and the information we have gathered—of which we have a very large amount and all of which is at the disposal of this committee in any form they want it—must be continued, and in offering my services going over there to help to do that now, and to first come here and then to go and call on the breeders again and tell them about it more in detail than you want me to take up the time to do to-day, of all the different matters that I found and of all the different items that came up over there; to explain the situation to them as fully as I could; but I am always at the service of the Department of Agriculture to carry that out. The secretary agrees that in order to get the benefit of this—and it looks like it is one of the best things that could be done by the department—you must continue the work. He has not put in any supplemental request for this appropriation, and I am coming before you as a

live-stock man, having made this investigation, to tell you the situation, and I will be glad to answer any questions or to go into any details with you in asking that you include in the estimate for the Bureau of Markets an estimate of \$25,000 for the attachés, an agricultural live-stock attaché at Rio Janeiro and one at Buenos Aires. I don't believe anything can be done that will do more toward putting a peg into our foreign trade. Right now our dollar is at a discount in Argentine because the balance of trade against us is over 50 per cent, and the live-stock trade that we can start there will be of great assistance to us.

To give you just one illustration—if you will pardon me—we met here in New York a man coming from Uruguay to buy live stock, just on a chance. We got in touch with him at once. I was taking lunch with an officer of the National City Bank before going over. He said: "There is a cattleman here from Uruguay to-day," and I got in touch with him right away, wired the Bureau of Markets to get hold of this man and put him into the right position. They put Mr. Burk, the live-stock man here, with him, and he purchased 43 head of cattle at a cost of \$65,000. Those cattle went to Uruguay and he has been most successful with that herd and has advertised from one end of South America to the other the great, valuable, expert official service that the Department of Agriculture gave him, that they saved him at least \$15,000 on his first importation of cattle. He published a booklet on it, with particulars of the cattle, and it has been one of the best things that has been done. To-day we have a telegram from this man and he is coming back. When I left Uruguay he had taken orders for 120 head. He went out with 43, and he is now coming back with an order for 125 head.

I was on the car with one of the largest breeders of Uruguay, and he told Señor Pareja, "Buy me the best two Hereford cows in America." I said, "What price?" He said, "I didn't say price; just buy the two best Hereford cows in America." He is coming back already, so I doubt if you will ever see bread cast on the waters returned so quickly, or see interest on an investment accumulate so rapidly, and I know if properly fostered and properly handled by the Pure Bred Association of America that we can develop a wonderful trade with South America.

The Statistics of the Sociedad Rural de Argentina, the Rural Society of Argentina, show that last year and for several years past the importations from Great Britain to Argentina alone in pure-bred live stock amounted to about 2,000 head each year at an average of \$3,000 a head, and it has been the backbone of their trade.

When we went down there we took with us copies of a book in Spanish showing the activities of the Department of Agriculture, the location of all the pure-bred herds in America, the climatic conditions, the relative climatic conditions that existed between North and South America; containing all of our quarantine laws for tuberculosis and all other matters relating to exportation and importation, the location of every pure-bred herd, so that a man coming in here would not have to go blindly all over the United States. They can go to England and just go around a little bit of a circle there, but they come here and they would spend months going around. We

show here by black dots [indicating] the location of every herd of cattle, hogs, and sheep, of all the different classes of cattle. That book was printed in Portuguese for Brazil and in Spanish for the balance of South America. We can't supply the demand for that book.

Mr. ANDERSON. Who gets that out?

Mr. HARRELL. The Department of Agriculture. We got it out here very shortly before I left. While I was in Chicago to take stock and meet all the breeders we had this book written and published here, and I took it along with me as advertising matter in their own language. One of the great faults of the American exporter is that he has sent his advertising over there in English, and we took this along in their own language. We had it translated here at the Pan American Union into good Portuguese and good Spanish, and we distributed those first hand to the breeders, to the ranchers, to the importers, to the different men over there.

The CHAIRMAN. Does that give the name and address of the breeders?

Mr. HARRELL. No; in the back of it is the name of the secretary and the address of every pure-bred live stock association in America. That is on the last page. We are getting letters every day about it. To-day I had an order, "Please send me 400," and the Department of State wired me at Buenos Aires, "Please return 250 copies of your publication, 200 copies in Spanish and 50 in Portuguese. We want to send them out to our consular agents in the countries which you did not visit.

For me to come in and ask for something that is not put into the appropriation bill I know you will understand that I am coming to you in the right spirit, and I believe if you go into it I will be very glad to give any of the members of this committee my time outside of the committee room, or any other time, all of the information that we could gather that will be pertinent, and I would be glad to answer any questions which you would wish to ask.

The CHAIRMAN. When was the first exportation?

Mr. HARRELL. The first exportation was made in July.

The CHAIRMAN. Do you mean 1919?

Mr. HARRELL. In 1919; yes; to that country. Mr. Parega is coming back here now.

The CHAIRMAN. Is that the first exportation from the United States?

Mr. HARRELL. That is the first large exportation made.

The CHAIRMAN. I understand that a number of representatives of the South American countries recently attended the Fat Stock Show in Chicago.

Mr. HARRELL. Yes, sir.

The CHAIRMAN. Have you any knowledge of their purchases?

Mr. HARRELL. They exchanged judges, you know, at the International Show. They had William J. Grant judging the Angus breed.

The CHAIRMAN. Have not a number of purchases been made recently?

Mr. HARRELL. There have, and are being made now, and this man is coming back here now, and it will be a great thing if we can put a man over there that will represent the live-stock interest who

understands the Brazilian and Argentine and Uruguayan countries and all of those things that are unfamiliar to the exporters here, and the personal contact there can be solved so readily that we can direct the sentiment and the building up of that trade very rapidly in that way, rather than going through the long way of finding out by hard knocks.

The CHAIRMAN. Are the inspection laws a handicap in exporting?

Mr. HARRELL. No; except in regard to the quarantine.

The CHAIRMAN. Are they shipped at the risk of the owner here, or do they buy them on their own risk?

Mr. HARRELL. They generally buy them on their own hook and insure them. Then they have to go through a 30-day quarantine in all the countries. The foot-and-mouth disease is rampant from one end of South America to the other, yet we take all the precautions here to see that they are shipped free from disease, with a clean bill of health. The foot-and-mouth disease in South America up to this time only meant a sickness of 10 days and that they were over it. It took some little time to recuperate, but it has been very fatal this year, and the losses over there are very great right now.

The CHAIRMAN. In all countries?

Mr. HARRELL. In Argentine, Uruguay, and Brazil both. The foot-and-mouth disease is all over that country.

The CHAIRMAN. The losses are much greater than they were in the past?

Mr. HARRELL. This last year they are very much greater.

The CHAIRMAN. Is the percentage larger?

Mr. HARRELL. It has never amounted to very much. The mortality had not been very high until this last year. It came in calving time, and it was a wet season and the loss was very great. This condition had the attention of the department of agriculture and the rural society there. They are trying to investigate it now.

Then they have in South America, just as we have here, the tick-free zones and the tick zones. All of Brazil has the tick. Half of Uruguay, about divided by the Rio Negro River, half is tick free and half is tick. Nearly half of Argentina is free from ticks. Only some of the provinces have the tick in them. They have some sort of tick eradication system as we do, but they have not carried it as far as we have yet.

Mr. ANDERSON. Were there any losses by foot-and-mouth disease in this exportation that you refer to?

Mr. HARRELL. No; not at all.

The CHAIRMAN. Do they not have the fever there?

Mr. HARRELL. Wherever you are above the line, which corresponds to below the line here—wherever you are in the fever district—they have to be immunized if they come from above the line here.

The CHAIRMAN. Are the losses heavy in shipping?

Mr. HARRELL. No.

The CHAIRMAN. Do many die from fever?

Mr. HARRELL. No; very few.

The CHAIRMAN. Are they treated for it?

Mr. HARRELL. They are treated for it, but not as scientifically as we treat it. The Southern States—Texas and the other Southern States that are shipping cattle from the North to build up the herds

through inoculation—are very much ahead of the work they have been doing over there.

The CHAIRMAN. The fever has handicapped shipping?

Mr. HARRELL. Yes.

The CHAIRMAN. They are overcoming it?

Mr. HARRELL. They are overcoming that a good deal now.

Mr. YOUNG. What is the feeling of the South American people toward the building up of trade relations with our country?

Mr. HARRELL. They are very anxious for it.

Mr. YOUNG. It always appeared to me that there was a feeling of antipathy on their part to this country.

Mr. HARRELL. No; I don't think so. Of course, you hear a good deal of the "big brother" act down there, and, of course, that is a trade word. Of course, the Germans or the British will say, "Oh, well, when the United States gets a hold in here they just want to grab your country." But that is all trade work, you know.

Mr. YOUNG. The point that I want to get clear is this, Mr. Harrell: Since this war do you find the sentiment changing, and that they are more friendly toward establishing trade relations with our Nation than they were before the war?

Mr. HARRELL. Of course, I only mixed with the agricultural and live-stock interests over there, but I found a most friendly attitude toward us, particularly in Brazil and Uruguay and Chile. In Argentina there wasn't any ill feeling against us, but there wasn't so much outspoken "We want Americans."

The English have a very strong hold in South America. It has been the backbone of their pure-bred trade for a number of years, and they are going to fight tooth and toenail to see that it isn't taken away from them. We didn't preach down there that we were going to take the English trade away. We said we were going to divide it up; there is room for us. And there was one point, we made the claim, after seeing the Herefords imported from England, where they paid \$35,000 for the champion Hereford bull of England, and \$16,000 for the junior champion at the last show—in fact, nearly every pure-bred animal that has been sold in England for the last four or five years the highest prices have been paid by Argentina—and after seeing those animals, I said, "We have developed in the United States Herefords superior to the English Herefords. You men should come here and see them." When Mr. Pareja's first shipment went down there he clearly demonstrated it to them. Mr. Grant, who is one of the greatest breeders of Angus cattle, came over to judge, to the International Show here, this year, and in his first published article the first thing he said was, "I found here an American type of Hereford developed by the American breeders far superior to anything in the world." Well, I wouldn't have taken a thousand dollars in gold, as poor as I am, not to have heard their own man come over here as a judge and make such a statement as that, because we preached that from one end of Argentina to the other. And that was said by a man who was a cattle breeder, a man who knew what he was talking about.

Mr. YOUNG. Your idea, then, is that, if we can enter that field, we will be able to compete, so far as high-grade cattle are concerned, with any nation on earth?

Mr. HARRELL. Absolutely.

Mr. YOUNG. With the different breeds of thoroughbred cattle?

Mr. HARRELL. That is the reason now we have to have this personal contact. We can't leave it to the breeder over here to ship blindly. But we have got to have a trade commissioner over there. There is one class of cattle, one class of hogs, one class of horses, one class of everything else that has got to go to Brazil. They are not going to pay \$35,000 for a bull in Brazil to put to a cow worse than the old Texas cattle to breed up the stock, but they are going to pay the highest price in the world in Argentina. Then in Uruguay you have got the Herefords as the principal animal there. In Argentina it is nearly all shorthorns. We have got the class of stock. We want a good quality and type of stock for a country that is just building up; a higher class for another; the best you can possibly furnish for another, and nothing but the best. You would ruin the trade if you sent anything but the best to Argentina, so it really needs some one on the ground and some one that knows their business to furnish the contact between the two trades, to put it on a business basis.

Mr. YOUNG. Take the pure-bred breeders and the organizations in this country, have they got their herds built up to such a state of efficiency and proper numbers that they are now interested in entering a new field of endeavor and trade?

Mr. HARRELL. Absolutely, because the world's market is the safety valve for overproduction.

Mr. YOUNG. Do you think we have reached that point in our civilization where our own Nation can not absorb as rapidly as we produce these animals?

Mr. HARRELL. I think so; and if you will take the statistics published now on the exportation of meat from the United States beef, particularly, has stopped. There probably will not be much more exportation of beef and beef products from the United States. The population is growing faster than the meat supply, and if we can't send meat to that country, and that country will supply a great deal of the meat consumed in this country, let us send them the pure-bred stuff to build up their stock and open the markets for the pure-bred stock.

Mr. YOUNG. You made one statement that was rather alarming to me, and also very interesting to me, and I presume to the other members of the committee. That was that whereas in all of our foreign trade relations we had representatives to look after the commercial enterprises of the Nation, manufacturing, and so forth, in none of the nations of the world did we have any representatives that took care of agriculture.

Mr. HARRELL. Yes, sir.

Mr. YOUNG. It never occurred to me before that that was true.

Mr. HARRISON. That is true with one exception, Mr. Young. In England we now have an agricultural commissioner.

Mr. LEE. What does he represent, Mr. Harrison?

Mr. HARRISON. The Department of Agriculture.

Mr. LEE. Any special branch of the department?

Mr. HARRISON. He is attached to the Bureau of Markets, but he represents no special branch of agriculture.

Mr. HARRELL. In fact, Mr. Young, I came home and told Mr. Houston and the chief of the Bureau of Markets that I thought the

most valuable thing we did over there was that we met a class of men that had never been met by our representatives before. We talked to the breeders; we talked to the agricultural men; we talked on their own ground and about their own subject.

Mr. YOUNG. The point that impresses me is this: We are a great agricultural Nation and export a great deal of our products. This live-stock industry is quite a large industry in our own country, and I ask whether or not the Government has not overlooked its duty in opening up fields—markets for the live-stock industry of our Nation?

Mr. HARRELL. We have never been in a position up to the last few years to be able to ship; we were building up our own stock first. But this very activity on our part furnished the backbone of the trade for England for a great number of years.

Mr. YOUNG. We should take the trade of our next-door neighbors; it really belongs to us geographically.

Mr. HARRELL. But the live-stock interests of America have never been in a position to go out into the world markets until they improved their own stock; until it measured up to the standard of export. It does now. I don't think there is any part of our wealth—and we are an agricultural and live-stock country; that is the basis of a great deal of our wealth—where we have gone as far ahead as the improvement of our live stock.

Mr. YOUNG. The ordinary run of cattle in Brazil, as I understand it, are pretty much the same type of cattle as the old longhorn in Texas.

Mr. HARRELL. Very much so. I have a number of pictures that I think would interest anyone interested in live stock of the development of the original stock there. They make me feel as I did in my very young days in Texas, when we used to have to saw the horns off to get them into the car.

Mr. YOUNG. Is there anything in the climatic conditions in that South American country that would render it impossible to develop and retain a trade there? I mean, will cattle thrive after being shipped from this country down there?

Mr. HARRELL. There is nothing at all to hinder. On the contrary, one of the things that I preached was that climatic conditions and the method and manner of raising our live stock were very similar to theirs down there, and therefore our live stock coming from here should really be the live stock that they would want, showing them that a great many of our cattle were raised on the range, raised in the pastures; whereas in Great Britain they are stall fed, raised on small farms, on high-priced land and under entirely different conditions, and that cattle imported from this country, raised under similar conditions to those they have down there, should really be better. Then we are closer together, and while they are on that side of the Equator and we are on this the conditions are more similar than in any other country.

Mr. YOUNG. As a practical live-stock man, coming in touch with these organizations of live-stock breeders in this country, do you say to the committee that they feel an interest that the Government do something that will help them open up this field to them, and that they are ready to cooperate should the Government undertake this venture?

Mr. HARRELL. Absolutely. I don't think I ever saw as enthusiastic a lot of men as when I called on the secretary of the National Swine Breeders' Association, the Dairymen's Association, the secretary of the Livestock Associations. They said they were ready to go the limit. They saw the opportunity and were keenly alive to it.

Mr. TINCHER. Have you ever thought of a proposition of a demonstration herd?

Mr. HARRELL. Yes; I have.

Mr. TINCHER. Is there enough enthusiasm in the local organizations to do that?

Mr. HARRELL. I am going down now to Chicago to suggest ways and means for the National Swine Breeders' Association to put that over; they will have to do that; the Government can't do it.

Just to show you how that comes—how our work comes in there—our trade representative connected with the American Embassy in Rio de Janeiro sent us a report that the British Chamber of Commerce in England had sent the following telegram out, that they desired in the interests of British trade to establish a demonstration farm of all the breeds of live stock, "and we ask you to present it to the minister of agriculture of Brazil; and if they will give us a concession of land, the British breeders, with the support of the British Government, will establish this herd there, so that they can see everything in that line." They went right back and said: "The Brazilian Government is not disposed to make a concession of that kind. The Department of Agriculture of the United States Government has two representatives here now offering free the services of the Department of Agriculture and distributing literature that is very beneficial to the breeders," and that they would have to turn down the proposition of giving any concessions to the British Government, and I felt pretty good about it. I have that right here. It shows how quickly they acted as soon as we went there. The British were going after that trade.

Mr. TINCHER. You are going to try to get the swine proposition; don't you think it would be a good idea to have demonstration herds of cattle of different breeds?

Mr. HARRELL. Yes. I am going to send out wires as soon as I am out of here—at the convenience of you gentlemen, as soon as you are through with me here—I am going right to Chicago to those representatives of the Breeders' Association, and I will give them the benefit of all the work that we did down there, with the suggestions that we have.

Part of my recommendations to the Secretary of Agriculture and to the heads of those departments were that in my opinion, from first-hand knowledge on the ground, that you must have two attachés, agricultural live-stock attachés; that they must speak the language and they must know agriculture and live stock.

Mr. YOUNG. You want swine men—hog men—cattlemen; and can you get those fellows that speak the language?

Mr. HARRELL. Oh, yes.

Mr. YOUNG. You have been living down there in Texas where you talk Mexican a good deal.

Mr. HARRELL. Yes.

Mr. LEE. Are we establishing banks in that country?

Mr. HARRELL. The National City Bank and the First National Bank, of Boston, and the Guarantee Bank are now getting financial arrangements made so that we are ahead of nearly everybody else. In Sao Paulo, which is the Chicago of Brazil, the National City Bank has now organized a farm loan company, a cattle loan association of 1,000 contros—a contro is \$250—and it has been oversubscribed two times, just through these activities, to furnish the means to promote the live-stock industry. The First National Bank, of Boston, the National City Bank, and the Guarantee Bank are all opening very good connections there.

Mr. LEE. I think that is very important.

Mr. HARRELL. It is very important, because in foreign commerce we must have the financial facilities. Then we must have the ships. Now, we are short on passenger service. I sent half a dozen telegrams to the effect that the most important thing now for South American trade is a dependable, regular, first-class, mail and passenger service. We were promised that a good while ago but never have secured it yet. That is very necessary. We have had the freight ships. I had word from the Shipping Board that 13 ships had been allocated to South American trade fitted for the shipment of pure-bred cattle to the east and west coasts, so we will be well taken care of there.

Mr. YOUNG. Before we leave the matter of banking institutions, in the organization of these cattle-loan associations down there by the National City Bank and others, have any of the local people taken stock in that, or is that fully financed in this country?

Mr. HARRELL. It is all financed over there. They just gave this organization so many contros, all furnished by the banks and the business men. They have got as many Brazilians and as many men interested down there as they could. There is a Brazilian here now whom we met down there and talked the whole situation over with. He has organized a company of, I think, three or four million dollars for South American trade. Those men were all taken into this organization of cattle men. I have the prospectus—if I haven't it here, I have it at home—I have the prospectus of the cattle-loan association there, with many interesting phases of the cattle business and all that business down there.

The CHAIRMAN. What is the Department of Commerce doing along this line?

Mr. HARRELL. Yes, sir; we worked together with those men. Mr. Phillipi, the commercial attaché at Rio de Janeiro, was very helpful indeed to us. He is the man who has been sending this information to us, but his time is all taken. He is not a cattle man, not an agricultural man, but he is doing splendid work there in commerce.

The CHAIRMAN. How many are employed by the department?

Mr. HARRELL. A stenographer and himself.

The CHAIRMAN. One in each country?

Mr. HARRELL. I don't know now. Dr. Kline is in Buenos Aires, and he is a splendid man there. Dr. Schurz—William F. Schurz—was in Paraguay when I went there. They are both first-class men. It is very hard to find a better man than Mr. Phillipi. He is attached to the American Embassy; but doesn't have the office out where it is located, in the outskirts of the town, but is downtown, and his office is entitled "Commercial Attaché, American Embassy." He

is a very busy man, a very efficient man. Dr. Kline has his office in one of the big buildings downtown in Buenos Aires.

The CHAIRMAN. What is required is a practical, experienced breeder, a cattleman.

Mr. HARRELL. Really they ought to have their offices with the commercial attaché, one to help the other in innumerable ways. The live-stock agricultural commissioner should help the commercial attaché, and the commercial attaché should help him. It would make a good double-team if you could get high-class men, get good men, and each would have just as much as they could possibly do to stimulate trade, because all the countries of the world are after that trade.

South America hasn't suffered during the war; they have made money, lots of money, and there is going to be a world trade there, and all the countries are wide awake to it and they are sending men and advertising matter, and we have got to meet it if we are going to get the trade.

Mr. YOUNG. What is the exchange relation between this country and Brazil, for instance? What is our exchange rate?

Mr. HARRELL. I really don't know right now. Of course, the South American money, I will say—for example, Chilean money—fluctuates 5 per cent in one day.

Mr. YOUNG. Argentina is a great cattle country?

Mr. HARRELL. Yes.

Mr. YOUNG. Do they have a higher grade of cattle than they do in Brazil?

Mr. HARRELL. Yes; there are no better cattle in the world than in Argentina.

Mr. YOUNG. Who developed that?

Mr. HARRELL. England. They bought the top wherever they could find it, regardless of cost. The result has been they have wonderful cattle down there; but they want new blood. They want it every year, and there is no reason why they couldn't come and get new blood from our country. The hog development all over South America has been neglected, and it is a wonderful chance for the hog man.

The CHAIRMAN. Are there any other questions?

Mr. HEFLIN. You said you had a list of the names of cattle-breeding places in the United States?

Mr. HARRELL. Yes, sir.

Mr. HEFLIN. Of thoroughbred cattle?

Mr. HARRELL. Yes, sir.

Mr. HEFLIN. How is that industry developing in the South?

Mr. HARRELL. It is developing very rapidly. The improvement in the South has been very rapid from the old long horn that we used to drive up the trail, till we have now as modern cattle as there are in the United States. In fact, a carload of Texas Herefords won the championship at the international year before last.

Mr. HEFLIN. At Demopolis, Ala., I noticed last fall they have a sale of Hereford bulls.

Mr. HARRELL. The South was the great winner in the international this year. The champion Hereford bull came from Kentucky and the champion shorthorn, I think, came from Georgia. I was in

South America when it was held, but I noticed the headlines, "The South swept the International."

Mr. HEFLIN. The industry is developing very rapidly in my district.

The CHAIRMAN. If that is all, we will take up item 81.

Mr. HARRISON. I would like to state, Mr. Chairman, that Mr. Harrell returned from South America long after these estimates were prepared, and that he has appeared before the committee and explained the situation to you gentlemen with the entire approval of the Secretary. The Secretary would like to see the foreign marketing work developed as rapidly as it may be possible, and especially to conduct some follow-up in South America in order that full benefit may be derived from Mr. Harrell's trip.

MONDAY, JANUARY 12, 1920.

MORNING SESSION.

The CHAIRMAN. Congressman Osborne wishes to make a statement. We shall be glad to hear from him.

Mr. LIVINGSTON. The item to which Mr. Osborne addresses himself is No. 81, on page 246, "For collecting and distributing, by telegraph, mail, and otherwise, timely information on the supply, commercial movement, disposition, and market prices of fruits and vegetables, \$269,600."

**STATEMENT OF HON. HENRY Z. OSBORNE, A REPRESENTATIVE
IN CONGRESS FROM THE STATE OF CALIFORNIA.**

Mr. OSBORNE. Mr. Chairman and members of the Committee on Agriculture, I appear before your committee in regard to the Bureau of Markets, in which the people of my State, California, are very much interested. The production of vegetables and fruits in California is, as you know, very large, and everything that conduces to make its production and delivery in the markets of the country more economical is of value to the whole country. In speaking for the interests of my own State, therefore, I feel that I am speaking in the interests of the entire country. I have a number of telegrams here this morning from Los Angeles and adjacent country in regard to the leased-wire market reports of the Department of Agriculture. When I was home between the two sessions of this Congress, I was visited by delegations or representatives of the various farm and horticultural organizations that are interested and are shipping vegetables and fruits in very large quantities, and they felt very badly about the discontinuance of the leased-wire market reports.

Mr. McLAUGHLIN of Michigan. Were they dealers or growers?

Mr. OSBORNE. They are growers. These organizations are all organizations of growers.

The CHAIRMAN. They are cooperative, are they not?

Mr. OSBORNE. They are cooperative.

The CHAIRMAN. The dealer and the grower is the same man.

Mr. OSBORNE. That is the case with most, if not all, of these organizations. They are cooperative organizations and divide the

expense and do away as far as may be with the middlemen. That is notably the case with the California Fruit Growers' Exchange, which handles citrus fruit exclusively. They have been organized a great many years and are composed entirely of the growers of the fruit; and they are powerful enough, and their organization and their production is sufficiently concentrated, so that they can take care of these things themselves very fully; but the organizations of vegetable growers are not so well situated with respect to looking out for these things.

Mr. WILSON. I do not know anything about it, but I would like to have you verify this statement: I have heard from people who have come from that part of the country that most of the vegetable growers in your section of the State are Japanese. Is that true?

Mr. OSBORNE. Oh, no. The Japanese are growers, but I think the Japanese production is mostly consumed in the local markets. The large producers are American people. Our production in the Imperial Valley down there, in the southeastern county of California, where the production is extremely large, is by Americans, the quantity produced by the Japanese being comparatively small.

Mr. McLAUGHLIN of Michigan. What is that town down in the southeastern part of California, shown on the map there—the terminus of the leased-wire system, which has been discontinued?

Mr. OSBORNE. That is Brawley, in the Imperial Valley, where the cantaloupe is produced. The valley is a valley something like the mouth of the Nile. It is a country that has been built up by accumulating silt for all time, and it is only within a few years that it has been cultivated at all. They have run in the water from the Colorado River, and have 4,000 or 5,000 acres of production. A very large proportion of the vegetables shipped here to the East in the winter time comes from the Imperial Valley.

I have from the Los Angeles Chamber of Commerce, which is the leading organization of the Southwest, with a membership of about 5,000 leading business men of that country, this telegram, which says:

LOS ANGELES, CALIF., *January 11, 1920.*

Hon. H. Z. OSBORNE,

House of Representatives, Washington, D. C.:

Telegraphic market news reports on fruits and vegetables more urgently needed California than any other State in Union. California, by far leading State in commercial production and shipping fresh fruits and vegetables, is at great distance from markets and dependable in large measure on reliable market reports, which can only be furnished properly by disinterested Governmental agency like Bureau Markets. Withdrawal this year telegraphic news service Government leased wire Kansas City west to California has been irreparable loss, California fruit and vegetable interests; over 40,000 carloads vegetables annually shipped east out California, 8,000 to 15,000 carloads cantaloupes, almost 50,000 cars citrus fruits; and California is leading dry bean and honey-producing State, with over five and one-half million of latter produced annually, and from five to eight million bushel dry beans. Service on last two commodities has been eliminated entirely owing lack appropriations. Tonnage, 1919, 23,581,000; value, \$278,101,000. We urge strongly sufficient appropriation be included for Bureau Markets for this specific purpose, releasing their leased-wire service to California for fruits, vegetables, and placing this market on same satisfactory basis as held last year, which we understand calls for not less than \$75,000.

WIGGINS,
Los Angeles Chamber of Commerce.

I have several other telegrams to the same effect, which I will not read to you. That is the purpose for which I appear before you, gentlemen. I do not know of any agency of the Government which affects our growing interests that is more popular than the Bureau of Markets and this leased-wire service. I thank you for your courtesy, and I hope you will see your way clear to make a liberal appropriation for the Bureau of Markets and especially for this leased-wire service.

Mr. McLAUGHLIN of Michigan. For many years the California Fruit Growers' Exchange had its own wires?

Mr. OSBORNE. Yes.

Mr. McLAUGHLIN of Michigan. Do they continue that?

Mr. OSBORNE. Yes; they are continuing that wire service.

Mr. McLAUGHLIN of Michigan. To the same extent as before the Government took it up?

Mr. OSBORNE. I am not informed as to that. The citrus fruit business keeps expanding all the time. In Southern California the first year I was there the total shipment was 1,500 carloads. Last year they shipped 50,000 carloads. It keeps growing all the time, and I suppose the demands for looking out for markets increase with the production to some extent. I will leave these telegrams with the committee.

(The telegrams referred to are as follows:)

LOS ANGELES, CALIF., *January 10, 1920.*

H. Z. OSBORNE,

Member of Congress, Washington, D. C.:

California produces enormous quantities of vegetables and fruits in excess of local requirements for which market must be found, and it is of the utmost importance to the industries concerned that reliable and accurate information pertaining to conditions and prices prevailing at distant markets be disseminated with as little delay as possible. This work can be efficiently carried on only by the Government and we request you endeavor have restored leased-wire service by Bureau of Markets which discontinued account lack of funds. Absence this service proving serious handicap.

CALIFORNIA VEGETABLE UNION.

LOS ANGELES, CALIF., *January 12, 1920.*

HON. H. Z. OSBORNE,

House of Representatives, Washington, D. C.:

California generally badly in need of telegraphic reports from Bureau of Markets. We urge strongly the appropriation of sufficient funds for said bureau to enable it to lease wire from Kansas City to California and give us service as during last year.

VAIL Co.

LOS ANGELES, CALIF., *January 11, 1920.*

HON. H. Z. OSBORNE,

Washington, D. C.:

We urge particularly that sufficient appropriation be given Bureau of Markets to extend the leased wire to Pacific coast and enable service to be rendered as good as last year on fruits and vegetables. No doubt curtailing of funds greatly hampers valuable service which we all need.

W. E. McCASLIN Co.

LOS ANGELES, CALIF., *January 10, 1919.*

HENRY Z. OSBORNE,

House of Representatives, Washington, D. C.:

Wish to call attention to extreme importance fruit and vegetable interests in California and great good Bureau of Markets has done. Urge appropriation for Bureau of Markets be continued.

J. B. VAILE,

President Los Angeles County Farm Bureau.

LOS ANGELES, CALIF., *January 10, 1919.*

H. Z. OSBORNE,

Representative from California,

House Office Building, Washington, D. C.:

Understand recommendation of Committee for appropriation for Bureau Market comes up consideration Monday. We earnestly request extra effort be made to extend Government leased wire Kansas City to Pacific coast, as data furnished with reference fruits and vegetables was found invaluable. Information given these reports is similar that provided for in Government distribution cantaloupes and will be sorely missed if discontinued.

RANDOLPH MARKETING Co.,

LOS ANGELES, CALIF., *January 10, 1919.*

Congressman H. Z. OSBORNE,

Washington, D. C.:

Are informed that House committee will consider legislation Monday affecting Department of Agriculture activities, including Bureau of Markets. Can you not arrange appear personally? Exert your influence toward securing increased appropriations. Any restrictions would prove disastrous to California shippers, and, in fact, ruin many cantaloupe and vegetable growers.

L. K. SMALL Co.,

MONDAY, JANUARY 12, 1920.

AFTERNOON SESSION.

The CHAIRMAN. We will take No. 81 next, Mr. Haugen.

Mr. TINCHER. That is a \$50,000 increase?

Mr. LIVINGSTON. Yes; the item reads as follows:

For collecting and distributing, by telegraph, mail, and otherwise timely information on the supply, commercial movement, disposition, and market prices of fruits and vegetables, \$269,600.

This is an apparent increase of \$19,600, but, taking into consideration the transfers from the lump fund to the statutory roll, it involves an actual increase of \$50,000. Mr. Chairman, I will ask Mr. Sherman, who is in charge of the market news service on fruits and vegetables in Washington, to speak to the committee with reference to this item. If I may say so, the background which Mr. Sherman will give with reference to this market news service applies to similar news service work in other items. As he may discuss it rather fully, it may not be necessary later to take up the other news-service items in great detail unless the committee especially desires it.

The CHAIRMAN. We will be glad to hear Mr. Sherman.

**STATEMENT OF MR. WELLS A. SHERMAN, SPECIALIST IN CHARGE
OF FRUIT AND VEGETABLE DIVISION, BUREAU OF MARKETS,
DEPARTMENT OF AGRICULTURE.**

Mr. SHERMAN. I am not certain how far you wish me to go into detail, because I went into detail on this a year ago and also two years ago when the news service was first organized, and if the members of the committee remember or care to refer to the minutes of the previous hearings they will have the background which, as I gave it then, is the same as we have now.

The CHAIRMAN. Do you wish to add to the statement of Representative Osborne this morning about the service in the West?

Mr. SHERMAN. Yes, sir.

The CHAIRMAN. You have charge of the leased wires?

Mr. SHERMAN. Yes, sir; I have charge of that part of the work which relates to fruits and vegetables.

The CHAIRMAN. The black line [referring to map] indicates the leased wires?

Mr. SHERMAN. No, sir. That represents that part of the leased-wire system which we have discontinued since the war appropriations were cut off.

As to the background of the whole thing, the purpose is a daily interchange of telegraphic information, marketing information, up to the minute, between all parts of the country, between the marketing centers and the shipping points. That is the basis of the whole service.

Historically you remember that was the particular thing which the gentlemen in the Senate had in mind when they first voted an appropriation to the Department of Agriculture for this purpose. The first move was to appropriate \$25,000 to put a division of markets in the Bureau of Crop Estimates for this very thing, to give quick telegraphic information. The result of that effort, as you know, was later a general item of \$50,000, out of which the Bureau of Markets was organized, and this was one of the first Nation-wide services that grew out of our first investigations.

I will say briefly, in order that you may get the right background, that this work had been developed to about one-third of what we consider its complete and proper proportions when the war broke out. Then, when Congress asked the Department of Agriculture what it could do to help in the war emergency, we replied that we could help in the stimulating of production of perishables through assisting producers to reach more efficiency and save waste, that we could help the situation by developing our news service to its full capacity, and Congress gave \$750,000 to us for that purpose. So we had for two fiscal years \$750,000 for this work.

You may remember in the informal discussions which took place when you first appropriated \$139,000 for this work in the fiscal year 1915, that the question came up in the committee as to what this work would ultimately cost. I said to the committee, "If you go into this it will be just as impossible to cut it out as it will the weather service, because people will come to depend on it in the same way, and we know that no one else could give this service as a Federal agency would give it; no one else can get the information." We get

it from all the railroad division superintendents in the United States. Every day at the close of the day's business a statement of the number of carloads of fruit and vegetables originated on each road with their points of origin and destination. We realized that it was useless to go into this work unless we could beat any commercial agency in the world. With this accuracy of information that we could get, we made it our business to do it. If the Government could not do it better than anybody else the Government had no business in the field.

When you gave a larger amount of money for war-time purposes, it was, I will say frankly, unfortunate that it was tied up with the war activities and so considered an emergency appropriation to meet an emergency, because we did with that emergency fund what we had been doing with the increased appropriation each year.

At informal discussions that first year, you will remember, the chairman asked how much we thought it would cost when completed. I said it would cost about half a million dollars. That was a guess at the future. It was not put in the record, because we did not want to commit ourselves. He said that if we succeeded in making this a nation-wide service that would not be half of what he thought it would cost. We have never put a million dollars into the service, but we had three-quarters of a million dollars for two years, and we developed on the spur of the moment, and with the war-emergency conditions, with the conditions of employment all against us, with our trained young men going into military service, we developed the news service to its nation-wide proportions, and when it was at its height we had for our market news service on fruits and vegetables a leased telegraphic wire system represented by what you see on this map in green and in black. The green ribbon represents what remains; the black represents what we have discontinued since the war-emergency appropriations were cut off. The unfortunate phase of the situation is this, that I am confident, knowing the action of the committee year by year, that we would now have almost as much as that amount of money if there had been no war. In cutting out the war-emergency appropriations the committee cut this service down so that what remains does not represent the legitimate growth of the work. We have had to cut a good deal of the life out of it. You will realize that we could not cut out our sources of information from the railroads, whatever it may cost. These reports from railroad superintendents must be kept up. That is the basis of the information. That is the distinctive feature that nobody else can get. If we discontinue that relationship when the roads go back to private ownership it may be impossible to reestablish it. It costs \$20,000 a year for telegraphic tolls to get those railroad reports. That is a fixed charge.

Then we have to maintain our permanent organizations in the large markets, because if we do not do that we have no price information to distribute. Therefore, no matter how far we have to reduce the service, we must maintain our own permanent representative in cities like Boston, New York, Chicago, Cleveland, and the 13 or 14 cities where we still have permanent offices. They must be maintained or we have no price information to distribute. We can not reduce the cost of that.

With those two fixed items, when we reduce expenditures we have to cut down the field service, the traveling itinerant which we render

to the producer, which is the most valuable part, but the only flexible part. We cut down expenses by discontinuing wires. The volume of the information that we can afford to send into these producing areas is greatly reduced since we have to send it at regular Government rates.

The black lines represent the leased wires, which have been discontinued, and the green lines, as I stated a moment ago, represent the present leased-wire system for the fruit and vegetable service.

Mr. JONES. The record should show where they are.

Mr. SHERMAN. The black lines extend from Washington to Atlanta, Birmingham, Memphis, New Orleans, Jacksonville, and Orlando, Fla. We had a leased wire to Orlando for six months during the year, because the volume of information that we were sending to that point made it cheaper to put on a leased wire than to have it carried by a commercial wire at the Government rates. We maintained a wire for eight months in the year from New York to Rochester. The wire to Buffalo is cut out entirely. This one [indicating] represents the discontinuance of our permanent news office at Columbus, Ohio; at Indianapolis, Ind.; at Fargo, N. Dak.; at Des Moines, Iowa; at Oklahoma City; Fort Worth; and Houston and to all points west of Kansas City. We originally had leased-wire connections from Kansas City to Denver, Butte, Spokane, San Francisco, Los Angeles, with temporary wires during the heavy shipping season to the Imperial Valley and out to Greeley, Colo. The wire running up to Greeley was leased about eight months during the period when we had a man there to distribute information on cabbage and potatoes.

You see the leased wire cost is on a mileage basis, and if we give the fruit and vegetable shippers a good market news service, which aids them effectively in the distribution of their products, the volume of information to be transmitted is so great that we can afford to pay for leased-wire service, for a 12-hour day, and maintain two telegraphers at every point. These men work on 7-hour shifts, overlapping in the middle of the day.

The CHAIRMAN. What is the mileage rate?

Mr. SHERMAN. \$12 a mile.

The CHAIRMAN. Is that the uniform charge?

Mr. SHERMAN. That is the uniform charge per mile, and that is just one-half what we had to pay for the short-leased wire that we had tried out experimentally just before the war broke out.

The CHAIRMAN. That is half the cost?

Mr. SHERMAN. Half of the regular rate to the Government. The American Telegraph & Telephone Co. made this half rate to the Government during the war, and we are on notice—

The CHAIRMAN. Do you mean during the war it cost just half of the regular rate?

Mr. SHERMAN. I mean that the leased wire is costing us now just half what it cost before the war, and half what it will cost as soon as the war emergency is over.

The CHAIRMAN. How do you account for that?

Mr. SHERMAN. The American Telegraph & Telephone Co. placed its facilities at the disposal of the Government during the war emergency, and the war emergency is still on.

Mr. TINCHER. Is it your idea in asking for this money to partly take care of that western leased-wire service?

Mr. SHERMAN. If we go back to the prewar basis the \$50,000 will be used for increased work in the West and on the Pacific coast; \$50,000 would not pay for the leased wires.

Mr. TINCHER. The gentleman from California was asking that we restore the leased-wire service.

Mr. SHERMAN. And he told you it would take \$75,000 to do it.

Mr. TINCHER. Would \$75,000 do it?

Mr. SHERMAN. We figure that on a prewar basis it will take two or three times the \$75,000 to take care of all the present leased-wire mileage and to lease wires and pay incidental expenses from Kansas to the coast.

The CHAIRMAN. Are we to understand that it will cost twice that amount after peace is declared; \$12 now and \$24 after peace is declared?

Mr. SHERMAN. Yes; if it goes back to the basis which prevailed before war was declared, unless they make concessions.

Mr. TINCHER. You started to say that we were on notice.

Mr. SHERMAN. When we took it up with them and asked if they would make a permanent concession to the Government, they said that they would not promise anything of the sort.

The CHAIRMAN. Is the \$75,000 based on the present rate or the increased rate?

Mr. SHERMAN. The present rate.

The CHAIRMAN. If peace should be declared the cost would increase?

Mr. SHERMAN. The expense would go up and we could not maintain the leased wires. That must have been Representative Osborne's assumption when he estimated that \$75,000 would care for it.

Mr. McLAUGHLIN of Michigan. You do not really lease and operate those lines, do you? Is it not simply a contract that you have with the company to send your business at a certain rate?

Mr. SHERMAN. It is a contract with the company by which at a certain hour in the morning this connection is set up throughout the country, the system is set apart for our exclusive use for 12 hours, we furnishing our own operators, and the minute the 12 hours is up our offices are disconnected and during the night the lines are used for their own business. That actually gives us 12 hours' exclusive use of their wires.

Mr. TINCHER. And, unfortunately, your proposition compels the leasing of these wires for next year.

Mr. SHERMAN. That brings me back again to the question as to what we need for a satisfactory service. We had not estimated for it. You will remember that the Secretary last year estimated \$360,000 for this service. That was lump sum, I think. I explained to the committee that the service had developed to nation-wide proportions and we felt that it would cut very much out of the service if the appropriation was less than that. The amount given us, however, was only \$250,000. When the question came up as to whether anything could be done to help out on the cost of living, the estimate was referred to the Appropriations Committee, as a deficiency estimate, but the judgment of your committee was followed, and the appropriation for this work was not further increased. It has been twice before Congress. It is for you to say. We will make the best use we can of the money allowed us.

Mr. JONES. If this increase of \$50,000 is granted do you expect to keep up the leased wires from Kansas City to the West?

Mr. SHERMAN. With that, if possible, we will reopen a permanent station at Fort Worth, but we will not connect with it by leased wire. It will be a permanent point for the distribution of such information as we can afford to send out at Government rates. The balance will be spent on the Pacific coast.

Mr. JONES. If peace is declared and the prices are doubled, what will you do?

Mr. SHERMAN. It is a question whether we would be able to maintain as much of these wires as we have shown here in green. Our idea is that it will cut out the leased wires materially. First, this leased wire to Rochester and then a part of the year the leased wire from Chicago to Minneapolis and the branch to Omaha.

Mr. JONES. You will either do that or ask for a supplemental appropriation.

Mr. SHERMAN. I do not know whether we should. Should we? If the committee thinks it necessary—

Mr. JONES. I am asking you what your plan is. If the department knows that the rates will be doubled after peace is declared, if the policy is established by the committee, do you expect to use that as a basis to make good on the cost?

Mr. SHERMAN. I had no such idea. We would simply cut the service down, as we did heretofore when the appropriation was reduced.

Mr. TINCHER. If we increase that appropriation for some legitimate purpose, we will have to get the money somewhere else. We are spending more money than we are taking in; so that if we increase an appropriation, we must do so at the expense of some other appropriation. Would you suggest from what we could take this \$75,000 with the least hurt all around?

Mr. SHERMAN. I may say that my responsibility runs only to these projects in the Bureau of Markets.

Mr. TINCHER. Which is to get the money?

Mr. SHERMAN. I beg your pardon. My attitude is not that of trying to get all the money. If I had the Treasury of the United States at my command I would not suggest to you gentlemen that you appropriate as much money for this service as you did during the war emergency. My own idea is that, considering that we have disbanded the service and let the men go and that it is extremely difficult to get competent men in the department in the face of outside competition, I would not want to put this work back to its former proportions in too short a time. If you want to know how much money you can put into this to make it render the service it was intended to render, I would mention a half a million dollars, which would mean that you would have to—the present estimate is \$426,000. We have \$376,000 now.

We could not do it with half a million dollars quite. If you will give us the \$75,000 that Representative Osborne requested, that with what we have will enable us to render satisfactory service, assuming that the leased-wire rate remains as it is. When that goes up, we will have to content ourselves by getting out such information as we can at Government rate. But I have this to say with reference to

the expenditure of any increase that is put into this item, we have not sold our furniture, but have transferred some of it to other projects, and we have our equipment at Fort Worth; we have all our equipment on the Pacific coast and all of the money that we get in addition to what we have now goes into the distribution of this information to the people that want it. Our collecting machinery remains practically intact—our machinery for getting information. We must maintain it, even if our news is distributed very inadequately, and any additional money you give us will be for information distributed by leased wire or by sending more information by commercial wire in case the leased wire becomes too expensive.

The CHAIRMAN. Have you found that leasing the wires is more economical?

Mr. SHERMAN. It has been a great saving. It was a saving in 1918 over what it would have been at Government rates, and you must remember, in order to get our information over the wires, that we code our stuff just as we did when using commercial wires, through the arbitrary five-letter code, each code word taking the place on an average of three words.

Mr. TINCHER. You furnish these reports on fruits and vegetables. Just what crops do you cover?

Mr. SHERMAN. Of course, the practice varies tremendously with the time of the year. We began originally with strawberries, peaches, tomatoes, and cantaloupes. Then we gradually extended it to cover most of the important perishable fruits and vegetables, and during the war emergency we took up dry beans. The market news service on live stock and meats is handled by other men, and that on dairy products is handled by still other men. The information has to be collected at different hours of the day and has to be released at different hours of the day. While the basic service is the same, at the same time the machinery has to be entirely different. It must be based upon the particular marketing machinery of that particular industry.

Mr. McLAUGHLIN of Michigan. A number of years ago the citrus-fruit growers of California had one or more very large organizations and they had a big telegraphic service. Are they still maintaining that for themselves?

Mr. SHERMAN. They are; and we have never touched the citrus products on the Pacific coast, and spend no money on news service on citrus products, because that industry has been getting along without it. I will say there that the independents of the citrus-fruit industry, who handle 25 to 30 per cent of the products, asked us to put in a market news service on citrus fruits so as to put them on a basis of equality with the exchange, but we have never done so. It would take a lot of money, more than we have ever been ready to expend, and we felt that the industry was so well organized and that the industry had such good market news service developed that our services were not needed. They have plenty of money and plenty of men and are able to get along without our assistance. We did establish a citrus-fruit service on citrus fruits in Florida for one year, and there was a tremendous protest on account of our inability to do it again.

Mr. TINCHER. To what extent do you furnish information to the live-stock and meat-producing industry?

Mr. LIVINGSTON. That is the next item.

Mr. SHERMAN. These little black triangles on the map represent the field stations in heavy-producing areas which have been discontinued or will be dropped this year and will not be reopened under our reduced appropriation.

Wherever you see that black triangle on the map you have a heavy producing area, shipping large amounts of one commodity, where we have rendered local service; that is to say, for instance, at the Laurinburg, N. C., station, a cantaloupe shipping station, we have distributed there all of the information that could be gotten on that commodity. It means that we had a local mailing list which covered the industry in this territory. It means that the county agents were notified that our man was coming in. Here is one thing that the county agent does: The county agent in every one of these points has been called upon to let his people know that this service was at their command, and that they would be put on the mailing list by request. It means that during the movement of crops from that locality our man was able to issue every day, between 12 and 2 o'clock, a statement to his people showing what the shipments were out of their own territory, what the shipments were out of every competing shipping territory, where they were going, what the prices were on all the different markets, what cars had arrived during the preceding 24 hours, and what the prices were on the North Carolina cantaloupes and on those from competing areas, and, of course, that is where we feel the service is most important. We feel that it is at just these points in the country that we are really rendering service.

Mr. YOUNG. Points like that are discontinued?

Mr. SHERMAN. Yes; every one where you see the black triangle.

Mr. YOUNG. That is a point where you believe you ought to have a wire service?

Mr. SHERMAN. That is where it would be of very great service.

Mr. YOUNG. If we cut down this part of the service, the producer does not get the information that he wants and the consumer does not get the advantage of the price. I am against this system if that is what we are going to do.

Mr. SHERMAN. This [indicating] represents what we can carry with the present appropriation. A number of these green pins represent the most important field stations, and these we can maintain.

Mr. YOUNG. As I understood it, the reason for organizing this whole system of the Bureau of Markets was to give to the farmer a better system by which he could market his products. That is why I advocated it.

Mr. SHERMAN. Absolutely.

Mr. YOUNG. We had a false, uneconomical system which drove out of existence many industries on the farm.

Mr. SHERMAN. That is true.

Mr. YOUNG. To meet that situation we brought into existence a Bureau of Markets. This telegraphic information is a part of that system. It had two objects in view: First, in order that the farmer down at this point that you are going to cut out might have information as to what is going on in these wholesale markets, and, in turn, that the consumer in these wholesale markets might know what is being produced in the agricultural sections.

Mr. SHERMAN. What is being shipped, and the local f. o. b. price?

Mr. YOUNG. The idea was that by that means we would eliminate some of these middlemen, who ought to be eliminated as an economic proposition.

Mr. SHERMAN. We have reduced their profits.

Mr. YOUNG. So that the man that actually produced a thing on the farm would be certain to have a fair price for it when it reached the consumer. If you cut out this information at the points that you indicate—the producing centers—you thereby enable the consumer in the big centers to have an advantage over him; in other words, instead of helping him to get a fair price for his product, you enable the other fellow to gouge him. I want the work to be done out in the producing centers.

Mr. SHERMAN. That is the tragic part of the situation as it exists, that the only place where you can contract and expand readily is at the producing end. That means a good many men traveling; that means a good many men with salaries and expense accounts; and the minute you begin to cut down, you cut down the field men. Next year we expect to have from 8 to 10 field men doing that work, and they will cover about 50 points, so you see we will still do a lot of it. We must maintain these city stations. At Cincinnati, St. Louis, and Kansas City they have mailing lists down to this southern territory. When the information is received from there, however, it is not as prompt and as valuable as where we can put a man right in the territory. But, as I explained, you see, we have got to keep getting our railroad information and maintain our city offices, or we would not have the information to distribute at all.

Mr. YOUNG. How much money do you need to keep the producing centers going?

Mr. SHERMAN. You see our expenses are uncertain now. I said a few moments ago that a half million dollars would do it, but I immediately felt that I put it too low, with the constantly increasing expense, travel, supplies, and the uncertainty of express rates and railroad rates if Government control is discontinued.

Mr. YOUNG. At one end of my district and in the adjoining counties is a great tomato-producing section—Smith County, for example—which illustrates the other sections of the country. I know that some of these industries have grown up, prospered, and have been made possible very largely by reason of this market-news service. They have the land that will produce the stuff, and they are willing to produce it; but under the old system I have seen magnificent orchards cut out and put into cotton. It was not that the world does not need this stuff, but we had such an uneconomical system of reaching the markets of the world that people could not successfully follow raising potatoes, for illustration, or tomatoes. After the establishment of this market-news service, however, those communities have been prospering. We feel the need of this service, and I would hate to see those communities denied this information that has been sufficient to measure the difference between adversity and prosperity.

Mr. SHERMAN. You happen to be near the local office in Jacksonville, Tex. That has been such a valuable office that it will be continued.

Mr. YOUNG. You are supplying this service to some in my district.

Mr. SHERMAN. That is one of the 40 or 50 points where we will maintain the service.

The CHAIRMAN. How long will it take for you to finish, Mr. Sherman? There is a roll call.

Mr. SHERMAN. That will depend on the wishes of the committee.

The CHAIRMAN. We want to go into this matter rather fully.

Mr. SHERMAN. It would take some little time.

The CHAIRMAN. If it is agreeable, we will take a recess until tomorrow and will hear you further then.

(Thereupon, at 5.20 o'clock p. m., the committee recessed until Tuesday, January 13, at 10 o'clock a. m.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Tuesday, January 13, 1920.

AFTER RECESS.

BUREAU OF MARKETS—Continued.

The committee reconvened at 2 o'clock p. m., pursuant to the taking of recess, Hon. Gilbert N. Haugen (chairman) presiding.

STATEMENT OF MR. WELLS A. SHERMAN, SPECIALIST IN CHARGE OF FRUIT AND VEGETABLE DIVISION, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN. I believe you explained to what extent the market news service on fruit and vegetables had been cut off. Will you state the territory which is covered at the present time and which would be covered under an increased appropriation?

Mr. SHERMAN. At the present time we have 12 permanent market stations in the 12 most important markets—Boston, New York, Philadelphia, Pittsburgh, Cleveland, Detroit, Cincinnati, Chicago, Minneapolis, St. Louis, Kansas City, and Omaha. We have no permanent full-fledged market stations west of Kansas City and Omaha. We are, however, maintaining one man each, with the nucleus of an office, retaining the rented quarters, at Los Angeles, San Francisco, and Portland, and we are keeping a man at Spokane during the apple-market season, which is a long one there, extending over a period of seven or eight months.

The CHAIRMAN. Is he employed at Spokane during the apple-market season?

Mr. SHERMAN. Yes, sir.

The CHAIRMAN. Reports are sent over the wire, but not over leased wire?

Mr. SHERMAN. They are sent by commercial wire?

The CHAIRMAN. At the Government rate?

Mr. SHERMAN. At the regular Government rate. Those three stations are being operated now on the same basis as the temporary field station is operated during the producing season; that is to say,

each one is being sent daily telegraphic news on one particular crop—that is, the crop they are most interested in in that locality; but they are not being given the full news service which we are able to distribute as far as our leased-wire service extends.

The CHAIRMAN. If the increase is granted, what territory will be covered?

Mr. SHERMAN. When the estimates were prepared the idea was we could increase the amount sent to Pacific coast points to probably double the amount we are sending them now, but not that we could reestablish that leased-wire service. We also thought it would enable us to maintain a man at Fort Worth and through him we can reach this large territory in the Southwest, which is not reached effectively at all under the present arrangement.

The CHAIRMAN. To the west of Minneapolis?

Mr. SHERMAN. Yes. We have a permanent office at Minneapolis, but we have taken out the station at Fargo and cut off that leased-wire service.

The CHAIRMAN. Do you contemplate restoring that?

Mr. SHERMAN. No, sir; there is not business enough at Fargo to justify us in keeping a man there more than three or four months during the potato-marketing season. We have a man stationed there while the crop is moving heavily, but, unless we have a materially increased appropriation we could not afford to keep a man there permanently either for this work or inspection work. I may say that since those projects of the Bureau of Markets have recently been put into a single division, of which I am in charge, that enables us to bring about a very close cooperation between the news service and the inspection service. And in some of those places where we have discontinued the news service we are still getting a report on the market from the inspector, but we can not use it as a distributing point for news because the inspector is busy climbing in and out of the cars all day and can not run off bulletins and attend to that sort of work at the same time.

You asked me to develop the points that Representative Osborne made to the committee. Representative Osborne spoke to you about the value of the work, especially to the vegetable and soft-fruit shippers in the vicinity of Los Angeles in southern California. I am not certain whether it was put in the record yesterday or not, but we have rendered no service on citrus fruits in that country.

The cantaloupe situation of the Imperial Valley is a unique one and is one of the first places where this service in its experimental stage was established and has had very great usefulness. There are some interesting figures connected with the development of that work which are really striking. I do not know whether you care for them in the record or not, but this is the way that industry had been running from the time they discovered they had a wonderful cantaloupe country up to the present time: About 1905 the industry first came on the map as being of some importance, with 297 carloads of cantaloupes shipped out of Imperial Valley. In 1906 they doubled that and shipped out 577 cars. In 1907 they had 644 cars; in 1908, 1,891. Then they had a bad year and they dropped, in 1909, to 1,411. Then in 1910 they went up to 1,621; in 1911, 2,580; in 1912, 2,887, and they were still making money for everybody almost

every year. Then in 1913 they had 3,502 cars, and the results were rather unfortunate. Nobody made anything in particular.

In 1914 the momentum of the industry carried it up to 4,446 cars and they had big losses and people began to say that the industry in the valley was going to pieces and they never could get their investment back. There had been a tremendous investment put in there in packing houses, icing and shipping sheds, and all that sort of thing. So in 1915 the Bureau of Markets came in with its marketing service just being organized and helped them on the distribution problem. They succeeded in spreading the crop out a little better over the country, and in 1915 they marketed 4,729 carloads, and they made a little money, although they had 300 more cars than they did in the disastrous year before. In 1916 it dropped 100 cars to 4,617. In 1917 they went up to 5,007 cars, with good results. In 1918 they had bad weather and dropped to 4,398 cars. In 1919 they went up to 7,616 cars to the 10th of July, when our office closed and there were probably about 100 cars shipped after that, or about 7,700 cars, which were marketed successfully, with large profits to the growers and distributors. Everybody in the deal made money on the cantaloupes and practically 4,000 cars more went on the market than were taken in the first disastrous year.

Of course, the buying power of the country had increased, there was no doubt of that, and we must not omit that consideration; but the people who handled the cantaloupes, the 18 big firms, through whom all of these cantaloupes are distributed, say emphatically that they never would have financed that acreage—and they do finance that acreage, because they begin to make advances against the acreage from the time it is planted—if it had not been for the assurance they gained by having this service to depend on in helping them distribute the crop. They have gotten into hundreds of towns, I may say, that never were reached otherwise and would not have been reached but for the news service.

Mr. ANDERSON. Do you control the sending of shipments into different localities in proportion to what you understand to be the consumptive capacity of the place?

Mr. SHERMAN. The control is exercised by these 18 firms—23 this last year. There were 18 the year I was down there, and there are 23 now, every one of which has a permanent local representative right there in the valley, and we give them the movements from day to day, the number of cars out, the number distributed to each market, and the number arriving in each market. And when you consider those cars are in transit, on the average, for about 8 to 10 days, they have an opportunity to follow those cars up with diversion orders and to switch them into every little market where they can get an order; and, of course, they have also the telegraph inquiries and offers going out from their home offices in Chicago, Pittsburgh, and Cincinnati trying to place those cars as they are coming over the rails.

Mr. ANDERSON. Is there any agreement as to the division of territory or the relative proportion of the crop which is to be shipped to various markets?

Mr. SHERMAN. Not so far as we know, but there is a very general knowledge now that when they get above a certain number of cars going into almost any of these markets, with the exact history of three years before them, they can tell practically to a certainty when any

particular market is being overloaded, and the man who has six cars en route to Chicago, if he sees so many carloads already on the market and more cars likely to arrive in Chicago in the next few days, will make a desperate effort to sell somewhere else.

Mr. ANDERSON. So that, without having any agreement, they get all the advantages of an agreement, which would be a violation of the Clayton antitrust law?

Mr. SHERMAN. Apparently there is not a division of the territory, because we find right here in the city of Washington the cantaloupes of five or six distributors all offered in competition with each other. One day you may find Weaver's products predominate and next week Girard's, and they overlap all the time.

Of course, there are certain firms that never ship a car except into the home office in Chicago. One of the big distributors does this, and if he disposes of a car otherwise it goes out from Chicago on order from somewhere else. Others, one or two, have headquarters in Los Angeles and are selling largely in the East; of course, doing all of it by wire. An interesting little point came up one day when I happened to be in Brawley, Calif., during the marketing season. I noticed many rather small towns taking a carload of cantaloupes occasionally. I knew that Knoxville and Chattanooga, Tenn., were larger towns than some of the towns that were taking a carload of cantaloupes, and I said, "Why is it a carload of cantaloupes never seems to be placed in either one of those two markets?" The best reason I was able to find was this: That there was not one of the 18 distributors who knew a firm in either of those towns he would trust for a carload of cantaloupes, and they never tried to sell any there, and the only cantaloupes going into those markets were express shipments from Cincinnati, or something like that. So this distribution hinged, to a certain extent, in having their attention attracted to the fact there were potential markets for their cantaloupes, so that those men have interested themselves and found out who was in business in those towns, and last year carloads of California cantaloupes went into each of those towns.

The CHAIRMAN. Are the firms you refer to local firms?

Mr. SHERMAN. No, sir; two or three of them have headquarters in Chicago. Some are in Pittsburgh, Columbus, and Cincinnati. All these commission firms put their money in the growing and marketing of the crop under contract, so that when the cantaloupes are grown they will take care of the distribution at a fixed percentage charge.

The CHAIRMAN. Are they in the commission business or are they merchants?

Mr. SHERMAN. They are in the commission business and they handle those cantaloupes.

The CHAIRMAN. Do they buy direct or sell on commission?

Mr. SHERMAN. They sell on commission. The grower pays 15 per cent for distributing that crop and interest on the money which they advance him. A contract is made to handle so many acres for each grower. It is an individual contract with each grower to make certain advances at different stages of the game, certain advances per crate.

Last season, of course, we rendered the same service—that is, where the cantaloupe movements start in the beginning of the year.

We have field stations in Georgia and Florida and then the next important western point is away over here in the Salt River Valley, around Phoenix, in Maricopa County, Ariz., and then we move out to Turlock, Calif., and then come over there finally to Rocky Ford. That is the itinerary of that man, serving those places in rotation.

The CHAIRMAN. A number of urgent requests were received last year. We did the best we could and we will do that again.

Mr. SHERMAN. Mr. Young raised the question yesterday about the policy or the necessity of discontinuing so much of our work in the field where it comes home directly to the grower, right in his home community. These black triangles on the map represent field stations where we have had men stationed for short periods during the heavy producing season and where we will not be able to continue the service with the present appropriation. I might say when the appropriation was reduced we had no hint given us by the committee of how you preferred we should curtail, and it was perfectly evident we had to discontinue the service on certain crops entirely.

The CHAIRMAN. That is a matter, of course, that the committee must leave to the discretion of the department.

Mr. SHERMAN. That had to be a matter of administrative judgment, and we dropped entirely the minor crops which had been the last ones taken on and discontinued the service on grapes, asparagus, and bunched vegetables, prunes, pears, spinach, and dried beans. Of course, as you know, when we discontinue a service on a crop all of the field stations pertaining to that crop go off automatically. So the number of these black triangles represents the points at which crops were reported and have gone out automatically with the elimination of the service on these crops. When we decided we could not continue the crop service, we did not attempt to continue the stations and when the shipping season opened in western New York we had a telegram from the grape growers in which they said they did not know what to do with the crop this year, that the wineries were off the market and they could not sell their crop to the wineries as they had in the past and they had no connections in the cities and did not know to whom to sell their grapes and were practically at the mercy of the juice factories to take what they offered. And they told us they lost a thousand dollars a day because of not getting this information that we had given to them. I do not know whether that is true or not, but we took their word for it, and, of course, they think when we come and tell you about that it will be all right.

I do not want to bore the committee by reading very much, but, if I may, let me give you just two or three sentences from letters of potato growers in different parts of the country which show you how people handling the more staple fruits and vegetables, where they did not think at first this service would be so successful, are referring to it. I will read two sentences from a letter from the secretary of the Aroostook County Potato Growers' Association, of Houlton, Me., the most concentrated potato territory in the United States, where we are now maintaining a field station during the fall shipping season. We circularized our whole mailing list there, something like 2,000 farmers, asking them how soon we could discontinue the service. This man says:

I wish to take this opportunity to express to you my gratitude for the very complete market reports we are receiving from day to day. In my opinion

there is nothing the Government could do for the farmers and shippers of potatoes which would be of any more benefit to them than this market-report system.

Mr. ANDERSON. Who is this gentleman?

Mr. SHERMAN. This is from Guy C. Porter, at Houlton, Me., secretary of the Aroostook County Potato Growers' Association. I think there are about 3,000,000 bushels of potatoes grown there in one county. It is the heaviest potato-producing county in the United States. That is the testimony of the men who have an eight months' or a nine months' shipping season. Now to drop down to Charleston, S. C., we have an entirely different proposition, where the potatoes are an early crop and they have to market them a day or two after they are dug, and where there is active competition with the growers, north and south of them competing for the early market. Let me give you this background. Most of the potatoes that go out of Charleston are offered by two organizations, one having about 75 per cent of the business and the other most of the remaining 25 per cent. We circularized this territory, as we have circularized all these territories, telling them the service is going to be reduced this spring and asking them how much it is worth to them in their neighborhood and whether it is worth while for us to try to cut it short or whether they can get along without the service, and they have come back with letters, each one in his own way, telling us what we have done for him, and we find some places where they thought nothing was going to hurt them so much as to be compelled to do without that information as they expect to be guided by it. This is the testimony from the organization that controls a little less than 25 per cent. The people who have about 75 per cent of the business said:

You do not need to send a man back to Charleston this year, if it is a matter of difficulty under your appropriation, because we can pay for a wire from Washington and get the information we want from that point.

The fellows who have 75 per cent of the business can afford to pay for getting the information by wire from Washington, but in that case they would have it and the smaller fellow would not. The smaller fellow says:

We would consider that we would be badly handicapped without the Government bulletin on "Daily Movement of Vegetable Crops," not only from here, but from other sections. This bulletin has been of great assistance to us in distributing these crops here, and when we are moving our crops we wait on them eagerly each morning. Without the bulletin we would have no way of knowing what Florida or points south have shipped; neither would we know the quantity points north of us have shipped. To give you an illustration of the potato movement of last season, this bulletin showed that Florida, Georgia, South Carolina, North Carolina, and Virginia were all shipping potatoes at one time. It was like watching a barometer to see the falling off of Florida and the gradual increase of South Carolina and Virginia.

They have competitors north and south of them. [Continuing reading:]

The movement had been running about 200 cars of new potatoes daily. We have not this bulletin before us, but our recollection is that suddenly the movement jumped to 500 cars, which includes a heavy movement from Virginia. Our market here had been running around \$8 f. o. b.

That is, \$8 f. o. b. Charleston, for the high-priced early potatoes they had last year. [Continuing reading:]

When we saw this Government report we knew that some one was going to get hurt, unless the movement was widely distributed.

That is the point I was making a few moments ago relative to the cantaloupe situation, unless those potatoes along the coast are widely distributed, somebody is going to get hurt, and the crop naturally gravitates to New York, because the New York commission merchants finance so much of it. [Reading:]

We hunted for new markets like we never hunted before. We took any reasonable offer—

That is the answer as to whether it hurts the consumer. [Continuing reading:]

We hunted for new markets like we never hunted before. We took any reasonable offer, and the final results showed a very good average, even under such a heavy movement. The eastern markets fell down badly when these potatoes arrived, some of them declined \$5 and \$6 per barrel.

Anyone who has had experience in distributing these crops knows how important these Government bulletins are, and if the Government wants to do the farmers a real service they will under no circumstances discontinue them.

Just to make this complete, I want to read two sentences of testimony from Mr. McLaughlin's territory, from Mr. C. A. Wagner, of Athens, Mich.:

My having the market report on potatoes last season enabled me to obtain 40 cents per bushel more for my crop of about 1,400 bushels than I would have received if I had taken the prices offered by the local buyers.

That is by telling him what he could get if he shipped outside. I won't burden your record with any more letters, unless you want them, but I can give you as many as you choose.

The CHAIRMAN. We have gone over this thoroughly; we will take up the next item.

Mr. SHERMAN. I had an answer here, which I hoped the committee would take a little seriously, to Mr. Tincher's question as to where to get the money for increasing the appropriation for this work.

I understand that is, perhaps, a joking question, but the figures on that are just a little surprising. I had never figured this until last night. I have figured many times in a rough way the saving to the growers and the public of this country, but I had never figured it in terms of the income tax. Those distributors from the Imperial Valley, every one of them, are big firms, whose business run up into the hundreds of thousands and millions of dollars, and every dollar you add to their income, in legitimate commissions or new business, is putting money right into the Treasury in the form of an income tax. Four thousand cars of additional cantaloupes, which they say we are responsible for, 4,000 cars of cantaloupes last year, were worth over \$1,000 a car, or \$4,000,000. The commissions, the legitimate, contract commissions for distributing that are 15 per cent, or \$600,000 of legitimate commissions on new business. Added to the earnings of firms whose income is running into the hundreds of thousands of dollars anyhow, an average of 25 per cent income tax is a modest estimate. That gives you \$150,000 paid into the Treasury of the United States on the increased business in one little community.

Mr. ANDERSON. What is your average income tax?

Mr. SHERMAN. I say, with the surtaxes, it is probably at least 25 per cent. With reference to the growers who have actually got that \$4,000,000, assuming only the minimum 4 per cent, you have \$160,000

more; or you have over \$300,000 of increased revenue derived from the increased business in one spot on one crop, which represents about 1 per cent of this service. If there is any bunk in those figures, I really do not know it; I have not put it there.

The Texas onion growers tell you it is worth \$1,000,000 a year to this onion industry; and so the thing goes on multiplying itself all over the country. In other words, this particular goose is laying some golden eggs right now, but she is laying at about one-half capacity for the lack of a few thousand dollars to make the service practically complete again.

Mr. McLAUGHLIN of Michigan. I never paid much attention to those large incomes. Is 25 per cent the tax on an income of \$600,000?

Mr. SHERMAN. That income of \$600,000 is distributed over about 20 firms, all of which do an enormous business. That is simply a guess. Probably it would be more than that for any one firm, very much more.

That is all I have to say.

The CHAIRMAN. Thank you, Mr. Sherman.

Mr. LIVINGSTON. The next item is No. 82, "To enable the Secretary of Agriculture to carry into effect until their termination the provisions of the proclamations of the President of June 18 and September 6, 1918, and the regulations thereunder relating to the stockyard industry," etc. The item is dropped in the estimates because the authority for the work will be discontinued with the proclamation of peace. In fact, the work has practically been discontinued at this time. That is to say, we have a sufficient amount of money to continue it for a month or six weeks more only.

Mr. ANDERSON. What has been accomplished by the stockyards supervision? That is what we want to know. What do we get for our money?

Mr. LIVINGSTON. The work that has been done this fiscal year was the same type of work as that done the last fiscal year, which was financed out of funds appropriated in connection with the food-control act. This item, as I understand it, was put in the Agricultural appropriation bill in the Senate in order to keep intact the machinery that was set up during war times, in order that there would be a nucleus to continue the provisions of that act until the enactment of the Kenyon or Kendrick bills. It was put in, my understanding is, at the instance of the Senate. I will be very glad to have Mr. Hall give you a brief statement.

The CHAIRMAN. You did not furnish us with any information last year because you were then in process of organization. It occurred to me that you might want to give a report now.

Mr. LIVINGSTON. I personally must plead ignorance, because I was not connected with that phase of the organization at that time. Mr. Hall, I am sure, can give you information regarding that.

The CHAIRMAN. We will be glad to hear Mr. Hall.

FURTHER STATEMENT OF MR. LOUIS D. HALL, IN CHARGE OF THE DIVISION OF LIVE STOCK, MEATS, AND ANIMAL BY-PRODUCTS, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.

Mr. HALL. As Mr. Harrison stated yesterday, this work was financed during the previous fiscal year out of funds allotted from

the President's emergency fund. Supervisors were stationed at all the principal live-stock markets, and regulations were issued by the President on the recommendation of the Department of Agriculture. The duty of the local supervisors was to see that those regulations were enforced, and the purpose of the regulations was to prevent unfair practices, combinations, deception, and overcharges for feed or service, and requiring the stockyard companies to furnish adequate and ample facilities to care for the stock that comes into those yards. The Secretary has included the report of the activities in his annual report, both for the previous fiscal year and the present fiscal year.

The CHAIRMAN. What was done?

Mr. HALL. We found in a good many of the stock yards that they were not furnishing sufficient pens and were not keeping them clean and that the terminal facilities were not sufficient to get the stock into the yards after they had reached the city in which the market was located. For instance, at Indianapolis the president of the live-stock exchange said they were going to build a monument to the Bureau of Markets, because for 25 years they had been trying to correct delays on the terminal railroad there, conditions which caused delays of from 6 to 8 to 24 hours in getting stock into the yards and unloaded after they reached Indianapolis, and within three weeks after the supervisor was stationed there that condition had been corrected by the addition of more switch engines, crews, and a better system of handling the business, so that it only took 45 minutes to 2 hours to get that stock in and saved a tremendous amount of shrinkage. He stated that item alone at Indianapolis would pay the cost of our supervision over all markets.

We found the packers, commission men, speculators, and traders and the stock yards themselves were practicing irregularities which had grown up and come to be recognized as more or less customary and therefore winked at. It would take a long time to enumerate all of them, but I would be glad to give you as many illustrations as time permits.

We found at Kansas City, for instance, it was costing commission men a couple of thousand dollars a year in tips to the yard men, the men employed by the stockyard companies who were supposed to unload the stock as it arrived on the market, and through a system of tipping certain commission firms had been favored in the pens that were assigned to them and in the promptness with which the stock was driven to the pens and weighed after being sold. And through our instrumentality a rule was passed by the exchange forbidding another practice at the Chicago Stockyards: The exchange, even previous to the license going into effect, established a rule stating in view of the fact that the license was going to go into effect, and since the Government doubtless would look with disfavor upon the trade in crippled hogs it would be forbidden on and after that date for any commission firm to employ any crippled hog trader or to use the services of any crippled hog trader in handling stock. Previous to that it was customary for the man who made it a business of dealing in crippled hogs and cattle to help the commission men yard and handle their stock, and it has been suspected more than suspected, I might say, that many of these men had not limited their dealings altogether to crippled stock; that is to say, if there were not enough crippled stock

in a load it is said they went so far as to take a club and make a few more crippled hogs.

All the way from Boston to Portland, Oreg., and from Jacksonville, Fla., to San Francisco we are dealing with large and small irregularities. The Senate Committee on Agriculture has our record of a large number of cases in which commission firms have been found to overcharge their customers for feed. The commission firms are not supposed to make any profit on feed; they are supposed to order feed from the stockyards company and charge their patrons for the feed they order. Instead of that, some firms have been ordering a great deal more feed than the stock needed and then, as they said, they salvaged what was left and sold it to the next fellow. In other words, they were charging two, three, four, or five farmers for the same hay. Some fairly high-class men had indulged in the practice, and they seemed to think it was one of the perquisites of the business, and when the matter was called to their attention admitted that they did not enjoy doing business that way, but that they found competition had forced them into it.

The CHAIRMAN. Do you class that as an irregularity—stealing hay? Is that just a mere irregularity? [Laughter.]

Mr. HALL. Sufficient to cause the revocation of the license. And one firm that had been engaged in that irregularity has been out of business for a good many months and there are some other cases of that kind now pending.

Mr. HEFLIN. The chairman wishes to know what you would regard as a serious offense.

The CHAIRMAN. Do you regard that as a serious offense?

Mr. HALL. I do, Mr. Chairman.

The CHAIRMAN. What did you do about it?

Mr. HALL. We have no authority to send men to jail; that is entirely within the province of the local courts or the district courts. We had two alternatives in cases of that kind, to revoke their license or to settle the matter with them.

The CHAIRMAN. How did you settle it?

Mr. HALL. To take a more prominent case, Rappal Bros. & Quinn, of Chicago, we found during a period since January 1, 1918, they had accumulated something like \$20,000 or \$21,000 in profits of that kind and during a period of three years it had amounted to something like \$60,000. There was the alternative of revoking their license, in which case they would keep the money, or requiring them to restore that money to the shippers and permit them to remain in business. It was impossible for the Secretary of Agriculture to do both. If he revoked their license, he would have had no further recourse as to the restoring of the funds. And under all the circumstances, which were carefully gone into by the various officials concerned in the administration of the law, it was decided to require them to restore the money to their shippers instead of revoking the license. And shortly after that the Chicago Live Stock Exchange called these people before it and found them guilty of a violation of the exchange regulations and expelled them; so that they are out of business now as promptly and probably more so than if the Secretary had revoked the license.

The CHAIRMAN. I infer that the Federal Government found them guilty and then simply withdrew their license, when it would seem as

though they should have been sent to the penitentiary rather than be let off and the cases compromised. That is being done in a good many instances.

Mr. HALL. If the district attorney should see fit, he could still proceed against them.

The CHAIRMAN. Why send anybody out there unless you enforce the law?

Mr. HALL. The Department of Agriculture is not charged, in the enforcement of this law, with sending licensees to the penitentiary.

The CHAIRMAN. What is the use of investigating if nobody is going to be punished?

Mr. HALL. Apparently the practice has been stopped.

The CHAIRMAN. Is it not the duty of the Department of Agriculture to turn the matter over to the Department of Justice, in order that justice may be meted out?

Mr. HALL. I think so; but I do not think the Department of Justice has any jurisdiction over that case, because similar cases which have gone to the Supreme Court have been found to be not within the jurisdiction of the Department of Justice.

The CHAIRMAN. We had better dispense with the whole service if you are simply running down evil practices.

Mr. HALL. I should say that practice has been stopped and other practices likewise have been stopped.

The CHAIRMAN. Is it the policy of the Department of Agriculture to stop here—not to punish the crime, but to agree that stopping these evil practices will be sufficient?

Mr. HALL. I should want to refer that question to our solicitor. Personally, I think that a willful case of such overcharging is a crime which deserves very severe punishment.

The CHAIRMAN. Evidently it did not receive very serious consideration.

Mr. HALL. It did receive serious consideration.

Mr. McLAUGHLIN of Michigan. After all, I think the stealing of money in Chicago is an offense against the State and should be prosecuted in the State courts. I agree with the witness that it is not a matter for the Department of Justice.

Mr. HARRISON. Mr. Chairman, you understand we merely had the power to revoke their license. It was a question of whether we should revoke their license, in which case we would not have been able to return these excess profits to the customers. There was \$20,000 involved in this case; we gave them an opportunity to make restitution, and they made restitution, the \$20,000 being sent back to the producers.

The CHAIRMAN. Was the crime committed during the term of the license?

Mr. HALL. Chiefly before the license went into effect.

Mr. HEFLIN. And the evil practice has been discontinued?

Mr. HALL. Other cases involving over \$80,000 are now under consideration, and in fact in litigation, and an appeal has been taken from the district court in Chicago and notices have been sent out and our supervisors have been so instructed that such practices have been stopped, saving a great many thousands of dollars more than a fine would amount to, in the amount that is actually being returned to the pockets of the stock raisers. I regret, with the chair-

man, that the laws of our land are not such that there is some Federal agency which can quickly and effectively punish offenses of that kind, because I assure you I consider it a great deal more than a mere irregularity.

The CHAIRMAN. The filing of a complaint is not limited to individual citizens; an officer of a department has just as much right to file a complaint as anybody else. It is a question of what the purpose of the department is after running down these frauds, whether they propose to punish those who are guilty or simply compromise and let them go.

Mr. HARRISON. The purpose of the department is to enforce the law as passed by Congress. The department has enforced the law; it is still enforcing it. If you wish to go into the legal phases of the proposition, we will have the solicitor come up here and discuss it with you.

The CHAIRMAN. I do not think we need to discuss it with the solicitor; we know what the punishment is for stealing.

Mr. LIVINGSTON. I wish to state for the record that the Solicitor of the Department of Agriculture has been before the Senate committee on this particular matter and has given a full explanation of it from the standpoint of the legal points involved.

The CHAIRMAN. I have heard a good deal of criticism in the stockyards by the commission men as to the way the matter was disposed of; I was trying to find out the facts about the matter.

Mr. HALL. You are quite right, but I might point out that the commission men have been very inconsistent in the matter in this way: They objected because the Department of Agriculture did not proceed vigorously enough against Rappal Bros., and they are now objecting because the department is proceeding too vigorously against some six or eight other commission firms that are guilty of the same thing, although not on as large a scale.

Mr. HARRISON. They combined together and enjoined the department from compelling the restitution of the funds, and the case has been carried to the court of appeals.

Mr. McLAUGHLIN of Michigan. What was the decision of the court?

Mr. HARRISON. The decision was against the department; that is, the court decided that the department could not revoke a license solely on the ground that a licensee failed to restore the overcharges to the parties in interest.

Mr. HALL. Could not revoke the license because of a refusal to restore the funds.

The CHAIRMAN. That would all depend on the terms of the license, of course.

Mr. HARRISON. The Senate committee has within the last week passed a resolution asking for a full report on these overcharge cases. That report is in course of preparation and we will be glad to send the committee a copy of it as soon as it is available.

The CHAIRMAN. The report will do no good. The matter has been disposed of. That is water that has gone over the wheel.

Mr. HALL. It is water that is still going.

The CHAIRMAN. As I understood you, the matter had been settled.

Mr. HEFLIN. How long has it been since the proposition was disposed of?

Mr. HALL. That was last June, Mr. Heflin.

Mr. LIVINGSTON. It is in the courts now.

Mr. HALL. I was speaking of the Rappal case that had been settled. The others are in the courts. Perhaps I can give a better illustration of the effect of supervision on the improvement of conditions. Our investigations in Indianapolis indicated that a large speculator had a monopoly, practically, of the sheep and lamb trade there by virtue of a secret agreement with Swift & Co.'s buyer whereby this speculator would find out in the morning what Swift & Co. would pay for the sheep, and then he would go out and buy accordingly, and Swift & Co. would not buy from the members of the trade, except this one man. A hearing has been held on that case. The attorney general of Indiana entered the complaint. A full hearing has been held, and the finding has not yet been formally issued, but action will be taken very shortly, and we think that practice has been stopped.

The CHAIRMAN. Is that the only conspiracy in the trade they found?

Mr. HALL. We dealt with it simply as a matter of violation of the regulations under the food-control act—an unfair practice.

The CHAIRMAN. Is that the only unfair practice that has been found?

Mr. HALL. By no means.

The CHAIRMAN. As to monopoly, agreements in restraint of trade, and violations of the antitrust laws?

Mr. HALL. I do not recall whether there are others that would come under the pale of the Sherman Act or not, Mr. Chairman. I would, of course, have to consult the solicitor's office on that legal point. Most of our work has dealt with the general improvement of conditions in the stockyards and the relations of the commission men, packers, and traders. We have had a force of auditors going through their books, and we have found all manner of irregularities. One commission man at Chicago, for instance, was taking out a few dollars from each shipment, simply stealing it out of the returns, and falsified the returns to cover it up. He plead guilty, his license was surrendered and canceled, and the money involved was restored to its owners. We found one man in Kansas City had been stealing cattle outright.

The CHAIRMAN. Was there any effort made to punish him?

Mr. HALL. His license was revoked.

The CHAIRMAN. That was the only punishment?

Mr. HALL. Yes, sir. I am inclined to think, if my memory serves me right, that he was proceeded against in the local courts. I know they either proposed to take or have taken action against him. I would be glad to enter into the record a very full statement of the work on supervision of the stockyards during the past year, if the chairman desires it. Such a report has been filed with the chief and could readily be made a part of the record.

The CHAIRMAN. I do not believe it is necessary to put any lengthy statement in the record, but if you wish to refer to some specific cases you may put them in.

Mr. HALL. I will answer any other questions here you wish to ask.

The CHAIRMAN. I believe that is all.

Mr. LIVINGSTON. The next item, Mr. Chairman, is No. 83, on page 248, "To enable the Secretary of Agriculture to gather from stock-

men, live-stock associations, State live-stock and agricultural boards," and so forth, "information relative to the number of different classes and grades of marketable live stock," and so forth, and I will ask Mr. Hall to discuss that item also. There is an apparent increase here of \$34,000, but, considering the transfers to the statutory roll, the actual increase is \$50,000, the same amount that was asked for in connection with the item on the market news service for fruits and vegetables.

Mr. HALL. The general features of the live stock and meat information source are very similar to those of the market news service on fruits and vegetables, concerning which Mr. Sherman has spoken in considerable detail. It is not my purpose to repeat a great deal of what Mr. Sherman has said, since it applies equally to both services, but the present organization and service so far as live stock and meats are concerned has been curtailed to five offices at the stock-yards in the Middle West and three branch offices at the large meat distributing centers in the East. On the 1st of July, like the fruit and vegetable information service, we were obliged to cut off all wires to offices west of the Missouri River, and I would like to show you at a glance, on a little map, just what that has meant to the live-stock industry of the United States. The green areas, including the States east of the Dakotas, Nebraska, Kansas, and Oklahoma, and including the north of Arkansas, Tennessee, parts of Mississippi and Alabama, North Carolina, and the remainder of the States north and east of those, are now receiving the daily telegraphic service of the bureau. All of the white area, which includes a great part of the live stock producing country of the United States, the western range, and the mountain and Pacific coast region, and a great part of the Gulf States and nearly all of Texas, practically all of Texas, are now without the information which they were receiving previous to the 1st of July.

The cutting off of this service brought forth a flood of protests from representative organizations and individuals among the live-stock trade. In California, for instance, the California Cattlemen's Association passed a resolution, which I understand was filed at the time with this committee, to the effect that the market news service had their hearty approval; that it had been of great assistance to producers and distributors, and would become more and more so by preventing extreme fluctuations in live-stock conditions, by establishing closer relations between the market prices of live stock and meats, and by facilitating and encouraging the production and purchase and slaughter of live stock in the market centers, and so on.

Mr. ANDERSON. What is the date of that letter?

Mr. HALL. This is a resolution of the association, the date of which I do not have here; but, if I am not mistaken, it was about May 15, 1919. I also have one from the Retail Butchers' Exchange, of Alameda County, the county in which Oakland, Calif., across the bay from San Francisco, is located. This exchange, by the way, or possibly the San Francisco Butchers' Board of Trade, I think it was, offered to raise the money to finance the continuation of this service provided the Government would continue to render the service, at their expense, but we found we did not have the legal authority to do that even though we had been willing to do so if we could.

The Florida Cattlemen's Association, the Texas Cattle Raisers' Association, the American National Live Stock Association—I am

not naming these in the order of their importance, but just as they occur to me offhand—have all passed resolutions, and a great many others I have not named have passed resolutions, indorsing the service, and stating specifically that it has been of value to the producer, and, incidentally, in some of the resolutions reference is made to the benefit to the consumers and to the distributors. I would be glad to file representative selections from those letters and resolutions if the committee wishes.

The CHAIRMAN. I understood you to say you could not furnish this information to California producers unless it was paid for by the Government?

Mr. HALL. We can send it to them collect over the commercial wire.

The CHAIRMAN. I understand that they expressed a desire to pay that expense?

Mr. HALL. What they wanted was to maintain the leased-wire service. We would not be in a position to accept contributions of that sort.

Mr. MCKINLEY. They could hire the wire, could they not?

Mr. HALL. Yes. It would require, however, building up and maintaining a rather expensive organization, which no one State could handle as a physical matter.

Mr. LIVINGSTON. May I suggest that I think they wanted to employ a man under our supervision. We did not feel we could accept that sort of service, because we do not want to be responsible for an individual whose salary is paid by some one else. We feel that that would be an unwise public policy.

The CHAIRMAN. Do they have the reports you send out?

Mr. LIVINGSTON. We send those out to anyone who wishes to receive them and is willing to pay for them.

Mr. ANDERSON. I understood you to say you sent them out to anybody who was willing to pay for them. To what extent are these reports being paid for?

Mr. HALL. To a very small extent, Mr. Anderson. I can not give the exact figures, but I think the live-stock and meat wires go to not over a dozen or 15 concerns in that way. Most of those who desire service by wire get it through the telegraph companies that give a monthly service—what they call a commercial news department service, at so much per month. It is much cheaper that way than it is to take it direct from the Bureau of Markets. But the Bureau of Markets supplies the information that the Western Union, the Postal, and the other news agencies now use in their commercial services.

Mr. MCKINLEY. Is not that reliable?

Mr. HALL. Yes, sir.

Mr. MCKINLEY. There is no objection to their taking it that way?

Mr. HALL. Not at all; we encourage that; we advise it. I hope I have made it clear that the information that is sent out over the wires by the commercial companies—the Western Union and the other telegraph companies, and various associations—is furnished to them by the Bureau of Markets.

If this \$50,000 increase that is asked for is granted we propose to use it as far as it will go in restoring the offices and the leased wires

west of the Missouri River, as nearly as we can tell now, at Denver, San Francisco, and possibly Fort Worth. It is impossible to say in advance, because, as was said here yesterday, there is a proposal to increase telegraph rates—that is, the rates of charges for the wires leased—so we are in the position of a man who is building a house—he doesn't know until he gets it done how much it is going to cost. It may cost 50 per cent more than he thought it would. We are now conducting a service covering live stock, meats, hides, and I spoke yesterday of wool reports, \$2,000 toward which has been allotted during the present fiscal year from the funds for reports for live stock, meats, and animal by-products.

I would like to show you very quickly, by means of a few pictures something as to the nature of the service we are giving now and call attention to some improvements that have been made since I appeared before you a year ago. This chart [indicating] shows the form of market quotations formerly used by the telegraph companies (the one on the left). The one at the right shows the present form used by the telegraph companies, as recommended by the Bureau of Markets.

The chief point to which I wish to call your attention is the fact that the subscriber to Western Union service now gets about twice as much for his monthly fee as he did before.

Mr. McLAUGHLIN of Michigan. Is the rate the same?

Mr. HALL. The rate is the same, and the quotations are given in very much more definite form than they ever were before. You notice on the old form [indicating], under hog quotations, the first one is "mixed and butchers." "Mixed hogs" is a very general and indefinite term. We had quite a task to persuade the trade to drop it. The commission men were fond of it because it was not definite, and the market reporters, the market papers, had fallen into a rut on that term, and it was only after a great many conferences, a great deal of argument and persuasion, that we succeeded in substituting this definite classification, based on weight and quality of the hogs. We don't quote any mixed hogs now at all. We quote eight grades of hogs, running from heavyweight, 250 pounds and up, down to stock pigs, 130 pounds and down, and under each of those the grades are definitely stated, as "medium," "good," and "choice." That is under heavy weight hogs. Under the lightweights the grades run from "common" up to "choice." The old style of market reporting—and in many cases the present style—used by market papers is something like this: "Good to choice hogs, so much; fair to good hogs, so much." Well, we did away with that entirely and substituted the names of the grades which are actually included in the quotation. Now, "medium to good" might mean either medium and good, or it might mean the "twilight zone" in between medium and good, or it might mean almost anything and never did mean anything very definite. The Bureau of Markets classifications have now been adopted universally at live-stock markets all over the country, and many of the market papers have been obliged to adopt them because the Western Union and the Postal Telegraph, the Associated and the United Press Associations are both using them.

The CHAIRMAN. What grades of cattle have you there?

Mr. HALL. Choice and prime is the first grade.

- The CHAIRMAN. That has reference to steers, has it not?

Mr. HALL. Yes, sir. First is beef steers, and under beef steers, first medium and heavy weight, meaning 1,100 pounds and up. Under that, choice, prime, medium good, and common. Then light-weight steers, 1,100 pounds and down, good and choice, common and medium.

The CHAIRMAN. Does that mean killers?

Mr. HALL. Yes, sir. Then the butcher cattle, including heifers, cows, and bulls of the different grades, cutters and canners, including both cows, heifers, and canner steers. Then veal calves, feeder steers, stocker steers, stocker cows, heifers, stocker calves, and western range cattle.

One of the most important features of this sort of thing is the adoption of the same standard at different markets. To illustrate what I mean by that, in the Chicago market a prime steer is the very best fat steer that you will find in this country. At Kansas City it is practically as high a grade of steer as can be found, but when you go to Fort Worth, for instance, you will find that what they used to quote as a prime steer down there would not grade higher than medium, perhaps, or good at Chicago; and yet those quotations were going out as quotations on prime cattle, when they were two or three grades below prime. Now, by having a force of men at these different markets, all of whom have been trained to use the same system of reporting, it means that we can compare quotations for Chicago with those for Fort Worth. Now, that means not merely the farmer getting better information, but it means that the Government has a better check on the packers. It means that when we compare prices of cattle with the prices of meat, we know what we are comparing; we are not taking a lot of averages and guessing at it, but we know exactly what grade the given price represents. Formerly, the telegraph companies sent out at 7 o'clock in the morning a quotation on hogs and cattle for that day. The first wire from Chicago at 7 o'clock in the morning would say, for example, "Hogs 10 higher." The hog market usually did not open until 8 or 9 o'clock and never as early as 7 in the morning; and the fact is that that quotation sometimes was sent out before the man who issued it had really gotten out of bed. Our investigation disclosed that one of the men who was responsible for sending out this quotation at 7 o'clock in the morning often used to take the telephone from the side of his bed and telephone it to the offices of the news agencies that were paying so much a month to send it out.

Mr. ANDERSON. Whom did he represent, or where did he get his figures?

Mr. HALL. He was employed by three or four different people; partly by the local market papers at Chicago, partly by the packers, and partly by the board of trade. And he has said very frankly that that estimate was just instinctive, just an intuitive guess. He would call up the railroads and find out how many hogs were coming into the market that day; then, by knowing how many were there a week ago and a year ago, and by knowing which road they were coming off from this morning, he would say—if the run was large from Iowa, they would be high-grade hogs; or if they were largely from the South, they would not be such high grade; and

knowing the trade in the East, the demand for pork cuts, etc., he would sort of average this all up in his mind and guess that hogs were going to be "10 lower to-day." He would send that out at 7 o'clock in the morning, when no one had any business to know what hog prices were going to be. We immediately cut that feature out of the report. There was a great deal of protest against it, both by packers and commission men, and by farmers who had been in the habit of getting it and still wanted to get that 7 o'clock quotation, although it was not doing them a bit of good. We had to wean them away from it.

Mr. MCKINLEY. Did you find that that quotation was not borne out by the facts?

Mr. HALL. Yes, sir; we found that it was about as reliable as the Rev. Mr. Hicks's weather report used to be in the old days.

The CHAIRMAN. When does your report go out?

Mr. HALL. Our first report of prices goes out about 9.15 in the morning from Chicago, Mr. Chairman; and it doesn't go out then unless hogs have actually been sold at that time. We don't get out a quotation until some hogs have been sold or until at least bids have been made.

The CHAIRMAN. Your 9.15 report is pretty much of a guess?

Mr. HALL. No, sir; it is made up from the first bids and sales. It is a preliminary report, of course. Then we send out others as the market develops, at about 10, 10.30, and 11, and then at the closing of the market, usually soon after noon.

The CHAIRMAN. 9.15 is the first one?

Mr. HALL. If I am not mistaken, the first wire on hog prices now goes at 8.30. The schedule has been changed more or less from time to time according to the market hours, the run of hogs, and so forth. We have to try to adapt it right along to the needs of the trade, but the custom is to get out the first hog-market wire at 8.30, giving any bids or sales made at that time. Then there is a later one, a flash wire at 9.15. At that time usually a sufficient number of sales have been made to establish an opening market.

The CHAIRMAN. I understood your representative in Chicago to say that practically nothing went out before 11 o'clock.

Mr. HALL. He was speaking of cattle, I think, Mr. Chairman.

The CHAIRMAN. Of hogs, too.

Mr. HALL. We are nearly always able to get sales on hogs by 9 or 9.15.

The CHAIRMAN. That would reach the country about 10 or 11 o'clock, would it not?

Mr. HALL. Yes, sir; or as long as it takes to get it over the wires, depending on the distance from Chicago. You see at Chicago the hog trade is usually opened by the speculators, not the packers. Often when there are 30,000 hogs in Chicago the speculators will get out before 9 o'clock and buy 15,000 or 20,000. So we have to quote it as a speculator market. If the packers get in and bid early, we say that in the message to the trade, and the farmers in the country will know, as near as we can tell them in a few words, what the bulk of the market is.

The CHAIRMAN. As a practical, experienced cattleman, of what value is this 11 o'clock report to the packer, for instance, in the

country? The packer must place his order for hogs or stock as early as 8 o'clock in the morning if he is going to get any stock at all?

Mr. HALL. Do I understand you are speaking of the packers' country-buying operations?

The CHAIRMAN. He places his order at 8 o'clock in the morning when the cattle and hogs go on the market. Practically everything is sold between 8 and 10 o'clock. Now, the packers' complaint is that they get your reports at 11 o'clock while they have to place their orders at 8 o'clock in the morning—three or four hours before this department report regarding the day's market reaches them—so it is of no value to them.

Mr. HALL. I see what you mean. They get all the information we have, just as fast as we are able to release it.

The CHAIRMAN. I am not criticising what you do; I am simply trying to find out how we can improve the situation. They get it after they buy. How can that be overcome?

Mr. HALL. The only way it could be overcome, Mr. Chairman, would be to have a faster telegraph service.

The CHAIRMAN. The wire can not take it before you deliver it, and, as your representative said, he delivers it about 11 o'clock in the morning.

Mr. HALL. You are speaking of the cattle market now.

The CHAIRMAN. Yes; of cattle and hogs.

Mr. HALL. We begin to give quotations from the hog market at half-past 8 or 9 o'clock in the morning. It is difficult to report the cattle market until 11 or 12, because the packers don't get out to buy, that is a condition that can not be overcome in any way that I know of.

The CHAIRMAN. My understanding is that you are trying to be absolutely safe. In order to play safe, it is necessary for you to ascertain the market and the sales before reporting.

Mr. HALL. Yes, sir.

The CHAIRMAN. You look over the tickets to know exactly what the sales are—who made them, who sold, and at what price. Your Chicago representative tells me that it is impossible to get those data until about 10 or 11 o'clock, so of course you can not send the reports before that.

Mr. HALL. But, Mr. Chairman, he is getting it as early as he got it before we started our service.

The CHAIRMAN. The packer gets his report, not from you but from other sources, at 8 o'clock in the morning. He acts upon the other reports and not upon your report.

Mr. McKINLEY. What does he get? Does he get that report that the man gives at the bedside; is that the 8 o'clock report?

The CHAIRMAN. Commission men or the Stock Journal send out their reports about 8 o'clock.

Mr. HALL. That is because they are in a position to guess at it.

The CHAIRMAN. After all, that is the report that they buy on, is it not? They get your report at 11 o'clock which is more accurate, I take it, but, after all, it comes along after all the purchases have been made.

Mr. HALL. That varies with different packers. The packers you speak of in Iowa, I think, Mr. Chairman, buy in various ways,

and I am inclined to think they have overemphasized the inconvenience which they have sustained as a result of the change in these reports. They have made various complaints to us, not entirely on the score of delay, but also that we quote the market too high; we do quote it higher than it was formerly quoted by the men that I spoke of a while ago.

The CHAIRMAN. The question is should there be a change in the policy?

Mr. HALL. I think the policy should be, if we had authority to do it, to put a stop to all those estimates.

The CHAIRMAN. They wouldn't have anything, then.

Mr. HALL. I failed to say a few minutes ago that we begin to send out reports of the live-stock receipts at the market, the estimated receipts, at 6 o'clock in the morning.

The CHAIRMAN. You are familiar with the stock business in the country—with what the buyer does?

Mr. HALL. Yes, sir.

The CHAIRMAN. You know, then, that in the morning between 8 and 9 o'clock he receives this report and buys upon the report for the day. He doesn't take your report of yesterday; he takes the morning report that comes along about 9 o'clock in the morning, and buys on that. About noon he gets your report.

Mr. McLAUGHLIN of Michigan. Doesn't he know that that is only a guess?

Mr. HALL. Yes, sir.

The CHAIRMAN. It is the only thing he has.

Mr. McLAUGHLIN of Michigan. It can't be given earlier than that accurately, can it?

The CHAIRMAN. They seem to be giving it about as accurately as anybody.

Mr. McLAUGHLIN of Michigan. Mr. Hall says his report goes out just as soon as there have been actual sales.

Mr. HALL. I would say, gentlemen, that we held a great many conferences, as I said a while ago, on this subject. I went to Des Moines and conferred with Corn Belt Meat Producers' Association officials, conferred with the American National Live Stock officials, and others as to whether it was wise or unwise to discontinue this morning service. The sentiment was unanimous that it was wise to discontinue it, and we acted upon their recommendations.

The CHAIRMAN. After all, your report is simply a verification and serves as a matter of comparison between this and the one on which they had been buying.

Mr. HALL. As to our reports on the meat trade, never before this service started was any information regularly available as to the prices of fresh meats in the East, which are the barometers, so to speak, of the meat trade of this country. Our reports cover New York, Philadelphia, Boston, Pittsburgh, and Washington; and although this was started three years ago we have been able to improve it in many ways, speed it up, so that we have brought about much closer relations between prices of live stock in the West and meats in the East, and have made it possible much more quickly than ever before to check up any discrepancies that appeared.

The CHAIRMAN. Have you any suggestions to make on live stock?

Mr. HALL. No, sir; except that as rapidly as Congress feels warranted in spending the funds for it, it seems to me it should be expanded and extended.

The CHAIRMAN. Would you suggest a change to furnishing information earlier in the morning?

Mr. HALL. No; I think I stated—

The CHAIRMAN (interposing). You expect to adhere to the policy you have adopted?

Mr. HALL. Yes, sir. It is very evident that it would be unwise to give out this guess.

The CHAIRMAN. You admit that it is of little value to get out a report after the cattle or live stock has been bought?

Mr. HALL. I must insist, Mr. Chairman, that they do get a good deal of information that is valuable before that.

The CHAIRMAN. They get it late.

Mr. HALL. No, sir; they get information showing estimated receipts of cattle, sheep, and hogs at Chicago as early as 7 o'clock in the morning. Our office gives that out at 6 o'clock, and any packer at Cedar Rapids or Ottumwa will get it by 7 certainly. There is laid on my desk every morning, often before I arrive, a summary showing the estimated receipts at all of the western markets for the current morning.

The CHAIRMAN. Receipts and prices are two different things. Very often prices are higher with big receipts than with small ones.

Mr. HALL. Prices are not made until the stuff is sold.

Mr. McLAUGHLIN of Michigan. The question is whether it is advisable to send out guesses or wait until there are actual sales.

Mr. HALL. We say it is not, and we don't intend to do it until some one insists on it.

The CHAIRMAN. Under the practice, it is of little value.

Mr. HALL. It is up to him whether he is going to begin buying before 11 o'clock on a guess or whether he is going to wait until he gets the report of actual sales.

The CHAIRMAN. You know very well that a buyer can not wait until 12 o'clock before he gets prices for hogs. Buying begins at 8 o'clock or even earlier.

They all understand in my section of the country that at 9 o'clock they can have the quotations on hogs, and they sell over the telephone. Most of the selling is done before noon. Your report comes along about noon, based upon facts, and the other is, I will admit, and must necessarily be, more of a guess. The question is whether the policy of the department shall be to continue the late reports.

Mr. McKINLEY. Didn't I understand you, Mr. Hall, to say that you sent out a hog-sale report at 8.30 in the morning and another at 9.15?

Mr. HALL. Yes, sir; provided either bids or sales have been consummated at that time. I will say we are doing the best we can to get it as rapidly as it is available.

The CHAIRMAN. Your representative told me he was not sending out anything before 11 o'clock.

Mr. HALL. I think you misunderstood him.

The CHAIRMAN. No; I asked him two or three times, and I called his attention to the complaints made by the packers.

Mr. HALL. That is true as to cattle.

The CHAIRMAN. I have reference to hogs.

Mr. HALL. I would be glad to file copies of our messages showing exactly the time that they went out to-day, the 13th of January. You will find they begin going about 8.30 or 9 o'clock, if I am not mistaken. It changes from time to time more or less, according to the way the hogs are coming in on the railroads. But I would be glad to give you the actual time for to-day if that will clear the matter up.

NOTE.—The Bureau of Markets' opening message on hog prices is filed at Chicago at or about 8.30 a. m. The actual time of receipt of this message via leased wire at Washington, January 13, 1920, was 8.41 a. m., central time.

Another point that I called to the attention of the committee in previous presentations of this matter is the fact that our reports cover about 70 or 72 stockyards, whereas up to two or three years ago practically all of the information that was available to any stockman or any commission man was the estimated receipts for five or six or not more than seven or eight markets.

Mr. ANDERSON. Of what value are the reports from a large proportion of the stockyards in determining what the prices are? I suppose that 90 per cent of the business is done in about 10 yards—perhaps less.

Mr. HALL. That is probably approximately correct, Mr. Anderson. And it is only the balance, the small percentage that one gentleman spoke of this morning—it is the 5 per cent above or below the demand for the day, often, that affects the price. Now, I don't mean to say that we are getting quotations on 70 markets daily. That comes out in our monthly report which is valuable only, of course, in showing the general trend, but our daily report has extended the number of larger markets, which are shown on the bulletin boards each morning.

Mr. ANDERSON. To get this down to a concrete point, tell us from how many markets you are getting now daily reports?

Mr. HALL. Twelve markets, if I am not mistaken.

Mr. ANDERSON. I would imagine that would be about right. From how many do you get weekly reports, or do you get any weekly reports?

Mr. HALL. No, sir; none in addition to those. The others I spoke of are monthly reports.

Mr. ANDERSON. I gathered from what you said in the first place that you were getting a daily report from some 70 markets.

Mr. HALL. I am afraid I gave a wrong impression.

Mr. ANDERSON. It struck me that that was entirely unnecessary.

Mr. HALL. I am afraid I gave that impression. I tried to correct it a moment later. But the monthly report does show a great deal more fully and accurately the general supply of cattle, hogs, and sheep in the United States than anything of the kind we ever had before.

Mr. ANDERSON. I should say that, for statistical and historical purposes, of course you ought to have all the markets in the country.

Mr. HALL. It is very eagerly watched for at the first of each month by thousands of members of the trade and the stockmen and farmers.

Now, here are a few pictures that show the way in which we have been studying the classification of live stock in connection with our

market reports. There are those who say that live stock can not be classified; that no two animals are alike, that every deal is a horse trade between the buyer and the seller, and that we can't hope for any more uniform standards than we have now. We do not claim that cattle can be standardized like cotton or wheat, because you can't take a sample of a load of cattle and take them to the office or the laboratory or the committee room and pass on them; and it is a question of dealing with them at the moment, not when it is water that has gone over the wheel. But I have placed this chart before you to show the possibilities of great improvement in reporting the market, simply as a matter of market quotations. We have adopted these five grades of beef steers, prime, choice, good, medium, and common, and have given our market reporters instructions to follow as nearly as possible that standard. We have done likewise with other classes of stock. Here are the feeder steers, the kind that the farmer buys to put into his feed lots as thin cattle and fatten them for the market. Here are selected, choice, good, medium, and common [indicating].

Mr. ANDERSON. Before you get away from beef steers, may I ask you if there is any definite relation between your beef steers and your meat grades?

Mr. HALL. Just one difference. There is one more grade of live cattle than there is of dressed beef. I will show you the grades of meat in just a moment.

Mr. ANDERSON. Is there any relation between the two?

Mr. HALL. Do you mean as to the prices?

Mr. ANDERSON. Yes.

Mr. HALL. Yes; there is a general relation. We don't know as much about it yet as we want to. The service hasn't been running long enough to go into that, but very often the beef from a medium steer, by the time it gets over the retailer's block is going by a very different name; and very often, I have no doubt, before it gets out of the packer's branch house it is good or choice steer by name. It is still a horse trade, even in the meat business as well as in the live-stock business. It will take a long time to develop it beyond the stage of a horse trade, and it is a matter of education, but we claim that rapid and substantial progress can be made in that direction. Here [indicating] is a class of cattle on which perhaps as much education is needed as any, the class that the farmer invests his money in when he starts to fill his feed lots with cattle.

Many farmers will make the mistake of paying a fancy price because the cattle are fancy—all red or all roan or all black or all white-faced—and do not consider the lessons of market history, which show that the prices for the highest grade of stock six months hence or three months hence, when they come on the market, are always at a discount. That is particularly true of farmers that feed cattle for the spring markets. It often happens that it would pay better in October or November to buy good or medium steers to put into the feed lots than to pay the price for choice or selected grades, because history shows that the margin between prime and good beef steers in the spring is less than it is at any other time in the year. So the farmer that is feeding cattle to make money, and not merely for the pride and satisfaction there is in having a nice load of cattle in his yard, will usually put in the cheaper grades of

cattle when he is feeding for the spring market; on the contrary the farmers feeding for the September market or Christmas market can not afford to buy common cattle, common feeders, because when the farmer comes to the market in the fall, when the grass cattle are all coming in off the range, he will find that he has a lot of competition for common cattle and it is to his advantage to have something choice or fancy.

Here are the grades of hogs [indicating]. Medium weight hogs have been chosen for these pictures, showing the good, choice, medium, and common grades, and I think that even at the distance at which you are sitting you can see quite a difference in the quality between the choice hogs and the common. At the best, a picture doesn't show the quality of an animal as fully as we would like, but it helps. Here are market grades of fat lambs, choice, medium, and cull. We haven't been able to include all of the grades because we didn't have satisfactory pictures of the good and the common, but this shows you the extreme range between a choice lamb and a cull.

Then you were asking about the grades of meat. I am sorry that I haven't a good picture of the dressed carcasses, but here are some of the wholesale cuts which will illustrate the point—wholesale cuts of beef [indicating]. The four cuts on the left are ribs—choice, good, medium, and common. The next row are the other end of the same cuts; taken at the shoulder end of the cuts—choice, good, medium, and common. This is the loin of beef [indicating], of the four grades—choice, good, medium, and common. Pictures of meat, like pictures of cattle, and even more so, usually fail to show the differences in quality, color, and texture and all that sort of thing, but you can see from the difference in shape there that it is not impossible by any means to arrive at a fairly satisfactory standard for either live stock or meats.

In connection with these pictures, although it doesn't relate to the telegraphic market information service, I would just like to take the liberty of placing this before you by way of supplementing what Mr. Harrell said yesterday about the trade in pure-bred live stock [indicating]. Our specialist in the marketing of pure-bred live stock, Mr. Burk, has at great pains and effort made a survey showing the location of the pure-bred live stock of the different breeds in the United States. The dots which give these maps their color, each one represents the location of a breeder who within the past year has registered live stock of the particular breed. The one at the left represents Hereford cattle; the one in the center, Jersey cattle; and the one at the right, Poland-China hogs. And you can see at a glance that whereas the pure-bred Hereford cattle are very largely concentrated in the central part of the United States, Jersey cattle are bred very largely in the northeast, developing extensively, however, in certain other centers. Texas stands out surprisingly here, and the little districts up there in Oregon and Washington. That happens to be Jersey cattle. A map showing the location of Holstein cattle would show an entirely different complexion.

I doubt whether it will be of any special service to go further into detail here as to the use of the \$50,000 that we are asking for, excepting to say that the offices we propose to establish at Denver and San Francisco—and we hope at Fort Worth—will render the same service as nearly as possible as is rendered by those now in operation at

Chicago, Kansas City, Omaha, St. Louis, and St. Paul. And the office at San Francisco, in addition to reporting the live-stock market in that section, would serve to report the meat trade of San Francisco.

In closing, I want to say just a word about the effect of this service on the improvement of the live stock and meat situation in the United States.

I have called attention to this point before this committee in previous years, and I have shown you a chart similar to this one in previous years [indicating]. It is intended to represent the live-stock situation in the United States at this time. The upper line shows the population, which is steadily increasing; the dotted line shows the swine supply, the number of hogs in the United States, which you will see was at a standstill practically from 1890 to 1910, and as a matter of fact it was at a standstill in 1914, when the beginning of the war caused a rapid increase in the production of hogs. The next line, showing the numbers of cattle, you notice followed the same direction as the increase in population up to 1900, since when the cattle supply of the country has been practically at a standstill. There are just about as many now as we had in 1900, which is a pretty strong indication as to why beef is high.

The sheep fairly kept up with the population from 1870 to 1900, with some ups and downs, but since 1900 you notice we have declined from over 60,000,000 sheep to only about 50,000,000, which helps to explain why mutton and lamb are high, as well as wool.

In other words, to sum it all up, we have been practically standing still in the production of meat in the United States for 20 years, excepting hogs, which since 1914 have shown considerable improvement, and yet the discrepancy between the demand represented by population and the supply represented by the number of meat animals, is very striking. It seems to us in the Bureau of Markets, after studying the matter for five or six years, that the principal remedy that is needed to close up that discrepancy—that gap between the curves—is more information and a real supervision. We are not here to discuss the question of supervision, because we are not asking funds for that. That comes under other legislation, but we think that no matter what supervision may be adopted, current daily market information is absolutely essential and fundamental to the efficient conduct of any kind of supervision. We think it is possible for an office located at Chicago and equipped with a corps of experts who know every department of the packing business and of stock-yards operations, to practically conduct a packing house on paper in such a way that it will be possible to determine on any day just what the situation is, just what the discrepancy in prices is, if any, between the price of cattle and the price of hides or tallow, for example; in other words, to operate as a constant check on the packing business. And I believe that if Congress sees fit to restore this service to the point at which we had it developed before the 1st of July, or as nearly that as possible, that it will be money well expended.

If there are any questions, I shall be very glad to answer them.

MR. McLAUGHLIN of Michigan. Under this item data are collected as to the kind and amount of meat and some other food products in cold storage. Have you had anything to do with that?

Mr. HALL. Yes, sir; our division has cooperated with the cold storage section of the bureau in determining the classification of products to be used, but the work actually is conducted by the cold storage branch of the bureau. If I am not mistaken, that comes under the general funds for investigation and demonstration. We are asking for no increase in that this year.

The CHAIRMAN. Is that all on this item?

Mr. HALL. That is all, unless there is some other question. I thank you.

The CHAIRMAN. We are very grateful to you, sir.

STATEMENT OF MR. GEORGE LIVINGSTON, ACTING CHIEF OF BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE—Continued.

The CHAIRMAN. The next item is No. 84, page 249:

For collecting and distributing, by telegraph, mail, and otherwise, timely information on the supply, demand, commercial movement, disposition, quality, and market prices of dairy and poultry products, \$69,780.

Mr. LIVINGSTON. Mr. Chairman, the information collected and disseminated under this item is obtained in substantially the same way as that for the news services on fruits and vegetables and for meats and livestock, which have already been described. All of these news services are conducted in substantially the same manner.

The CHAIRMAN. I believe there was some discussion about this last year on the floor.

Mr. LIVINGSTON. I don't recall it.

The CHAIRMAN. There was some controversy by Mr. Moore.

Mr. LIVINGSTON. I think that was over the inspection service.

The CHAIRMAN. That is not under this item?

Mr. LIVINGSTON. No; it is under a later item, Mr. Chairman, item 88.

The CHAIRMAN. This service is practically of the same character as that already discussed under the other items?

Mr. LIVINGSTON. Yes; the same type of service that has been explained to the committees under items 81 and 83.

The CHAIRMAN. You might state where the principal offices are.

Mr. LIVINGSTON. New York, Boston, Philadelphia.

The CHAIRMAN. The larger cities?

Mr. LIVINGSTON. Yes, sir.

The CHAIRMAN. How many branches have you?

Mr. LIVINGSTON. Seven altogether.

The next is item 85:

For collecting and distributing, by telegraph, mail, and otherwise, timely information on the supply, demand, commercial movement, location, disposition, quality, and market prices of grain, hay, feeds, and seeds, \$44,600.

In this item no increases are requested. Information is collected and distributed here in substantially the same manner that has been heretofore described.

The CHAIRMAN. Could not two or three of these items be brought under one head? I think we consolidated one or two last year.

Mr. LIVINGSTON. It would be difficult to administer if that were done, for the reason that the organization which puts into effect

item 85 is an entirely different organization, so far as administration is concerned, from the group of men who put into operation item 84. One of these items relates to dairy products, the others relate to fruits and vegetables, live stock and meats, etc., and we must have in the bureau a separate and distinct organization to handle those commodities. The bureau is organized along divisional lines and it would make some additional bookkeeping for us to keep those funds straight if it were all lumped into one item. We should prefer to let it stand as it is.

Mr. McLAUGHLIN of Michigan. That is one fault, each time any little piece of work—little or big—is authorized, there is a separate organization, with a number of high-priced men in it. It would seem as though they might be put together and the work done by one organization and that money could be saved.

Mr. LIVINGSTON. I don't mean to convey the impression that it means any more overhead expense. We should have to have the same men to handle it whether it appeared in one item or in two. The only difference is that item 84 is administered by our dairy marketing division through our dairy experts; whereas item 85 is administered by the division called grain, hay, and feed marketing, and is handled by an entirely different group of men.

Mr. McLAUGHLIN of Michigan. Do you have to have an expert in dairying and an expert on poultry in order to report the supply and demand for those products?

Mr. LIVINGSTON. No; those are handled together, because they are commodities which are handled in that way.

Mr. McLAUGHLIN of Michigan. Do you have to have an expert in dairying in order to report the supply and demand for dairy products?

Mr. LIVINGSTON. That is a relative term, sir. The people who handle the dairy work of the bureau are expert dairymen; yes, sir. We should not attempt to handle it unless we did have men who knew the dairy industry and the dairy business. Likewise the men who handle the market news service on fruits and vegetables must, above everything else, know the fruit and vegetable industry. The man who knows the fruit and vegetable industry does not necessarily—quite likely does not—know the marketing machinery necessary and in use in marketing dairy and poultry products. To combine these items would not change the organization a bit. It would be a matter of bookkeeping only. We would require the same number of men, the same type of men, and pay them substantially the same salaries, whether these items were all grouped into one or whether they were left separate as they appear in the estimates. I may say that we will be very glad to arrange our organization and our bookkeeping system to meet the desires of the committee in that respect. It makes no material or substantial difference to us whether those items are grouped, other than that grouping would complicate our bookkeeping. It would make no difference in the number of men employed or the character of work done.

The CHAIRMAN. We will take up item 86.

Mr. LIVINGSTON. No 86 reads as follows:

To make investigations relating to the transportation, storage, preparation, marketing, manufacture, and distribution of agricultural food products, in-

cluding the extent, manner, and methods of any manipulation of the markets or control of the visible supply of such food products, or any of them, by any individuals, groups, associations, combinations, or corporations, \$45,620.

The work under that item has been carried on in cooperation with the Federal Trade Commission, as explained to the committee last year. We have now in the hands of the Trade Commission four reports and are completing the fifth.

Mr. McLAUGHLIN of Michigan. I see under 86 you have investigations relating to transportation, storage, preparation, marketing, manufacturing, and distribution.

Mr. LIVINGSTON. Yes, sir. You may remember that the appropriation of \$250,000 given the Federal Trade Commission contained substantially the same language. By direction of the President the work of the Federal Trade Commission and the work of the Department of Agriculture under this item have been carried on jointly and cooperatively. We have taken up certain phases of the work, while the Federal Trade Commission has taken up other phases, and the report is to be published jointly as a joint contribution. Part of the report is now being printed and part of the report has been printed.

The CHAIRMAN. Did you cooperate with the Federal Trade Commission in the investigation?

Mr. LIVINGSTON. Yes, sir; our part in the investigation, Mr. Chairman, with reference to the packers, was to look into the cost of marketing from the producer to the packing house, to the stockyards; and then into the retail distribution of the meats. The Federal Trade Commission took up investigations in the central markets and investigation of the packers as such; the Department of Agriculture did not engage in that phase of the investigation.

The CHAIRMAN. Does the department take part credit for that report?

Mr. LIVINGSTON. No; the Bureau of Markets does not take credit for that report; we will take credit in part, however, for the report which is coming out soon, which relates to the cost from the producer or the shipping point to the terminal market, and also the investigation in which we are now engaged as to the cost of distributing meat from the local distributing houses to the consumer.

The CHAIRMAN. I had reference to the report made by the Federal Trade Commission—the report on the millers, packers, and tanners, for instance.

Mr. LIVINGSTON. No, sir.

The CHAIRMAN. You cooperated with them?

Mr. LIVINGSTON. We cooperated in doing a certain part of that work.

The CHAIRMAN. And you furnished them with certain data?

Mr. LIVINGSTON. Yes; we gave them all the information we had, but we did not actually enter into the investigation of the central markets; the Trade Commission took that over themselves. Our phase of the work was concerned with the cost of marketing up to the central market, and from the central market to the consumer. Reports regarding that work are now in course of preparation, and

some volumes are in the printer's hands. Page proof has recently been read upon part of them.

The CHAIRMAN. You covered certain parts of the work that was done?

Mr. LIVINGSTON. Yes; and in the grain investigation, the grain phase of the work, the Bureau of Markets cooperated with the Federal Trade Commission in studying the country-elevator situation and the terminal-elevator situation as well.

Mr. McLAUGHLIN of Michigan. Will you explain why the Bureau of Markets, which has to do with marketing, has anything to do with the preparation of food and the manufacture of food products?

Mr. LIVINGSTON. It is very difficult to distinguish between preparation for marketing and the marketing itself. It is just as hard to draw a line between the preparation for marketing and marketing, as it is to tell, for instance, where daylight stops and darkness begins, because the preparation for marketing is essentially a part of the marketing.

Mr. McLAUGHLIN of Michigan. But it is the preparation of food.

Mr. LIVINGSTON. The preparation for marketing.

Mr. McLAUGHLIN of Michigan. It is a process of manufacturing.

Mr. LIVINGSTON. We did not enter into the manufacturing phases of it because the Federal Trade Commission took up that phase of it—the milling of wheat and the packing-house operations. The Bureau of Markets did not engage in that phase of the investigation at all. You will recall that last year this item included authority to investigate and report upon the cost of production. The committee last year removed that authority from the item.

Mr. McLAUGHLIN of Michigan. Then you have had nothing to do with this question of investigating the manufacture?

Mr. LIVINGSTON. No, sir.

Mr. McLAUGHLIN of Michigan. And you don't intend hereafter to do that?

Mr. LIVINGSTON. No, sir.

Mr. McLAUGHLIN of Michigan. Then that word could go out?

Mr. LIVINGSTON. That word could go out, so far as we are concerned; yes, sir. This item, as I say, covers a very broad field and we have divided up the work with the Federal Trade Commission.

Mr. McLAUGHLIN of Michigan. How far do you go in this matter of investigating the preparation of food products?

Mr. LIVINGSTON. Only so far as it concerns marketing. For instance, in the preparation of fruits and vegetables preparation for market is a very important phase of the work which Mr. Sherman will discuss a little later in connection with standardization and grading. As a general statement, I will say that our investigations under this item have been confined strictly to marketing questions.

Mr. JACOWAY. In a way, this means the standard container and an investigation of the soundness of fruits and vegetables?

Mr. LIVINGSTON. Yes; the term "preparation for marketing" is a relative term, and by most people would be considered part of the marketing, because it is a very important part of marketing, when considered as meaning standardization, packing, and things of that sort.

Mr. McLAUGHLIN of Michigan. That means preparation for market, then?

Mr. LIVINGSTON. Yes.

Mr. McLAUGHLIN of Michigan. And that word "preparation" as used there doesn't mean in any sense the making or the manufacturing of it?

Mr. LIVINGSTON. No; it is grading, classifying, packing, and methods of shipping—things of that sort.

Mr. McLAUGHLIN of Michigan. "Preparation" is a pretty big word if you apply it only to marketing.

Mr. LIVINGSTON. Preparation for market, as we consider it, is an essential phase of marketing. It relates primarily to grading, packages, methods of shipping, and activities of that kind.

Mr. JACOWAY. In shipping peaches or strawberries, do you instruct the trade as to the amount that the package will hold, the physical condition in which the strawberry or peach must be before it goes into the package, how much room it will take up in a car, and how many packages you can put into a car, and things of that kind? That is what you mean by the word "preparation," isn't it?

Mr. LIVINGSTON. That is it. The preparation of a commodity has a great deal to do with the condition in which it arrives at the market and the price received.

Mr. JACOWAY. On it depends the whole question of whether you are going to sell it or not sell it.

Mr. LIVINGSTON. Very largely. It is a term, Mr. McLaughlin, that is tied up very closely with marketing, and a very broad interpretation of the word "marketing" would include preparation.

Mr. JACOWAY. If you didn't have this preparation, the trade would not buy the commodity, because they would not know what they were buying. Is not that the situation?

Mr. LIVINGSTON. Yes, sir.

Mr. McLAUGHLIN of Michigan. Take the preparation of breakfast food, for instance. "Preparation" there means the entire manufacture of it, doesn't it?

Mr. LIVINGSTON. That would be a manufacturing process, I should say, Mr. McLaughlin, rather than preparation for marketing.

Mr. McLAUGHLIN of Michigan. This doesn't say "preparation for marketing."

Mr. LIVINGSTON. We have interpreted it that way, "transportation, storage, preparation, marketing." Preparation, preceding marketing, has meant to us preparation for marketing, and we haven't gone outside of the agricultural field, outside of the strictly agricultural field, and I assure you that the bureau will not interpret that term in the broad sense that you have in mind. We would feel restricted if the word were eliminated, because there might be some question as to what the term "marketing" included; but I can assure the committee we will not give that word its very broad interpretation.

Mr. McLAUGHLIN of Michigan. The next item is 87.

Mr. LIVINGSTON. The next is 87:

For collecting and distributing by telegraph, mail, and otherwise, information on the supply, demand, commercial movement, disposition, quality, and market price of peanuts, and their products, \$12,000.

There has been no change in this item. The peanut growers are vitally interested in this service. A delegation came down to see us

recently asking for an extension and an increase in the work. If the committee desires we shall be very glad to have Mr. Sherman explain the work.

Mr. McLAUGHLIN of Michigan. Isn't this inquiry as to peanuts carried on in the same sections of the country where you are collecting data in regard to vegetables and fruits, and so forth?

Mr. LIVINGSTON. Yes, sir.

Mr. McLAUGHLIN of Michigan. Why can't that be done by the same service?

Mr. LIVINGSTON. It is done by the same men, Mr. McLaughlin.

The CHAIRMAN. Why should not this item be merged with some other item?

Mr. LIVINGSTON. If you are going to merge it with anything, I should say merge it with item 81.

Mr. McLAUGHLIN of Michigan. You have a separate organization for that, with an investigator at \$2,400, an assistant at \$2,040, and so forth.

Mr. LIVINGSTON. As I mentioned a while ago, Mr. McLaughlin, it makes no difference in the personnel whatever—the number of men required.

Mr. McLAUGHLIN of Michigan. I should think it would make a difference in the personnel if you have two or three heads to the thing.

Mr. LIVINGSTON. We don't have two or three heads, even though these items appear individually. For instance, Mr. Sherman is in charge of the fruit and vegetable division, and we have included peanuts in that division. We have no other man who deals with those commodities in the same way that Mr. Sherman deals with them. He deals with them in an administrative capacity. We have no specialist in marketing peanuts who has the same administrative authority that Mr. Sherman has. Mr. Sherman will administer that item regardless of whether it appears as an individual item or whether it is included in item 81. We will be very glad to adjust ourselves to the committee's desire. If they desire to put that work in item 81, it will be perfectly satisfactory to us.

The CHAIRMAN. If that is done, the work will be taken care of just the same as though it were carried in an independent item?

Mr. LIVINGSTON. Yes, sir.

The CHAIRMAN. I take it that the people interested in this news service want to know that the work is going to be done, and do not particularly care whether it is carried in two items or one.

Mr. LIVINGSTON. It would mean this: If you put it in that item you would add \$12,000 to the item for this particular service. When I spoke a while ago about grouping items, I referred primarily to commodities which are not related. For instance, we don't want to group fruits and vegetables with hay, because it takes a different type of man to handle those two items; but it so happens that fruits and vegetables and peanuts are handled by the same organization.

Mr. HARRISON. The peanut item was inserted by the Senate, you will recall, Mr. Chairman.

The CHAIRMAN. Yes, I recall; and it was suggested then that it be merged into some other item. At that time they wanted it carried as a separate item, at least for a year. I take it, if you can assure them now that the work will be done, they will be satisfied to have it go into another item.

Mr. LIVINGSTON. We will be very glad to adjust ourselves to the committee's desires.

Mr. McLAUGHLIN of Michigan. You suggest that 87 can be combined with 81 by adding the \$12,000 and the word "peanuts"?

Mr. LIVINGSTON. Yes, sir.

Mr. McLAUGHLIN of Michigan. But your item No. 81 calls for an increase of \$50,000.

Mr. LIVINGSTON. Yes, sir.

Mr. McLAUGHLIN of Michigan. Suppose that increase of \$50,000 should not be allowed by the Congress.

Mr. LIVINGSTON. That would be unfortunate.

Mr. McLAUGHLIN of Michigan. Then the peanuts would be included in there with a total amount less than the total of the two items now. Then what would you do?

Mr. LIVINGSTON. I should like to have you increase the total, Mr. Chairman, to make it equal to the sum of the two items now.

Mr. McLAUGHLIN of Michigan. There may be a majority of the committee who will be economically inclined and will not do it.

Mr. LIVINGSTON. I appreciate that, but I was assuming, in accordance with the chairman's suggestion a while ago, that this service would be carried on during the next fiscal year in the same manner and to the same extent that it has been during the past fiscal year. In order to do that we must have \$12,000.

The CHAIRMAN. I appreciate that, but you also appreciate that it is an unusual thing not to cut some items. If the committee should find it necessary to cut part of the \$50,000, what would become of the peanuts?

Mr. LIVINGSTON. I would suggest to the committee that the first thing to do is to decide on how much money they are going to permit us to have under item 81. After once having decided that question, add to it \$12,000.

The CHAIRMAN. How should that be indicated to the department?

Mr. LIVINGSTON. If you decide, for instance, Mr. Chairman, to give us \$269,000 for item 81, all that is necessary to combine the two items is to add \$12,000 to the \$269,600 for service on peanuts, and you will have it.

The CHAIRMAN. And so specify in the item?

Mr. LIVINGSTON. So specify in the item.

The CHAIRMAN. We do not want to set aside a lump sum by itself.

Mr. HARRISON. If you merely add \$12,000 to item No. 81, we will see that that amount is expended on the peanut market news service.

The CHAIRMAN. It is bad policy. We are drifting into politics every time we set out certain items.

Mr. LIVINGSTON. I appreciate the committee's position.

The CHAIRMAN. We want to treat the country as a whole; we do not want to foster any favorite project or anything of the kind. When we begin to set aside \$10,000 for North Dakota and \$10,000 for South Carolina, we get into politics.

Mr. HARRISON. And it requires additional bookkeeping.

The CHAIRMAN. Yes. We want to take care of the peanuts; we want to make it clear to you that they are to be taken care of. What would it be necessary for the committee to do?

Mr. McLAUGHLIN of Michigan. Last year, for example, you had \$250,000 under 81. Suppose that should be made \$262,000, which

would leave that amount in 81 the same as it was last year, \$250,000, and include the peanut item, \$12,000.

Mr. LIVINGSTON. In other words, what you are trying to decide—

Mr. McLAUGHLIN of Michigan. I am trying to tell you that some of these increases are going to be reduced.

Mr. HARRISON. Mr. McLaughlin, we would not know the purpose of that \$12,000, except in this way—and I think it has been done every year—if the committee will state in its report that this item has been increased by \$12,000 for, in this case, the conduct of a market news service on peanuts, the department would be guided by what the committee says in its report.

The CHAIRMAN. Then we will handle it in that way.

Mr. LIVINGSTON. We should prefer, however, that they add \$12,000 to the \$269,600.

Mr. HARRISON. We would much prefer that.

The CHAIRMAN. That may be done; we are not passing upon those things now.

The next is No. 88.

Mr. LIVINGSTON. The next is 88:

For enabling the Secretary of Agriculture to investigate and certify to shippers and other interested parties the quality and condition of fruits, vegetables, poultry, butter, hay, and other perishable farm products, when received in interstate commerce at such important central markets as the Secretary of Agriculture may from time to time designate, under such rules and regulations as he may prescribe, including payment of such fees as will be reasonable and as nearly as may be to cover the cost for the service rendered: *Provided*, That certificates issued by the authorized agents of the department shall be received in all courts of the United States as prima facie evidence of the truth of the statements therein contained, \$191,700.

If I may, I would like to suggest that hay be taken out of that item and be put in a separate item, for the reason that, while hay is not a perishable commodity, it is included with a lot of commodities which are perishable products.

Mr. McLAUGHLIN of Nebraska. May I ask what is the difference between information that you are getting and disseminating relative to hay in item 88 and in item 85?

Mr. LIVINGSTON. This is strictly an inspection service; whereas the other item relates to market reports on prices, supply and demand, etc. One item is strictly an inspection service and the other is a price service; and while dealing with the same commodity they are entirely different types of work. For instance, the market news service on fruits and vegetables, reports prices, car movements, and things of that sort, while the inspection service deals with the quality and condition of the fruit when it is inspected upon request on arrival at the market. This item provides for the inspection service. Information regarding quality and condition of products is given in the form of a certificate to the party interested, which certificate constitutes prima facie evidence in the United States courts as to the quality and condition of the fruit at the time and place of inspection. It has nothing to do with prices, only dealing with quality and condition.

Mr. McLAUGHLIN of Michigan. How many of those inspectors have you now?

Mr. LIVINGSTON. I will have to get that information.

Mr. JACOWAY. Under the law the certificate of inspection is taken as prima facie evidence in a court of justice?

Mr. LIVINGSTON. Yes, sir.

Mr. JACOWAY. That provision was incorporated in the law some two years ago. Don't you find that of great advantage to the shipper?

Mr. LIVINGSTON. I think it is, sir.

Mr. JACOWAY. In other words, don't it cut off a great deal of dishonest dealing on the part of people who want to act dishonestly, especially with the shipper of perishable products?

Mr. LIVINGSTON. It does. I will call attention to a thing which came to my notice very recently. A car of a certain commodity—I have forgotten what it was, one of the fruits or vegetables—arrived at Galveston for export to Cuba. The shipper back in the country received a telegram from the forwarding agent stating that the car was in bad shape; that it had to be rebagged and sorted, and that it would cost the shipper about \$200. The shipper called for an inspection on the car from one of our men employed under this item 88, and the inspection certificate showed that there were only three bags out of the whole lot that were in any way out of condition. This saved the shipper about \$200. He paid \$2.50 for the inspection service and avoided paying \$200 in resacking and sorting charges. The direct monetary result is not the only thing to be considered, moreover, but the indirect result—which to my mind is more important—is the breaking up of such a practice as that. That forwarding agent is not going to send back very many reports of that kind now that he knows the inspection service is going to be utilized.

Mr. JACOWAY. It has a tendency to eliminate dishonest commission merchants all over the United States?

Mr. LIVINGSTON. Absolutely. I am sure Mr. Sherman, who is dealing with this problem every day, can give you a number of illustrations of that kind.

Mr. HEFLIN. Have you figured out now the amounts annually that you think you would need?

Mr. LIVINGSTON. For the Bureau of Markets; yes, sir, \$3,023,395.

Mr. HEFLIN. Do you think any reduction in that amount would seriously cripple the work?

Mr. LIVINGSTON. It would, in our opinion; yes, sir. In fact, we think the amount ought to be increased.

Mr. McLAUGHLIN of Michigan. I missed the answer to my question as to how many of these inspectors you have and where they are located.

Mr. LIVINGSTON. Mr. McLaughlin, you will notice that we are asking for an increase of \$50,000 in this item, to be expended for two things: First, \$15,000 for inspection on butter, and through a typographical error there was omitted also "and poultry products." In other words, we want to spend \$15,000 on dairy and poultry products and the remaining \$35,000 for hay.

In order that the committee may have a background of what this service is, I am going to ask Mr. Sherman to make a very brief statement regarding the inspection service on fruits and vegetables. The work on butter and poultry products will be substantially the same as

that done with reference to fruits and vegetables. Mr. Sherman will also answer the question about the number of inspectors we have.

The CHAIRMAN. You may proceed, Mr. Sherman.

FURTHER STATEMENT OF MR. WELLS A. SHERMAN, SPECIALIST IN CHARGE OF FRUIT AND VEGETABLE DIVISION, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.

Mr. SHERMAN. The inspection service, as you know, is a definite service offered to the public at a definite price.

Congress has dignified the standing of the certificate that we issue by making it prima facie evidence in court in case the controversy goes to court, as it has in a number of cases. There are certain restrictions which you have placed upon this service, one of which is that the goods must have moved in interstate commerce. I presume that the idea there was to limit the amount of our work, but the practical result is to limit the amount of our collections, because our man in New York City may inspect the first and the third car in a train of potatoes which originated in New Jersey or Pennsylvania, but can not inspect the second car that happens to originate in New York State.

There is another restriction in that we can make these inspections under the language of the bill only in markets designated by the Secretary, and the Secretary, of course, could hardly designate every town on the map where somebody might want an inspection; so around each of the inspection centers there are designated a few points of secondary importance which our men can reach, and if a man goes out from Philadelphia to Allentown or Harrisburg to make an inspection, there is added to the price of the certificate his car fare out and back. So that if a man in Harrisburg wants an inspection, it will cost him \$2.50 plus the carfare from Philadelphia and return. If a man in Philadelphia calls for the inspection, he gets it for \$2.50.

Mr. McLAUGHLIN of Michigan. Is this work growing?

Mr. SHERMAN. It has grown to the point now where we can not hire inspectors enough to do the work, because the railroads have issued orders in some cases to their claim agents not to entertain any claim—that order was issued in Philadelphia—that was not supported by a Government inspector's certificate. That is to say, if a dealer in Philadelphia receives a car of potatoes partly frozen and wants to lodge a claim against the railroad company, the railroad company will not entertain his claim unless he has our inspection certificate, which shows just exactly what proportion of the potatoes are frozen and all other facts as to the condition of the car in which the frozen potatoes are found, by which they can determine pretty accurately whether they are responsible.

The CHAIRMAN. Are fees charged in all cases for the inspections?

Mr. SHERMAN. In all instances. There are no exceptions.

Mr. JACOWAY. At how many places in the United States can these inspections be made?

Mr. SHERMAN. I have a list here. I will have to stop to count them up. There are 29 major points—163 points altogether. On the map the large red dots indicate the points where we have inspectors permanently located.

Mr. JACOWAY. It is possible, then, for the entire shipping public of the United States to get this inspection service if they want it?

Mr. SHERMAN. No, sir; not at all.

Mr. JACOWAY. Shouldn't that be extended to all the people? Don't you consider it very important?

Mr. SHERMAN. We consider it very important work and one of the services which should be extended. It is one of those services which is making for better moral and ethical conditions in the trade. The news service, the inspection service, and the work in grading and standardization, all contribute to the morals and ethics of the industry by bringing about a better understanding between shippers and receivers.

Mr. JACOWAY. It increases production, too, doesn't it?

Mr. SHERMAN. It increases production. We went into that very elaborately this morning with reference to market news items.

Mr. McLAUGHLIN of Michigan. How much money are you collecting from inspections?

Mr. SHERMAN. In the last six months, from the beginning of this fiscal year to the 3d day of January, we had collected \$28,604. That is for the first six months of this fiscal year. Of course, in the preceding fiscal year the work was newer, we had a smaller number of men; it was in the pioneer state and collections for the preceding fiscal year were \$45,000. We are running at the rate now, you see, of over \$57,000 for this year, and that is on a \$2.50 fee per car. So you see a great many of these men are not only busy but are overworked. We have a chart that will show you the number of inspections that were turned down because we could not hire men enough to do the work. We have turned down from July to October only of this year, 967 applications for inspections because we hadn't the men to do the work, or because the men were working 10 or 12 hours a day and there was not enough daylight to cover additional cars. Of course, that doesn't represent the business we might have done, because the receivers who have cars that they want inspected at points that have not been designated have stopped making applications.

Mr. JACOWAY. How many cars would 967 applications include?

Mr. SHERMAN. Each application represents a car lot. That represents the total that you see here [indicating on chart]. There were this many inspections made during these four months. This was the number that was turned down because there were not sufficient inspectors. You will observe that the largest number turned down was in Pittsburgh. Four hundred and eight applications were turned down in Pittsburgh alone because of the peculiar conditions that exist there.

If you want a very definite, specific statement of exactly how the service works at the point where I should say it is most highly appreciated and most completely used both by the trade and the railroads, I would be glad to have Mr. Robb, who has been in Pittsburgh ever since the work started and has just been brought to Washington, give you that information.

Mr. JACOWAY. We had a man in Arkansas who represented a number of sellers of different kinds of perishable products. He picked out a commission merchant in Chicago that he thought was honest and shipped all these carloads of apples, peaches, watermelons, etc..

to him, and every time he got a return on a car something was wrong with it. So he came here to see me about it. I got busy with him through the Department of Justice, and, as a result, the Chicago man had to return over \$4,000 to the shippers there. This service will correct that, not only in cases like that, but in all other similar cases, will it not?

Mr. SHERMAN. It has corrected it in a great many cases, and we have found, Mr. Chairman, that the result has been in certain markets where we have put an inspector that he has had a great deal of business to do for a short time. Cars were shipped in and buyers would turn them down, alleging something was the matter, and he had a great deal of business for a little while. He issued a few certificates which showed up the game, and the unjust rejections ceased and the man has practically worked himself out of a job. But he was performing exactly the same function that a policeman performs in the suppression of violence and disorder in a city.

Mr. HEFLIN. How many of these inspectors have you?

Mr. SHERMAN. Forty-three inspectors are in the field now, and we need at this moment at least 10 more, in order to take care of the business actually offered and the business which the railroads tell us they will demand in the spring. I might say that the Louisville & Nashville road in Cincinnati has served notice that when the strawberry movements starts from the South coming into Cincinnati they are going to demand Government inspection on every car on which they can't get a clean delivery.

Mr. JACOWAY. Isn't it the only protection that the producers have that will enable them to get a fair price for what they ship to the commission merchant in case controversies arise?

Mr. SHERMAN. It is the only protection I know of.

Mr. JACOWAY. It is absolutely the only protection?

Mr. SHERMAN. It is the only protection of which I know.

Mr. JACOWAY. Because if they bring suit they have got to travel thousands of miles and go to a hostile forum in many instances, and wherever this Government certificate comes in under this law, which says that it shall be prima facie evidence in a court of justice, it seems to me that that settles the question almost absolutely, provided your service could be universal in the United States.

The CHAIRMAN. Have you done anything in the way of inspecting hay?

Mr. SHERMAN. Nothing whatever.

The CHAIRMAN. Have you had many applications?

Mr. LIVINGSTON. We haven't had a man to do it, Mr. Haugen. We hope to take that up next year, and for that purpose we are asking an increase of \$35,000 in this item.

Mr. SHERMAN. Mr. Chairman, if this committee should see fit to make the money that we collect from this service a revolving fund, out of which we could hire additional inspectors, we could take care of it. We wouldn't have to ask you to increase this item. This business next year would take care of itself. See what is getting away from us now, 408 applications in Pittsburgh with three men there.

The CHAIRMAN. If we allow this amount, how much will you turn into the Treasury from the fees?

Mr. SHERMAN. About \$58,000 a year, at the rate we are going now.

The CHAIRMAN. You will turn in next year not quite half of the amount of the appropriation?

Mr. LIVINGSTON. Mr. Chairman, may I suggest that that is on the inspection fee of \$2.50; and we are considering raising that to a higher figure, which will automatically increase the amount of money that comes in, and therefore the amount which is turned in to the Treasury.

The CHAIRMAN. Are we safe in saying that half of the appropriation will be returned to the Treasury?

Mr. LIVINGSTON. On the item as it stands to-day I should say that would be a fair statement.

The CHAIRMAN. You say you intend to increase the fee?

Mr. LIVINGSTON. We are talking about it now. We have it under consideration.

Mr. McLAUGHLIN of Michigan. Do you have in mind what your increase will be?

Mr. SHERMAN. Probably we will double the fee.

Mr. McLAUGHLIN of Nebraska. It ought to be doubled.

Mr. SHERMAN. It is generally believed that we can double that fee without substantially decreasing the business.

Mr. HEFLIN. If you do double it, in your opinion what will you be able to turn into the Treasury in a year?

Mr. SHERMAN. The opinion of our men in the markets is that the increasing of this fee to \$4 would not materially lessen the number of applications. There is usually so much at stake in the car—practically the smallest amount at stake is a difference of \$25. If there is a claim lodged against the car at all, it is at least \$25 and it is liable to be \$300 or \$400. So I think with the larger fee we should be able to turn in over \$80,000.

The CHAIRMAN. How much do you charge on a small shipment?

Mr. SHERMAN. \$1.50 on half a carload; for over half a car it is \$2.50.

Mr. LEE. Don't your men find, as a rule, that the amount in controversy runs into the hundreds of dollars, instead of being less than \$100?

Mr. SHERMAN. Yes, sir.

Mr. ROBB. I will say that most controversies run from \$50 to \$200. Sometimes, of course, there will be a complete loss of a car. I have known it to go as high as \$1,500 in a car of strawberries.

The CHAIRMAN. What is the charge for the inspection of a car of wheat?

Mr. LIVINGSTON. It varies considerably.

The CHAIRMAN. It seems to me when you get it up to \$5 you are getting inspection fee pretty high. Of course, it requires more investigation to pass upon perishable commodities than it would ordinarily in inspecting a car of wheat.

The thought was that, if there is a controversy, shippers might appeal to the Department of Agriculture and have this question settled?

Mr. SHERMAN. Yes, sir.

The CHAIRMAN. That was the thought we had in mind. I think we all appreciate the value of this service.

Mr. HEFLIN. Who pays for the inspection of the wheat when it arrives at the market?

Mr. LIVINGSTON. The shipper.

Mr. HEFLIN. That is apart from this inspection service that we have been discussing?

Mr. LIVINGSTON. Oh, yes.

Mr. HEFLIN. If your man is called in he must make his charge?

Mr. LIVINGSTON. He makes his charge, yes.

Mr. HEFLIN. When a dispute arises as to the condition?

Mr. LIVINGSTON. Yes, sir.

Mr. JACOWAY. Have you ever had a complaint from anyone as to the fee charged? In other words, don't they gladly pay the fee?

Mr. SHERMAN. Yes; most of the large commercial interests think the fee is ridiculously small, and such inspections as private agencies have made for fees heretofore have always been for at least a \$5 charge.

Mr. HEFLIN. Don't you think, though, that you ought not to put it high and thereby get it out of the reach of the little fellow?

Mr. SHERMAN. No, sir.

Mr. HEFLIN. Five dollars might be high for some.

Mr. SHERMAN. But not when there is \$100 at stake.

The CHAIRMAN. Should you charge a uniform rate?

Mr. SHERMAN. Fruits and vegetables are made uniform, but the labor of making inspections differs on different cars tremendously. You send a man to inspect a car loaded with sacks of potatoes, loaded so high that he can't climb over them, can't get in, and he has got to dig out and get samples from the bottom, potatoes on the lower layer, because often they freeze on the floor, and he has got an enormous amount of physical labor to perform. These men actually work, and that is one of the difficult things about this service, you have got to have the combination of an able-bodied laborer who is willing to get in there and do a lot of dirty, hard work, and a man technically qualified to judge of the condition that he finds.

The CHAIRMAN. It wouldn't require as much labor to inspect a car of hay as it would to inspect a car of potatoes.

Mr. LIVINGSTON. That would depend on circumstances.

The CHAIRMAN. It will have to be left to future consideration.

Mr. LIVINGSTON. The next item is No. 89. Mr. Murph, who will present that item, is unavoidably detained, and I suggest that we pass it over until to-morrow.

The CHAIRMAN. Very well.

AFTERNOON SESSION.

WEDNESDAY, JANUARY 14, 1920.

STATEMENT OF MR. DANIEL S. MURPH, SPECIALIST IN COTTON MARKETING AND WAREHOUSING, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.

Mr. LIVINGSTON. If it is agreeable, Mr. Chairman, we will take up the next item, No. 89, on page 252 of the estimates. That is the item

that we passed over yesterday in the absence of Mr. Murph. This item reads as follows:

For investigating, demonstrating, and promoting the use of standards for the different grades, qualities, and conditions of cotton, and for investigating the ginning, grading, stapling, baling, marketing, compressing, and tare of cotton, etc.

There is no change in the amount.

Mr. McLAUGHLIN of Michigan. You may remember, Mr. Murph, when you were with the committee that I raised some objection to the use of money for operating a mill to test the textile strength of cotton, and so on, insisting, in my feeble way that that is not a marketing proposition at all. What are you doing along that line now?

Mr. MURPH. The tests have covered in the past the various grades of cotton, showing their waste and tensile strength. During the war period we were particularly engaged in connection with the Signal Corps Service of the Army in testing cotton for aeroplane balloon fabric. Up to that time only Egyptian cotton was used, and the specifications called for the use of Egyptian cotton in manufacturing that sort of fabric. As the result of the tests we made, we found that Sea Island and American Egyptian cotton, while probably not quite up to the Egyptian cotton in strength, yet was of such a nature that balloon and aeroplane fabric could be made from these cottons, and the War Department, as a result of that test and investigation that we made, changed the specifications so as to allow the use of these American-grown cottons, which, of course, made available for the purpose much larger quantities of cotton than otherwise would have been available.

Mr. McLAUGHLIN of Michigan. What kind of apparatus and paraphernalia have the Government for that kind of work?

Mr. MURPH. We have a little apparatus for testing here, but the most of the work is done in cooperation with the mills. They are very glad to allow us the use of certain parts of their machinery for making the tests that we make.

Mr. McLAUGHLIN of Michigan. But the Government has a plant of its own, has it not?

Mr. MURPH. We have a little machinery of our own here.

Mr. McLAUGHLIN of Michigan. Where is that?

Mr. MURPH. We use the machinery at Clemson College, South Carolina, and at the Agricultural and Mechanical College at Raleigh, N. C., chiefly for checking up the tests. The machinery that we own here is only tensile strength apparatus and a piece of machinery for moisture test. The most of the work, as I say, is done primarily at the mills, and is checked up at the agricultural and mechanical colleges.

Mr. McLAUGHLIN of Michigan. What use is made of the information gained in that way?

Mr. MURPH. For instance, the information we gained in reference to the airplane fabric was useful in the way that I have indicated just a few moments ago.

With reference to other work, our tests have shown certain facts with reference to the real value of certain grades of cotton, and they are guides upon which people interested have tried to fix in their own minds something of the intrinsic value, as we might say, of

cotton. For instance, if mills find as the result of our tests that cottons of certain grades have certain spinning qualities, which they did not realize thoroughly that it had before, there is a demand created for cotton of that kind, and on the other hand, persons who have cotton to sell and, knowing of its intrinsic value, are able to trade more intelligently as to the real value of the cotton that they hold.

Mr. McLAUGHLIN of Michigan. Have the facts that you have developed in this line of work influenced the fixing of the standards?

Mr. MURPH. You mean did they influence the determination in our minds of what should enter into the standards when the department fixed the standards?

Mr. McLAUGHLIN of Michigan. Yes.

Mr. MURPH. No, sir; I can hardly say that. The standards were fixed some time ago, but these tests relate to cotton of the official standards. We refer to the official standards in making these tests, so that when the information becomes available it is available with reference to cotton of particular standards, which are known. During the past year, just as a further illustration, if you will permit me, the advances of the boll weevil appear to have about wiped out the Sea Island cotton industry. We seem this year to be reduced to possibly not more than 10,000 bales, from 100,000 bales a few years ago. This, as you know, is an extremely valuable sort of cotton, and this cotton is in very great demand for certain kinds of fabric, and effort is being made to develop a cotton which will mature early in that section of the country and which therefore may be planted to some extent in place of the Sea Island cotton, as we have it now. That cotton is known as the Meade cotton. It has a good staple, and we have made a preliminary test of Meade cotton as compared with Sea Island cotton, which we expect to follow by making a little more complete test. After making the tests we have in mind at present on the Meade cotton, we should be able to give some very definite information as to the comparative value of Meade and Sea Island cotton, to indicate whether, as a matter of fact, the Meade cotton can be substituted in use for the Sea Island cotton.

Mr. YOUNG. Some of the manufacturing establishments—in fact, most of them, I assume—must of necessity have this long-staple cotton in certain weaves of goods?

Mr. MURPH. Yes.

Mr. YOUNG. And, if we finally lose out by reason of the boll weevil, we shall have to import that cotton?

Mr. MURPH. We shall have to import that cotton.

Mr. YOUNG. I was going to ask you a question along that line. The growers in the Imperial Valley in California, and some valley in New Mexico or Arizona, I believe, which has an irrigating proposition, propose to raise a long-staple cotton, and I notice their acreage is increasing from year to year. Does that long-staple cotton measure up in quality to anything like the Egyptian cotton?

Mr. MURPH. It is comparable. It has been said that its spinning value is not quite so great as that of the Egyptian. That is, that possibly the Egyptian cotton may be a little more suitable for certain purposes than the American Egyptian cotton. As a matter of fact, there have been times during the past season, however, when the

American Egyptian cotton was selling at a better price on the market than the Egyptian, and this indicates that it is of very high character. The acreage, which last year was around 85,000 acres, it is possible, will be about doubled this year; that is, they are expecting to plant about 175,000 acres.

Mr. YOUNG. Where is that increase—in California or Arizona?

Mr. MURPH. It will be largely in Arizona and will be developed somewhat in California, too. There is a section of territory out there which seems to me especially suitable for this cotton, a section of territory in California in which some short-staple cotton has been grown which seems to be suitable for long-staple cotton; therefore there is no reason why it should not be grown there.

Mr. YOUNG. The boll weevil has not made its appearance there?

Mr. MURPH. No, sir. That is a reason why we are interested in trying to show whether or not a particular character of cotton may also be substituted for Sea Island cotton. If this Meade cotton turns out well and can be substituted very largely for Sea Island cotton, we will be in a position to plant the Meade. The wiping out of 100,000 bales of that cotton was a very serious blow.

Mr. HUTCHINSON. Do not most of the long staples go into automobile tires?

Mr. MURPH. Yes, sir. One of the subsidiary companies of a tire company plants about 20,000 acres of American Egyptian cotton—

Mr. HUTCHINSON (interposing). This Sea Island cotton—in what particular goods is it used?

Mr. MURPH. It is used in fancy goods, fine goods, laces, and things of that kind, and it is woven into other goods that are of a more practicable, serviceable nature, but of a fine class.

Mr. HUTCHINSON. Mercerized cotton?

Mr. MURPH. Yes, sir.

The CHAIRMAN. Thank you very much, Mr. Murph.

MONDAY, JANUARY 12, 1920.

AFTERNOON SESSION.

The CHAIRMAN. What is next, Mr. Harrison?

Mr. HARRISON. Mr. Thompson, who is in charge of our State co-operation in marketing work, is compelled to leave the city this afternoon, and so, with your permission, we will take up item 91, on page 254. We will see that the discussion appears in its proper place when the hearings are printed.

TUESDAY, JANUARY 13, 1920.

AFTERNOON SESSION—continued.

The CHAIRMAN. The next item is No. 90, "To enable the Secretary of Agriculture to make studies of cooperation among farmers in the United States," and so on. That item is dropped from the Bureau of

Markets, because the work has been transferred to the Bureau of Farm Management, and the lump-sum appropriation correspondingly reduced.

The CHAIRMAN. We will be glad to hear you now, Mr. Thompson. You might state what item you will take up.

STATEMENT OF MR. C. W. THOMPSON, IN CHARGE STATE COOPERATION IN MARKETING, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.

MR. THOMPSON. The item is No. 91, "To enable the Secretary of Agriculture to cooperate with the several States in the employment of agents to acquire and diffuse useful information connected with the distribution and marketing of farm products through investigational, demonstrational, or extension methods."

I call your attention to the map which shows in orange color the States in which we have cooperatively employed agents at this time. There is also indicated in green the States with which cooperative relations will be established in the event that the proposed increase in the appropriation is granted. In other words, we have under the existing item with the funds at our disposal cooperative relations with the States you see there in orange color.

The CHAIRMAN. Will you give the names of some of the States? The map will not show in the record.

MR. THOMPSON. I shall indicate it in the record. Of course, I can give all the States now if you so desire. Cooperative work is being conducted with the following States: New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, Ohio, Indiana, Michigan, Virginia, North Carolina, South Carolina, Georgia, Tennessee, Mississippi, Missouri, Arkansas, Texas, Minnesota, Iowa, Nebraska, North Dakota, Montana, Colorado, Utah, New Mexico, Washington, and Oregon.

MR. YOUNG. Wouldn't it be easier to give those with which we have no cooperative relations? There are only a few of those.

MR. THOMPSON. Yes, sir. The States that are ready to take up cooperative work with us under this item, and with which it is intended to arrange relations, are Maine, New York, Pennsylvania, New Jersey, Florida, Louisiana, Wisconsin, South Dakota, Kansas, Oklahoma, Wyoming, and Idaho.

MR. RUBEY. What State is that down there in white, in the South?

MR. THOMPSON. That is the State of Alabama.

MR. HEFLIN. What does that mean—the white?

MR. THOMPSON. It means that those States have not taken up the matter with us to the extent of indicating that they would have funds for use in the cooperative employment of a joint marketing agent in the State.

MR. HEFLIN. You mean to say that the bureau of markets in Alabama does not cooperate with your department?

MR. THOMPSON. We have informal cooperation with every State, Alabama and all the others in white, the ones to which you refer, but when we say "formal cooperation," it means we contribute financially toward cooperative arrangements and contribute, perhaps, something toward the salary of cooperatively employed agents in the States.

The question you naturally would ask is, "How are these funds used?" Largely, I should say, on the salaries of marketing agents stationed in the States, who are cooperatively employed by a State agency and by the Bureau of Markets, and whose work is confined to the State for the most part.

Mr. TINCER. In all of the States marked in orange you are spending money in that way?

Mr. THOMPSON. In all the States marked in orange we are now spending money, and the States themselves are spending from two to three times as much money as we are on the joint arrangement.

Mr. TINCER. In the States marked in white you don't intend to spend any money next year?

Mr. THOMPSON. There is no present request such as we have in States marked in green. Now, it is possible that something might develop in the course of the year which would lead one of the States in white to take up the matter with us, and we with them, perhaps. It may be that one of the States painted in green would fail to come across so that we could make arrangements with them. For instance, take the State of Kansas. We had almost completed arrangements with the State of Kansas a considerable time ago for the employment of a man, but it happened that Kansas permitted the State of Wisconsin to take that man, Prof. Macklin. They appointed him on the staff of the State Agricultural College at Madison. Kansas has not been able since then to select a man, so the matter has been held in abeyance.

Mr. RUBEY. How many State legislatures have passed laws providing for some sort of a marketing system?

Mr. THOMPSON. There are 27 States that have what we call State market bureaus, which are provided for in one way or another under a special State law.

Mr. HEFLIN. Alabama is one of them.

Mr. THOMPSON. Alabama is one of those States. I have before me here a map which shows in red the States that have State bureaus of markets.

Mr. RUBEY. It might be well to put in the record the States that have those.

Mr. THOMPSON. Those States are as follows: Maine, New Hampshire, Vermont, Massachusetts, New York, New Jersey, Pennsylvania, Ohio, West Virginia, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Missouri, Arkansas, Louisiana, Oklahoma, Texas, Wisconsin, Minnesota, South Dakota, Nebraska, Idaho, Washington, and California.

Mr. HEFLIN. What will it cost Alabama to get this cooperative work?

Mr. THOMPSON. The actual cost may be very slight. That is, we might put in a joint man under conditions where possibly the State would put in anywhere from \$1,200 to \$2,000. Of course, they have to pay the traveling expenses of the man. They pay for clerical assistance also. We apply our funds generally to the salary of the agent, leaving it to them to supervise the question of travel and local detail.

Mr. HEFLIN. Does the State that wishes to cooperate with you make application?

Mr. THOMPSON. It does.

Mr. HEFLIN. Do you tell it what is necessary to be done?

Mr. THOMPSON. That is one way. As a matter of fact, we make it a point, as rapidly as we can—I myself for one and others of the staff—as we travel through the States, we stop off as we can, both at the agricultural college and at the State bureau of markets, get acquainted with them, acquaint them with what we are doing, and show them the ways in which we can work with them.

Mr. JONES. The States that are in green on this map and the States that are in orange take care of it now through their State force; and the ones that are in orange have helped from the Federal Government?

Mr. THOMPSON. No; the States in green do not have marketing agents at this time. Those that are in green are the ones with whom we would establish cooperative relations if the increase were granted.

Mr. JONES. Do not the States themselves take care of it now without coordination with the Federal Government in the green States?

Mr. THOMPSON. To such an extent as they are conducting marketing work. However, you will find in many cases they are handicapped and they are not in a position to do what they would do immediately if we would join with them in the employment of joint cooperative agents.

Mr. TINCHER. Who are you corresponding with, for instance, in Kansas about their getting into this arrangement?

Mr. THOMPSON. In Kansas we have taken it up personally on the ground at Manhattan with the agricultural college authorities, and they have also taken it up with us here in the city.

Mr. TINCHER. You say the reason they have not been participating in the fund is their inability to get a suitable man?

Mr. THOMPSON. That is the difficulty that interrupted our perfecting arrangements some time ago.

Mr. PURNELL. The trouble is they send their best men to Congress. [Laughter.]

Mr. TINCHER. They haven't a State law establishing a State bureau of markets, have they?

Mr. THOMPSON. They do not have a State bureau of markets, as you see here; no.

I have just been reminded that in speaking of the ways in which we operate—and that is the thing that I intend to come to presently—we cooperate, of course, with the State bureaus as well as with the colleges, and I could mention a number of States. Take, for instance, the State of Ohio. There we have a State bureau of markets, and we have the agricultural college, of course, at Columbus. We have cooperative arrangements with both.

I may say that in the State of Wisconsin, which is in green, we have a State bureau of markets, and we have a request from both the agricultural college and from the State bureau, and have taken steps, initial steps toward the perfecting of cooperative arrangements.

Mr. ANDERSON. What is the purpose of this cooperative arrangement? Is it extension work, or investigation, or what?

Mr. THOMPSON. It is both. It provides for extension work and for investigation work. These men, stationed either at the college or at the State bureau, are men that acquaint themselves as rapidly as

they can with local conditions, with a view to determining what the local marketing needs are, and with a view to developing a program of work along the lines which seem to promise best results in marketing work. Now, at the same time it is realized that the marketing work in any State, besides having its local aspects, which need to be understood first, also has its interstate aspects, and the agent who is cooperatively employed is a man who must be familiar not only with local conditions and needs, but must understand what lines, perhaps, are most important to take up. For example, in one State, such as the State of Iowa, it will be live stock or grain marketing; down in the State of Arkansas it might be sweet potatoes for one thing and live stock; out yonder in such States as Nebraska it might be grain marketing for one thing. It will be different in different States. The special lines that will be attacked at the outset will depend upon the marketing needs of the States.

Mr. PURNELL. What does all that mean? What do they actually do by way of investigation?

Mr. THOMPSON. They assemble information within the State regarding marketing organizations, in order to be in a position to assist local marketing organizations both in the organizing of associations and in keeping them going.

Mr. PURNELL. The Federal Bureau of Markets, then, merely assists the State organization?

Mr. THOMPSON. The Federal bureau assists the State organization through this jointly employed man in cases where perhaps they would not have any one man for particular studies. But in the main I will say that the work of these marketing agents is to furnish information, to serve as a clearing house of information to the farmers and to the farmers' associations in the State, and especially to the county agents.

Mr. PURNELL. Is their work beyond the experimental stage? Has it reached the point where you are able to say that the Government is justified in spending over a million dollars in conducting this sort of work?

Mr. THOMPSON. Your million dollars refers, of course, to something else, does it not?

Mr. PURNELL. It means to the whole matter. I don't mean this particular branch with which you are dealing, but I mean the Bureau of Markets generally. In your judgment, is it beyond the experimental stage?

Mr. THOMPSON. Yes; in many respects. There are many lines where we can show very definite results from particular activities, and where we can put a monetary value on the results of those activities.

Mr. PURNELL. How do you reach that conclusion as to its monetary value?

Mr. THOMPSON. To answer that it will be necessary, of course, to particularize.

Take, for instance, the example of our field agents—well, we will take one at a time—take the State of Iowa. One of the things that Mr. Foster, our field agent in Iowa did was to provide for a State exchange list, through which farmers and others, with the aid of the county agents, would find out where they could get pure-bred live

stock, seeds, and feeds, and, in other words, make known the surplus of pure-bred live stock and seeds by counties, so that they could exchange locally, instead of going outside of the State, perhaps, to get that information.

Mr. JONES. Let me interrupt you there. Why couldn't the State, through its own organization, do that same thing?

Mr. THOMPSON. That is the thing we are helping and encouraging the States to do.

Mr. JONES. Why couldn't the States do it themselves?

Mr. THOMPSON. The answer is that the States with whom we cooperate have not taken it up. They are not ready to do it. They haven't the money in some cases. Even where they have established State bureaus I could cite examples where they would not be able to take up the work they now have. In Ohio, for example, they would not have the funds; they would not be able to conduct the work.

Mr. JONES. Is it your opinion that these States would take this thing up when they saw the necessity of it if they knew they were not getting aid from the Federal Government?

Mr. THOMPSON. On the other hand, the answer I shall give is this, that our attitude is to furnish a sort of a nest egg where we give \$500, and they give \$1,500 or \$2,000, and the \$500 that comes from us makes it possible to appoint a \$2,500 or \$3,000 man, and it is from that point of view that we approach the appointment of these men in the States.

Mr. HEFLIN. You are trying to show these States the importance of it?

Mr. THOMPSON. Yes.

Mr. HEFLIN. And it may be that later on they can do the work, after they get organized?

Mr. THOMPSON. Yes. The more money they can put into it, of course, the less we will, and we always give a minor fraction of the funds necessary.

Mr. McLAUGHLIN of Michigan. You don't think there is any lack of money in Ohio, do you?

Mr. THOMPSON. There is not the money available at this time for the marketing work which is being conducted, and our funds have been instrumental in putting men in the State where there were none before.

Mr. JONES. How about Pennsylvania?

Mr. THOMPSON. The State of Pennsylvania has recently made provision, and rather generous provision, for a State bureau of markets.

Mr. JONES. I am going on the assumption that the various States have just as bright men to handle this proposition as the Federal Government could get from the States, and I can't understand why the States, if they see the necessity for this thing, can not develop it themselves. All the States that are financially able to do it are simply seeking Federal aid because the other States are getting Federal aid. That is the only reason they are getting it.

Mr. THOMPSON. The point raised is a very important one, I think, and the answer I believe would be this, that in order to handle the marketing work it has been approached from an interstate as well as from a local standpoint, and the States with the aid of their local information are not in a position to command the interstate relation and the facilities that we have in the Federal bureau which we combine with theirs in the conduct of the work.

Mr. JONES. Will you tell me why John Smith, because he is employed by the Federal Government, has more knowledge of interstate matters than John Smith who is employed by the State?

Mr. THOMPSON. Yes, sir. An example of that would be, for instance, the following: As a joint employee he would be brought in touch, in intimate touch, with all our projects.

Mr. JONES. In other words, he would study?

Mr. THOMPSON. He would study the problems.

Mr. JONES. Couldn't a fellow in the States study them, too?

Mr. THOMPSON. He would know our grades, he would know the standards for one thing, and he would be in a position to connect up with our market news services and help to make the market news service, which is a national service, connect up with the local service in the State, and thus extend the usefulness of the service within the State.

Mr. RUBEY. Isn't this a fact, that some years ago, before the United States Government began this work, there wasn't any of this work done, or practically none of it done in any of the States, and it was only after the Government took the initiative and organized the Bureau of Markets and got into this work and demonstrated the benefit of it that the States took it up and it became in general use all over the country? Isn't that a fact?

Mr. THOMPSON. Yes. I should go on further and say that it must be remembered that the information gathered by the Federal Bureau of Markets is outstanding in importance, and that it is a very important thing to get that information in a practical way to the States, to the farmers, to the county agents; and all these men that we are talking about are the intermediaries to whom the county agents and the State associations look.

If you will give me an opportunity I would like to illustrate concretely how these marketing men bring the information within the State.

Mr. ANDERSON. You just spoke about county agents. I think I will ask you at that point the question that we have asked everybody else. Why can't the county agent do all this work?

Mr. THOMPSON. Mr. Anderson, we are trying to get the county agents to do the work. These marketing men are simply teaching the county agents how to do it. Let me give you an illustration: Here is a marketing specialist invited down to see the county agent in a certain county, and he goes with him out into the country to take up a problem of importance in that county which perhaps takes him four or five different places. The method of this marketing agent, the specialist, is to put it up in such a way that the county agent gets it as quickly as possible, and before he gets through with his third or fourth place he leaves it not to himself to make the demonstration, but he has the county agent do it, in order that when he leaves him the county agent may be able to go on and do it in other places.

Mr. JONES. You, see, Mr. Thompson, we are trying to ascertain somewhere in the course of these hearings before we get through what the county agent really does, and we haven't been able to ascertain yet.

Mr. RUBEY. I want to ask unanimous consent that we recall the previous speaker and ask him to put into the record why the county agents can't take up this work in South America. [Laughter.]

Mr. PURNELL. I object.

The CHAIRMAN. Objection is raised, Mr. Rubey.

Will you kindly set out in detail the character of these demonstrations and investigations?

Mr. THOMPSON. In Nebraska, our man there, Mr. Filley, for instance, has at the request of the county agents and the farmers' associations, gone out and assisted in the organization during the past year of 13 farmers' cooperative grain elevators among the farmers; furnished them forms of by-laws prepared with the assistance of experts in the Bureau of Markets.

The CHAIRMAN. The department published them in pamphlet form many years ago. They did not have to go there to deliver the pamphlets.

Mr. THOMPSON. Mr. Haugen, no constitution and by-laws that the bureau has ever been able to prepare is such that we would recommend it generally without reference to local conditions. It is always necessary in developing a cooperative association, whether it be an elevator or anything else, to look into local conditions and to understand the local situation before giving final recommendations with reference to the by-laws and constitution.

The CHAIRMAN. Do you go out then and encourage the organization?

Mr. THOMPSON. Our work has consisted in furnishing information on request from the county agents and the farmers' associations or groups of farmers. It is supposed that they are ready to organize, they desire to organize, they want assistance, guidance, in regard to the form of organization and also afterwards in regard to forms of accounts that will enable them to know how their business is going on.

Mr. TINCHER. You mean in the State of Iowa that the customary way of organizing a cooperative association is not to depend upon some local man for important information, but to bring in the Federal bureau and find out how they can organize a cooperative association? In Kansas we don't have to have the help of the Government to organize a cooperative association.

The CHAIRMAN. We never asked their help in Iowa. We got along without it. [Laughter.]

Mr. JONES. That is the reason Kansas is green. [Laughter.]

Mr. THOMPSON. Assistance has been given in the organization of more than two dozen live-stock shipping associations and of 14 or more cooperative elevators in the State of Iowa, in elevator organization and also in certain cases of reorganization from the old stock company to a cooperative form of association.

Mr. PURNELL. What is the object to be attained—to find a market or to obtain for the producer a higher price for his products?

Mr. THOMPSON. To assist the producer in improving the methods of marketing farm products. For instance, to help him get information regarding grades and standards; give him information regarding organization of cooperative associations and accounts for those associations.

Mr. PURNELL. That is clerical.

Mr. THOMPSON. To take up the market news service, which gives him information regarding the movement of car lots to market and also prices in the different markets. The market news service tells

him where to ship his carloads of live stock, grain, or other commodities.

Mr. JONES. Is it the idea to take the same position with the farmers that Gompers does with the labor organizations?

Mr. PURNELL. I wish, Mr. Thompson, that you would just pursue the line that you are on there. I would like to know, as a matter of information, what is the ultimate object to be attained in connection with the establishment of these various marketing organizations and these organizations that the Federal Government assists in organizing? Is it to obtain a higher price for the producer or is it to help him find a market for his products?

Mr. THOMPSON. It is both.

Mr. PURNELL. Is there anything else to be attained—any other result?

Mr. THOMPSON. Yes; the typical cooperative marketing association helps the farmer, first, to know what to produce; that is, to show him what is the standardized commodity he should produce of a given kind, whether it is potatoes or whatever it is; it helps him in the matter of grading and assists him in the handling and storing of it locally; it furnishes him a sales agency through which carload lots are shipped right to the market and also information that tells him where the carloads should be sent to find a good market.

Mr. RUBEY. And it enables him to ship in carload lots.

Mr. THOMPSON. That is very important. Many of the farmers have small lots which by themselves are so small that they would not be able to ship them to advantage. By pooling their commodities in carloads they get the advantage of large-scale handling in shipping and economies that come from that sort of work.

Mr. HEFLIN. It is also beneficial to the consumer?

Mr. THOMPSON. Yes, sir.

Mr. PURNELL. That is just the thing I want to find out. If he gets better markets and higher prices, what does the consumer say about it?

Mr. THOMPSON. Of course, our work enables the farmer, all the farmers, to effect economies that on their side will give them better prices than they would get if they had to go it individually, and it enables them to eliminate certain wastes, to effect economies in handling and grading which gives them better prices.

Mr. HEFLIN. In other words, he can get his produce to the market under these improved methods cheaper than he could under the old system?

Mr. THOMPSON. Yes, sir.

Mr. PURNELL. And he can afford to take less for them?

Mr. THOMPSON. Individually the local farmers get a better price for the commodities that they handle as a result of the associations through which they do their business. On the other hand—well, I want to be sure that I am answering questions rather than going on with a statement that you are not interested in.

Mr. PURNELL. You were pursuing your argument, saying whether you thought it would be possible for him to get even a lower price for his products and yet make more money out of it.

Mr. THOMPSON. Of course, the point you deal with there possibly would come in more particularly if you were figuring on how, on

the farm itself, the farmer could produce a commodity at lower cost. Then he could afford to accept a lower price and still perhaps make a better profit. That is not our problem in the Bureau of Markets. That is a problem in the Bureau of Farm Management.

Mr. TINCHER. How long have we had the Bureau of Markets?

Mr. THOMPSON. The Bureau of Markets began its work about six years ago. I think its first items were provided for in 1913.

Mr. HARRISON. The bureau was organized in May, 1913.

Mr. TINCHER. Ever since its organization there has been a constant increase in the difference between what the grower receives for everything he produces and the price that the consumer pays for everything he consumes; so it hasn't been a very effective organization along that line.

Mr. THOMPSON. The point you raise, which has to do with general price levels, touches on much more fundamental things than can be approached by the activities of the Bureau of Markets. You are referring to general price levels, and the cause of price levels as such, and I am sure that all here understand that if you are going to attack the causes that lead to a gradual rise in the level of prices you have to deal with many things outside of the things that we are concerned with in the Bureau of Markets.

Mr. PURNELL. Has your experience enabled you to say what the individual producers all over the country think of the Bureau of Markets—how they feel toward it; whether or not they are in sympathy with it?

Mr. THOMPSON. Yes; we have a great many reactions with reference to that matter, showing us that our services are wanted far in excess of our ability to supply them. For instance, we have men whom, within the limits possible, we send into the States to furnish first-hand personal assistance, not to local farmers, because we could not afford to do that, but to associations of farmers, to cooperative agricultural and other extension agencies, and to agencies such as the secretaries of farmers' organizations in States, who themselves are busy with work directly with the farmers. I could illustrate it, I think, by saying this: That not long since, at the request of secretaries of farmers' grain dealers' associations in 12 States, our men met with them, and these men who themselves go out to organize cooperative elevators virtually agreed at that time upon a plan of organization, which was discussed and worked over with the aid of experts from the Bureau of Markets.

Mr. TINCHER. Do you think any body of men in any kind of business should organize a cooperative association without sufficient intelligence in its membership to organize it without Government aid?

Mr. THOMPSON. No; there should not be any such organization.

Mr. TINCHER. And do you think that the Government at this time should spend any money in encouraging the organization of cooperative associations?

Mr. THOMPSON. We never encourage any specific group of farmers' organizations directly.

Mr. TINCHER. Then I can't understand what you mean to do with this money that the Government will appropriate toward cooperative associations. I can't understand just what you are going to do with that money.

Mr. THOMPSON. Of course the work on cooperative organization comes under another item specifically, but what we do is to furnish information for farmers who desire to organize. We feel that is the only way—our attitude is that the proper source of organization is the farmers themselves. They should know and finally determine whether or not they want to organize a given association. After they have so determined and then request our expert assistance, then we come with information such as we have, both as to plans of organization and as to records of accounts, to help them keep track of the organization after it has been established.

Mr. TINCHER. Most every State has a cooperative organization statute.

Mr. THOMPSON. That is a matter that has been developing somewhat slowly, and in some States they have statutes following the model prepared by the Federal Bureau of Markets.

Mr. TINCHER. Isn't a matter of procuring the blanks necessary and following the forms; but when you get down to the business that the cooperative association is going to transact, they have to be their own judges of that, don't they?

Mr. THOMPSON. Most certainly.

Mr. TINCHER. Now, let me see whether I understand you. What you really want with the money is to employ agents to go there and give them expert advice on how to run that business?

Mr. THOMPSON. If he is an organization specialist, yes. That is one of the things, and that is a very important thing from the standpoint of the organizations themselves; and, further, giving them assistance in records and accounts, so that they will know how to keep track of their accounts.

Mr. TINCHER. To keep books, you mean?

Mr. THOMPSON. Yes, sir.

Mr. TINCHER. That is, you furnish to those cooperative associations expert advice on how to keep the books of the corporation, and you tell them that they can get along without bookkeepers generally, don't you?

Mr. THOMPSON. Even if they have a bookkeeper the chances are that they have not an adequate system of accounts.

Mr. TINCHER. Ought they not to have a bookkeeper, no matter what system of bookkeeping they have?

Mr. THOMPSON. Yes, sir. They ought to have a system of accounts that tells them what they ought to know, and that is the thing that many of them do not have. I will say this with reference to that point that the National Association of Credit Men, after a survey that they made, have reported that they think about 85 per cent of the marketing agencies do not have the necessary information that they should have, that they do not have proper bookkeeping.

Mr. TINCHER. That is accounted for by the fact that some expert wants them to organize, and it is not pointed out to them that they need to have a bookkeeper.

Mr. THOMPSON. Oftentimes that may be true.

Mr. TINCHER. Then the principal thing to do is to hire a bookkeeper. Does not your bureau issue a bulletin on that?

Mr. THOMPSON. Bulletins are insufficient. Our experience has shown us that unless we can furnish first-hand personal contact, we will not get to them the kind of information they need. It is with

this demonstration work, in other words, as it is in many other things.

Mr. McLAUGHLIN of Nebraska. I believe you spoke of 24 organizations in Iowa that the bureau had helped to organize. Did I understand you correctly?

Mr. THOMPSON. Yes, sir.

Mr. McLAUGHLIN of Nebraska. And that your representative in Nebraska had assisted in perfecting 13 organizations in Nebraska?

Mr. THOMPSON. Yes, sir.

Mr. McLAUGHLIN of Nebraska. I understand that there are from 600 to 1,000 cooperative organizations in Iowa, and some 400 or 500 in Nebraska that have been operating for many years, most of them. Are we to understand that these few organizations that have been recently perfected are much more efficient than those that have been long established, or is it the purpose of the department to go ahead and assist all these other organizations that have been operating for many years?

Mr. THOMPSON. Our method is to help existing organizations, and to help new organizations where farmers are ready and want to organize new associations. But our work also consists in helping the old stock companies where farmers have organized under an old law, and where since then a cooperative law has been passed and they want to organize a cooperative society. The main part of our help is with existing organizations, not with new associations, and in the case of new associations is to help those groups that are ready to organize a new association.

The CHAIRMAN. Are these cooperative organizations generally successful?

Mr. THOMPSON. I can best answer by being concrete. In the State of Michigan they started some years ago organizing local potato associations for the marketing of potatoes. The joint agent, with our bureau, Mr. Tennant, assisted the local associations and afterwards helped them to organize a central potato marketing exchange at Cadillac. To-day they have 100 local potato marketing associations in Michigan, all of which market their potatoes through the central potato exchange at Cadillac. Last year they marketed something like 2,000 carloads through that central exchange. During the present year, up to the present time the indications are that they will market something like 3,000 carloads from that exchange, and I think that if you were to talk to the people there who are personally and directly interested in that enterprise, their answer will be, as it has been given to us, that it has been of immense benefit to the farmers connected with all of those 100 potato marketing associations.

The CHAIRMAN. Is that due to the activity of the department?

Mr. THOMPSON. The department assisted.

The CHAIRMAN. Who initiated it?

Mr. THOMPSON. We worked right with the farmers—

The CHAIRMAN. Who started it?

Mr. THOMPSON. The farmers themselves started certain local associations, but even then they asked the assistance of our joint representative in the organization of these local potato marketing associations. When it came to the work in the central exchange, they again asked the assistance of a representative of our central bureau. Mr. Tennant, the joint representative of the Bureau of Markets, and

the State has assisted them in the establishment of this potato marketing exchange for the State of Michigan.

That is only one example. I could cite State after State enterprises of that sort which have been set up, and where technical and expert assistance has come from the joint employe of the State and the Government. Supplementing this, further assistance in certain cases is offered by mail and personal help from the experts in the Bureau of Markets.

Mr. JONES. Did they all get the same price for their potatoes?

Mr. THOMPSON. In case they all sold the same grade. They have different grades, but all the shippers having a certain grade of potatoes have got the same price.

Mr. JONES. That is one of the purposes of the organization, is it not?

Mr. THOMPSON. Yes. Another example I can cite is in the State of Arkansas, where they have the problem of marketing sweet potatoes, and you have heard of the storing of sweet potatoes this morning. During the year they have perfected a series of 12 or 13 sweet potato marketing associations, and an exchange through which all the local associations market sweet potatoes. The same thing is true in Mississippi. As a result of that, a large number of carloads of these potatoes have been shipped and marketed through the central exchange, and important economies effected.

Mr. JONES. After one of these associations is established in the State and it works successfully, is it possible for other associations who contemplate organizing to obtain help from the one that is organized?

Mr. THOMPSON. Yes.

Mr. JONES. Then, why do you have to have the Federal agent do it; just as a matter of convenience?

Mr. THOMPSON. Because other associations, while they are glad generally to advise others who come to them, they do not feel competent from simply their own experience to advise the other associations in all the details.

Mr. JONES. How long does an agent stay in a locality to learn conditions sufficient to give him the knowledge to organize and meet the local conditions?

Mr. THOMPSON. I would like to say he does not organize. We never say that any of our agents organize, but they furnish technical information. He first gathers information, let us say, along many lines—the kind of information that is needed regarding any of these organizations—and then he visits the place, perhaps, once or twice in advance, looks into the matter, and takes it up with the local people themselves and supplies information that the people there want; and they must be ready to organize a local association before he gives assistance.

Mr. JONES. They organize because the experience that other farmers have had in their organizations shows that it is a beneficial thing to do. Do you not suppose that if they see the results are beneficial they would be able to perfect an organization without the help of the Federal agent?

Mr. THOMPSON. There are many times that they do. Many times the only question is whether they get it perfected as well as they should under the existing conditions.

Mr. JONES. They would work out their own salvation, would they not?

Mr. THOMPSON. Yes; many of them; and many of them fail at times.

Mr. ANDERSON. Many have been started that ought not to have been started?

Mr. THOMPSON. Quite so. Promoted associations have sometimes not succeeded. Following the last question of Mr. Anderson, there are many cases where it has been to the interest of some agency that wants to sell equipment, and they will go into a locality, regardless of local conditions, and induce the farmers to set up an association, so as to sell them something in the way of equipment without reference to whether they have proper use for the equipment. In the matter of establishing creameries, they often do not look into the question of whether they have cows in sufficient numbers to supply cream and to make it successful the year round. They do not look into the question of whether the farmers have the right number of cows and whether they have a reasonable chance of succeeding in advance. In the past many associations were started just because a promoter wanted to put something over on them.

The CHAIRMAN. Can you give the number of failures?

Mr. THOMPSON. The Bureau of Markets has not been able to get the data that I could quote as a percentage of failures. It differs with different types of associations. For instance, we have found fewer failures in certain kinds and relatively more in others, and still more in other kinds of cooperative endeavor.

The CHAIRMAN. Is the percentage of failures large or small?

Mr. THOMPSON. We have published a bulletin on the results of the cooperative stores, which showed a relatively large number of failures.

The CHAIRMAN. Were any of them successful?

Mr. THOMPSON. Yes. There are successful examples, even of that.

The CHAIRMAN. What percentage?

Mr. THOMPSON. I would not try to give a percentage on that. It is a very difficult kind of cooperation to enter into, and our bureau experts have not encouraged that particular kind of association, but advised them to be cautious, because it is a very difficult kind of association of which to make a success.

Mr. TINCHER. What did you advise in your book on cooperative stores?

Mr. THOMPSON. That was issued to show the result of the study of a certain number of selected cooperative stores, showing the actual results obtained in those cases, to act as an object lesson.

The CHAIRMAN. Is it not a fact that success depends upon the efficiency of the management of the concern?

Mr. THOMPSON. That is one very important factor, but not the only one.

The CHAIRMAN. What are the others?

Mr. THOMPSON. The manager may be ever so efficient, and yet there may be many things that he does not know and would be glad to know.

The CHAIRMAN. Markets, of course; we understand that.

Mr. THOMPSON. Let me give you an illustration of that. For instance, suppose we have an association which has been established—

a creamery. We have to have a system of records for the creamery. Now, in this record [indicating], you see the amount of butter made by months from January to July. Here [indicating] you see the actual expense, operating expense, per pound of butter. Now, if the manager of a creamery has the kind of accounts he ought to have, or the manager of any other association, whether it be fruit, produce, or creamery butter, or anything else, he ought to be able to compare the volume of business from month to month with the item of operating expenses from month to month to see how the business is progressing. In the month of February, in this case, where the volume was low, the expense was a little over 10 cents a pound, whereas in the month of May, where the volume was raised to 60,000 pounds of butter, the operating expenses per pound were less than 7 cents. That is one kind of information that he ought to have month after month, continuously, in order to know how his business is running.

Another kind of information that he ought to have as a creamery operator is this: He ought to keep his records in such a way that he can tell every month the year round the percentage of patronage returns from the sale of butter. For instance, this much goes to patrons in the shape of patronage dividends. In this particular case, the average was 89 per cent from the month of January to the month of July. If you were to go to the creameries of this country to-day and ask the managers to look up the account of a farmer member of this association, and ask him whether he can tell the exact relation between the patronage dividends and the total sales, or the relation of expenses to the volume of business, the chances are he can not tell you. Our experience is that very few of them can.

Mr. McLAUGHLIN of Michigan. How do you get those figures?

Mr. THOMPSON. We have made studies of the expenses of creameries.

Mr. McLAUGHLIN of Michigan. How?

Mr. THOMPSON. By expert accountants of our staff.

Mr. McLAUGHLIN of Michigan. You sent them to the creameries?

Mr. THOMPSON. Yes; men have gone to cooperative creameries to get data.

The CHAIRMAN. Do not the farmers in sparsely settled communities find it expedient to build creameries in order to cut down the expense of hauling and delivering the cream?

Mr. THOMPSON. Experience shows that they are very much in need of help of expert information of all kinds. I have indicated by example here in regard to successful creameries, and we could go on and cite cases.

Mr. TINCHER. Have you one of the men here to advise?

Mr. THOMPSON. We have only a small staff. We have six or seven men who are accountants who have made a special study of organization accounts.

Mr. TINCHER. I would like to talk to the man that you send out to these farmers who are going to organize the elevator. I would like to get a line on his talk.

Mr. THOMPSON. We have a man who used to be, some years ago, a manager and operator of a local grain elevator in the Central West.

Mr. TINCHER. Does he advise any cooperative association to start out without the service of some man who has had experience?

Mr. THOMPSON. No.

Mr. TINCHER. That is the first thing he advises it to do—to get a man who knows the business?

Mr. THOMPSON. Yes.

Mr. TINCHER. Is he not about through, then?

Mr. THOMPSON. No; for the chances are that, if they want a co-operative association, they will want to know how to organize an association as such.

Mr. TINCHER. Can you think of any branch of business, or any business in the United States, that would not need Federal aid and advice in its organization if an ordinary grain elevator company needs it?

Mr. THOMPSON. I am not sure that I get your question.

Mr. TINCHER. Assuming that a body of men organized to build a cooperative farmers' elevator needs Federal aid in the way of expert advice; now tell me some business that does not need the same degree of Federal aid—some private business?

Mr. THOMPSON. There is inefficiency in marketing agencies more or less generally. Of course our intention has been to try to study lines of efficiency in marketing agencies and to render assistance wherever we can, wherever it will save waste.

The CHAIRMAN. In your opinion, or in the opinion of the department, are these cooperative organizations of great importance?

Mr. THOMPSON. Yes.

The CHAIRMAN. You naturally wish to encourage them?

Mr. THOMPSON. The Secretary has made special reference to it in his annual report.

The CHAIRMAN. You encourage them?

Mr. THOMPSON. Where worthy.

The CHAIRMAN. You stated awhile ago that you did not encourage them, but only responded to requests.

Mr. THOMPSON. I do not want to be misunderstood, because that is one point about which there has been some misunderstanding, and I trust anything that I may say will not lead to further misunderstanding. We believe in encouraging cooperative associations among farmers along certain particular lines.

The CHAIRMAN. You encourage cooperation?

Mr. THOMPSON. Yes.

The CHAIRMAN. And the organization on cooperative lines?

Mr. THOMPSON. Yes.

The CHAIRMAN. That is, generally—throughout the country?

Mr. THOMPSON. Yes.

The CHAIRMAN. But I understood you to say a moment ago that you did not offer any advice or any encouragement on cooperation.

Mr. THOMPSON. What I intended to say a moment ago was this, that we would never undertake to go to any group of farmers and say, "You farmers ought to organize such and such an association." We leave to them the question of deciding whether or not they ought to organize. We give them information as to what an association has been doing elsewhere, and we tell them about the results elsewhere, and the dangers that they have where they do not organize right, but we insist that it must be left to them to decide and not to any promoter to go to them as a group to decide whether or not they should organize an association.

Mr. ANDERSON. You are not 'actively and indiscriminately engaged in promoting cooperative enterprises?

Mr. THOMPSON. We are not.

Mr. McLAUGHLIN of Michigan. For my own information, I wish you would tell me why you think the Government of the United States should take part in the organization of cooperative stores.

Mr. THOMPSON. As a matter of fact, on that particular subject, we do not take part, because it happens to be a field where our experience so far has made us realize that it is so hazardous that the advice of our men has been not to undertake, at least to go out and encourage it.

Mr. McLAUGHLIN of Michigan. Heretofore you have to some extent advised. Why should the Federal Government do that?

Mr. THOMPSON. I think we have not sent anyone, to my knowledge, to the farmers, or to anybody that wanted to form a cooperative store. To my knowledge we have never offered them assistance in organization. I think the reason for that is that we have felt that assistance to farmers in cooperation along relatively more simple lines where real success is more assured is safer, and therefore we confine ourselves to other lines of cooperation where from our point of view we feel that we could assist them more satisfactorily.

Mr. McLAUGHLIN of Michigan. If you thought that that could be done successfully, would it be part of the Federal Government's business to go out and show the people how to run a cooperative store?

Mr. THOMPSON. Of course, as I have stated, we have never taken up that matter, and we are not now asking any item to be used for that purpose.

Mr. McLAUGHLIN of Michigan. In my judgment it is none of the Federal Government's business.

Mr. THOMPSON. We are not recommending any item which we propose to use for that purpose.

The CHAIRMAN. Did you assist in the cooperative buying organization here in the District?

Mr. THOMPSON. We gave no direct assistance in that matter, to my knowledge.

The CHAIRMAN. Did you assist the Treasury Department?

Mr. THOMPSON. We gave no direct assistance in that matter, to my knowledge.

The CHAIRMAN. They have such organizations in the Treasury Department, have they not?

Mr. THOMPSON. I understand they have.

The CHAIRMAN. Have you any in the Department of Agriculture?

Mr. THOMPSON. We have none, to my knowledge, of the kind that we have in the Treasury Department or the Department of the Interior. They may have informal buying clubs on a small scale, but they have no large general departmental club of the kind I understand that they have in the Treasury Department and in the Interior Department.

The CHAIRMAN. It does not matter by what name it goes; it is along the same line. Have you met with any opposition on the part of the merchants or the middlemen throughout the country? Do they feel that you are encroaching upon their territory?

Mr. THOMPSON. There are times when possibly there may be criticism; and there is criticism, of course, along all constructive lines against it, either wisely or unwisely.

The CHAIRMAN. The purpose is to put the middleman out of business, to sell directly from the farm to the consumer?

Mr. THOMPSON. So far as we can effect economies, of course, we do away with unnecessary middlemen's profits, but our thought is: When farmers come to us and say that they are ready to form an association, we tell them what is needed for an association that will enable them to market their products more efficiently, and we proceed to give them assistance and advice on request.

The CHAIRMAN. What advice do you give as to the middleman—the necessity of the middleman in the community; a stock buyer, a grain dealer, an implement dealer, a storekeeper? Do you take that into consideration?

Mr. THOMPSON. There are cases where, of course, farmers have a cooperative organization where there are private elevators, may be, generally so. Naturally, it is not our business to tell them they can do away with this or that private enterprise. That is not a thing that we enter into. We look specifically at the economies which the farmers themselves as such can effect through their effort to get the proper facilities.

Mr. HEFLIN. In getting their potatoes to market?

Mr. THOMPSON. In getting their potatoes to market without entering into the question of doing away with this or that other private man's business.

Mr. McLAUGHLIN of Michigan. Can you tell us how many men you have employed to go about the country and examine the books of the creamery companies?

Mr. THOMPSON. We have not more than one such man at this time. He is on the staff of the project on market business practice. I am discussing another item. I am not discussing this item here. That comes under another item, being looked after by the project known as market business practice.

The CHAIRMAN. How many items have you in this bill with reference to cooperation?

Mr. THOMPSON. The investigation of market business practice is provided in another item, item No. 80.

The CHAIRMAN. Are there any others?

Mr. THOMPSON. No others.

The CHAIRMAN. Can you estimate the amount to be used in the two items for this purpose?

Mr. THOMPSON. The investigation of market business practice as such is a separate item.

The CHAIRMAN. Could it not be brought under one head, so that we would not have to divide it up?

Mr. THOMPSON. For that particular item about \$22,000 is estimated.

Mr. McLAUGHLIN of Michigan. Which one is this?

Mr. THOMPSON. It is under item No. 80, which is split up into a number of different lines of work. We finished with that item this morning.

The CHAIRMAN. Could it not be combined all under one item?

Mr. THOMPSON. The work is different.

The CHAIRMAN. It is cooperative work.

Mr. THOMPSON. No; item 80 provides for people on our staff here in Washington who have studied these problems as members of our staff. The item we are now discussing, under 91, provides for cooperatively employed agents in all the different States, stationed in the different States, with respect to all investigational and demonstrational lines of work.

The CHAIRMAN. The one you are discussing has reference to field work?

Mr. THOMPSON. Yes.

The CHAIRMAN. The other is in the department in Washington?

Mr. THOMPSON. Yes, sir.

The CHAIRMAN. Item 91 has reference to field men?

Mr. THOMPSON. Field men.

The CHAIRMAN. That is expended out in the country—in the field? This amount carried in 80 is for expenses in Washington?

Mr. THOMPSON. Yes, sir. I should like to say further that, of course, these field men do not represent simply organizations and market business practice. Their demonstrational work covers all the lines of work in the Bureau of Markets. They are called upon to furnish assistance to county agricultural agents in grades and standards, in market news service, in all the different lines of marketing work with which the Bureau of Markets is concerned. They act as a sort of clearing house of information for the entire Bureau of Markets in the States.

The CHAIRMAN. Is it not a fact that your agents in the States act as a clearing house for information in the State?

Mr. THOMPSON. Yes.

The CHAIRMAN. I think that is excellent work. He advises of the supply in certain localities?

Mr. THOMPSON. All the county agents in the States look to him as a market expert to advise them.

The CHAIRMAN. He issues circulars?

Mr. THOMPSON. Yes, he does.

The CHAIRMAN. He also advises the county agents where they can procure products?

Mr. THOMPSON. That is work he is called upon to perform, all sorts of information about marketing to county agents.

The CHAIRMAN. You are a sort of bureau of information for the county agents?

Mr. THOMPSON. Yes.

The CHAIRMAN. They come to you for the information?

Mr. THOMPSON. Yes. It is a clearing house for the entire bureau for all the extension forces of the State.

The CHAIRMAN. Why is it separated from the State's Relations Service? Why should it come under two heads?

Mr. THOMPSON. In order that this particular man, this marketing agent in the State, might be able to give to the county agents the kind of information they ask regarding marketing it is necessary for him to be in intimate personal contact with all the subject matter of any of the projects of the Bureau of Markets, and that enables him to get the benefit of direct information from all the subject-matter men we have, whether grain marketing, live-stock marketing, or what not.

The CHAIRMAN. How many men do you have in each State?

Mr. THOMPSON. Ordinarily one to a State. The State may sometimes appoint an additional expert, live-stock marketing man, or grain-marketing man, depending on how far the State can go.

The CHAIRMAN. What is the average expense of each?

Mr. THOMPSON. That the State pays?

The CHAIRMAN. What does the Federal Government pay on an average for each State?

Mr. THOMPSON. I should say something around about \$2,000 perhaps would be an average.

The CHAIRMAN. Is that all?

Mr. THOMPSON. That is all about this item; yes.

The CHAIRMAN. We are very grateful to you, Mr. Thompson.

TUESDAY, JANUARY 13, 1920.

AFTERNOON SESSION—continued.

STATEMENT OF MR. GEORGE LIVINGSTON, ACTING CHIEF OF THE BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE—Continued.

Mr. LIVINGSTON. I should like to say, Mr. Chairman, that in listening to the discussion yesterday, I was not sure that the committee got the full meaning of what we are doing under item 91. I am afraid the committee got the impression that item 91 relates primarily to cooperative organizations. That is not the case, because under item 91 the State agent in marketing deals with all the work that we are doing in the Bureau of Markets—all of those three subdivisions—investigational, demonstrational, or extension work. In other words, he is the clearing house for information regarding all of the work that we are doing in the bureau. Cooperation is only a part of that work. I wanted to make that statement in order to clear the record.

The CHAIRMAN. The reason why the discussion was confined largely to that particular part of the work is that that matter has perhaps attracted more attention than any other phase of the work.

Mr. LIVINGSTON. Mr. Thompson, of course, is handling the cooperative work in addition to this particular item.

The next item, Mr. Chairman, is 92:

For investigating the handling, grading, and transportation of grain, including the grain sorghums, for the purpose of fixing definite grades thereof, \$81,150.

The committee knows that we have already established standards for corn, wheat, oats, and that we have at this time standards for milled rice regarding which hearings will be held very soon. We are working now on grades for barley, rye, flaxseed, and grain sorghums, and just as soon as we can arrive at satisfactory standards for those grains we will announce tentative standards and hold hearings, and later promulgate them under the grain standards act. We are ask-

ing for no increase in this item. It stands substantially as it did last year.

Mr. YOUNG. What kind of satisfaction have you given to the trade with reference to the standards that you promulgated on wheat and corn?

Mr. LIVINGSTON. I will say, Mr. Young, that since the price adjustments have been made by the Grain Corporation, the grades for wheat have been received very favorably by producers and grain handlers. In fact, there has been little or no complaint of the grain standards since the price matter has been adjusted. Our great difficulty came at the time when there were fixed prices and fixed grades, but now that wheat is selling at a premium over the guaranteed price we hear little or no complaint regarding the wheat standards.

Mr. HARRISON. Showing that the difficulty was not with the grades but with the price?

Mr. LIVINGSTON. Yes; which makes the point that we have made all along, but which it was very difficulty to convince people of—that the difficulty was with the fixed price and not with fixed grades.

Mr. YOUNG. We have the same trouble. I am not so familiar with the wheat, but our trouble with cotton is really more difficult than with grain, although we have some with grain. I think the price item cuts a good deal of figure in that. For instance, if I sell 100 bales of cotton and that cotton goes up in price to-morrow, whatever the grade is, I don't usually have any trouble in getting my cotton passed through; but if it goes down in price we have a hard time.

Mr. LIVINGSTON. Yes, sir; that is universal experience.

The CHAIRMAN. What was the spread between the grades, for instance, of wheat? Is it not a fact that that has been modified considerably by the Grain Corporation?

Mr. LIVINGSTON. Yes, sir; they narrowed up the spread. I haven't got the figures with me.

The CHAIRMAN. Who is responsible for the first spread?

Mr. LIVINGSTON. All price matters have been the concern of the Grain Corporation, and all changes in prices have been made as the result of their decisions.

The CHAIRMAN. Does the grain act provide that it should be determined by the Secretary?

Mr. LIVINGSTON. No, sir; not price.

The CHAIRMAN. You have nothing to do with determining the spread?

Mr. LIVINGSTON. Not in price; no, sir.

The CHAIRMAN. You never have had anything to do with it?

Mr. LIVINGSTON. We never had anything to do with it.

The CHAIRMAN. It was fixed by the Grain Corporation?

Mr. LIVINGSTON. Yes, sir.

The CHAIRMAN. The Grain Corporation was responsible for it?

Mr. LIVINGSTON. Yes, sir.

The CHAIRMAN. Did the Grain Corporation try to convince the people that you were responsible for it?

Mr. LIVINGSTON. I wouldn't say that, Mr. Chairman. I would say that there was a lot of misunderstanding on the part of the producers and grain dealers in the country as to whether the prices were responsible or whether the grain standards were responsible.

The CHAIRMAN. As I recall, the spread was 52 cents. That was modified to 12 cents.

Mr. LIVINGSTON. I have forgotten just what changes were made, but I know they have narrowed the spread between grades very materially.

The CHAIRMAN. My recollection is they narrowed it 40 cents.

Mr. LIVINGSTON. I think probably you are right.

Mr. HEFLIN. Did the trade make any suggestions to the Grain Corporation that you know of?

Mr. LIVINGSTON. I think the Grain Corporation obtained suggestions from a great number of people, including the trade and the producers, and, I think it was last spring, the price differentials were changed.

The CHAIRMAN. The contention is that the spread remained at 52 cents until the grain had been marketed by the farmer, and when in the hands of the speculators the spread was modified to the extent of 40 cents a bushel, so that the speculator profited to the extent of 40 cents a bushel.

Mr. LIVINGSTON. Of course, the price of grain has gone up very materially.

The CHAIRMAN. I have reference to the spread; who fixes the spread?

Mr. LIVINGSTON. We had nothing to do with it.

The CHAIRMAN. Then we have the responsibility located.

Mr. HEFLIN. You don't think the Grain Corporation fixed the spread at 52 cents while it was in the hands of the farmers, and then as soon as it got out of the hands of the farmers reduced it to 12 cents, do you?

Mr. LIVINGSTON. No. My understanding is that the spread was changed by the Grain Corporation at the earnest solicitation of farmers from North Dakota and Minnesota. They sent a delegation down, and I think probably some Members of Congress accompanied the delegation to see Mr. Barnes, and as a result of the interview price differentials were changed. I do not recall the exact time at which that change took place.

The CHAIRMAN. That was practically after the marketing of the grain by the farmers. The largest part of the grain had been marketed by the farmers.

Mr. LIVINGSTON. The price that obtained up to that time was the same price differential that had existed during the past year with the previous crop. The price differential was changed for the 1919 crop.

The CHAIRMAN. Not this crop. It was after the marketing of a great deal of the crop.

Mr. LIVINGSTON. It was not at the time of the reorganization of the Grain Corporation; it was later—I don't recall the date.

Mr. BESLEY. It was last fall; approximately November 1.

The CHAIRMAN. By November, of course, practically all the wheat had been marketed.

Mr. BESLEY. A good deal of it had.

The CHAIRMAN. Practically all the wheat had been.

Mr. LIVINGSTON. Particularly the red winter wheat and the hard winter wheat.

Mr. JACOWAY. Then the man that produced the wheat didn't get the benefit, but the speculator did?

The CHAIRMAN. The farmer that produced the wheat lost 40 cents—or whatever the spread was—a bushel, which the speculator made.

Mr. LIVINGSTON. The spread was never definite, because the Grain Corporation didn't fix the price on sample grade. The spread was fixed between the first three grades, and the rest of the wheat falling below grade No. 3 was sold on sample, although I think in the last revision there was a price fixed on No. 4.

The CHAIRMAN. Does the Grain Corporation buy on sample?

Mr. LIVINGSTON. Yes, sir. I don't know how much sample wheat they buy, but when they buy wheat in the market they either buy on sample or buy it on grade.

The CHAIRMAN. Is that the practice of the Grain Corporation?

Mr. LIVINGSTON. If they have a representative in a market like Chicago, who buys from the table, he may buy some sample grade wheat. I don't know what proportion of their purchases were of that grade.

Mr. HEFLIN. How many grades of wheat are there?

The CHAIRMAN. How do the salaries paid by you compare with the salaries paid to the same people before you took them over?

Mr. LIVINGSTON. Mr. Chairman, I think I can answer that question by stating that since August 1, 1918—

Mr. HARRISON. He has in mind salaries under the grain standards act.

Mr. LIVINGSTON. We will be very glad to take that up when we reach that item.

The next item is 93, "To enable the Secretary of Agriculture to carry into effect the act entitled 'An act to fix standards for Climax baskets for grapes and other fruits and vegetables, and to fix standards for baskets and other containers for small fruits, berries, and vegetables, and for other purposes,' etc."

We are asking for a small increase in this item, Mr. Chairman. You will note that the amount of money available this year for the enforcement of this act is only \$3,800. It has been almost impossible to discharge our responsibility with credit to ourselves or with satisfaction to the country on \$3,800. We are therefore asking for an increase of \$1,000. If the committee desires, I will be very glad to have Mr. Sherman, who is in charge of the enforcement of this act, make a brief statement about it.

The CHAIRMAN. It is a small item. I presume the work is about the same as explained in previous years, and that you are doing good work.

Mr. LIVINGSTON. The next item is the cotton futures act.

The CHAIRMAN. It is now 5 o'clock. I suggest that we take a recess until 10 o'clock to-morrow.

(Thereupon, at 5.20 o'clock p. m., the committee recessed until 10 o'clock a. m., Wednesday, January 14, 1920.)

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Wednesday, January 14, 1920.

BUREAU OF MARKETS—Continued.

The committee met at 10 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. You may proceed, Mr. Livingston.

Mr. LIVINGSTON. Mr. Murph will make a statement to the committee regarding the cotton futures act on page 257.

FURTHER STATEMENT OF MR. DANIEL S. MURPH, SPECIALIST IN COTTON MARKETING AND WAREHOUSING, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.

The CHAIRMAN. Kindly read the first line of the item.

Mr. MURPH. This is item 95, on page 257, "To enable the Secretary of Agriculture to carry into effect the provisions of the United States cotton futures act, as amended March 4, 1919," etc.

There is an apparent increase in this item, including the transfers to the statutory roll, of about \$79,000. That increase, however, is only apparent, because there was available this year for the enforcement of the United States cotton futures act, in addition to the amount carried in the annual appropriation act, an amount approximating \$100,000. As you will recall, there were some amendments to the cotton futures act in the wheat price guaranty act of March 4, 1919; and an allotment of \$100,000 was made under that act for carrying out the purposes of those amendments.

Mr. ANDERSON. I want to have this perfectly clear in my own mind. Of the \$3,000,000 of funds carried in the wheat guaranty act of administration, do I understand that \$100,00 was allotted for the purpose of carrying out that portion of the act which was represented by the amendment relating to cotton?

Mr. MURPH. For the amendments to the cotton futures act; that is correct. My attention has been called to the fact that the details of the figures in the notes under the enforcement of the United States cotton futures act are slightly inaccurate, but the real situation is the same, that is to say, there really is a decrease as between this estimate, the appropriation asked for in this estimate, and the amount of money available this year for carrying out the United States cotton futures act, of a little over \$20,000. That is to say, instead of there being an actual increase in the amount of money made available, there is really a decrease of a little over \$20,000.

That is the explanation, Mr. Chairman, as to the financial situation, and I wonder whether the committee would be interested in knowing something of the activities of the Bureau of Markets under the amendments that were made to the act under the wheat price guaranty act.

Mr. ANDERSON. Before you pass to that, I am curious to know what there was in this amendment to the cotton futures act. As I recall, it was largely a change of standards that made it necessary to expend \$100,000 additional in its enforcement.

Mr. MURPH. That amount was made available, but my thought is that we will not expend all of that \$100,000. I am expecting we will get through the year without the expenditure of all of that.

Mr. ANDERSON. As to that proposition, I must say that it never was suggested by anybody when that amendment was under consideration that the adoption of that amendment would cost 1 cent more in administration than the act had cost previously.

Mr. MURPH. I can not answer for that. I happened to be away on sick leave at the time these amendments were considered and passed, and I am not familiar with the negotiations surrounding the passage of the amendments. I can point out to you why there was need for an additional amount of money for carrying out those amendments.

Mr. ANDERSON. That is what I want.

Mr. MCKINLEY. How much more was spent?

Mr. MURPH. The year has not yet expired, and I am not able to answer that.

Mr. MCKINLEY. You can say how much more is spent to-day?

Mr. MURPH. You mean how much of the appropriation of \$100,000 has been expended?

Mr. MCKINLEY. Yes.

Mr. MURPH. About \$35,000, I think. That is given merely from memory. I think it is about \$35,000.

Mr. HEFLIN. It has been about 8 or 9 months since the law went into effect.

Mr. MURPH. Yes. Now, Mr. Anderson, in making the explanation as to what is done under the amendments, I think we will also answer the question that you have in mind as to the necessity for additional expenditures. One amendment under the cotton futures act provided that the Department of Agriculture—the Secretary of Agriculture—should classify cotton to be delivered on section 5 future contracts. That necessitated the establishment of a board of examiners at New York and New Orleans, the points at which the future exchanges are located. A board of examiners, with the necessary equipment and the necessary clerical help, was established at each of these two points.

Mr. McLAUGHLIN of Michigan. At New York and where?

Mr. MURPH. At New York and New Orleans, where the future markets are. This classification of cotton before delivery on future contracts took the place of the classification of cotton in the determination of disputes that might arise as to the classification of cotton, as you gentlemen will recall. In other words, it was conceded that to have the Government classify the cotton before it was delivered rather than to wait upon Government classification after the delivery of the cotton, in case the classification of the cotton was disputed, would be of value to the trade and everybody concerned in the handling and the marketing of cotton. The Secretary was authorized to create a revolving fund out of costs assessed for the classification of cotton under the amendment. That has been done, and the charge assessed at present is 30 cents per bale.

In addition there is some loose cotton that accumulates—waste—and this is sold, and the returns from this are also used as a part of the revolving fund.

Of this \$100,000, \$30,000 was set aside as a revolving fund. The other \$70,000 was set aside for the purpose of making more com-

plete investigations of cotton prices in the primary markets and other spot markets in order that the producers and others interested might have an opportunity to be advised as to the actual prices at which cotton was being sold. The report of the House Committee on Agriculture accompanying the bill which finally eventuated in the amendment pointed out that the purpose of certain changes in the legislation was to enable the Secretary of Agriculture to obtain information as to the prices for grades that were made untenderable by the amendments to the act. Prior to March 4, 20 grades of cotton were tenderable on future contracts. The act of March 4 reduced the number of grades tenderable on future contracts to 10. Objection was raised by many people to the amendment upon the ground that the cutting off of 10 grades from delivery on future contracts would deprive those who held cotton of such grades of an outlet for the delivery of this cotton and would also prevent producers and others from having the advantage of knowing what cotton of those grades was worth. The report of the committee, as I said a moment ago, showed that Congress intended that the Secretary of Agriculture should obtain information with reference to prices on those untenderable grades.

Mr. ANDERSON. Do you get the authority from the report of the committee or from the law itself?

Mr. MURPH. The authority is in the law, but I mention the report of the committee merely as substantiating our belief that that was the intention of the law. The law was amended so as to give the Secretary of Agriculture a great deal of additional authority to get information, and the report showed that that was the purpose for which it was intended that this information should be obtained. We did not go outside of the law, but merely referred to the report of the committee because it was corroborative of our understanding of the intention of the law.

Mr. ANDERSON. Right on that point: The seventh paragraph of this act provides that all money collected as such costs may be used as a revolving fund for carrying out the provisions of this subdivision of section 5 of the act as amended. Do you construe that as authorizing the use of \$30,000 of the appropriation for the administration of the price-guaranty act for the establishment of this revolving fund?

Mr. MURPH. That amount was allotted to the department for this purpose, Mr. Anderson, by the Treasury Department, presumably. As I say, I was away from Washington for four or five months about that time, and I do not know just the negotiations which led up to that, but evidently the Treasury Department was satisfied that there was authority for the allotment of \$100,000 for that purpose.

Miss LYNE. The President allotted that much from the funds available for administration out of the emergency act, because there was no special fund provided in the act for the enforcement of this cotton legislation.

Mr. ANDERSON. That is the exact point I am trying to make, that there was no authority for the use of this \$100,000 at all. The President deliberately, and apparently without any authority of law, allotted \$100,000 of this \$3,000,000 for this purpose.

Mr. HARRISON. Mr. Morrill will be glad to explain the legal phases of the matter.

MR. MORRILL. I have not the wheat price guaranty act before me, but you will find that the appropriation provides that the money shall be available for carrying out the wheat price guaranty and otherwise for the purposes of the act.

MR. ANDERSON. That is very true.

MR. MORRILL. And when the situation arose that we would have to enforce this amendment, it was necessary to consider where the money would have to come from, because it was an entirely new activity that had not been provided for in the existing legislation under the cotton futures act. Therefore, the question was taken up as to the advisability, and legality also, of obtaining an allotment from the wheat price guaranty act appropriation for the purposes of this amendment to the cotton futures act, the one the classification of cotton and the other the quotations. The President made the allotment of \$100,000 and the Solicitor of the Department of Agriculture held that that was legal. As the Treasury issued the warrants the Treasury must have been satisfied regarding the legality.

MR. MURPH. You will understand that the amendments required the department to do certain things which previously it had not been required to do, and to do which, therefore, in the funds available for carrying out the cotton futures act as unamended, there was no money available. In other words, without an allotment from this fund or from some other source the Department of Agriculture would have been powerless to carry out the amendments which Congress had made to the legislation.

The CHAIRMAN. Is this revolving fund to be made permanent?

MR. MURPH. That revolving fund is to be a permanent fund, and as stated in the note that fund is to become permanent, and for that reason we have not requested any appropriation this year for carrying on that particular work.

MR. ANDERSON. Of what is that revolving fund made up, outside of this \$30,000?

MR. MURPH. That is all.

MR. ANDERSON. The act evidently contemplates that some costs shall be assessed against somebody and collected and paid into this fund?

MR. MURPH. I do not quite understand you. The \$30,000 is the capital on which we started that revolving fund. For the classification of the cotton on the exchanges 30 cents a bale is charged. There is a certain amount of loose and waste cotton that accumulates, and that is sold. All receipts are added to the fund. The expense is charged against the fund, and the whole is used as a revolving fund.

MR. ANDERSON. Is 30 cents a bale self-sustaining? Does that cover the cost of the operation?

MR. MURPH. I was going to say that up to the present the costs assessed are approximately about \$3,600 less than the outlay. Of that amount about \$2,800 represents investment or expenditures that will not have to be duplicated, expenditures incident to the beginning of the work; so that, aside from that \$2,800 of expenses which will not have to be duplicated, there is an excess of about \$800 in expense over costs assessed. Now, as you gentlemen know, the amount of cotton delivered on the future exchanges, and hence the amount classified from day to day and from week to week, depends on market conditions. Some months there may be very heavy deliveries, and

consequently very large quantities of cotton classified. Other months there may be very little cotton delivered and hence very little classified; so that the receipts vary from month to month. During the fall I may say that there were longshoremen's strikes in both New York and New Orleans which interfered with deliveries. We had reliable information, for instance, from New Orleans that the delivery of 15,000 bales of cotton was contemplated, but it never was delivered. It was found almost impossible, physically, to deliver the cotton. Even if only that 15,000 bales had been delivered, the costs assessed would have been greater than the expense of the service up to date. I merely state that to show the exigencies that arise from month to month.

We feel that this service has hardly been going long enough to enable us to judge accurately as to whether the present charge of 30 cents a bale is going to be sufficient to make it self-sustaining. We feel that we ought to watch the course of income and outgo for a little longer, and then if we find it apparent that the costs will not cover the expense, we will increase the charge per bale.

Mr. ANDERSON. Let me see if I have this proposition clear in my own mind. I understand that before we passed this amendment it was the practice for the department only to classify and grade cotton where it was delivered under contract, and dispute arose as to whether it was deliverable on the contract or not.

Mr. MURPH. Yes.

Mr. ANDERSON. Under this amendment, instead of waiting for the dispute to arise after the delivery of the cotton you proceed to classify it before it is delivered.

Mr. MURPH. That is correct.

Mr. ANDERSON. You say that the money which was available for the enforcement of the act before the amendment was not available for the enforcement of the act as amended. Am I correct about that?

Mr. MURPH. That there was not enough money for carrying out the purposes of the amended act.

Mr. ANDERSON. That is what I wanted to be clear about. Then this \$100,000 is assumed to be in addition to the appropriation that was originally carried in the appropriation bill, on the theory that it costs more to enforce the act as amended than in its original form. Am I correct about that?

Mr. MURPH. Yes; that is correct.

Mr. ANDERSON. All right.

Mr. YOUNG. Your hope is that this revolving fund, after you have done a little further work in it, will be self-sustaining?

Mr. MURPH. Oh, yes; we expect to make it self-sustaining if we have to increase the charge per bale.

Mr. MCKINLEY. If that is the fact, why do you practically ask for \$73,000 now?

Mr. MURPH. We are asking for \$20,000 less than we have this year.

Mr. MCKINLEY. But you ask for \$100,000, and you only use \$30,000 for the revolving fund.

Mr. MURPH. I was coming to an additional point.

The CHAIRMAN. Why should the revolving fund be made permanent?

Mr. MURPH. In the opinion of the solicitor, while the rest of the wheat price guaranty act expires not later than June 1, the parts of

that act which relate to the amendments to the cotton futures act are permanent legislation, and therefore the part of the act relating to the revolving fund is permanent.

The CHAIRMAN. That has been settled by the solicitor?

Mr. MURPH. Yes.

The CHAIRMAN. Why should it be made permanent?

Mr. MURPH. You mean as to the merits of the revolving fund?

The CHAIRMAN. Yes.

Mr. MURPH. It is on the basis that those who receive the service should pay for it without cost to the Government. By having a revolving fund, when they pay for the service we can see whether it is self-sustaining or not.

The CHAIRMAN. It is simply to save the trouble of coming to Congress and asking annual appropriations; the position may be well taken. Do you charge 30 cents a bale?

Mr. MURPH. Yes.

The CHAIRMAN. There is no limit as to the amount of the existing revolving fund?

Mr. MURPH. The expenses under the revolving fund during the year will be more than \$30,000, and the receipts will be more than \$30,000. The \$30,000 is comparable to the capital of a bank. A bank will handle and loan more money during a year than the \$30,000 capital stocks which it may have, but that is the working fund, and that is what the \$30,000 in this revolving fund means; that is the working capital. As a matter of fact, the costs assessed and the expenses up to date are each more than \$30,000.

The CHAIRMAN. You pay salaries and charge fees?

Mr. MURPH. Yes.

The CHAIRMAN. In that way it takes it out of the power of Congress to control the salaries and expenditures. To what amount will the revolving fund be limited?

Mr. MURPH. We have only \$30,000.

The CHAIRMAN. You are limited to \$30,000?

Mr. MURPH. We can not get any more than that unless Congress gives it to us.

The CHAIRMAN. Is it limited to \$30,000?

Mr. MURPH. Yes; it is limited to that. We can not get any more than that unless Congress gives it to us.

The CHAIRMAN. That is settled?

Mr. MURPH. That is all that we have been allotted for that purpose.

The CHAIRMAN. Allotted by whom; by Congress?

Mr. MURPH. The President allotted \$100,000 for carrying out the amendments to the act. Now, when that came to the department, \$30,000, following the provisions of the act, were put into a revolving fund.

The CHAIRMAN. Of the \$100,000?

Mr. MURPH. \$30,000 of the \$100,000 was put into this revolving fund.

Mr. McLAUGHLIN of Michigan. If you increased your charges you would add to the \$30,000, and then your revolving fund would be increased, would it not?

Mr. MURPH. It would be increased, but it is our purpose, in accordance with the law, to make the charges just sufficient to make

the service self-sustaining. Sometimes, as is the case now, we may have a slight deficit. It may be a month from now——

The CHAIRMAN. Your intentions undoubtedly are good, but years from now somebody else may have control of this work. It is like a snowball; the more you roll it the larger it grows.

Mr. MURPH. I do not think so.

The CHAIRMAN. If you double the fees you double the amount?

Mr. MURPH. The trade would not stand for charging an unreasonable fee, for one thing.

The CHAIRMAN. Thirty or 60 cents a bale is a small matter with a \$200 bale of cotton.

Mr. MURPH. These salaries are under the same restrictions that the salaries in the other branches of the department are under. We can not pay a man more than \$4,500 salary from this revolving fund, under the law. As a matter of fact, we are not paying any man nearly \$4,500.

The CHAIRMAN. What I am interested in knowing is whether there is any limit to this revolving fund.

Mr. MURPH. We have \$30,000 as the capital stock of this fund. Does your question relate to this, namely, whether we can make a profit, whether we can charge so much as to make a profit, and increase this sum from \$30,000 to \$60,000? Probably I should put it this way, that the limit is the cost under the law.

The CHAIRMAN. Now, we have got that far.

Mr. MURPH. We could not charge, under the law, more than the cost of the service.

Mr. HEFLIN. And he charges just enough to make this work self-sustaining.

The CHAIRMAN. You are charging the cost?

Mr. MURPH. We do the best we can to ascertain the actual cost and charge that, and we can not go beyond that.

Mr. HEFLIN. When this law went into effect there was a change made in the number of grades from 21 to 10, and you had to set up a new order entirely?

Mr. MURPH. Yes.

Mr. HEFLIN. The New York Exchange closed its doors temporarily to work out new plans?

Mr. MURPH. Yes.

Mr. HEFLIN. You said there was complaint as to cutting the grades down to 10; that they said it did not furnish them markets for certain grades of cotton?

Mr. MURPH. Yes.

Mr. HEFLIN. We do not agree to that contention in the South, in the cotton-producing States. We hold that seven grades, year in and year out, will cover the entire crop. Ten grades will certainly cover all cotton, and the fact that all the cotton is consumed every year answers the complaint that there is no market for certain grades of cotton. As to the reduction of the number of grades from 21 to 10, the fact is that it deprived speculators of their privilege of tendering bales of unspinnable cotton on contract, to the detriment of the producers of cotton. We found that the practical result of the old system where we used the 21 grades.

The spinner can now get cotton that he can use in his work, but under the 21 grades he could not. The producer was not called upon to fill these contracts. The spinner could not get his contracts filled under it, and therefore it was a gambling business, pure and simple. The producer is now called upon to fill his contracts, and the spinner is supplied.

The CHAIRMAN. What was the loss under that 21-grade system, as against the 10 grades?

Mr. HEFLIN. I do not know. The loss was very heavy.

The CHAIRMAN. Was it \$20 a bale?

Mr. HEFLIN. In some instances it was that much and maybe more.

The CHAIRMAN. To what extent has this corrected it?

Mr. HEFLIN. To the actual crop; these 10 grades practically represent the crop of spinnable cotton, whereas the other stuff, that they accumulated throughout the years and divided up into 21 grades, did not represent the crop; and when they sold that crop and tendered those grades on it, no spinner would take it. He would say, "There is cotton in that which I can not use," and he refused to take it, and they settled the difference in money.

Lastly, we claim that there was no authority to use 21 grades. We set up standard grades. We found that Mr. Brand was permitting them to use 21 grades, but I do not believe yet that he had any authority to permit them to do it. We amended the law and cut the number of grades down to 10, and that is the law to-day. The way they are robbing us to-day is on the difference between the grades.

The CHAIRMAN. Between the grades?

Mr. HEFLIN. Of cotton.

The CHAIRMAN. The manipulation of the various grades?

Mr. HEFLIN. No; the impression goes out that cotton is bringing 40 cents a pound. Maybe a low grade of it is bringing only 20 cents, but the impression goes out that a man is getting 40 cents for his crop. He may be getting 40 cents for the highest grade, 30 cents for another grade, 28 cents for another, and so on down; and we hold now that they are robbing us on the differentials.

The CHAIRMAN. Under the law they are permitted to deliver any grade on any contract?

Mr. HEFLIN. Within the 10 grades.

The CHAIRMAN. By manipulating the price and fixing the price on the lower grades above what it is worth, they deliver a grade that is not desirable and can not be used by the spinner?

Mr. YOUNG. No, sir. The best that these 10 grades can do would be to cover real spinnable cotton. That is what we believe is right. Under the old system, where we had the 21 grades, we discovered that they were accumulating from year to year nonspinnable cotton. For instance, when this amendment was put on this wheat-price guaranty bill last year, I discovered that they were having shipped to Norfolk, Va. (and that is not a cotton section of the country), a lot of this riff-raff stuff that was not spinnable. Then I began to inquire in my own mind, "What is the purpose of that"? These two exchanges, one at New Orleans and one at New York, are the only two exchanges in the Nation that deal not only in spot cotton that passes through their institutions but with cotton that is never intended to be delivered at all, and that is far in excess of the actual cotton that they deal in. But,

while they are dealing in futures that they never expect to deliver, it does have a remarkable effect on the actual spot cotton market.

This delivery, I mean the speculative delivery, does come so often; so that, when the settlement came under the old system, if I had gone in as a future dealer and gotten a bale of that cotton, I never intended to receive or tender any cotton. Under the old system they would say, "We will not settle unless you settle on our basis. We will tender you the cotton that we have a right to tender you under the cotton-futures act under these 21 grades." They would, therefore, call on Norfolk to ship them so many bales of this cotton that is not spinnable and tender them to me. I could not take that cotton because there was no market for it. I was broke if I took it. Therefore, I had to settle on their basis, and it had an effect on the actual spot cotton that the producer was picking, and it battered his market down. Hence, we feel, if you are going to permit these future dealers to operate at all, that you must make them operate in real cotton; and real cotton, as we call it, comes within these 10 grades. On account of the long rainy season, we are now gathering the cotton that ought to have been gathered in October. Cotton grades are very bad. But my contention is, and the contention of the men who produce cotton is, that, because we allow the grades of cotton that represent actual cotton, grown in the fields, these speculative interests in New York ought not to be able to use something that is not valuable with which to pull down real values. That is the situation that we tried to reach, and we have remedied the situation somewhat.

The CHAIRMAN. Your contention is that the cotton shipped to Norfolk was not within the grades?

Mr. YOUNG. Yes; and they were accumulating it there. They had no place to put it in New York. They were accumulating it at Norfolk, so that, if I demanded cotton, they would then get this rotten stuff and tender it to me in order to drive me to a settlement on their terms.

The CHAIRMAN. The cotton was not within the grade specified in the law?

Mr. YOUNG. Not as now specified.

The CHAIRMAN. And the law specifies that no other grades are deliverable on contract?

Mr. YOUNG. Yes.

The CHAIRMAN. That was a violation of the law.

Mr. YOUNG. It is now.

The CHAIRMAN. Before?

Mr. YOUNG. No; because they had this stuff that did come within those 21 grades. They extended those grades over to take in that unspinnable cotton.

The CHAIRMAN. We did not authorize 21 grades.

Mr. YOUNG. That was the construction put upon it, and that is why it was necessary to make this amendment.

Mr. HEFLIN. Mr. Murph, who adopts these differences now between the grades that obtain in the spot market?

Mr. MURPH. The differences between the grades are established by sales in the spot market. Those quotations are made by committees of the spot exchanges under the supervision of representatives of the Bureau of Markets. We have 2 or 3 men in the field, and then we have a man in Washington who goes constantly from one place to

another. He happens to be from your State, Mr. Heflin, this man in Washington who supervises quotations, to see that they are absolutely reliable.

Mr. HEFLIN. How do you find out what is the proper difference between middling fair and good ordinary?

Mr. MURPH. At present good ordinary is not tenderable; but you refer, of course, to the differences generally. Under this plan we get at the actual sales that take place. There are 10 designated bona fide spot markets. The gentlemen of the committee might be interested in this matter. The spot exchanges that are used for this purpose are indicated on this map by red dots. They include Houston, Galveston, Little Rock, Memphis, New Orleans, Dallas, Montgomery, Savannah, Augusta, and Norfolk [indicating on map.] Those 10 markets are what we call bona fide spot markets, designated for the purpose by the Secretary of Agriculture. In each one of those markets there is a committee of the cotton exchange, or the spot exchange, as it is called to differentiate it from the future exchanges. The committee makes up and sends to us and to New York daily figures for the prices of different grades of cotton. We have a man at the present time at New Orleans and one in Memphis and another in Charlotte, and we expect to have two other men in the field who will maintain the closest sort of supervision over this service.

Then, we have a man in the field constantly going from one market to another and going to the primary markets, and ascertaining the prices actually being paid for the different grades of cotton. So we keep such close check on it, to assure ourselves that those quotations are as nearly accurate as it is humanly possible to get them.

Mr. HEFLIN. How does this man get his information or knowledge as to what is the proper difference between the prices of two grades of cotton?

Mr. MURPH. He goes to people who buy and sell the cotton themselves, and gets the information from them. Under the act he has authority now to demand access to their books and records if they will not give him information.

Mr. LEE. It is based on actual sales?

Mr. MURPH. It is based on actual sales.

Mr. HEFLIN. Are the buyer and seller ever consulted as to what the price should be?

Mr. MURPH. They are, and the price quotation service men can ascertain what that price is and—

Mr. HEFLIN. He does not determine what the difference should be but what the difference is?

Mr. MURPH. No, Mr. Heflin; he determines what the prices are at which cotton is actually sold.

Mr. HEFLIN. This paper I have here gives a sample of this. I am a buyer, for instance, and I say, "I will give you 30 cents for that cotton." Then I may turn right around and sell that cotton for 42 cents for this grade, and 38 cents for that, and so on down, and beat the producer out of 10 cents a bale on that transaction. That is done all the time.

What is the remedy? Would not this be a good remedy for the producer's side of it, to have him state the figures himself—what he believes should be the differentials—and get the commissioners of agriculture of the cotton-growing States to set up or establish

what they believe to be proper? That would help those in the trade in fixing the difference, would it not?

Mr. MURPH. Any step that would eventuate in causing sales to be made at certain prices would have an effect on the quotations. In other words, they must quote, under the law, the actual commercial differences. They have got to quote prices at which the cotton is sold. That is in accordance with the law.

Mr. HEFLIN. If the producer and the cotton merchant object to this, they must suggest what they believe would be proper in order to have their opinions avail.

Mr. MURPH. When sales are made at the prices that the producers and the cotton merchants think are proper, those sales will be quoted, because they have become actual sales. As you suggest, anything that has an effect on prices at which sales are actually made must have an effect on the quotations, because the quotations represent actual sales.

Mr. TINCHER. This work is under an amendment to the wheat price guaranty act?

Mr. MURPH. This work of getting differences from the spot market, is carried on under the cotton futures act as unamended. I am coming to a change that has been made which I think will answer your question. Under an amendment to the cotton futures act under the wheat price guaranty act the Secretary of Agriculture was given much greater authority to get information covering the actual sales of cotton, the character of the sales, the prices, the volume of the sales, and anything that has a bearing upon the nature of the sales, to show this reliability, and to show the value that must be placed upon them in determining quotations. This, as I pointed out a moment ago, was for the purpose of getting information particularly back to the producers of cotton, as to the prices at which cotton is being sold. Operating under that authority, we have divided the cotton-producing territory into five districts which you will see roughly indicated by the blue lines [indicating on map]. The headquarters of these districts will be Charlotte, Atlanta, New Orleans, Dallas, and Memphis. It has been very difficult to get men properly equipped for that sort of work, and up to date the offices at Atlanta and Dallas are vacant.

Mr. TINCHER. That is in the wheat-price act?

Mr. MURPH. Yes; that is in the amendment.

Mr. TINCHER. That law expires the 1st of June. Is there any exception in the law, so that this does not expire?

Mr. MURPH. In the opinion of the solicitors of the Agricultural Department and the Treasury Department, the amendments to the cotton futures act are permanent.

Mr. HEFLIN. It was hitched onto this bill, but it is an amendment to the cotton futures act.

Mr. McLAUGHLIN of Michigan. One of the later sections of that act says that this shall expire.

Mr. MURPH. There is a difference of opinion as to whether these acts are permanent, and that is a matter that I wanted to take up with members of the committee at a little later date.

Mr. TINCHER. Would not now be a good time for the committee to arrive at their conclusion as to the permanency of the amendment, in

view of the fact that you are asking for appropriations on the theory that the amendments are permanent?

Mr. HEFLIN. You are a good lawyer, Mr. Tincher; what do you think?

Mr. TINCHER. I think they expire with the act, but I would not want to put my opinion against that of the solicitor of the department. I do not think there is anything in that act which says they shall not expire.

Mr. MURPH. I think I might say, generally, that the opinion of the Solicitor of the Department of Agriculture hinged largely upon this point, that a reading of the amendments to the cotton-futures act, contained in the wheat-price guaranty act, and the reading of section 11 of the wheat-price guaranty act, to which you have referred, raises a doubt as to whether those amendments are permanent. That is, the peculiar language of the amendments themselves, taken in connection with section 11 of the act, raises a doubt as to the permanency of the amendments, and the courts under those conditions would seek to find out the intention of Congress, and for that purpose they would consult the legislative history of the act, and in his opinion the courts would find, if it came to a question of construction in court, that the amendments were permanent.

Mr. HEFLIN. Here was the matter: The cotton-futures act in certain portions was objectionable and we wanted it amended. It was not before the House. The wheat-price bill was. It was an emergency matter. We hooked this amendment onto the wheat-price bill, but it was an amendment to the cotton-futures act. It was passed. I think it is permanent law.

Mr. TINCHER. You think it was a permanent emergency? [Laughter.]

Mr. HEFLIN. The emergency through which we got it on to a permanent law makes it permanent.

Mr. ANDERSON. You got it onto a temporary law, unfortunately.

Mr. MURPH. Shall I proceed outlining the work we are doing under these price-fixing quotations and come back to the other later?

The CHAIRMAN. You referred to Norfolk as a market.

Mr. MURPH. A spot market.

The CHAIRMAN. Is it a real spot market?

Mr. MURPH. Yes, sir.

The CHAIRMAN. I understood Mr. Young to say it was not.

Mr. MURPH. Mr. Young said there was an accumulation there of grades that were deliverable under the old-style contract and that ought not to have been deliverable—and they are not deliverable—under the new contract.

Mr. HEFLIN. Before you get away from that, I said something about the spinners being unable to do business under the old contract. Are the spinners using the exchanges more under the new contract than under the old?

Mr. MURPH. I heard the president of the New York exchange say the other day that the buying interest at this time was overwhelmingly spinners and the trade interests; that is, the spot interests. Does that answer your question?

Mr. HEFLIN. Yes. I wanted to say that they were using the exchange more under the new law than under the old.

Mr. MURPH. It has been recently reported to us that one lot of 2,500 bales that was shipped to New York for delivery on contract was diverted to the mills, showing that the cotton now deliverable on contract is cotton that may be used in the mills.

Mr. TINCHER. May we consider from that that the 10-grade system is working better than the 21-grade system did?

Mr. MURPH. The 10-grade system provides for a contract that is intrinsically more valuable than the old contract.

The CHAIRMAN. It is 12.30 o'clock; at 1.30 o'clock Dr. True and Dean Russell will be here to discuss the extension work informally. If any members are interested, kindly come at 1.30. The committee will take a recess until 2.30.

(Thereupon at 12.30 o'clock p. m. the committee took a recess until 2.30 o'clock p. m.)

AFTER RECESS.

The committee met at 2.30 p. m., pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. You may proceed, Mr. Murph.

STATEMENT OF MR. DANIEL S. MURPH, SPECIALIST IN COTTON MARKETING AND WAREHOUSING, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE—Continued.

Mr. MURPH. Mr. Chairman, when we took a recess this morning I was just coming to the price-quotations service, which we have instituted in accordance with one of the amendments contained in the wheat-price guaranty act. I think I had stated that we have divided the cotton-producing section into five districts, with headquarters at Charlotte, N. C.; Atlanta, Ga.; Memphis, Tenn.; Dallas, Tex.; and New Orleans, La. We have held a number of civil-service examinations in an effort to get suitable men to take charge of the offices at these points, and have done everything we could think of in the effort to get suitable men. It is important that men located at these points for this work shall be conversant with trade methods, the various ways of trading in spot cotton, and be able to judge of the pertinency and value of information they get. To date we lack two men of having enough men of the type we need to put this work into effect in all five of those districts.

We have one man stationed at Charlotte and another stationed at Memphis, and the board of examiners at New Orleans engaged in the classification of cotton have charge of the price-quotations service in that district, so that, as a matter of fact, we have three districts in operation.

A weekly bulletin is issued from each one of these points, and it is given wide distribution, being sent by mail to anyone who requests it, and certain parts of it are sent by telegraph to anybody who wants it and is willing to pay for the telegrams.

We distribute it by mail to producers, and, in fact, anybody who would like to get it. We have a great number of requests from various parts of the country. I have been really surprised at the number of requests we get from parts of the country that presumably would not be interested in this quotation service, from the West, for in-

stance, and even the northernmost States have shown great interest in this service.

I have copies of the bulletins here and I thought the committee might be interested in seeing them. I shall not take time to read them. This is a specimen of the bulletins we issue. Here is the last one issued from Charlotte. This is the issue of January 10. I have not one issued from Memphis or New Orleans of that date, because it takes the mail a little longer to get to Washington from those points.

We give information relating to the prices of cotton at various places for various grades and various lengths of staple, and this information is given wide distribution upon the theory that the possession of information as to market conditions is most valuable for any man who is dealing in any particular commodity. In addition to giving this information as to prices, we take advantage of this opportunity to add a pertinent paragraph occasionally with reference to cotton marketing in general. For instance, in this bulletin that I have before me, issued on January 10, we have one paragraph of about eight lines, with reference to the loss of cotton through country damage. We had information that cotton seed of an inferior variety were about to be sold in the Memphis territory, on the theory that that particular variety produces more per acre. We had made investigation previously about that particular sort of cotton and found it very undesirable, and we just inserted in the bulletin a short paragraph warning farmers against it. So a few of those things occur to us as being worth while from the marketing standpoint, and they are inserted as giving timely advice.

I think you wanted me to say something about the permanency of the amendments.

The CHAIRMAN. You have reference to the cotton futures act?

Mr. MURPH. Yes; to those amendments to the cotton futures act. Before I come to that, I may say, with reference to the estimate for this appropriation, that some of the work under the cotton futures act has become more expensive; that is to say, the work in the preparation and distribution of cotton standards, through the increased cost of cotton, the increase in the cost of cartons and other material, the increase in the cost of labor, and except for that condition this estimate could have been considerably smaller than it is now.

Mr. McLAUGHLIN of Michigan. But you charge for those sample exhibits, do you not?

Mr. MURPH. Yes, sir.

Mr. McLAUGHLIN of Michigan. Can you not increase the price to meet the increased cost?

Mr. MURPH. But, Mr. McLaughlin, we can expend the money only once. That is to say, we can buy only a stated number of bales of cotton with a stated amount of money, and when the standards we make up from that quantity of cotton have been exhausted we can not do anything more.

Mr. ANDERSON. That is, what you get for the sale of the samples goes into the Treasury?

Mr. MURPH. Yes, sir.

Mr. ANDERSON. You can only use the appropriation once?

Mr. MURPH. That is right.

The CHAIRMAN. How much is returned to the Treasury?

Mr. MURPH. I have that right here.

The CHAIRMAN. Is it self-supporting?

Mr. MURPH. During the past year, Mr. Chairman, we turned into the Treasury from the sale of miscellaneous and loose cotton and from the sale of cotton standards and revision of standards, \$37,-840.71. In addition to that we turned into the Treasury—I have the figures, but I can not lay my hands on them right here—about \$9,000 collected for the determination of disputes. You see, the old form of contract was in force for a while, and we collected about \$9,000 in the determination of disputes under that form.

We expect to turn into the Treasury this year a greater amount from the sale of standards than last year, for the reason we had a very great demand for standards; we are away behind now in furnishing the standards. We have not been able to get enough competent men to make up the standards and to get the cotton fast enough; it is a difficult matter, as you gentlemen understand, to buy the cotton exactly suitable for those standards, and we have not been able to get the material in fast enough and get capable men in large enough numbers to keep up with the orders, so we have got away behind with our applications.

Mr. McLAUGHLIN of Michigan. Receipts from samples sold ought to pay the expense of it, ought it not?

Mr. MURPH. It is difficult to assess the exact cost of the preparation of these standards, because of the way in which the work is done; it is done along with other lines of work and carried on under the cotton-futures act, and sometimes men are employed partly in one line of work and partly in another line.

Mr. McLAUGHLIN of Michigan. Do you fix the price you charge, having in view the idea that the total amount ought to equal the total amount of cost for preparing?

Mr. MURPH. As I say, it is difficult to assess that exactly, but I do not think the total amount of receipts received from the sale of standards, if we should make that division, would cover the entire cost. When the cotton-futures act was first put into administration a price of \$2.50 per box was agreed upon, and lately that has been increased to \$5 per box for standards.

Mr. McLAUGHLIN of Michigan. The thing involves very little money, but I was thinking that, if the Government could break even on something, it would be a good thing.

Mr. MURPH. A set of the standards for grade for upland cotton costs \$100 as against \$50 at the outset; that is to say, the price has doubled. The Bureau of Markets, in its cotton-marketing work, carries on the work of demonstrating the value of the standards. That is carried on in a variety of ways, and we try to carry that on in connection with our marketing and demonstration work, our handling and marketing work, and we feel that whenever we get one of these sets out to the trade that has an educational value; in other words, we feel that the Government and the people through the Government get a return that is not exactly measurable in dollars and cents, when one of these sets gets out into the trade, because people then come to use them more and more and trade on them more and more, and the fact they are traded on, the fact there is accurate information for standards, that there is a Government set of stand-

ards, gives the people as a whole who are interested in the marketing of cotton a return we can not measure in dollars and cents.

Mr. YOUNG. I noticed that the State department of agriculture down at Austin, Tex., has been furnishing to counties who would pay a certain percentage of the salary scale an expert on the matter of cotton grading. They, of course, use these Government samples as a basis of their operations. Has this practice been built up to any extent over the country, over the cotton belt?

Mr. MURPH. That practice is more widespread in Texas than any other State.

Mr. YOUNG. I understand in my own county——

Mr. MURPH (interposing). Where is that?

Mr. YOUNG. Kaufman. I know they operate in some part of the State, and I understood them to say they sent a man to Tyler, Tex.

Mr. MURPH. We have a man there this year.

Mr. YOUNG. Yes. Any farmer who is interested in knowing the grade of his cotton before putting it on the market can go there and have it graded by this expert, so he will know what he is really selling the merchant or local buyer.

Mr. MURPH. Yes, sir.

Mr. YOUNG. It struck me as being a very useful piece of work.

Mr. MURPH. I have in my hand here the progress report on this work in your State and what is being done. Do you happen to know the firm of Parker & Pinkerton, at Tyler?

Mr. YOUNG. Very well.

Mr. MURPH. Are they cotton buyers?

Mr. YOUNG. They are farmers and buyers.

Mr. MURPH. Do you happen to know Mr. Oscar McFarland, president of the Guarantee State Bank?

Mr. YOUNG. Yes.

Mr. MURPH. We have letters from these gentlemen commending the work. Then we have a letter here signed by 30 farmers, in reference to the work, and the substance of this letter from the farmers, which really assesses the value of the work and, of course, from the class of people you have in mind——

Mr. McLAUGHLIN of Michigan (interposing). What is that particular work?

Mr. MURPH. This is cotton marketing. It is connected with the demonstration of the standards and merely suggested itself to Mr. Young in connection with our discussion of the standards. It is not done under the cotton futures act.

Mr. McLAUGHLIN of Michigan. Is a man located at a place to advise with the owners of cotton, the growers, what price they ought to charge those who want to buy it?

Mr. YOUNG. Oh, no. I come to him with five samples of cotton, taken out of five bales, and I want to know what grade these samples are—middling, strict middling, light middling, or what. As a grower, I do not know. It is a peculiar thing, but no growers know what their cotton will grade. This fellow is a technical expert. So, if he says these five bales of cotton grade middling, the farmer at once knows what middling cotton is worth, because those quotations are in practically every town in the cotton belt; nearly every town of any size is getting the market reports. Take my little town of 3,500 peo-

ple; we raise a local purse and hire telegraphers, who go to that office at 9 o'clock in the morning, and we get all the reports from New Orleans, New York, and Liverpool. In fact, we have got the whole market every minute in the day coming into this little office. Any farmer can walk up there and see that the quotation on middling, for instance, is 30 or 40 cents, as the case might be. Now, the question is, What have I got to sell? He does not know what his cotton grades. The expert says that bale of cotton is middling. He sees that report and knows what that cotton is worth; so he is trading on an equal basis with the fellow who is buying that cotton.

Mr. McLAUGHLIN of Michigan. I may not be very liberal, but how far should the Federal Government go with that work?

Mr. YOUNG. That is local; that is State.

Mr. MURPH. I might make this explanation. The work, from the standpoint of the Bureau of Markets, is a demonstrational and educational work rather than a work of service. That is to say, the Bureau of Markets, from its investigations, has found that conditions prevailing in the cotton marketing business, especially in the markets used by producers, are such that the producer in so many instances never gets the value of his cotton for the reason that he does not know the grade, the staple and the character of it, and does not know its value. As Mr. Young has just pointed out, many farmers do not know the grade, do not know how to staple cotton, do not know how to get the length of staple. There is a difference of about 45 cents now between cottons of the same grade merely on account of the different lengths of staple. That is an extreme case, but there is a difference of 2 cents, 5 cents, 6 cents, 10 cents, 20 cents, on account of the different lengths of staple. Now it is a highly technical proposition to class cotton, that is, to grade it and to staple it, and very few farmers can do it. Our investigations, covering the collection of actual samples and figures, show, for instance, in the same market on the same day cotton of the same grade and value sold at \$15 difference per bale, and at that time cotton was bringing about 12 cents per pound—cotton actually of the same value being sold in the same market on the same day by two different persons at a difference in price of about \$15.

Mr. McLAUGHLIN of Michigan. I can understand that condition, and it would be very helpful to the producer of cotton if he had that knowledge. I was wondering how much the Department of Agriculture was going to help him, and how much it was the duty of the Federal Government to assist the owners of property to know the value of it, so as to put a proper price on it.

Mr. MURPH. I was coming to that, Mr. McLaughlin, and I felt I ought to make some little statement about general conditions, so that members of the committee might appreciate the significance of this work. As I say, from the standpoint of the Bureau of Markets, the work is educational and demonstrational. The Bureau of Markets goes into a community and joins in this work for the purpose of showing the farmers themselves what they can do themselves. It is a very recent work on the part of the Bureau of Markets, and when we feel we have made a sufficient demonstration in one community we will just move along to another community. It does not become permanent in any community. We are showing the way, that is all:

then we help the farmers with their associations, show them what they can do, and we put a man there just for that purpose for a while.

Mr. McLAUGHLIN of Michigan. Would it not be better and more in keeping with our way of doing business if you would advise with and instruct men to be employed by the State to go out and do that work instead of carrying this to individuals all over the State? That is quite an undertaking on the part of the Federal Government.

Mr. MURPH. We do not undertake to carry the work to individuals. We only have about 35 such stations throughout the cotton belt; and, as I say, it is for educational and demonstrational purposes, and the valuable information that we get from one of these stations becomes available for other stations, and when we feel we have completed the work in one section we move on to another section.

In the State of Texas, at some of these points, we pay about \$250 of the classer's salary; at other points only \$1. The farmers themselves pay the great bulk of it.

Mr. McLAUGHLIN of Michigan. That is educational, then, at the place where you are doing the work; and after you do the work there you do not go back there, but you go to some other place, and leave them to take advantage, if they are able, of the instruction you have given them?

Mr. MURPH. Yes, sir; that is the theory on which we have approached it, and that is the limitation which we set about it.

The question would naturally arise as to the way in which the service was paid for finally, and it eventually gets back to this, that the individual farmers themselves really pay for the service they get through the local associations. The local associations, for instance in Texas, will make a charge of about 25 cents a bale for each bale of cotton this association handles, so after all the farmer who gets the service pays for it through his association.

Mr. McLAUGHLIN of Michigan. The association collects the money from the farmers and pays the expenses of your men?

Mr. MURPH. Yes, sir; we have a joint agreement with them; they are to pay them so much and we pay so much, and then the State extension department, as you suggested a while ago, the Agricultural College usually pays a small part of it. The bulk of it is paid, however, by the growers themselves.

I think there is nothing more I care to add here unless there are some questions on this appropriation.

WEDNESDAY, JANUARY 14, 1920.

STATEMENT OF MR. GEORGE LIVINGSTON, ACTING CHIEF OF THE BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE—Continued.

Mr. LIVINGSTON. If it is satisfactory to the committee, Mr. Chairman, we will take up item 96, on page 258, "To enable the Secretary of Agriculture to carry into effect the provisions of the United States grain-standards act," and so forth.

There is no increase requested in this item, but we are resubmitting a request for an amendment to section 6. You will recall that we submitted the same request last year.

Mr. RUBEY. And it went out on a point of order.

Mr. LIVINGSTON. It went out on a point of order. As I remember it, one change in section 6 was approved by the committee, and went out on a point of order on the floor, and the other change was not approved.

Mr. McLAUGHLIN of Michigan. Was not one put in in the Senate and stricken out in conference?

Mr. LIVINGSTON. Not that I recall. The requests for the changes, I think, are set forth very fully and concisely in the note appended to this item, and with the approval of the committee I would like to insert that note in the record of this hearing in order that it might appear in connection with it.

Mr. McLAUGHLIN of Michigan. Do you mean you want to reprint this note at the foot of page 96?

Mr. LIVINGSTON. Yes; in connection with this item in the hearings. It makes no difference, however, if the committee does not desire to do that.

The CHAIRMAN. You brought this up last year?

Mr. LIVINGSTON. The first amendment, Mr. Chairman, provides authority for the Secretary to entertain appeals on any grain that has been inspected by a licensed inspector. At the present time the Secretary of Agriculture is restricted to such grain as passes into interstate commerce. For instance, at the present time suppose a car of wheat originates at this point (indicating on map), goes to Chicago, and is inspected by a licensed inspector; an appeal may not be taken to the Secretary of Agriculture; but if the car goes to Indianapolis—if it crosses the State line—an appeal may be taken to the Secretary. Now, we have a number of requests from individuals, from boards of trade, from chambers of commerce, asking us to entertain these appeals.

Mr. McLAUGHLIN of Michigan. The first case you cited there of a car of grain shipped from a point in central Illinois into Chicago is of a transaction between citizens of the State of Illinois.

Mr. LIVINGSTON. Yes; but if the grain—

Mr. McLAUGHLIN of Michigan. Do you think it is a function of the Federal Government to take part in disputes between citizens of a State?

Mr. LIVINGSTON. Yes; Mr. McLaughlin, when the standards have been established by the Federal Government, and the integrity of those standards must be maintained, and when the grain in question is inspected by an inspector licensed by the Federal Government.

Mr. McLAUGHLIN of Michigan. When that grain reaches Chicago it may not go any farther, or it may be shipped out into interstate commerce.

Mr. LIVINGSTON. It may be shipped out into interstate commerce.

Mr. McLAUGHLIN of Michigan. If it enters interstate commerce it may be inspected; and then, if a dispute arises, it can be determined by an appeal?

Mr. LIVINGSTON. Yes.

Mr. McLAUGHLIN of Michigan. Is not that enough?

Mr. LIVINGSTON. No; it is not.

Mr. RUBEY. It does not help the producer, where the grain originates; and, as I understand it, the producers and sellers of wheat are urging this action, are they not?

Mr. LIVINGSTON. Yes; in order that they may be protected in their local markets.

Mr. McLAUGHLIN of Michigan. I know they are, but is it incumbent upon the Federal Government to do everything, entirely within a State, simply because it would be convenient and agreeable to those people?

Mr. RUBEY. How else can it be done? Congress is exercising a constitutional authority to fix standards of grain.

Mr. LIVINGSTON. Yes.

Mr. TINCHE. If they fix them they ought to enforce them.

Mr. RUBEY. Nobody else can do it but the Federal Government.

Mr. LIVINGSTON. We look upon it as a step towards maintaining the integrity of the United States standards. These inspectors are all licensed by the Federal Government. They inspect grain and apply the standards of the Federal Government, and we would like an opportunity to check up on all their inspections. It will not increase the cost of the service at all, because we take samples for supervision purposes, in addition to samples taken for interstate appeal. We consider it a convenient method of supervising the work of the inspectors.

Mr. YOUNG. Do the producers of wheat want this?

Mr. LIVINGSTON. Yes.

Mr. YOUNG. Do the wheat growers themselves want this?

Mr. LIVINGSTON. Yes; of course, the great number of producers of wheat do not ship wheat, but those who do, want it. Let me read a very brief statement from a letter on this point. This is from the Toledo Produce Exchange. [Reading:]

The ruling of your department saying no appeal to the Government officials can be taken on intrastate shipments is considered as "class legislation" by our directors. That Ohio shippers to Toledo or other Ohio markets can not have the same privilege that is accorded their shipments to markets outside the State is considered unfair to the Ohio markets. The local United States office is deprived of fees which would otherwise be taken in, in case of appeal by intrastate shippers.

May we hear from you as to why can not the ban be lifted and the appeal rule be the same in both intrastate and interstate shipments.

To emphasize the point I made a while ago—Toledo is an important grain market. If a car originating in Ohio goes to Toledo, no appeal may be taken by the shipper, although the grain has been inspected by an inspector licensed by the Federal Government according to the standards promulgated by the Federal Government.

Mr. McLAUGHLIN of Michigan. Why should the Government inspector inspect wheat where the transaction is entirely within a State?

Mr. LIVINGSTON. Dealers in grain know no State lines—

Mr. McLAUGHLIN of Michigan. I beg your pardon; you have just stated that the dealing is entirely within the State.

Mr. LIVINGSTON. I was referring to the nature of the transaction. Let me illustrate further. If this car of grain had originated the same number of miles on this side of Toledo (indicating on map), this man would have had a right to an appeal.

Mr. McLAUGHLIN of Michigan. That is true; that often determines the duty of the Federal Government in a thousand and one matters.

Mr. LIVINGSTON. Not the standards; not where the Constitution gives the right to the Federal Government to fix standards of grain.

Mr. McLAUGHLIN of Michigan. I do not know why.

Mr. LIVINGSTON. Let me give you an illustration of what might happen. We have an inspector in Toledo who is licensed under the grain standards act, who inspects grain according to the standards promulgated by the Federal department, and part of the grain that originates in Ohio comes up to him for inspection. He may grade it correctly or incorrectly. If he grades it incorrectly he is throwing the official standards of the United States into disrepute; yet, because of this provision in section 6, the parties at interest, the buyer and seller, can not have the information from the Federal Government as to whether or not that inspector has properly graded that lot of grain.

Mr. McLAUGHLIN of Michigan. Here is a case that is not entirely analagous: We were speaking yesterday of these inspections of perishable products at the points of destination. The law provides that only products shipped in interstate commerce shall be so inspected, with the idea that the Federal Government has nothing to do with the commerce within the States. Is it, then, the duty or the function of the Federal Government to interfere, or can it, with propriety, interfere in a quarrel or dispute as to business matters that concern the people of the States alone?

There is another reason why that kind of inspection should be confined to interstate shipments, because the act makes the certificate issued by the inspector prima facie evidence in a court, and that can only be in a United States court. We can not pass a statute that will make a certificate of a Federal inspector prima facie evidence in a State court. So that it would seem to me that inspection of grain by the Federal Government for any purpose, where the transaction is entirely between citizens of the State, is going beyond the functions of the Federal Government. You say the inspector at Toledo does inspect?

Mr. LIVINGSTON. Yes.

Mr. McLAUGHLIN of Michigan. I question the propriety of having him inspect it until it is destined for, or is in, interstate commerce.

Mr. LIVINGSTON. Mr. McLaughlin, the inspector is merely licensed by the Federal Government.

Mr. McLAUGHLIN of Michigan. I know that.

Mr. LIVINGSTON. He inspects all grain that is tendered to him.

The CHAIRMAN. Is he paid by the State or by the municipality?

Mr. LIVINGSTON. Frequently he is paid by the board of trade or other similar organization.

The CHAIRMAN. He is not paid by the Federal Government?

Mr. LIVINGSTON. No; he receives no compensation from the Federal Government.

Mr. McLAUGHLIN of Michigan. You say the dealers there, or those concerned in the transaction there in Ohio—or Illinois, according to your first illustration—would like to have this done?

Mr. LIVINGSTON. Yes.

Mr. McLAUGHLIN of Michigan. That does not cut any figure whatever. There are a thousand and one things that they would like to have the Federal Government do for them that it has no right to do.

Mr. LIVINGSTON. Coming back to my original point regardless of whether or not these people want to have this done, it does seem to us that it is perfectly feasible for the Federal Government to take that step and protect its standards, as it will not involve any increased cost and will at the same time render a service which people want. In other words, our standards, it seems to me, must be protected.

Mr. McLAUGHLIN of Michigan. There are other members of the committee who know a great deal more about this grain-standards law than I do and about these operations, but it just occurs to me that the Federal Government is going a long way if it is going to inspect products involved in a transaction entirely within State lines, both parties to the transaction being citizens of one State. There is practically no limit beyond which you can not go if that is entered upon.

Mr. LIVINGSTON. This is a permissive measure so far as the appeal provisions of law are concerned. No one is required to take an appeal. The appeal is taken at the request of somebody in interest.

Mr. McLAUGHLIN of Michigan. That is my suggestion. I am not making an objection, because I think perhaps I may be wrong about it—perhaps do not know enough about it; but my objection goes to the inspection of this intrastate business at all.

Mr. LIVINGSTON. Licensed inspectors could not handle the grain-inspection business at all unless they were permitted to inspect intrastate as well as interstate grain, because this would involve setting up duplicate inspection machinery in every place of inspection.

Mr. McLAUGHLIN of Michigan. Why duplicate?

Mr. LIVINGSTON. Because the grain at Chicago and many other markets is largely intrastate grain, which later crosses States lines and becomes interstate grain. If the inspector who is licensed under the grain-standards act is precluded from inspecting grain that does not cross a State line it will mean that some inspectors must be available for inspecting that grain which comes from within the State. Therefore it would mean a duplicate equipment for inspection—one inspection to be made for grain that crosses the State lines and another to inspect grain that does not cross State lines.

Mr. McLAUGHLIN of Michigan. That would be a State matter. Let them do it if they wish.

Mr. LIVINGSTON. If you will remember, these inspectors are not paid by the Federal Government. These men are employed by the chambers of commerce or by the State, and in many cases they operate as private individuals, on a fee basis; so that if we were to preclude or prevent the licensed inspectors from inspecting grain that does not cross State lines, we would immediately get into a great amount of difficulty, because it would necessitate, as I have said, two inspection departments in every important grain market in the country.

Mr. McLAUGHLIN of Michigan. Carrying that out to the logical conclusion, every shipment of grain from one point to another, whether the distance is 1 mile or 100 miles, might be inspected by a Federal inspector?

Mr. LIVINGSTON. Yes.

Mr. McLAUGHLIN of Michigan. My idea is that the Government has no right to do that. Suppose some man in your State wants the Government to build a house for him. Carrying your theory to the logical conclusion, you would say that we ought to do that.

Mr. TINCER. Is there not about as much demand among producers for the repeal of the act as there is from the other side?

Mr. LIVINGSTON. There used to be, but there is not now.

The CHAIRMAN. This is to provide for an appeal in the case of all grain shipped in intrastate as well as in interstate commerce. It was finally determined that it should be limited to interstate shipments; now the whole fight is coming up again, whether it shall be extended to intrastate traffic. I fully agree with the proposition. I tried to have it incorporated at that time. In my opinion it would be a good thing to incorporate it here.

Mr. LIVINGSTON. It involves no expense to the Federal Government.

The CHAIRMAN. There is a charge for the appeal?

Mr. LIVINGSTON. Yes; \$3 per car.

The CHAIRMAN. You say that it involves no expense to the Government, but that it is merely a matter of convenience to the people concerned?

Mr. LIVINGSTON. Yes.

Mr. TINCER. The Government has fixed standards for grain. If I am shipping wheat, and it is intrastate, and I am not satisfied with the grading, I have no right to appeal to the Department of Agriculture because it is altogether within State lines, and the appeal that I am denied is on a subject on which the Federal Congress has legislated.

Mr. LIVINGSTON. Yes; according to standards fixed by the Federal Government, upon inspection by a man that is licensed by that Government. The fact that a man ships the grain within a State ought not to deprive him, if he thinks he is wronged, of an appeal.

Mr. McLAUGHLIN of Michigan. That is saying that you have started a law to interfere with local transactions and therefore you must carry it on to the end.

Mr. LIVINGSTON. All grain arriving at these markets where there is a licensed inspector is inspected by a licensed inspector.

Mr. McLAUGHLIN of Michigan. Whether it is intrastate or interstate?

Mr. LIVINGSTON. Yes.

Mr. McLAUGHLIN of Michigan. You have started a process that may be wrong, and is wrong according to my notion, and therefore you would carry it out to the end?

Mr. LIVINGSTON. We believe that it is legal in all respects. When we took up the question of issuing licenses, the solicitor of the department rendered an opinion that a man might have a license to inspect grain moving in interstate commerce, and that he might at the same time act as an inspector to inspect grain that did not go into interstate commerce. But the point is that almost all States have adopted the Federal standards as State standards, and all the transactions in grain throughout the country are based on the Federal standards, regardless of whether the grain is shipped in interstate commerce or not.

Mr. RUBEY. I doubt your ability to get this through. We may pass it through the committee, but any one man on the floor of the House can object to it, and no doubt somebody will object to it. In the last Congress the second part of your proposition here was reported by the committee, but it was objected to by a Member of the House and went out on a point of order; although, so far as I am concerned, I shall be glad to recommend it. At the same time, however, I think the best thing for you to do is to prepare a bill covering this amendment and have it introduced—let the committee report it to the House—and seek these changes by legislation in a separate measure.

Mr. LIVINGSTON. That, of course, is a question for the committee to decide.

Mr. RUBEY. I think that is the only way you are ever going to get the change made, and there is no doubt in my mind but what it ought to be made. For instance, take the second part of your proposition. You have had 14,000 appeals, I believe it is, which have been entertained, and in only 1 case out of the 14,000 have the parties asked for a hearing or been granted a hearing. Of course, if they have asked for it they have been granted it; so that that shows absolutely the fallacy of this granting of a hearing on the proposition of the grading of grain. Notwithstanding that fact was impressed upon the Member who made the objection last year upon the floor of the House, he could not be convinced and continued his objection. I do not see how it is possible for you to get this through the House by legislation on this appropriation bill.

Mr. LIVINGSTON. The point of order, I think, was raised by a gentleman who misunderstood the matter.

Mr. RUBEY. Certainly; but you could not make him understand.

Mr. LIVINGSTON. He thought that it was a hearing on the establishment of standards.

Mr. RUBEY. Certainly; and you could not make him believe otherwise.

Mr. ANDERSON. The original grain-standards act was passed apparently on the theory that you could only apply those standards to grain moving in interstate commerce. Is it the opinion of the Solicitor's office that we should now modify that so as to make the standards apply to grain that moves in intrastate commerce?

Mr. LIVINGSTON. Do you mean make them applicable also to the grain?

Mr. ANDERSON. Yes.

Mr. LIVINGSTON. I am not prepared to say. Do you refer to the question whether the act should be based on the weights and standards measure rather than the interstate commerce clause?

Mr. ANDERSON. Yes.

Mr. LIVINGSTON. I am not prepared to answer for the Solicitor on that point.

Mr. ANDERSON. It seems to me that is a point that has got to be determined before this proposed new language is adopted or rejected.

Mr. LIVINGSTON. This is rather putting it on the basis of protecting the integrity of the standards.

Mr. RUBEY. I doubt very much whether or not we can pass that kind of legislation; that is, whether, after it is passed, it would be

considered constitutional or not; because we have no authority except over grain that goes into interstate commerce. At the same time, by a separate bill we might be able to find some way of passing that sort of legislation.

Mr. LIVINGSTON. I think the point was, Gov. Rubey, that, whereas this grain standards act was based on the interstate commerce clause of the Constitution, is it not possible to base it on the weights and measures feature rather than on the interstate commerce clause? I shall be very glad to refer that question to the solicitor, Mr. Anderson, and get his opinion on that.

Mr. ANDERSON. Of course, I appreciate the viewpoint which suggests that this appeal is perhaps a matter of supervision; but I think that is a pretty far-fetched proposition, because, of course, it does not amount to anything unless you have the authority requiring the intrastate grain to be graded in accordance with the Federal standards. The fact that you have an appeal does not amount to anything except that, as Mr. McLaughlin suggested, it is another wedge into the local control over local affairs.

Mr. LIVINGSTON. Almost all the States have adopted the Federal standards and almost all grain passing in either interstate or intrastate traffic passes this inspection.

Mr. ANDERSON. What States have adopted State inspection?

Mr. LIVINGSTON. Almost none.

Mr. ANDERSON. I understand that Minnesota intends to abandon Federal grades.

Mr. LIVINGSTON. I understand they have made that statement a number of times, but thus far they have taken no action.

Mr. ANDERSON. My impression is that they had some legislation at the last session that authorized the creation of State standards and their enforcement so far as intrastate grain is concerned, and my understanding was that those standards would probably be made effective with the next crop.

Mr. HEFLIN. Do you mean they are going to set up different standards from the Federal standards?

Mr. ANDERSON. Yes; I think so.

Mr. LIVINGSTON. As I said at the start, I think these notes that are appended to the item in the bill give a very definite and very brief summary of the points that led us to make the recommendation.

Mr. ANDERSON. So far as I am concerned, I will resolve all doubts about the proposition by saying that, so far as I am concerned, there will be no amendment to this act until we get some standards that will be satisfactory.

Mr. LIVINGSTON. I take it that the standards are not satisfactory to you, then?

Mr. ANDERSON. They certainly are not.

Mr. LIVINGSTON. We have had no complaints about them since the price-fixing matters have been adjusted.

Mr. ANDERSON. We have complained about them until we have got tired of complaining, and we are going to substitute standards of our own.

Mr. LIVINGSTON. There has been no complaint since the establishment of the new differentials between grades of wheat.

Mr. ANDERSON. That was not until after all the wheat was out of the hands of the producer that it was possible to get cars to take away.

Mr. LIVINGSTON. No.

Mr. ANDERSON. Why was not that done?

Mr. LIVINGSTON. That is out of our jurisdiction.

The CHAIRMAN. In regard to the grain regulation, do you recall the amount the spread was modified?

Mr. ANDERSON. I was present at the meetings with the Grain Corporation. My recollection is that at that time the spread ran as high as 42 cents between the No. 1 and No. 4. Probably it was not as high as that, but it was very great. I can look it up and put it in the record. I do not recall the spreads that were arranged there, but my recollection is that the total spread between No. 1 and No. 4 was not over 10 cents.

Mr. LIVINGSTON. I think it was 12 cents, probably.

Mr. TINCHER. The change that you made made a difference of 28 cents a bushel to the producer in my State on the No. 4 winter wheat. He got that much more for his wheat. Was that change made in the department?

Mr. LIVINGSTON. Not by our department. That is a matter that comes entirely under the jurisdiction of the Grain Corporation.

Mr. TINCHER. That was made 90 days after they commenced—

Mr. YOUNG. I want the record to be made straight, to the effect that the Department of Agriculture did not have anything to do with that.

Mr. TINCHER. Why did not the Department of Agriculture have something to do with it?

Mr. YOUNG. The price-fixing committee of the Grain Corporation dealt with that whole subject.

Mr. TINCHER. They had no right to deal with the grading of this wheat. That came from the Department of Agriculture, from the Bureau of Markets.

Mr. LIVINGSTON. They do not deal with grading.

Mr. TINCHER. The standardizing.

Mr. LIVINGSTON. But they fixed the prices based on the grades. The grades were established before the price was fixed, and after the grades had been established the price was fixed, which was recently modified.

Mr. YOUNG. The point I want to make is that it would be unfortunate to have it go out to the producers that in this country, where we are seeking to establish a set of grades that will take care of the producer in order that the stuff may be profitable to raise, this was done through the Department of Agriculture, when, as I understand, the department has had absolutely nothing to do with it except to establish these grades. The department had nothing to do with the price-fixing part of it, and that is what the farmers complain about. We have had the same question on the cotton. The point is that your Kansas department said that there had been too big a spread between certain classes and grades. The department had nothing to do with the price fixing.

Mr. ANDERSON. There is no use going into that here, but the point remains that the character of grades and the character that resulted

from it was greatly modified by the price fixing, because under normal conditions, if a good quality of wheat was graded down because of foreign matter in it, the competition in the central market would, nevertheless, get the producer a reasonable price for the quality of the wheat they could sell, while under the fixed-price system, if the wheat was graded down, although it was a good quality of wheat, it got the price of that grade and that is all.

Mr. LIVINGSTON. That would be true, regardless of what grades were employed. You have stated the case, I think, very clearly.

Mr. TINCHER. Your theory, then, is that there was nothing that the department here could have done under your authority of law to have protected the producer against the injustice of that spread?

Mr. LIVINGSTON. I think not, sir.

Mr. TINCHER. Then I do not think we ought to have the department. If it could not take care of an emergency of that kind, where you permitted wheat to be graded down, whether it had one grain of rye or 100 grains; when your grade that you fixed permitted that to cost a man 30 cents a bushel on his wheat—and you lay that all onto the Grain Corporation—then I can not see how you can ever hope to be of any service to the people of the United States.

Mr. LIVINGSTON. My point is this, that if we had modified the grades under the law the price differentials would be changed to conform to the grades. As a matter of fact, we did change the grades at one time, and the price was changed to conform to the new grades. That would have resulted if we had made a further attempt to change the grades. You remember one year they had 4 cents premium on dark winters and on dark hard, and after the grades were changed the premium was reduced to 2 cents.

Mr. TINCHER. You think, then, that if you had changed the grades last spring, as I tried to get the department to do, the Grain Corporation would have been able to go ahead in some other way and turn the same back to the producer?

Mr. LIVINGSTON. Yes; they would have modified the differential between grades.

Mr. TINCHER. If you had changed it and made that right, they could not have blamed you for it; but they are blaming you for it.

Mr. LIVINGSTON. That is unfortunate.

Mr. TINCHER. If you had changed your grades then, as I told you to [laughter], they could not have blamed you.

Mr. LIVINGSTON. Under normal conditions we think these grades are all right.

Mr. TINCHER. If the conditions are normal?

Mr. LIVINGSTON. Since these price differentials have been changed we have had no complaint about the grades, and the farmer is getting 50 cents or a dollar more than the Grain Corporation price. Just as soon as the price went above the guaranteed price people quit making complaints against the standards.

Mr. YOUNG. I do not know about the grain situation; there may be something that we ought to do, but I do not know what it is; but we have a commodity in my country, the cotton crop, for which we have established standards. They make a spread between certain grades of 500 to 700 points. The Government has nothing to do with it, and I do not know where the defect shows, but it is something

that ought to be attended to. The trade has done it. We know that we are being robbed. That is done by the trade; but when a Government agency engages in that practice it is a different thing.

Mr. RUBEY. To what Government agency do you refer?

Mr. YOUNG. The point to which I am addressing myself is that we have that trouble with the wheat; that is, where the Government has taken charge of the wheat. That spread, you gentlemen say, is too big. I have no reason to dispute that. We have that same condition, probably to a worse extent, in the cotton trade, where we have established standards, and where the trade has gone in there and made that spread. That is wholly unjustifiable, and we were held up on that cotton and got \$25 to \$50 a bale less. We have sustained that loss. How are you going to get at that?

The CHAIRMAN. Yes, but in this case that was made by a Government agency.

Mr. YOUNG. Here is one thing that the Government has taken charge of, and it seems that you still have the defect. Here is another commodity that the Government has not taken charge of, except to establish standards, and we have that complaint, to a greater extent, that the producer is being held up. How are you going to reach it? I should think that all the producer ought to want—all that I as a producer would want—is a fair price. I do not want to be held up and have the value of my crop taken from me by a monopoly and not let me get the value that the market would justify me in getting. There is a defect there. How are we to remedy it?

Mr. TINCHER. Here is one thing about grades. I do not know if it affected any other locality. For instance, it took off from wheat and made an off-grade of wheat for rye and foreign matter the same as for dirt. The millers did not do that, but that was according to the grades fixed.

Mr. YOUNG. Let us stop there a moment. I am interested in that, too. Of course rye is not wheat, but under the present system it is treated the same as though it were gravel—absolutely worthless. Is there a method by which we can make the trade pay for rye; because rye has value, even though it is not wheat?

Mr. TINCHER. The miller does not object to a certain percentage of rye. He does not want his flour to have more than a certain percentage of rye, but he does not want 10 per cent of dirt. The highest percentage of rye they would allow was about 2 per cent. What is that now?

Mr. LIVINGSTON. I understand your question to be, What is the maximum percentage of rye permitted in each grade of the Federal standards for wheat as they now stand? Grade No. 1 permits 1 per cent; grade No. 2, 2 per cent; grade No. 3, 3 per cent; grade No. 4, 5 per cent; grade No. 5, 7 per cent.

Mr. TINCHER. What is the highest grade?

Mr. LIVINGSTON. By the highest grade I presume you mean the highest numerical grade, namely, No. 5, which, of course, includes the poorest wheat covered by a numerical grade, from the standpoint of quality and condition. The maximum of rye content now permitted in grade No. 5 is 7 per cent.

Mr. ANDERSON. Seven per cent?

Mr. LIVINGSTON. Yes; 7 per cent.

Mr. TINCHER. That has been changed. What was it at first?

Mr. LIVINGSTON. I do not know what it was at first; 6 per cent, I think.

Mr. TINCHER. No; I think you will find it was 4, though I may be mistaken in that. But that was still too low, as far as that is concerned. No man who owns a mill will tell you that 10 per cent makes any difference. As a matter of fact, they do not make any difference under 16.

Mr. YOUNG. Suppose it has got 10 per cent rye and the miller does not recognize any difference, but goes ahead and sells on the basis that there is no rye in it?

Mr. TINCHER. He will tell you that it does no harm to the flour. The flour is just as good for every purpose.

Mr. LIVINGSTON. What is your suggestion?

Mr. TINCHER. My suggestion is that you discriminate between rye and dirt in the grades.

Mr. LIVINGSTON. We discriminate now between rye and dirt, but the miller is not going to pay wheat prices for rye. You can not regulate commercial transactions by establishing grades.

Mr. TINCHER. But at that time the price of rye was higher than the price of wheat, and there was no objection on that ground. You say now that the farmer gets 50 cents more than the guaranteed price for his wheat?

Mr. LIVINGSTON. Yes.

Mr. TINCHER. The Department of Agriculture can not take credit for that any more than Congress can.

Mr. LIVINGSTON. We do not take any credit for it.

Mr. TINCHER. The guaranteed price of wheat happens to be lower than the market price of wheat.

Mr. LIVINGSTON. I cited that to show that when the market price went above the fixed price and the fixed price played no part, then the matter of fixed grades was forgotten.

Mr. TINCHER. Yes; but the price was fixed too high. When the farmer is losing 25 or 30 cents on every bushel of wheat, it ought not to be forgotten.

Is it not a fact that the export of wheat was not opened up while the farmer had the wheat?

Mr. LIVINGSTON. I do not know about that.

Mr. TINCHER. And the export was opened up after the speculators got the wheat?

Mr. LIVINGSTON. I do not know.

Mr. TINCHER. I just wanted to know what you thought about it.

The CHAIRMAN. One department should know about the other departments, and especially—

Mr. RUBEY. But the Department of Agriculture does not want to take the responsibility of telling you or of telling Congress why the Grain Corporation did this, that, or the other. The thing for us to do, if we want that information, is to get the information from the people responsible, from the Grain Corporation.

Mr. McLAUGHLIN of Michigan. That satisfies me. If the Department of Agriculture says it has no authority over the matter, let it be put in the record. If there is any fault, and the Department of Agriculture had nothing to do with it, then you ought not to blame it on the Department of Agriculture.

The CHAIRMAN. They should have done something.

Mr. YOUNG. I think it would be very unfortunate for the Department of Agriculture if the records should show that the department had anything to do with price fixing. This will prejudice the farmers of the country against the department. The farmers now must have faith in the Department of Agriculture, and, whatever the Grain Corporation may have been guilty of, this record ought not to show that the department is responsible for it.

Mr. McLAUGHLIN of Michigan. It ought to show that the department is not responsible for it.

Mr. YOUNG. That is what it ought to show and what I think it will show. The Department of Agriculture has had nothing to do with the fixing of prices.

Mr. HARRISON. We have been criticized many times for the difference in prices between grades—a matter for which we were in no wise responsible.

The CHAIRMAN. The grades are in a degree responsible.

Mr. HARRISON. The point is that no matter what the prices were the Grain Corporation was the price-fixing agency and it could fix whatever differences it pleased, so long as it complied with the provisions of the act under which the guaranty was made.

Mr. ANDERSON. That is not quite true. The Grain Corporation had no authority to fix any prices at all. They could not regulate the prices at all except to the point of the guaranteed price. That is all the authority they had. They had no authority to fix anything above the guaranteed price. They did assume, however, in view of the situation that existed, to establish tentative relations between the grades; that is, the tentative price of bread, which they were able at least partially to enforce. So far as I am concerned, I do not absolve the Department of Agriculture altogether from all blame with respect to the wheat situation, not by a jugful.

Mr. HARRISON. As I recall it, the law prescribed No. 1 northern as the basis—

Mr. LIVINGSTON. It did.

Mr. ANDERSON. And below the price fixed by the act. The Grain Corporation could fix these differentials, and it did fix them.

Mr. LIVINGSTON. Yes.

Mr. ANDERSON. But above that price—and the price has been above that price most of the time—those grades were only effective in so far as the Grain Corporation was able by one method and another to make them effective. It had no real authority to do it.

Mr. LIVINGSTON. Then I do not see your point, why the Department of Agriculture should assume responsibility for it.

Mr. ANDERSON. I do not say that you should assume responsibility for it, but when you say that the grades had nothing to do with the resulting injustice to the farmer I do not agree with you.

Mr. RUBEY. The point he makes is this, that, whatever the grades may have been, no matter what the grades may have been which were established, if some other grades had been established, the same conditions would have prevailed.

Mr. ANDERSON. That is nonsense, because, if it is true we might just as well do away with the grades altogether.

Mr. RUBEY. No; it is not nonsense.

Mr. ANDERSON. If the grades have nothing to do with seeing that the farmers get a fair price, we might just as well abolish the grades and abolish the Department of Agriculture.

Mr. RUBEY. No; it is not nonsense. The Grain Corporation fixed certain differentials between these grades, and, if the grades had been some other grades, those same differentials would have existed; those same variations would have existed.

Mr. ANDERSON. Yes; but it makes some difference, when the basis is a fixed price and when good wheat falls in grade No. 4 when it ought to fall in grade No. 2. That is the point that I am making.

Mr. RUBEY. That comes under the question whether you agree with these grades or do not agree with them. You do not agree that these grades are right, and you have a right, of course, to your opinion. A great many other people think they are all right.

Mr. TINCHER. Here is the proposition, Mr. Rubey: Last spring before any wheat was harvested we made an effort with the department here to have those grades changed so as to put a lot of wheat that would be graded in No. 4 up into No. 3.

Mr. RUBEY. Yes.

Mr. TINCHER. I was informed by the department (and I have the letter yet) that there would be no change in those grades. They did make the change in the grades and put a large majority of wheat in my district from 4 to 3. That made a difference to the farmer of about 28 cents a bushel on his wheat, because, while the Department of Agriculture had nothing to do with the differential between grades 3 and 4, and that was done by the Grain Corporation, they did control the grades, and, when they were informed that the wheat they were putting down in No. 4 was absolutely good milling wheat and that that ought to be up in No. 3, they ought to have done that.

I want to have the respect for the Department of Agriculture that I had before I came to Congress, and I think the farmer ought to be able to rely upon the Department of Agriculture as his friend; but is there anything on record anywhere where the Department of Agriculture ever made one fight with the Grain Corporation in the interests of the producer of wheat—where it ever wrote one letter or tried to help the farmer with the Grain Corporation?

Mr. HEFLIN. That was a nonpartisan board, was it not, composed of Republicans, largely?

Mr. TINCHER. I am not talking about the Grain Corporation. I do not know what it is composed of. There are a lot of renegade Republicans just like there are a lot of renegade Democrats. They knew nothing about wheat, or very little, and they had a vital proposition in wheat.

Mr. RUBEY. That whole system is going to be gotten rid of anyway within a few months.

Mr. LIVINGSTON. It has been gotten rid of now. The price-fixing business stops with this crop.

Mr. RUBEY. In the end we will probably have no prices fixed; and then the scheme of putting these grades into effect will go on without confronting those difficulties.

Mr. LIVINGSTON. I think so.

Mr. RUBEY. I think the thing we are discussing now is something that is already past and can not come up in the future, and I doubt whether it is worth while giving any more time to it.

Mr. TINCHER. It is absolutely in the future.

The CHAIRMAN. You say you did not have any authority to fix prices, but only to fix grades?

Mr. LIVINGSTON. Yes.

The CHAIRMAN. And Mr. Anderson contends that the Wheat Corporation had no authority above—

Mr. ANDERSON. I said they had no authority above a fixed price.

The CHAIRMAN. The law says, "The President shall thereupon fix such guaranteed prices for grain, and so forth, according to such standards as are established under the United States grain-standards act, approved August 11, 1916."

Mr. LIVINGSTON. Yes.

The CHAIRMAN. When we speak of the President in this matter we have, of course, reference to the Secretary of Agriculture.

Mr. LIVINGSTON. Yes; with respect to the fixing of grades.

The CHAIRMAN. It is true that the law gives the authority to the President, but that means the Secretary of Agriculture, as we understand it.

Mr. LIVINGSTON. Yes.

The CHAIRMAN. Either the President or the department had the authority to fix the different grades.

Mr. HARRISON. The President's authority was exercised through the Food Administration and not through the Department of Agriculture.

The CHAIRMAN. I have the language here. It says "shall fix such guaranteed prices" according to the grain standards. That means a certain price for each grade. The minimum was \$2. The authority was in the President.

Mr. LIVINGSTON. The department did not exercise the price-fixing authority under the food-control bill.

Mr. YOUNG. You have been reading from the food-control law?

The CHAIRMAN. From section 14 of the act of Congress.

Mr. YOUNG. That does not touch the proposition that this department had nothing on God's green earth to do with fixing these prices.

The CHAIRMAN. The differentials as stated in the act.

Mr. RUBEY. That was given to the President, and the President turned that over to the Grain Corporation.

The CHAIRMAN. As Mr. Livingston said, when it spoke of the President it meant the department.

Mr. RUBEY. The President did not turn it over to the Department of Agriculture.

The CHAIRMAN. That is Mr. Palmer's idea. You say here that we should drop it and condone it. If that position is to be taken, very well, but I dissent.

Mr. RUBEY. We are here acting upon our own responsibility and not upon the responsibility of Mr. Palmer or anybody else.

The CHAIRMAN. Exactly; and so far as I am concerned, I will not support anything of the kind.

Mr. YOUNG. I guess I am in rather a unique attitude in the committee. I opposed this whole price-fixing scheme both in the committee and on the floor. I am going out of Congress, but I do want to leave in this record that the United States Department of Agriculture did not have a thing to do with the manipulation of this

price-fixing scheme. Let it be right or wrong, whatever act has been done has been done by the Food Administration in the wheat end of it, in charge of Mr. Barnes. I do not want this record to show that our permanent Department of Agriculture has been guilty of any of these things, right or wrong, because you know and I know, and every other member of this committee knows, that, so far as the price-fixing part of it is concerned, it is administered by a different piece of machinery from that of the Department of Agriculture.

The CHAIRMAN. The general opinion seems to be that the Department of Agriculture had something to do with it.

Mr. YOUNG. That is what I want to correct. It did not.

The CHAIRMAN. Where it rests at the present is up to the Grain Corporation to explain. As Mr. Livingston has said, the department had nothing to do with it, but I also want to clear up the matter whether the department did have authority from the President to fix prices.

Mr. HARRISON. The President had the authority, but the department did not.

The CHAIRMAN. I want to make it clear that the President did have authority.

Mr. HARRISON. The law says "the President"—not "the Secretary of Agriculture."

The CHAIRMAN. The President did have the authority.

Mr. HARRISON. But he exercised it through the Food Administration and the Grain Corporation—not the Department or the Secretary of Agriculture.

The CHAIRMAN. Will you tell us something about these salaries under the grain-standards item?

Mr. LIVINGSTON. The salaries are all listed on page 259. The salaries that we are paying are substantially the same salaries that are being received in the trade. The salaries of our grain samplers average a little higher than those being paid by grain exchanges, chambers of commerce, and the like.

The CHAIRMAN. If you will refer to the hearings I think you will find that the department salaries are much higher than those paid by the trade; there is complaint about the salaries.

Mr. LIVINGSTON. I have here a card index of every grain exchange or other organization supporting a grain-inspection department, with the salaries which are paid to inspectors and samplers, and I would be glad to answer any question.

The CHAIRMAN. Take Minnesota, for instance.

Mr. LIVINGSTON. The salaries for Minnesota were inserted in the record last year.

The CHAIRMAN. You have salaries up to \$4,000?

Mr. LIVINGSTON. Would you like to have that inserted in the record?

The CHAIRMAN. How much are they paid?

Mr. LIVINGSTON. Members of the Board of Grain Appeals at Minneapolis each receive a salary of \$3,000.

The CHAIRMAN. How much do you pay the members of your board?

Mr. LIVINGSTON. The department's man, who is stationed in Minneapolis, is getting \$3,000; he is in charge of the office.

Mr. ANDERSON. The supervisor?

Mr. LIVINGSTON. The supervisor.

The CHAIRMAN. How much is paid by the State?

Mr. LIVINGSTON (continuing). The highest salaried man on our appeal board gets \$3,240. This board is located at Chicago and is the appeal board for the entire United States. The men on the appeal board located at Minneapolis are employed by the State of Minnesota and handle appeals on grain which arise in Minnesota, for the State of Minnesota.

The CHAIRMAN. How much do they pay?

Mr. LIVINGSTON. \$3,000.

The CHAIRMAN. And you pay how much?

Mr. LIVINGSTON. We have a grain supervisor located at Minneapolis who supervises the work of this appeal board, together with all inspectors located there, and he gets \$3,000.

The CHAIRMAN. How much does the State of Minnesota pay inspectors?

Mr. LIVINGSTON. Our records show that at Minneapolis there is one chief deputy inspector at \$3,000, and there are four assistants at \$2,110 each. I find that the average annual salary of the 24 inspectors, including the chief inspector and deputy inspectors, is \$2,077. They have approximately 15 deputy inspectors at an average salary of \$1,850, plus an average annual overtime of about \$185, making a total annual salary of \$2,035. Four deputy inspectors, \$1,600, plus an average annual overtime of \$160, making a total of \$1,760.

The eight foremen of samplers average \$1,440, plus an average overtime of \$144, making a total of \$1,584.

They have a number of grain samplers at a salary of \$1,320, plus an average overtime of \$132, making a total average annual salary of \$1,452; and—

The CHAIRMAN. Your samplers are paid from \$1,200 to \$1,740?

Mr. LIVINGSTON. Yes.

The CHAIRMAN. That is exclusive of the bonus?

Mr. LIVINGSTON. To those who have been in the service we pay the bonus in addition. The average salary we pay the samplers in the service is \$1,508.08.

The CHAIRMAN. Your salaries run from \$4,000 down to \$1,620?

Mr. LIVINGSTON. I will read you, Mr. Chairman, the salaries of the chief inspectors at some of the important markets. Minneapolis, \$3,000; Chicago, \$4,000.

The CHAIRMAN. Where would you make your comparison—with what position?

Mr. LIVINGSTON. I will read, first, the name of the city; second, the salary of the chief inspector employed by the State, board of trade, chamber of commerce, or some other organization; and, third, the salary paid to the grain supervisor, who is the employee of the Bureau of Markets.

First, Minneapolis: Chief inspector's salary, \$3,000; grain supervisor's salary, \$3,000.

The CHAIRMAN. That is the Federal salary?

Mr. LIVINGSTON. The last one I read is the salary of the Federal supervisor.

Chicago: Chief inspector's salary, \$4,500; Federal supervisor's salary, \$3,240.

New York. Chief inspector's salary, \$10,000; Federal supervisor's salary, \$3,240.

Indianapolis: Chief inspector's salary, \$3,000; Federal supervisor's salary, \$2,080.

Toledo: Chief inspector's salary, \$4,000; Federal supervisor's salary, \$2,760.

The CHAIRMAN. I think that is sufficient. Is there not considerable difference between the responsibilities of the work of the one and the other?

Mr. LIVINGSTON. Yes; our man has the greatest responsibility and gets the smallest salary.

The CHAIRMAN. In what respect is his responsibility greater?

Mr. LIVINGSTON. Because he is responsible for the correct grading of all grain that goes through that market subject to the grain standards act.

The CHAIRMAN. I take it that the inspector in Minneapolis supervises the whole grain-inspection service?

Mr. LIVINGSTON. Yes.

The CHAIRMAN. You have a man there?

Mr. LIVINGSTON. Yes, sir; the man you describe is our man. He has under his jurisdiction the State inspectors, all of whom are licensed inspectors.

The CHAIRMAN. To what extent?

Mr. LIVINGSTON. So far as the administration is concerned and so far as the correct grading of the grain is concerned.

The CHAIRMAN. He is acting in the capacity of the inspector who checks the service?

Mr. LIVINGSTON. No; he acts as supervisor, as his name indicates.

The CHAIRMAN. What does the State inspector and supervisor do?

Mr. LIVINGSTON. The State inspector actually looks at the grain and passes judgment upon it, and the Federal supervisor checks up his work to see whether or not it is done accurately.

The CHAIRMAN. What does the State supervisor do?

Mr. LIVINGSTON. I do not recall any State that has a supervisor.

The CHAIRMAN. You compared salaries.

Mr. LIVINGSTON. The chief inspector at these markets is the chief of the staff at the market.

The CHAIRMAN. He really supervises the work?

Mr. LIVINGSTON. From the administrative standpoint, yes, sir.

The CHAIRMAN. He checks what you do?

Mr. LIVINGSTON. He may check it up, but his judgment is not final on that matter.

The CHAIRMAN. What does the chief inspector do?

Mr. LIVINGSTON. The chief inspector employs the grain samplers, and he probably tells them in which yard they will be located. He employs, perhaps, the inspectors, and tells them their hours of service, and things of that sort.

The CHAIRMAN. He is in charge of the force and is responsible for it?

Mr. LIVINGSTON. The responsibility for securing the correct grade of grain at any of those markets rests on the Federal grain supervisor. This chief inspector, if he actually inspects the grain, is under the supervision of the Federal supervisor so far as the correct grading of the grain is concerned. The chief inspector is in

authority over the expenditure of State funds or funds provided by boards of trade and chambers of commerce.

The CHAIRMAN. Does your man examine every sample, as you have indicated?

Mr. LIVINGSTON. He does not examine every sample. Ordinarily, we have one supervisor who is on the floor of the inspection department.

The CHAIRMAN. Does not the State officer do the same; whether you call him supervisor or inspector it matters not?

Mr. LIVINGSTON. He probably has some administrative officials who act in an administrative capacity in respect to their own men.

The CHAIRMAN. Is it not positive?

Mr. LIVINGSTON. That depends on the inspection department.

The CHAIRMAN. You were speaking about Minneapolis.

Mr. LIVINGSTON. They have two or three so-called reinspectors. Those reinspectors act in an advisory capacity.

The CHAIRMAN. Your supervisor has to check them?

Mr. LIVINGSTON. Yes.

The CHAIRMAN. Are not this supervisor and this inspector doing practically the same kind of work?

Mr. LIVINGSTON. No.

The CHAIRMAN. Is the Federal Government doing all of it?

Mr. LIVINGSTON. No.

The CHAIRMAN. Is the State doing part of it?

Mr. LIVINGSTON. The Federal Government is doing no actual inspection work. All of the inspection work is done by the licensed inspectors.

The CHAIRMAN. Does not the State pay the licensed inspectors?

Mr. LIVINGSTON. Yes.

The CHAIRMAN. Then the State is doing it?

Mr. LIVINGSTON. Yes.

The CHAIRMAN. Why not say that the State is doing it, because it is paying for it?

Mr. LIVINGSTON. I never said the State was not doing it.

The CHAIRMAN. All that the Federal Government does is to issue licenses and check up?

Mr. LIVINGSTON. Yes, sir.

The CHAIRMAN. Are we going into Minneapolis in the grain market and doing part of the physical work or are we unloading the responsibility on the State?

Mr. LIVINGSTON. We do a lot of the physical work in the way of sampling cars for supervision purposes and for appeal purposes, but we do not relieve the State of any physical labor that is connected with the inspection of grain in the first instance.

The CHAIRMAN. We are still talking about supervisors. What do they do?

Mr. LIVINGSTON. The grain supervisor has on his staff one or more samplers.

The CHAIRMAN. How many samplers?

Mr. LIVINGSTON. That will depend on the market.

The CHAIRMAN. How many in Minneapolis?

Mr. LIVINGSTON. Nine.

The CHAIRMAN. He has nine.

Mr. LIVINGSTON. Those samplers are sent out to the railroad yard.

The CHAIRMAN. They bring in samples?

Mr. LIVINGSTON. Yes.

The CHAIRMAN. They bring them to the supervisor?

Mr. LIVINGSTON. Yes; and he grades them and checks up the grade which he places upon it with the grade placed upon it by a licensed inspector employed by the State.

The CHAIRMAN. He has a force of nine people. How many people has the State inspector?

Mr. LIVINGSTON. I do not have that totaled up, but there are a number.

The CHAIRMAN. About 200, are there not?

Mr. LIVINGSTON. Yes; I should say there are 200. However, these are divided among several points within the State.

The CHAIRMAN. Is not the responsibility greater with a force of 200 than it is with a force of 9?

Mr. LIVINGSTON. That would depend on how you describe responsibility. One is a financial responsibility and the other is a responsibility for applying standards.

The CHAIRMAN. Are not the labors greater?

Mr. LIVINGSTON. I should say not. I should say that the responsibilities of the Federal supervisor (and I think this is considered true in every market of the country) are greater than those of the chief inspector. Of course, it is a different type of responsibility.

The CHAIRMAN. You are the one that drew the comparison. There is nothing wrong about it. I wanted to try to find out just what these people do.

Mr. LIVINGSTON. Yes. One of them is a Federal employee, and the Federal supervisor is not a licensed inspector.

The CHAIRMAN. What salary do you pay these nine assistants?

Mr. LIVINGSTON. I think the salaries vary from \$1,200 to \$1,620, depending upon the length of the service. The last item, Mr. Chairman, is No. 97, page 260, relating to the enforcement of the United States warehouse act. Mr. Murph will discuss this item.

FURTHER STATEMENT OF MR. DANIEL S. MURPH, SPECIALIST IN COTTON MARKETING AND WAREHOUSING, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.

Mr. MURPH. Mr. Chairman, the estimates request an increase of \$45,000 over the amount carried in last year's appropriation act for the enforcement of the United States warehouse act. There was available, however, during the present year \$38,000 from the original continuing appropriation, so that the increase asked in the estimates over the amount available during the present year is in reality only \$7,000.

I should like to make a statement which will follow very closely the statement contained in the note in the estimate book on the enforcement of the warehouse act, as to the reasons for the request of an increase for the next year.

There have been up to this time, Mr. Chairman, two or three reasons why the work under the United States warehouse act has not been extended as rapidly as it would have been under other

conditions. One is that it is very difficult to get men with the proper equipment and training to carry on this work, which was a new activity, and we felt that we must have the very best men we could get. Another reason was the fact that for some of the commodities to which the warehouse act is applicable there was during the war Governmental control, and a licensing system which was, in effect, compulsory. The Bureau of Markets felt, that under those conditions, it would not be wise to urge a system of licensing which was designed for bettering trade conditions, but was not compulsory, while the trade was under a compulsory system of licensing under another branch of the Federal Government.

Mr. Chairman, we felt that the time would come when we would be able to give, after the close of the war, an effect to this as permanent peace legislation that would be out of proportion to the value of temporary legislation under the war period. So we felt, for some of these reasons, that the enforcement of the provisions of the act as it related to certain commodities would better be deferred until after the close of the war.

We expect from this time on a very great development and expansion of the work under the United States warehouse act for the reason that having entered more fully and more completely, on the expiration of the war, into the work of carrying out its provisions, we have made certain definite agreements and taken certain definite steps which seem to us to assure the more widespread application of the act and its benefits to people who are interested in warehousing agricultural products. In the first place, then, we have entered into an agreement, Mr. Chairman, with State officials of North Carolina whereby the warehouses that are licensed under the State law of North Carolina will be licensed under this act. In North Carolina a law has been passed which enables the State government to loan money for the building of warehouses, and we have entered into a very close arrangement with them by means of which they are to take out licenses under the Federal act.

Mr. ANDERSON. Who?

Mr. MURPH. The officials in North Carolina.

Mr. ANDERSON. How can they take out a license under the Federal act to build private warehouses?

Mr. MURPH. They are licensed under State control. I will ask Mr. Nixon to explain the details.

Mr. NIXON. The State will control quite a number of warehouses which will be leased to the State, and actually operated under the supervision of a State official known as the State superintendent of warehouses. He has agreed that every warehouse operated under his supervision will be conducted in accordance with the requirements of the Federal act.

Mr. ANDERSON. Let me see if I understand correctly about that? Do I understand that these warehouses are actually operated by the State, by officials of the State, simply under State supervision?

Mr. NIXON. They are under State supervision legally. As I understand it, when the owner of a warehouse wishes to obtain the benefit of the State system of warehousing he will lease his warehouse to the State superintendent of warehouses for a nominal sum, then the State superintendent will designate a local manager and a local

classifier, who operates the warehouse under the name of the State of North Carolina. The State superintendent will be licensed to operate each of these warehouses under the Federal act.

Mr. McLAUGHLIN of Michigan. He gets a license from the Federal Government?

Mr. NIXON. Exactly.

Mr. McLAUGHLIN of Michigan. And he is known as the Federal inspector?

Mr. NIXON. No; he is licensed under section 9 of the act, authorizing the Secretary to license persons not warehousemen who have control of State warehouses.

Mr. McLAUGHLIN of Michigan. Is he compensated by the Federal Government?

Mr. NIXON. No licensee is compensated by the Federal Government.

Mr. ANDERSON. It does not seem to me that "issuing to persons not warehousemen" contemplates any such arrangement.

Mr. NIXON. It was our understanding from the beginning that the provision of section 9 was made to enable us to license these officials who had actual supervision over warehouses.

Mr. ANDERSON. I must say that that is a very strange arrangement.

Mr. NIXON. As I understand, Mr. Murph, that section was put in for that specific purpose.

Mr. MURPH. That is my understanding. If I may read the section—

Mr. ANDERSON. I have the language here.

Mr. MURPH. The language provides for it specifically.

Mr. YOUNG. What does the Government do before issuing a license?

Mr. MURPH. The Government before it issues a license satisfies itself that the warehouse is a proper place for the storage of the commodity for which it is intended. Then the warehouseman that applies is required to give a bond. If the bond is satisfactory, the license is issued, and whatever the warehouseman does he does as being licensed by the Federal Government, and the warehouse is subject to inspection by the Federal Government and is operated under the applicable rules and regulations of the Secretary of Agriculture.

Mr. ANDERSON. It strikes me that section 9 contemplates licensing the owner of the warehouse and not the State supervisor.

Mr. MURPH. The State supervisor in the sense Mr. Nixon uses the term is the State official who has charge of the operation of the warehouse leased.

Mr. NIXON. Exactly. That is what I understood the section (section 9 of the act) to provide for.

Mr. YOUNG. Have you gone far enough with the administration of this warehouse law to find what effect it is going to have?

Mr. MURPH. Mr. Young, I think, if I may proceed along the line I was going, it will answer your question.

The CHAIRMAN. What is there beyond what you have told us that requires an expert to examine the warehouse?

Mr. MURPH. A great deal of this work at the outset was investigational work—for instance, work relating to the requirements that should be made of a warehouseman before he was licensed, to deter-

mine what, as a matter of fact, are proper regulations, what are proper requirements—and we tried to be very careful in working out the fundamental requirements of warehousemen, and it was for that class of work that we felt we should be very sure of our ground before we determined that such and such a requirement should be made. We wanted to make requirements in harmony with the spirit of the act, and we wanted to make requirements that were reasonable and would bring about the practical results we had in mind.

The CHAIRMAN. Have the requirements been definitely formulated?

Mr. MURPH. Yes, sir; the regulations have been issued for cotton warehouses and grain warehouses. Regulations for tobacco warehouses and wool warehouses are in tentative form, and hearings will be held in February on wool warehouses and in April on tobacco warehouses. Regulations are written in tentative form, and after we get what we think is desirable we take them to members of the trade to see if they are suitable. Sometimes we get valuable suggestions and sometimes we get suggestions that we do not adopt. But the regulations have been adopted for cotton and grain warehouses and have been prepared for tobacco and wool warehouses.

The CHAIRMAN. What other warehouses are contemplated?

Mr. MURPH. Flaxseed is the other product covered by the act.

The CHAIRMAN. Are you not practically through with the investigation?

Mr. MURPH. We have very nearly reached the point where we can turn our attention to the actual administration of the act as it applies to warehouses and the issuing of licenses.

The CHAIRMAN. What is there about that that requires an expert?

Mr. MURPH. In reference to the inspection of warehouses in order to determine whether they are kept in proper condition, and as to whether the commodities carried in them are kept in proper condition, the Secretary has the authority under this act to inspect the commodities stored in warehouses to see whether or not they are properly taken care of. We require men with knowledge of that kind. We expect also to give suggestions as to the construction of warehouses.

Mr. McLAUGHLIN of Michigan. How often do you make these inspections?

Mr. MURPH. We do not make them at stated intervals, because we think it is better that the warehousemen shall not know just when we are going to make them.

Mr. McLAUGHLIN of Michigan. I know; but about how often has it been?

Mr. MURPH. So far about every six weeks.

The CHAIRMAN. How many warehouses have been licensed?

Mr. MURPH. We have now received applications for 83 cotton warehouses and have licensed 19. We have received applications to-day for the one hundredth grain warehouse, and have licensed 1.

The CHAIRMAN. You have licensed 19?

Mr. MURPH. Nineteen cotton warehouses have been licensed, and we have had applications for 83. The others are pending. We have received applications for 100 grain warehouses. The regulations and the application forms for grain warehouses have been in usable form

only about one month. In that time we have received applications for 100 warehouses and have licensed 1.

The CHAIRMAN. Of grain?

Mr. MURPH. Yes. I make that statement to show why the number of applications is so great compared to the number of warehouses actually licensed. We have had them out for only about four weeks.

The CHAIRMAN. Until we amended the law, practically rewrote the law, there were few applications, were there not? As it stands, there is very little left of the law.

Mr. MURPH. There were about 60 applications before the act was amended.

The CHAIRMAN. How many licenses did you issue prior to the amendment?

Mr. NIXON. About 10, Mr. Chairman.

Mr. MURPH. You will understand, of course, that the regulations for grain warehouses were not issued until after the act was amended, so I could not give figures for grain warehouses at all.

Mr. McLAUGHLIN of Michigan. Are these inspectors who look over these warehouses employed all the time?

Mr. MURPH. Yes, sir.

Mr. McLAUGHLIN of Michigan. How many of them have you?

Mr. NIXON. We have three men who do inspection work, but all their time is not given up to it, for we find we can use their time economically by doing some other work in the interim of making inspections.

Mr. McLAUGHLIN of Michigan. What are they paid?

Mr. NIXON. About \$1,800 to \$2,700.

Mr. McLAUGHLIN of Michigan. And their traveling expenses?

Mr. NIXON. And their traveling expenses; yes, sir.

Mr. McLAUGHLIN of Michigan. If you have a licensed warehouse at no more places than you have spots on the map, you will require a good many inspectors—traveling men. How many?

Mr. NIXON. It would be very difficult to estimate offhand. I should say that we have held up the inspections of those warehouses until other applications have been received, in order to save traveling expenses very largely, in the same community, so that a man can make inspections with comparatively little travel for each inspection.

The CHAIRMAN. This law has been in operation about three and one-half years, has it not?

Mr. NIXON. Yes.

The CHAIRMAN. And we have 20 warehouses licensed. You are not making very much progress, are you?

Mr. MURPH. When you consider merely the number of warehouses licensed the results do not appear commensurate with the time that the act has been in operation. But there are other considerations—

The CHAIRMAN. But we have expended about \$200,000.

Mr. MURPH. I do not recall.

The CHAIRMAN. The first year it was \$50,000, then \$59,620, then \$53,540, and last year it was \$35,000.

Mr. NIXON. Those amounts have never been entirely expended.

The CHAIRMAN. How much have you turned back into the Treasury?

Mr. NIXON. I know we had an original \$50,000 appropriation, and we had at the beginning of this fiscal year \$38,000 of that, so that it will be seen that prior to this fiscal year only \$12,000 out of the \$50,000 had been spent, and then we turned back a considerable amount of the \$59,000 for the second year.

Mr. HARRISON. \$96,000 has been expended in three years.

Mr. McLAUGHLIN of Michigan. How many people are employed in Washington?

Mr. NIXON. We have 12 people altogether, and three of those are in the field practically all of the time and another one is in the field a good deal of the time. We sent out another man recently on investigational work.

The CHAIRMAN. You are asking for an increase of \$45,000.

Mr. NIXON. I do not remember whether Mr. Murph covered that point or not. We had a balance of \$38,000 from the original appropriation at the beginning of this fiscal year. That, together with the \$35,000 appropriated for the current year, makes \$73,000 available for the present fiscal year; so the increase is actually only \$7,000.

The CHAIRMAN. Mr. Harrison says you have expended \$96,000.

Mr. HARRISON. In the three years.

The CHAIRMAN. That would build warehouses, would it not, and not only license them?

Mr. NIXON. It would not build very many at the present cost of material.

The CHAIRMAN. Are they large houses?

Mr. NIXON. Some of them are, and a great many of them are comparatively small.

The CHAIRMAN. I am at a loss to know why you should require the services of \$2,700 men to inspect these warehouses?

Mr. MURPH. His services, Mr. Haugen, are not entirely given to inspecting warehouses.

The CHAIRMAN. You said you had three inspectors?

Mr. MURPH. I said a part of the time was given to inspection. A part of the time of the three field men is given to inspection; but this \$2,700 man spends a part of his time in Washington and has done valuable investigational work.

Mr. McLAUGHLIN of Michigan. What kind of investigational work is necessary?

Mr. MURPH. Work looking to the promulgation of proper rules and regulations, the determination of what ought to be included in rules and regulations.

Mr. McLAUGHLIN of Michigan. If a company builds a warehouse, do you go and see if it is sufficient?

Mr. MURPH. That has to be done after the application has been received; but, before any applications are received, the Secretary, under the act, must issue regulations for the operation of warehouses that may be licensed, and a licensed warehouseman must know what he is expected to do under the act; and, in order to do that, it was necessary to do a considerable amount of investigational work.

Mr. ANDERSON. What are you going to do with a man who violates some of the terms of the license?

MR. MURPH. We have authority under the act to revoke his license.

MR. ANDERSON. He does not need any license to do business. Why is he any worse off than before?

MR. MURPH. He does not want to have his license revoked. It is an advantage to do business under Federal license.

MR. ANDERSON. Let us see about it. Two or three amendments were adopted to this act at the last Congress, or thereabouts. One of those amendments did away with the requirement for fire insurance. Another one of those amendments permitted warehouse receipts to be issued in case where the articles were not classed or graded in accordance with some standard. Under the law as it now stands, the warehouseman can issue a receipt for one bale of cotton, against which there would be no fire insurance, and against which there was no grade stated or anything of that sort. Do you mean to tell us in the note under this item that the Federal Reserve Board or somebody, some Federal reserve bank, is going to give a preference to that kind of a receipt?

MR. MURPH. They have stated so. I may make this statement in reference to the two points you have just mentioned. With reference to the statement of grade, the amendment, as I recall it, provides that when requested by the depositor a certificate may be issued omitting the statement of the grade, but the receipt itself will always show whether or not the grade is stated. In reference to the other point regarding the elimination of the requirement in the act for fire insurance, as long as that language was in the act it was construed by bonding companies to be subject to the interpretation that the bonding company, as a matter of fact, was practically insuring the cotton. With that language eliminated that objection was overcome. That was an excuse for requiring a higher premium rate on bonds by the bonding company.

MR. ANDERSON. Nobody ever thought of that particular reason for putting this amendment in when it was made.

MR. MURPH. I did not think of that. I was with this committee when this act was adopted. I did not think of that, but so long as this language remained in the act the bonding companies had used it for the exaction of a higher premium, or for taking a position of aloofness from issuing bonds to warehousemen. Now, as a matter of fact a receipt will show whether or not the cotton or other commodity stored is insured, so that the receipt carries on its face an indication as to its exact value.

MR. JACOWAY. Mr. Murph, why did you not enforce the provisions of that act before you did?

MR. MURPH. The war emergency and some of the things touched by those amendments had a deterrent effect. We felt that those amendments removed objections and did not destroy the fundamental purposes of the act, and at the same time made it a little more workable.

MR. ANDERSON. In other words, there were a lot of rotten warehouses around the country on which nobody would take a risk, and by eliminating this provision you could license them.

MR. MURPH. That was not the purpose. The purpose was, as I have outlined, to change this language so that it would give the bonding companies no excuse for claiming that practically the bondsmen became insurers for the commodity stored in the warehouse.

Mr. TINCHER. What class of warehouses is applying for the licenses?

Mr. MURPH. Cotton and grain warehouses.

Mr. TINCHER. I am going to be frank with you. I had a gentleman get me a list of the Kansas warehouses. I see some in my district, four or five in my own congressional district, and no one of them is in a town, I would say, to exceed 300 population. In that congressional district, which produced more wheat than any other district in the United States last season, there are good towns—Great Bend, Pratt, Lenora, all great grain centers—and each one has a good big warehouse. None of those is mentioned. None of them applied, but only the small places with a high school, with a little railroad station, and probably 200 or 300 people. You do not seem to have these large warehouses.

Mr. MURPH. We have licensed only one grain warehouse. As I have stated, the regulations for grain warehouses were not sent out until about the middle of December.

Mr. TINCHER. None of those in Kansas are licensed?

Mr. MURPH. None.

Mr. TINCHER. Why is that? I do not want to reflect on these little ones, but why is it that the big ones have not asked for licenses?

Mr. ANDERSON. The whole theory of this act is to permit a piece of land with a barbed-wire fence around it to be a warehouse under the Federal Government and to have a standing as such.

Mr. TINCHER. The fence is costing too much.

Mr. HEFLIN. You do not concede any such proposition as that, Mr. Murph?

Mr. MURPH. We have not licensed places like that, Mr. Anderson.

Mr. ANDERSON. The act permits it.

Mr. HARRISON. There must be a "warehouse" at least.

Mr. ANDERSON. No; a piece of land inclosed with something.

Mr. MURPH. The act refers to an inclosure. I think I know what you have in mind, but we have not licensed any such place under the act.

Mr. TINCHER. If those small towns want licenses and nobody else wants them, of course, I want you to give it to them.

Mr. MURPH. Mr. Tinchler, as I understand, your statement with reference to warehousemen is not a reflection upon the value of those particular warehouses. It is merely that they are small.

Mr. TINCHER. That is it. Their locations would indicate that, they are not the people who are doing the business, and I wondered why the larger warehouses were not taking up the proposition. I know they have large warehouses there.

Mr. MURPH. We have large warehouses that have made application also. I do not know how this happens in Kansas, but, for instance, in Buffalo we have a wheat concern that handles 2,000,000 bushels, which has made application for a license.

Mr. RAINEY. Following Mr. Anderson's suggestion, these investigators of yours who go out to promulgate the work, at least see that there is a building?

Mr. MURPH. Mr. Rainey, of course, we never issue a license to any warehouse without first examining it and seeing that it is a proper place for storage of the particular commodity for which it seeks a

license. The Secretary is to decide what are proper places for storage.

Mr. ANDERSON. I remember when we passed this act there was great opposition to providing that it should be a building, because we were told that in certain sections of the country all they had were pieces of ground with fences around them.

Mr. JACOWAY. To be stored so many feet above ground with a covering on it, and it was brought out that cotton thus stored would not deteriorate.

Mr. NIXON. I may say in that connection that recently we had an informal application from a warehouseman, a man who called himself a warehouseman, from what we speak of as the desert or irrigated area of Arizona. Their practice there is to store it in the open only. As a rule they have a fence around it, but the solicitor's office has just recently advised against licensing any inclosures of that kind, so that question seems to be pretty well settled. It has never been considered on our part except in those arid areas where there is supposedly little damage to cotton from rain or from soil moisture, and even that has now been decided in the negative, so there is no proposition to license an inclosure that is not a building. While we have never written out any definite standards that we go by in our inspection of cotton warehouses, we require that at least three conditions be met. First, there must be a building; the building must have a roof on it so as to make it unaffected by rain and snow; it must have protection for the cotton from the soil moisture; and it must be inclosed so as to prevent theft. In addition to that it must be a risk that can be insured with insurance companies regularly authorized to do business there.

In addition to those requirements as to the physical properties of the buildings, we are insisting that before a warehouseman can become licensed he must submit to us a financial statement showing a certain amount of net assets over and above all of his responsibilities, the amount of those assets depending upon the storage capacity of his warehouse.

We are trying to make a standard that will be sufficiently high to insure the integrity of every receipt issued by a licensed warehouseman. On the other hand we realize that many of the small warehouses; take those in Kansas, for example, are the ones that need assistance, more than some of the larger warehouses, so we are trying not to use standards which will be out of the reach of the smaller warehouses.

Mr. ANDERSON. Is this warehouse business a regulatory proposition?

Mr. NIXON. It is a permissive regulatory act. It is a purely voluntary proposition. Any warehouse that can meet the conditions can become licensed if the warehouseman so desires. If it does not wish to operate under the Federal act that is its own business.

Mr. TINCHER. It is compliance with the idea expressed by my predecessor, Jerry Simpson, to license Government warehouses?

Mr. NIXON. Exactly so.

The CHAIRMAN. The bill was drafted with the view of giving standing to warehouse receipts, was it not?

Mr. NIXON. Exactly.

The CHAIRMAN. Where the receipt meant something, had something back of it, so the banker or the money lender might feel safe in lending money on the receipt?

Mr. NIXON. Exactly.

The CHAIRMAN. It required certain things, last session of Congress we struck out all the provisions, so that now you have just a shell left. You now have a receipt purporting to be from a Government warehouse inspector which in itself may be deceiving, so that now, instead of giving security to the money lender, you may be deceiving him.

Mr. NIXON. I do not agree with you.

The CHAIRMAN. I did make a very vigorous protest. I do not think we should appropriate money to do anything that may deceive the people.

Mr. NIXON. I do not think that is being done, Mr. Chairman, because in the first place the receipts that do not show a statement of the grade are not issued except at the request of the depositor, and then it is done only in the case of products which can not be mixed, where the man gets back the very product that he stored. If a man stores a bale of cotton and he asks that it be not graded, the warehouseman will write conspicuously on the receipt that it is not graded. Any man that accepts that receipt is put on notice, and on the face of the receipt, that the product is not graded.

The CHAIRMAN. Let us see about that. The gentleman who stores a short-weight bale or a bale of inferior quality, of course, will not ask for an inspection. But he will store the bales and will hold a receipt for a certain number. The cotton may be of little value, but he has a receipt for a certain number of bales, which he may take to the banker and draw on.

Mr. HEFLIN. The banker will not lend him any money on that.

The CHAIRMAN. The banker sees that it is a Government receipt and loans the money.

Mr. HEFLIN. The banker will see what grade it is. If he does not, he will not let him have a dollar. You are mistaken about that.

The CHAIRMAN. Look what occurred in Arkansas. That was the excuse for this legislation, to give proper security, if issued under the proper provisions of law. The bill was well drawn, but all the good features in it formerly were taken out.

Mr. HEFLIN. The only way you can get money is this: The banker will say, "I will go down and look at the cotton."

Mr. TINCHE. What value, then, would the receipt have?

Mr. HEFLIN. It would tell him that there was cotton there, whereas he might come to the banker and say, "I have 10 bales of cotton at home," and he would not know whether there was any there or not. Then he would ask the man what the grade was, and, if he did not know the grade, he could not get a dollar.

The CHAIRMAN. Of course he can ascertain whether the cotton is there.

Mr. YOUNG. I will speak from actual knowledge of how that situation is handled. We have no Federal warehouse in my district, but we have got some under private and State jurisdiction. When they issue a cotton receipt you have got the name of the party to whom issued, you have got the weight of that bale of cotton, you have got

the grade of that bale of cotton, and the receipt is turned over to the owner of this cotton. If he wants to borrow money on the cotton, he takes the receipt to the bank. The local banker is not a fool.

The CHAIRMAN. Is that a Government warehouse?

Mr. ANDERSON. The purpose of the act was to make it possible to take the receipt to New York or any place.

Mr. YOUNG. I am telling you how it works out. He goes to the local banker. The local banker looks at the cotton tickets and sees what grade it is; he sees that it is properly issued by this warehouseman; then, if he wants to make a loan, he makes it. The banks have a strict supervision over it. They go down and look at the cotton. They are not going to take any chances. Then, if the bank wants to rediscount this paper, it has the right to do it under the Federal reserve act at the Federal reserve bank at Dallas, Tex. They send all these papers, all these certificates. We have not any under Federal supervision yet, but you need not have any doubt that the local banker is not going to take any chances.

The CHAIRMAN. You are not referring now to these licensed warehouses?

Mr. YOUNG. I am interested in what the Federal Government is doing. I am speaking of that community, but that is typical of every community. What I would like to see as to these farm commodities is that there is some little verity given to the Federal Government's certificate of a warehouse. A certificate of this kind is the best paper, I think, if it is properly protected. With the Government supervision and the Government licensing of this local warehouseman, the time will come when these warehouse receipts will pass current all over the country, and men will seek for that kind of an investment. It is a question of whether we have established a system here that will so guard the integrity of the transaction that it will make it a piece of paper that the public will like to invest in.

The CHAIRMAN. That is what we thought at the start, but every protection has been taken away.

Mr. YOUNG. I will say this further: A local banker will not lend his money to the farmers unless he has this warehouse receipt and until he sees that his cotton is there. They take every precaution.

Mr. NIXON. I think we can clear up some of the objections that have been raised in your statement. Every receipt issued to a licensed warehouseman must among other things show the weight of the product for which the receipt is issued, and it must show the grade of that unless the depositor requests that the receipt do not show the grade. There is one other thing it must show, and that is, whether or not it is insured by the warehouseman, and to what extent it is insured. That, it seems to me, would prevent any fraud or deception being practiced upon anyone. Now, as to the purpose of the amendments that you referred to, the first was the one which relates to fire insurance, which had the effect of writing fire insurance into the language of the bond that the warehouseman was required to give.

The CHAIRMAN. The first provision—the insurance provision—favored the insurance trust. The amendment eliminating it was a good amendment. But in addition, the bill provided that the receipt should be conspicuously marked that it was not negotiable; that it would not be negotiable unless certain requirements were complied

with. The requirements were taken out by the amendments and the receipt now does not amount to anything.

Mr. NIXON: The purpose of the amendment permitting the issuance of a non-negotiable receipt, not showing the grade of cotton—I mention cotton because it would not be possible for a grain warehouseman to issue such receipt; that amendment does not apply to grain at all. It applies only to nonfungible agricultural products. A number of cotton mills send out their own buyers who know just exactly what cotton they want, and they determine that the cotton is what they want before they ever buy it. Then they store it in a warehouse. They know what it is, and they have their own banking arrangements to enable them to finance it. They are unwilling to pay the warehouseman to classify that cotton a second time.

Also there is a class of cotton men, some of them cotton factors, cotton exporters, that have their own classifying rooms; they have their own men employed and they send them out to grade the cotton, they are in position to finance their business, and they are unwilling to pay warehousemen to grade it again. It would be an economic loss.

Mr. ANDERSON. We are just asked to appropriate a large amount of money to have the Federal Government classify cotton so that we will know that it is done right. Now, you tell us that it would be an economic loss to have this done.

Mr. NIXON. In particular cases, I do not mean in general. Certain classes of people in the cotton trade do their own grading; I mean in particular cases, and the purpose of the amendment was to provide for those particular elements in the trade.

Mr. HEFLIN. You have reference to contract cotton and the exchanges, Mr. Anderson. He is talking about the large number of spot markets in the cotton belt. There are 820 counties in the cotton belt.

Mr. ANDERSON. I am not talking about spot cotton. We are talking about warehouse receipts.

Mr. HEFLIN. Yes; it is altogether about spot cotton when you are talking about warehouses.

The CHAIRMAN. The cotton is stored, a receipt is given and money is borrowed on the receipt.

Mr. HEFLIN. There is no exchange transaction about that cotton. It is bought off the wagons or out of a warehouse in the spot trade, and Mr. Anderson has reference to money that is appropriated to classify or grade cotton in the exchanges or that is dealt in in the exchanges on contract. Mr. Nixon is talking about cotton stored in the market places throughout the South.

The CHAIRMAN. What the law provided for before was that there should be marked conspicuously on it that the receipt was not negotiable unless it fulfilled certain requirements, but that language was stricken out of the law by the amendments.

Mr. McLAUGHLIN of Michigan. I noticed one of the applications marked in Michigan is in my district, at Pentwater. What kind of an application was made there—for the storing of what kind of product?

Mr. MURPH. Grain.

Mr. McLAUGHLIN of Michigan. What kind of grain?

Mr. NIXON. I could not say, because these applications have all come in in the last two or three weeks and I have not examined them.

Mr. ANDERSON. May I ask if you sent out to the various elevators over the country any communications indicating the great advantages of this permissive Federal warehouse system?

Mr. NIXON. In December we sent out application blanks, with a very brief announcement of the act and the fact that the regulations had been promulgated and that we were ready to consider applications.

Mr. McLAUGHLIN of Michigan. Have you copies of the kind of papers—literature—that you sent out?

Mr. NIXON. I have no copies with me, but I could furnish the committee with copies if it so desires.

Mr. MURPH. Mr. Chairman, if I may make a statement here as indicating the value of licenses to the receipt itself, a gentleman from Georgia told me voluntarily that he lives in a little town, which I shall call A, because I do not care to discriminate, and that 30 miles from A is a town called B. He said in town B there is a warehouse licensed under the United States warehouse act, and that in his own town of A the warehouse is not licensed under the act. People who stored cotton in the licensed warehouse at B borrowed money at 6 per cent on their receipts, whereas people who stored their cotton in the unlicensed warehouse at A had difficulty in borrowing at any price at all, and paid 8 per cent when they could get it. I wanted to know whether there were not some other conditions that would account for this difference, and I asked him whether there were conditions at this second point which ought to be taken into consideration in addition to the fact that the warehouse there was licensed under the act, and he said positively there were not; that the fact that one warehouse was licensed and the other warehouse was not made the difference.

Mr. ANDERSON. I have no question about that at all. The only question in my mind is whether people are not being misled as to the value of this receipt, as to the value of the license system that this law provides for, which is permissive in character without absolutely compelling the enforcement of it in any way.

Mr. MORRILL. The fire insurance companies investigate these things with the greatest of care. I do not believe anybody would accuse them of being deceived or of being imposed on in the matter of these licensed warehouses. They have investigated this situation, and, on the sole consideration that a warehouse is licensed by the Federal Government, they are giving a reduction of as much as 25 per cent in the premium rates.

Mr. ANDERSON. But the real reason is that there is an occasional inspection of the fire risk. That is why the rate is reduced.

Mr. MORRILL. All those things are part of the Federal licensing system.

Mr. ANDERSON. Of course, Mr. Morrill, you do not mean to seriously suggest here that the basis of the fire insurance companies' reduction is the license? It is the inspection.

Mr. MORRILL. I mean that that is one of the things which go with the license under the act. They do not get those benefits without the license.

Mr. ANDERSON. I am talking about the receipt—the value of the receipt issued under a law of this sort.

Mr. MURPH. Mr. Nixon brought out the fact that the receipt in each instance shows exactly all the facts about the bale or bales of cotton that it represents, and that appears to me to answer the objection you have in mind.

Mr. ANDERSON. I do not think it shows all the facts. It simply shows that, when it does not state all the facts, it does not state them all.

Mr. MURPH. For instance, it must state whether or not the cotton has been graded. Now, anybody who wants to know the value of the receipt from the standpoint of the grade, may find it out from reading the receipt. It also states whether it is insured. Anybody interested in the fact may get it from the receipt. There is other information on the face of the receipt, which also states that the cotton is stored subject to all the rules and regulations promulgated by the Secretary of Agriculture under the authority of the act, that is to say all the rules and regulations that are applicable to that particular form of warehouse are embodied in the receipt by reference to the rules and regulation.

Are there any further questions, Mr. Chairman?

The CHAIRMAN. All credit, of course, is based upon integrity and ability to redeem an obligation. The license of itself does not add anything to the security, the integrity or the ability to meet the obligations. Most business is honestly conducted, but, fortunately, not all. What we tried to do was to get security against dishonest practice. We wrote it in the bill, but last session of Congress, unfortunately, the bill was amended striking out the protection against dishonest practices. I believe we ought to put those provisions back in the bill. But it would be subject to a point of order here.

Mr. MURPH. Mr. Chairman, I may state that there is one important respect in which the licensing of warehouses and the proper supervision and inspection of warehouses has a bearing upon the producer in the marketing of his product, and that is to say that he is in a position to store his product in warehouses whose standing is recognized, he is able to finance it, and to market it according to his own judgment rather than according to the dictates of someone who for the time being is his creditor and may be a very persistent creditor. In the case of cotton, for instance, up to this time about 70 per cent of the product has been marketed during four months, during the four harvesting months. That is unsound from many standpoints. It is unsound from your standpoint as a consumer, and it is unsound from the standpoint of the man who makes it as a producer. Now, the establishment of a uniform system of warehouses in that trade, as well as the establishment of a uniform system of warehouses for grain and other commodities, presents to the producer an opportunity to secure credit and to market his product more in accordance with his judgment than with the exigencies of the demands upon him for the payment of his debts. I think that is one important feature.

The CHAIRMAN. Because of increased storage facilities?

Mr. MURPH. Yes.

The CHAIRMAN. Due to this act?

Mr. MURPH. This act contributes to that in that it provides here a vehicle for procuring a better system of storage throughout the producing areas.

The CHAIRMAN. We are grateful to you, Mr. Murph.

Mr. MURPH. May I express, also, in a personal way, my appreciation of having this opportunity to meet with the members of the committee again.

The CHAIRMAN. The committee is very glad to hear you. We are very grateful to you, Mr. Murph.

Mr. LIVINGSTONE. I will have Mr. Sherman make a very brief explanation about item 100, on page 262, "To enable the Bureau of Markets to complete the work of the Domestic Wool Section of the War Industries Board."

The CHAIRMAN. We will hear Mr. Sherman again.

FURTHER STATEMENT OF MR. WELLS A. SHERMAN, SPECIALIST IN CHARGE OF FRUIT AND VEGETABLE DIVISION, BUREAU OF MARKETS, DEPARTMENT OF AGRICULTURE.

Mr. SHERMAN. Mr. Chairman, the War Industries Board issued permits to 179 distributing center dealers—that is to say, wool dealers—in the large markets who had facilities for handling and grading wool in large quantities, and through them the entire domestic wool clip of 1918 was taken over by the Quartermaster's Department for the use of the United States.

The machinery set up by the War Industries Board also permitted the purchase direct from farmers in the fleece wool districts, which, generally speaking, include all the territory west of the Mississippi River, by country dealers.

This regulation provides that the country dealer should pay the grower fair prices for his wool, deducting only moisture shrinkage, freight to the seaboard, and interest on the money invested. In other words, the country dealer was supposed to know when he bought the clip in the grease what its scoured value would be at the seaboard, and the Government bought wool, just as all dealers buy wool, on its estimated scoured value. The valuation committees of the Quartermaster's Department were expert wool men, who were supposed to be able to judge with reference to each lot of wool as it comes from the sheep, and how much it would scour, and the price was based on the scoured value.

The War Industries Board used this little pamphlet, a copy of which I have here, "Government regulations for handling wool clip of 1918," which constitutes practically all there is given to the public in the way of a guide as to how this wool should be handled.

The CHAIRMAN. Did you state the profits that were allowed?

Mr. SHERMAN. It states specifically. Perhaps I might read that into the record, which appears under the clause headed "Profiteering":

"As a guard against profiteering, the books of all approved dealers in distributing centers shall be at all times open to Government inspection, and if it be found that their gross profits, including the aforesaid commission of 4 per cent, are in excess of 5 per cent on the season's business, then such gross profits shall be disposed of as the Government decides."

In explanation I should say just there that the additional 1 cent was what they were permitted to make on the fleece wools which they bought through their own direct purchasing agencies in the field; the 4 per cent being paid them as an addition to the Government fixed price on each lot of them as the Government took it over.

The CHAIRMAN. Those are your 179 dealers?

Mr. SHERMAN. Yes.

The CHAIRMAN. In addition to that, on what were they to have 4 per cent?

Mr. SHERMAN. They were to have 4 per cent paid them by the Government; in addition to that they were permitted to make 1 per cent more on the wool that they actually purchased.

The CHAIRMAN. On their own account?

Mr. SHERMAN. Yes; on the wool they actually purchased, where they sent their own money out into the country and paid for the wool.

Mr. YOUNG. How was the price arrived at that the Government agreed to pay for the wool clip of 1918 and 1919? Who made those price agreements?

Mr. SHERMAN. Those price agreements were arrived at, as I understand—I had nothing to do with it at the time—at a conference between representatives of the Quartermaster's Department and the wool trade itself and, I think, the War Industries Board, as it then stood.

Mr. LEE. And the woolgrowers?

Mr. SHERMAN. The wool trade includes the woolgrowers.

Mr. YOUNG. So it was a mutual agreement between the dealers in wool, the woolgrowers, and the Government?

Mr. SHERMAN. The price as fixed was. On the 31st of December the President issued an order transferring the Wool Division of the War Industries Board to the Department of Agriculture for the purpose of liquidating its business. At that time the board had already sent out blank report forms to the country dealers, on which to make a report of their business, showing in detail their purchases and sales, so that their profits could be determined.

The work, I might say, Mr. Chairman, was turned over to me when it had reached that point. I had my first connection with it at that stage of the game. It came over to us the 1st day of January; the War Industries Board formally dissolved at that time, and this particular activity was referred to the bureau for administration and completion.

The Government had not yet finished taking over the wool; it was not yet all valued, and therefore the different central dealers were not in a position to make a report, but just as soon as the valuation of the wool was completed, just as soon as the Quartermaster's Department had taken over the last part of it, they were called on to make a detailed report of their transactions.

Mr. HUTCHINSON. By that date do you mean this month or a year ago?

Mr. SHERMAN. January 1, 1919. The progress of this work to date is that we have received reports from more country dealers than the War Industries Board issued permits to. That is to say, we have found, in checking up the reports the distributing center dealers, the big fellows through whose hands all the wool came at least,

that there were some 1,600 men who bought and sold wool in the United States without any permits at all, whose operations the War Industries Board did not discover and who went through the season without let or hindrance or supervision. We have called upon all those men to make us exactly the same report that has been required from permit holders, and a great many of them have done so, and a great many of them have sent in their excess profits, so that we have actually received reports, which are, at least on their face, satisfactory, from more than 3,600 country dealers, and are now actively dealing with over 3,900 in the closing out of this affair.

The distributing center dealers have, practically all of them, rendered reports, and we are pushing the auditing of those reports just as rapidly as we can, the limiting factor in the work having been our inability to secure enough competent auditors to go into those rather complicated reports and handle them satisfactorily. As you know, the Internal Revenue Service has absorbed practically all auditing talent in this country, and this being temporary work nobody wants it enough to do it. To put it the other way, nobody good enough to do it wants it, because it is only a temporary job.

Up to this time we have collected over \$200,000 in excess profits. We have audited and outstanding for collection accounts showing additional excess profits of approximately \$270,000, and a first inspection of the returns received, which have not been audited in detail, indicates that our total collections should be somewhat in excess of half a million dollars.

I want to say that our investigation so far indicates that there will be about 20 per cent of all the moneys that were collected which we will not be able to distribute back to the grower, because there is at least that proportion of missing information in the record, certain dealers having no records of individuals from whom the wool came, so there will be very much more money to remain in the Treasury as an undivided fund than all you will ever appropriate. In fact, I think we will have a final balance in the Treasury of many times the appropriation you will make for this work.

Mr. JACOWAY. You said your experience in this wool matter has given you certain valuable information and that, if the committee ever called on you to give your information, you felt it would be of some benefit to the wool growers. I want to ask whether your main suggestion along that line would not be to cut out the unnecessary agent or middle man and make it from the producer to the consumer? Is not that what your observation leads you to?

Mr. SHERMAN. I prefer not to go in the record on that further than to say that I think we learned some very valuable lessons as to how some things can be operated from the experience of the Food Administration.

The CHAIRMAN. Thank you, Mr. Sherman.

Is that all, Mr. Livingston? We are grateful to you, sir.

Mr. HARRISON. That completes the estimates of the Bureau of Markets, Mr. Chairman.

The CHAIRMAN. The committee will now recess.

(Thereupon the committee recessed until the following morning at 10 o'clock a. m.)

Activities under lump-fund items, Bureau of Markets.

Project.	Allotment, 1920.	Estimate, 1921.	Increase (+) or decrease (-).
Marketing and distributing farm products:			
Cooperative purchasing and marketing	\$30,000	\$30,000
Market surveys of fruits and vegetables	22,800	22,800
Market grades and standards for fruits and vegetables	25,000	25,000
City marketing and distributing	10,560	10,560
Transportation and storage	12,780	12,780
Direct marketing activities	11,000	11,000
Market business practice	25,000	25,000
Foreign marketing activities	20,200	20,200
Miscellaneous problems in marketing and cooperation	28,160	28,160
Cotton handling and marketing	31,000	31,000
Cotton warehousing investigations	7,840	7,840
Marketing cotton seed and its products	4,700	4,700
Marketing live stock, meats and animal by-products	31,000	31,000
Marketing wool (new)	15,000	+ \$15,000
Marketing dairy products	13,000	13,000
Marketing hay, feeds, and seeds	21,300	21,300
Preservation of fruits and vegetables in transportation and storage ..	23,180	53,180	+ 30,000
Total	317,520	1 362,520	+ 45,000
Market news service on fruits and vegetables	250,000	2 300,000	+ 50,000
Regulation of stockyards	75,000	- 75,000
Market news service on live stock and meats	105,320	3 155,320	+ 50,000
Market news service on dairy and poultry products	80,600	4 80,600
Market news service on grain, hay, feeds, and seeds	50,000	5 50,000
Food supply investigations	48,800	6 48,800
Market news service on peanuts	12,000	12,000
Market inspection of perishable foods	150,000	7 200,000	+ 50,000
Investigation and demonstration of cotton standards, and cotton testing:			
Investigation and demonstration of cotton standards	18,960	18,960
Cotton testing	26,960	26,960
Total	45,920	8 45,920
Rural cooperation	15,780	9 -15,780
State cooperation in marketing work	77,750	10 104,400	+ 26,650
Grain standardization investigations	86,050	11 86,050
Enforcement of the standard container act	3,800	4,800	+ 1,000
General administrative expenses	20,635	20,635
Enforcement of the United States cotton-futures act	131,780	12 211,500	+ 79,720
Enforcement of the United States grain-standards act	598,600	13 598,600
Administration of the United States warehouse act	35,000	80,000	+ 45,000
Completion of work of Domestic Wool Section of War Industries Board ..	35,000	- 35,000
Total	2,139,555	2,361,145	+ 221,590

¹ Includes \$14,540 transferred to statutory roll.² Includes \$30,400 transferred to statutory roll.³ Includes \$16,000 transferred to statutory roll.⁴ Includes \$10,820 transferred to statutory roll.⁵ Includes \$5,400 transferred to statutory roll.⁶ Includes \$3,180 transferred to statutory roll.⁷ Includes \$8,300 transferred to statutory roll.⁸ Includes \$2,000 transferred to statutory roll.⁹ Transferred to office of Farm Management.¹⁰ Includes \$1,400 transferred to statutory roll.¹¹ Includes \$1,900 transferred to statutory roll.¹² Includes \$12,590 transferred to statutory roll.¹³ Includes \$27,500 transferred to statutory roll.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Thursday, January 8, 1920.

AFTER RECESS.

The committee reconvened, pursuant to recess, at 2.30 o'clock p. m., Hon. Gilbert N. Haugen (chairman) presiding.

FEDERAL HORTICULTURAL BOARD.

The CHAIRMAN. Who do you desire to have heard, Mr. Harrison?

Mr. HARRISON. Mr. Marlatt will discuss the estimates of the Federal Horticultural Board, on page 266.

The CHAIRMAN. You may proceed, Mr. Marlatt.

STATEMENT OF MR. C. L. MARLATT, CHAIRMAN OF THE FEDERAL
HORTICULTURAL BOARD, DEPARTMENT OF AGRICULTURE.

Mr. MARLATT. I think the statement relative to the statutory roll is self-explanatory throughout.

The CHAIRMAN. There are no changes?

Mr. MARLATT. There are no changes that are not fully explained in the statement.

The CHAIRMAN. What is the amount of the increase?

Mr. HARRISON. There are no increases. The changes are merely transfers made at the same salary and lump sums have been correspondingly reduced.

The CHAIRMAN. You might take up these transfers as they appear in the record; the first is item 2, "one executive clerk by transfer from lump fund for enforcement of plant quarantine act, \$2,250."

Mr. MARLATT. I may say in explanation that both the field and quarantine work has developed very rapidly, and we have had to take on several additional employees in the administrative office. These are now being transferred to the statutory roll and the lump sums correspondingly decreased.

Mr. HARRISON. The chairman has in mind having you mention all the items in which a transfer is made so they will appear in the record.

The CHAIRMAN. Yes. We may not have the Book of Estimates before us so we wish to have that information appear in the record. First is item 2; then item 6, "one clerk by transfer from lump fund for eradication of pink-bollworm, \$1,620."

Mr. MARLATT. These transfers are: Item 2, one executive clerk by transfer from lump fund for enforcement of plant quarantine act, \$2,250; item 6, one clerk by transfer from lump fund for eradication of pink bollworm, \$1,620; item 7, one clerk, class 3, by transfer from lump fund for eradication of pink bollworm, \$1,600; item 10, one clerk, class 2, by transfer from lump fund for eradication of pink bollworm, \$1,400; item 12, one clerk, class 1, by transfer from lump fund for eradication of pink bollworm, \$1,200; item 13 one clerk by transfer from lump fund for eradication of pink bollworm \$1,080; item 14, one messenger, by transfer from lump fund for eradication of pink bollworm, \$600.

These transfers total \$9,750, and are of clerks in the administrative offices of the board. The growth of the work of the board makes it certain that this administrative force will have to be continued and from time to time enlarged.

The CHAIRMAN. These are simply transfers from the lump sum to the statutory roll?

Mr. MARLATT. Transfers to the statutory roll, and the lump fund correspondingly decreased.

The CHAIRMAN. They are now being transferred at the same salary?

Mr. MARLATT. Yes.

Mr. HEFLIN. What is the amount now to keep the pink bollworm out?

Mr. MARLATT. We are discussing now the general appropriation for the administrative work of the Federal Horticultural Board and will come to the pink-bollworm appropriation later.

Mr. McLAUGHLIN of Michigan. This transfer of this amount for pink-bollworm work to the statutory roll indicates that that work is to be permanent. I will see it in the record.

Mr. MARLATT. The item for the general expenses of the Federal Horticultural Board at one time reached the sum of \$75,000. It has been decreased year by year by transfers from the lump fund to the statutory roll, so that now it is \$47,700. There is, of course, no actual decrease, because we have the services of the men who have been thus transferred. The increase now requested of \$100,000 is for a special purpose which is described in the note at the bottom of page 267 of the estimates. In the enforcement of the various quarantines which have been promulgated under the plant quarantine act we have used this fund of \$47,700, and have also secured the cooperation of the customs officers of the various ports of entry of the United States. The quarantines prohibiting and regulating the entry of plants and plant products have now reached the number of 15, and in addition to that there are some six orders which regulate and control the entry of other foreign products, making 21 controlling orders or quarantines now being enforced by the Department of Agriculture in relation to plant imports.

Mr. McLAUGHLIN of Michigan. The quarantines you speak of are orders issued but not stations located?

Mr. MARLATT. These are orders which govern and regulate the entry of foreign plant products. To enforce these quarantines and to properly administer them, we have established certain quarantine stations at important ports of entry and, as just stated, have secured

additional aid in the enforcement of these quarantines by cooperation with the customs service of the Government; but the work has grown so large that the customs officials can not give the aid which we need and which we have attempted to get from them. It is absolutely necessary for the proper and efficient enforcement of these quarantines to further greatly enlarge our port inspection work.

Mr. McLAUGHLIN of Michigan. Why has it grown? I thought you were getting it under control.

Mr. MARLATT. Most of this work in relation to imports is continuing work and, in addition, new subjects come up for quarantine every year and these mean increased work.

Mr. McLAUGHLIN of Michigan. This is the pink bollworm work, is it not?

Mr. MARLATT. I have not come to the pink bollworm subject yet. I am speaking of the general appropriation for the Federal Horticultural Board to administer the plant quarantine act. The pink bollworm appropriation is a special appropriation considered in another part of the estimates.

The CHAIRMAN. At how many ports are you doing this inspection work?

Mr. MARLATT. We have inspection forces at New York and Boston on the Atlantic side, at San Francisco and Seattle on the Pacific side, at New Orleans, and at the principal border ports of entry from Mexico to the United States—some seven along the Mexican border.

The CHAIRMAN. How many all told?

Mr. MARLATT. All told, the board maintains inspectors at some 12 ports of entry. Much of this work has relation to the quarantine on account of the pink bollworm. It includes, however, all the other quarantines, such as those in relation to corn, wheat, potatoes, fruits, nursery stock, etc. Under the pink bollworm quarantine, for example, all import cotton, which enters chiefly at the ports of Boston, New York, and San Francisco, is subjected to disinfection. An inspection force must be maintained at these ports to inspect and supervise the disinfection of such imported cotton and cotton waste, cotton bagging, etc. Seven huge plants have been erected by private funds for the purpose, one at New York, one at Newark, two at Boston, one at San Francisco, and two at Seattle. There are additional plants at San Francisco and Seattle for the disinfection of oriental corn, wheat, and other grains.

Mr. McLAUGHLIN of Michigan. Do they have to be specially constructed?

Mr. MARLATT. They have all been specially devised and constructed to meet these needs. Some are expensive and cost half a million dollars. One of the plants at Boston is reported to have cost that.

Mr. McLAUGHLIN of Michigan. Under what appropriation was that constructed?

Mr. MARLATT. These plants were built by the importers and others concerned as private enterprises.

Mr. McLAUGHLIN of Michigan. You are operating it by cooperation?

Mr. MARLATT. We are cooperating. The work is done under our supervision and direction. About \$50,000,000 worth of cotton is imported normally.

(At this point item 9, on page 282, of the Book of Estimates, relative to the eradication of the pink bollworm, was taken up for consideration. The discussion will be found under the miscellaneous section of these hearings.)

Mr. MARLATT. Near the beginning of my testimony, I was describing the general work of the Federal Horticultural Board. I pointed out that there are now being enforced some 21 restricting orders on the importation of plants, including cotton, which has been discussed. Another of these orders has relation to corn from the Orient, on account of important corn diseases. A good deal of oriental corn comes into San Francisco and Seattle for local use on the Pacific coast. This corn enters under permit and is disinfected by steam treatment—cooked, dried, and utilized chiefly for chicken feed. There are also quarantines in relation to oriental wheat and other small grains on account of oriental grain diseases. Other quarantines are in relation to foreign fruits, potatoes, sugar cane, certain trees, etc. The enforcement of these 21 restricting orders comes under the general administrative fund for the Federal Horticultural Board. This fund, which is now \$47,700 we have asked to be increased by \$100,000. The purpose of that increase is to establish a more effective inspection service at the principal ports of entry. I have attempted to explain what we have been doing in this work with insufficient forces at some 4 or 5 ports, leaving out the Mexican border ports, and that we have been endeavoring to get aid in this work by cooperation with the customs service. The volume of this port work has grown so that the customs service is not able to help us in any material way, and we have got to maintain our own service at the principal ports of entry of the United States, if proper protection is to be secured.

The need for this service is abundantly evident, not only as to the enforcement of these quarantines, but for the general inspection of incoming boats and traffic to see that infested and quarantined articles are not brought in as ship stores or by passengers or as a part of the cargoes. As an illustration, you may recall the German prize ship *Appam* that came into Norfolk loaded down with various products from Africa. Among those products were some 300,000 bags of cotton seed. We got word of that part of the cargo only by a chance noting of the publication of the contents of the ship. We had considerable trouble with the captain, but we finally got hold of the cotton seed and had it converted into fertilizer. That cotton seed was full of evidences of the pink bollworm and other insect work. This is just one instance. A good many ships come into Norfolk from Brazil, from Santo Domingo, and from the South American countries with cotton seed on board. The same thing is happening at New Orleans, Savannah, and other southern ports, and these ships may bring not only cotton seed, but any of the other articles the entry of which is prohibited or restricted.

The customs service can not be relied upon to safeguard such shipments and materials. The inspector of the Federal Horticultural Board will see that such ships are fumigated, that the hatches are kept closed, and that none of the prohibited cargo is removed

from the ship. Many of these ships are en route to Europe and come to our ports for coal and provisions.

Mr. McLAUGHLIN of Michigan. They may land some of their freight?

Mr. MARLATT. They may, but, even if no attempt is made to land these prohibited articles, their mere presence in our harbors for days and often weeks is a source of great danger unless protective steps are taken. At New Orleans we have now two men, and they have to examine the hundred or more ships that come to that port monthly from Central and South American countries. Those vessels may bring not only prohibited cargoes but also ship stores and articles in the hands of passengers that are prohibited entry. There was intercepted and destroyed in the first two months' work at New Orleans a long list of pests new to our Southern States. This risk is going on all the time throughout the country. There are only two States that have sensed this danger and have taken steps to overcome it, Florida and California.

California has had such a service for some 30 or more years. I fancy California is spending in that work fully \$50,000 annually, perhaps more, in protecting her own State from these port introductions and incidentally protecting the whole United States.

Mr. McLAUGHLIN of Michigan. They are doing good work in those two States?

Mr. MARLATT. Splendid work. The whole country has benefited by this work.

Mr. McLAUGHLIN of Michigan. It seems as though other States that have ports should do the same thing.

Mr. MARLATT. The incentive in Florida and California is the big fruit industries of these States. There is no similar incentive in Louisiana, Alabama, and Georgia, or, at least, it does not work the same way.

Mr. McLAUGHLIN of Michigan. You say if those pests had not been kept out by your activities they would have infested those Southern States. I would think that would be an incentive. You say there is no incentive in Georgia and Alabama. They would have been overridden if you had not taken care of them. Is not that true?

Mr. MARLATT. We have been doing no work of importance except on the Mexican border, and recently at New Orleans.

Mr. McLAUGHLIN of Michigan. You speak of the different things that come in on ships. You have prevented the landing of some things?

Mr. MARLATT. We have not done as much as we would like to. We have now only a limited port service at New Orleans.

Mr. McLAUGHLIN of Michigan. You do not have to do it in California and Florida?

Mr. MARLATT. We are now cooperating with California and Florida. California is paying the bill and is getting some of her authority under our quarantines. The California inspectors have been appointed collaborators of the Department of Agriculture for the purpose of giving them authority to act for the department. This collaborator service costs us from \$1 a year to the maximum of \$25 a month. There is a very great need for this service throughout the United States. We have now an insufficient force at New York,

Boston, San Francisco, and New Orleans. The existing service grew out of the necessity for the administration at certain ports of the regulations as to inspection and disinfection of cotton, corn, wheat, and other imports, the entry of which was limited to these ports. We have insufficient funds to properly care for such imported articles and, now that the war is over, these imports will increase; but the main purpose of the increase is to meet the needs outlined at ports where there is now no service or protection at all.

Mr. McLAUGHLIN of Michigan. Are those States, New York and so on, as backward and as unwilling to help with money as Georgia and Alabama, or are they in the class with California and Florida?

Mr. MARLATT. I do not look on it in that way at all. The port of New York is the main port of America, and the imports that come into New York go to Chicago, St. Louis, and Cincinnati, and every town in the country. You can not expect New York to do the work for the whole country. Boston is much in the same position; the bulk of the cotton importations enter through this port.

Mr. HEFLIN. The port of Mobile makes Alabama one of the principal ports for the Southern States.

Mr. McLAUGHLIN of Michigan. You have offered a good alibi for New York and Boston. Can you think of a good one for the southern places?

Mr. MARLATT. I think there is an equally good argument for New Orleans. That is the important port for Central and South America. We should have a larger force at New Orleans to inspect the many ships that come in there daily. They must inspect the storerooms, etc., as well as cargoes and the baggage of passengers. Such inspection has revealed, for example, boxes of fruit infested with maggots of the fruit flies that we are trying to exclude, and this within a few miles' flight of orange orchards. That is the kind of service that California and Florida are rendering. If Louisiana can not or does not do it, we should undertake the work as a protection to the whole country. We can not force the State to do it.

Mr. McLAUGHLIN of Michigan. They will not do it as long as you do it.

Mr. MARLATT. I am afraid they will not do it anyway. We will not go into Florida and California and duplicate what they are doing, but what we want to do is to take care of these unprotected ports and continue our cooperation with Florida and California. There is a big need as to the ocean ports of America. There is less need of protection on the Canadian side, but there is a big need as to all of the ocean ports. The border Mexican ports are now taken care of under the pink-bollworm appropriation.

Mr. McLAUGHLIN of Michigan. Do you have any inspection service of that kind for Detroit or Port Huron?

Mr. MARLATT. No. There is less need at such northern ports. It is true that some material from China, Japan, and other ports of the Orient enters at Detroit and Chicago, for example, but as a rule we are able to take care of that by other means, that is, by sending inspectors to such ports from time to time, and by requiring as far as we can that such shipments enter and be cleared at the port of first arrival, whether San Francisco, Portland, or Seattle.

Mr. McLAUGHLIN of Michigan. That is a big increase, from \$47,700 to \$145,000. It is an increase of about \$100,000.

Mr. MARLATT. It is an increase of \$100,000, and it is a small increase compared with the amount of work we want to do and the danger which we know to exist and want to control.

Mr. McLAUGHLIN of Michigan. The practice has been adopted by the committee, and has been followed in the case of the other gentlemen who have appeared before the committee when increases in appropriations are asked, of inquiring whether they could suggest some manner of obtaining the money and getting it into the Treasury.

Mr. MARLATT. I expect to pay a part of this myself, Mr. McLaughlin. My tax has been increased four or five times since the war began.

Mr. McLAUGHLIN of Michigan. That is a better answer than some of the gentlemen have made.

The CHAIRMAN. What are you going to do with the \$50,000 under item 21, page 268?

Mr. MARLATT. Item 21 provides an appropriation of \$50,000 "to enable the Secretary of Agriculture to meet the emergency caused by the establishment of the potato wart in eastern Pennsylvania, and to provide means for the extermination of this disease in Pennsylvania or elsewhere in the United States in cooperation with the State or States concerned, including rent outside the District of Columbia, employment of labor in the city of Washington or elsewhere, and all other necessary expenses."

An appropriation of \$50,000 was given for the current fiscal year and we would like to have the same sum for next year.

The CHAIRMAN. What progress have you made with that?

Mr. MARLATT. This potato disease is limited to a few districts. We have had the whole United States surveyed from Maine to California in cooperation with the several States. This survey has followed the crop from the South northward, and as a result this disease has been found only in Pennsylvania and in West Virginia. Those two States contain apparently all the disease that is in the United States. The area in Pennsylvania has been doubled. But the situation is worse than that would indicate because the new area is in the western part of the State. It is not an enlargement of the old area. Practically all the infestations are in mining districts. Much of the big importation of potatoes in the winter of 1911-12, before we had a plant quarantine act, went to mining districts. They were a poor grade of potatoes, imported to be sold at a low price, and went in the main to places where a cheap potato could be sold, but they were also pretty widely distributed throughout the United States. One very encouraging fact has developed in the course of the work, viz, that several of our principal varieties of potatoes are immune to the disease. One of these varieties is the Irish cobbler, which is one of the important varieties grown in this country. Two or three other important varieties of potatoes are not affected by the disease, as determined by plantings made in diseased ground.

The CHAIRMAN. The remedy is in getting disease-resistant potatoes?

Mr. MARLATT. That will be the remedy if we can not exterminate the disease. An earnest effort to exterminate the disease is being conducted in cooperation with the States of Pennsylvania and West Virginia.

The CHAIRMAN. What are the States doing, anything along this line?

Mr. MARLATT. They are doing more than we are.

The CHAIRMAN. How much are they appropriating?

Mr. MARLATT. I do not remember the amount, but I believe the State of Pennsylvania appropriated \$50,000. Moreover, Pennsylvania has devoted practically its entire agricultural service to it, and is taking means to strengthen the efforts to clean out the disease, stopping the growing potatoes, and controlling even the carrying of manure out of the infested district. It is a soil disease and may be carried by manure or soil of any kind. The State of Pennsylvania through its very efficient service is doing a thorough piece of work.

The CHAIRMAN. Do you treat the soil?

Mr. MARLATT. Various means of treating the soil have been tested. The main method, however, has been by the elimination of potato growing; and hereafter the growth of potatoes in these districts will be restricted to the varieties which are believed to be absolutely immune. The fact of the discovery of these immune varieties of potatoes has taken away a great deal of the fear which this disease first raised in the minds of potato growers. You will perhaps remember that the potato wart was one of the diseases which brought about the passage of the plant quarantine act and that a quarantine against it was specifically authorized in that act.

The CHAIRMAN. If proper seed potatoes are provided, will there be any need of treating the soil?

Mr. MARLATT. Except that it would be desirable, if possible, to exterminate the disease altogether.

The CHAIRMAN. Would not that exterminate the disease?

Mr. MARLATT. The scientific phases of the problem have not been fully worked out. We know that the disease will remain in the soil without potatoes for seven or eight years, but whether it will attack other plants is, so far, on a negative basis only.

Mr. McLAUGHLIN of Michigan. How was the soil treated?

Mr. MARLATT. It was disinfected by steam and by impregnation with corrosive sublimate. I think these were the principal methods of value.

Mr. McLAUGHLIN of Michigan. Both of those would be quite expensive.

Mr. MARLATT. The efficiency of disinfecting has been established, but its cost is heavy.

The CHAIRMAN. How destructive is this wart?

Mr. MARLATT. On varieties of potatoes which it infests freely it may destroy practically the entire crop.

The CHAIRMAN. Does the wart make the potato deteriorate?

Mr. MARLATT. The potato turns into an unrecognizable black fungoid mass.

The CHAIRMAN. Is the crop a total failure in those instances?

Mr. MARLATT. Practically all potatoes attacked are destroyed. The failure of the crop depends on the percentage of infestation, which ranges all the way from nothing to 100 per cent, in different fields.

Mr. McLAUGHLIN of Michigan. Is this spreading by the manure by reason of the stock eating the potatoes affected?

Mr. MARLATT. No; it is simply carried mechanically by the manure.

Mr. McLAUGHLIN of Michigan. How does it get into the manure unless the animals have eaten the affected crop? You spoke of it being carried in manure.

Mr. MARLATT. What I intended to say was that the State was controlling the manure, because the disease may be carried by the manure. It is true that potatoes may be fed to hogs, or potato vines may be thrown on the manure pile to weather down to compost. Such manure might carry the disease with it. There is a similar risk even with farm utensils not fully cleaned.

Mr. McLAUGHLIN of Michigan. I can see how that might happen, but something was said about the disease destroying the potatoes so that they could not be used.

Mr. MARLATT. They might be thrown on the manure pile.

The CHAIRMAN. How about item 22, on page 169, "That the plant quarantine act, approved August 20, 1912, be, and is hereby amended," etc.?

Mr. MARLATT. Yes; this was before you last year and was favorably reported by your committee and by the Senate committee. I refer to the amendment of the plant quarantine act giving authority for control work on plant diseases and pests in the District of Columbia.

The CHAIRMAN. It is extending it to the District of Columbia?

Mr. MARLATT. In the matter of local control; yes. There is no question about the desirability of this amendment. There is no opposition to it that I know of. The enforcement will cost very little, and no additional funds are being requested. It can be enforced under the general administration fund. But it is authority that we should have in the District to do for the District exactly what all the States are doing for themselves. The District of Columbia is the only place in the United States where diseased or insect-infested plant material may come as domestic or foreign shipments and remain without control. We have no authority to prevent their coming in, to clean up or disinfect such shipments, or to prevent their going out after they get in. There is noted in the explanation of this amendment in the estimates an important instance of a pest (the oriental fruit moth), which came into the District of Columbia and has spread through this District and from this District has invaded half a dozen States, and we have no authority here to control a single plant or tree with respect to it.

Mr. McLAUGHLIN of Michigan. I should think you would have authority.

Mr. MARLATT. It is a necessary authority, which should be given. This committee has once favorably reported on it. I suppose it went out on the ground that it was new legislation.

The CHAIRMAN. Do you recall whether it went out on a point of order?

Mr. HARRISON. It was eliminated through a point of order on the floor of the House. The Senate reinserted it, it went to conference, but was rejected by the conferees. Both committees were in favor of it.

The CHAIRMAN. This committee reported it to the House and it went out on a point of order; it was reinserted in the Senate, went to conference, and was rejected in conference?

Mr. HARRISON. Yes.

The CHAIRMAN. Is that all, Doctor?

MR. MARLATT. I think that concludes the estimates for the Federal Horticultural Board.

MR. McLAUGHLIN of Michigan. Under the act I understand the District of Columbia stands by itself. You can forbid entrance of infested plant material into the United States from any foreign country; you can forbid the passage from one State to another; but you can not forbid the entrance into the District of Columbia from any State or from a foreign country, and can not forbid the taking of anything from the District of Columbia to another State?

MR. MARLATT. No; the plant quarantine act now includes the District of Columbia, but gives no local powers such as the States exercise supplemental to the Federal powers under the act. Under the act all foreign importations may now be controlled, but there is at present no law or authority, except by a general quarantine, under which the movement of diseased or insect-infested nursery stock and other plants and plant products into the District of Columbia from surrounding or other States, or from the District of Columbia into surrounding or other States, can be controlled, nor is there authority for the control and extermination within the District of Columbia of plant pests and diseases.

MR. ANDERSON. You have no control after it gets in?

MR. MARLATT. No.

MR. McLAUGHLIN of Michigan. Have you not authority to prevent passage into the District of Columbia?

MR. MARLATT. No; except by a general quarantine of all the States and of all plants in relation to the District of Columbia—an unnecessary and impractical and expensive method; and we have no authority to enforce such quarantine or do any necessary work within the District.

MR. McLAUGHLIN of Michigan. A moment ago you suggested, as I understood it, that you could not prevent these infested plants from crossing the line into the District of Columbia nor passing from the District of Columbia into the States, but you say you could do that by the expenditure of a large amount of money. If this is enacted into law, how do you propose to control it?

MR. MARLATT. I perhaps gave you the wrong impression, Mr. McLaughlin. The quarantine act authorizes the Secretary of Agriculture to prohibit interstate movement for some specific reason, which must be indicated. Under that authority we could prohibit, for example, the movement of potatoes out of Maryland into the District of Columbia if we knew that in Maryland there was a potato disease. But if there was no such disease, we could take no action. Such prohibition of movement may rarely be necessary, but we want authority to inspect material when it is deemed necessary either as a condition of entry or after the material has entered. We want authority if something gets in like this peach moth, for example, to control it; and we want authority, furthermore, to prevent the sending out of the District of Columbia of diseased plants. Such authority we now lack.

The CHAIRMAN. Practically every State has enacted such laws as a protection against the importation of these things, but similar action has not been taken in the case of the District of Columbia.

MR. MARLATT. Every State has such laws.

The CHAIRMAN. You want an act to protect the District of Columbia just as the States protect themselves?

Mr. MARLATT. That is the idea exactly.

The CHAIRMAN. Is that all?

Mr. MARLATT. That is all.

The CHAIRMAN. We are very much obliged to you, Mr. Marlatt. (Thereupon the committee proceeded to take up another matter.)

Activities under lump-fund items, Federal Horticultural Board.

Project.	Allotment, 1920.	Estimate, 1921.	Increase.
Enforcement of plant-quarantine act:			
(a) Administration.....	\$5,000	\$5,000
(b) Control of entry of plants and plant products under regulation and enforcement of foreign plant quarantines, including port inspection.....	42,250	142,250	\$100,000
(c) Plant-quarantine investigations.....	450	450
Extermination of potato wart.....	47,700	147,700	100,000
	50,000	50,000
Total.....	97,700	197,700	100,000

† Includes \$2,250 transferred to statutory roll.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Wednesday, January 14, 1920.

The committee met pursuant to taking of recess, Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. Do you wish to be heard next, Dr. Haywood?

ENFORCEMENT OF THE INSECTICIDE ACT.

STATEMENT OF DR. J. K. HAYWOOD, CHAIRMAN OF THE INSECTICIDE AND FUNGICIDE BOARD, DEPARTMENT OF AGRICULTURE.

Dr. HAYWOOD. Mr. Chairman, I suppose the committee is familiar with the purposes of the insecticide act. It is an act designed to control the manufacture, sale, and transportation of insecticides and fungicides and prevent the shipment in interstate commerce, importation, or exportation of misbranded and adulterated insecticides and fungicides.

During the fiscal year ending June 30, 1919, the inspectors of the Insecticide and Fungicide Board collected 904 official samples of insecticides and fungicides (including disinfectants) for subsequent analysis and test by the scientists of the board to determine whether or not such samples were in conformity with the provisions of the insecticide act of 1910. The board reported to the solicitor of the department 104 cases presenting alleged violations of the insecticide act, with the recommendations that the facts be transmitted to the Attorney General to institute criminal action or seizure proceedings. Disposition was made of 129 cases by correspondence with manufacturers. Action was taken to place in abeyance 621 samples, which

upon examination and test were shown to be in compliance with the provisions of the act or were from shipments of the same goods made prior to shipments for which the manufacturer had been convicted and had after citation conformed to the requirements of the law.

During the year 41 official and unofficial samples of import insecticides and fungicides were collected for examination and test, and disposition was made of 43 such samples. Sixteen were found to be adulterated or misbranded, or both, and appropriate action was taken under the provisions of the act. Twenty-seven samples were found to be neither adulterated nor misbranded.

While these statistical figures will give you some idea of the volume of work conducted by the board, you will probably be more interested in some of the principal cases of adulteration and misbranding found to exist and the steps taken to combat same.

You are doubtless familiar with the work that is being performed in the South by Mr. Coad, of the Bureau of Entomology, to find means of combating the cotton boll weevil. Mr. Coad has found that the application of calcium arsenate under certain conditions gives quite efficient control, but it is very essential that the calcium arsenate be of a certain standard quality—that is, it must contain a certain amount of arsenic oxid to be effective against the weevil; it must not contain enough water-soluble arsenic oxid to burn the plant, and it is highly desirable that it have a certain density, so as to make a satisfactory dust cloud.

During the past year a very large quantity of calcium arsenate was shipped into the South for this work, and the board was requested by Mr. Coad to aid him in keeping off the market all calcium arsenate that was not up to standard or which contained enough water-soluble arsenic oxid to cause it to injure the cotton plants. Because of the great importance of this project the board decided to give all the help it could to Mr. Coad. Mr. Coad circularized the cotton-growing section of the South and offered to make analyses of calcium arsenate before it was sold by retailers or used by farmers. Our chemist made all these analyses and Mr. Coad reported to the farmer and retailer whether the product should be used. The board also sent an inspector to this region to collect official samples of all of the calcium arsenate he could find for examination to determine whether it was in conformity with law. A large amount of material which was adulterated or misbranded, or both, was seized, and in some cases action was also taken against the manufacturer under the provisions of the insecticide act.

In addition to our work on calcium arsenate, the board found that some manufacturers of pyrethrum insect powder were adulterating their product. Since the war pyrethrum insect powder has increased in value to a very large extent. This has caused manufacturers to adulterate, and they have been using field daisies as adulterants. Field daisies are inert, but they look like pyrethrum. Seizures were made and action taken against certain manufacturers, with the result that this practice appears to have been materially reduced.

The campaign against disinfectants, which we have been carrying on for several years, has been extended. We have done a great deal of work along this line and made a great many prosecutions of disinfectant manufacturers during the year. That, of course, is very

important because of the fact that, if a disinfectant does not do what it is supposed to do, the disease will go ahead unchecked.

A campaign was also started against shipments of Bordeaux mixture and other fungicides containing Bordeaux as one of the constituents, which shipments bore such faulty directions that if the directions were followed the products would not control the diseases for which they were recommended to be used. By action under the law against manufacturers, by correspondence, and by the publication of correct data, a decided improvement was brought about in the labeling of this class of products.

Other instances of adulteration and misbranding were encountered and handled under the provisions of the act, but the above represent the four most important campaigns carried on during the year.

The Insecticide and Fungicide Board has requested that its lump-sum appropriation be increased by \$17,970 to carry on its work successfully during the coming fiscal year. This sum will allow of the appointment of two additional chemists, one plant pathologist, one entomologist, one veterinarian, one chemist aid, and one inspector, and will provide for the expenses of these new assistants, and also allow \$500 for the replacement of worn-out apparatus.

The need for this extra sum to pay the salaries and expenses mentioned above may be explained as follows:

The insecticide act of 1910 became effective January 1, 1911. For the first full year of its operation, the total appropriation for enforcing the law amounted to \$87,000. For the present fiscal year the total appropriation available for enforcing the act is \$123,940. During the period the law has been in force the insecticide industry in the United States has increased fully 100 per cent; we believe more than that. Therefore, our appropriation for controlling this industry has not kept pace with its growth, and we can not effectively regulate the industry unless there is a material increase in our appropriation.

Again, if we help Mr. Coad in the South this year, the work entailed will be a great deal more extensive than it was the past year, because of the increased output of calcium arsenate. While about 3,000,000 pounds were shipped last year, there will be much more—probably in the neighborhood of 10,000,000 pounds—shipped this year. We have found that a good many insecticide manufacturers who have not heretofore engaged in the production of calcium arsenate are going into its manufacture. This will mean that much adulterated and misbranded goods will come on the market, because new manufacturers often go wrong in their processes and in labeling. In order to take care of that we will need more help.

The CHAIRMAN. Is that manufactured in this country or imported?

Dr. HAYWOOD. It is all manufactured in this country. It is not manufactured anywhere else. It is a new product, manufactured in the past three years. It was discovered by the Bureau of Chemistry and exploited by the Bureau of Entomology.

Since the insecticide act of 1910 became effective, the use of dusting materials in the control of insects and plant diseases has greatly developed and to a considerable extent has superseded the use of liquid sprays. At the present very little is known, and decidedly contradictory results have been obtained in respect to the action of

dust applications. It has, therefore, become necessary for the board to make many basic investigations relative to dust applications, as well as tests of various dusts which appear on the market, to determine whether or not they will do what is claimed for them. Such work can only be carried out by collaborative work of the entomologist, plant pathologist, and chemist, and it is impossible for us to carry on this needed work with our present appropriation.

As we have gained experience in the enforcement of the insecticide act, we have realized keenly the necessity for a more precise knowledge of the insecticidal qualities of some of the ingredients entering into the composition of certain preparations used on horses, cattle, sheep, goats, and swine, as well as a deeper insight into the therapeutic action of some of the drugs used in the treatment of various animal diseases. Much information along this line may be obtained by the board through the experts of the Bureau of Animal Industry, but the additional assistance of a widely informed veterinarian is practically an essential to the proper conduct of such investigations—one whose entire time may be devoted to it, working under the eye of an adviser especially qualified along the line under study.

It is necessary in the enforcement of the insecticide act to make many tests of commercial insecticides and fungicides in other localities than Washington. This means that it is necessary to hire orchards and truck patches, buy fertilizers for the same, and employ labor to cultivate them. The cost for such labor and for other operating expenses has greatly increased during the past two years, so that extra money is needed for this purpose.

Finally and possibly most important of all, it is especially important that the board make more use of the seizure section of the insecticide act, since such section allows us to withdraw from the market insecticides and fungicides which will not do what is claimed for them or will be injurious to vegetation. To make seizures requires, first of all, a large amount of inspection work, and, second, more chemical and testing work. To make effective use of the seizure section of the act we are of the opinion that it will be necessary to have the increased funds requested in this estimate.

Mr. YOUNG. I want to ask this question: Suppose a certain remedy is being advertised to do certain work, and you have no reason to know whether it is effective or not. I am curious to know how you would go about getting these samples in order to make your test to find out the facts.

Dr. HAYWOOD. Here is the way we do that: Our inspectors are operating in the field. In the absence of specific instructions the inspectors have general directions to collect any insecticide or fungicide samples that they come across. We will suppose, however, that you have written in to us and informed us that there is a certain insecticide or fungicide that you do not think will do what is claimed for it. All right; we have our inspector collect samples of that.

Mr. YOUNG. How do you get that? Do you go to the factory?

Dr. HAYWOOD. No; we buy it on the open market, because the law says that the material must have entered into interstate commerce. We must be able to show by shipping records and an invoice that the product entered into interstate commerce before we have any jurisdiction. If we do not have jurisdiction the State would have. We only have jurisdiction in interstate commerce. It must be a prod-

uct that has left the factory except in the case of goods manufactured in the District of Columbia or the Territories. We usually collect a number of samples.

Mr. YOUNG. You do not go to the factory and give them an O. K. of any particular remedy?

Dr. HAYWOOD. No.

Mr. YOUNG. But when reports come in to you that the thing is found to be a fraud, then you pick these things up and make your analyses and investigations?

Dr. HAYWOOD. Yes, sir.

Mr. YOUNG. Probably this does not come under your department, but just as I got home recently a remedy for the prevention of diphtheria had been promulgated by a wholesale manufacturing drug firm. I believe they called it an antitoxin.

Dr. HAYWOOD. That would come under the food and drugs act as to whether the claims made on the label were in accordance with the facts.

Mr. YOUNG. Is that administered by your department?

Dr. HAYWOOD. The food and drugs act is administered by our department but not by the Insecticide and Fungicide Board.

Mr. YOUNG. A diphtheria scare broke out in my little town and in the city of Dallas and some of the adjacent cities, and the authorities wired to the concern which manufactures this preventive for a supply of same. They sent this remedy in there and it was administered to perfectly well children, and when the reaction came a great number of those children died—some of them instantly. When the agent for these people was asked for an explanation, he claimed that the manufacture of this product was under Government inspection. That was the point I wanted to get clear in my mind.

Dr. HAYWOOD. Mr. Harrison, is there not in the Hygienic Laboratory some control of antitoxins?

Mr. HARRISON. Yes, a branch of the Public Health Service. It deals with antitoxins used on human beings. There is a Federal law, I understand, under which it acts.

Mr. YOUNG. What I want to get at is this: Does the Government send out people in advance to inspect this remedy at the factory, or do they wait until after the damage is done and then make an inspection?

Dr. HAYWOOD. I can not tell you about such things as drugs, because they do not come under me at all. I can only state about insecticides and fungicides.

Mr. HARRISON. We inspect the factories where viruses, serums, and toxins for use on animals are manufactured.

Mr. McLAUGHLIN of Michigan. Not for human medicines?

Mr. HARRISON. That is under the Public Health Service. We inspect only the establishments preparing the serums and toxins used in combating animal diseases.

The inspection is made at the plants and every batch that is manufactured for shipment in interstate or foreign commerce is inspected to determine whether the product is potent, whether it will accomplish its purpose, and whether it is harmless. If it is found to be worthless, contaminated, or harmful, it is promptly condemned.

Mr. YOUNG. What really happened in the case of that particular remedy that they did not have the proper balance between the toxin and the antitoxin.

Mr. HARRISON. The insecticide act operates along lines similar to the food and drugs act. It would not be possible to furnish inspection for the plants which manufacture insecticides and fungicides, but we do that in the case of the establishments which manufacture serums, toxins, and analogous products for the treatment of animal diseases.

The CHAIRMAN. Do your activities extend all over the country?

Dr. HAYWOOD. Yes, sir.

The CHAIRMAN. You collect samples from each section of the country?

Dr. HAYWOOD. Yes, sir.

The CHAIRMAN. To what extent do you cooperate with the Bureau of Chemistry in the enforcement of the food and drugs act?

Dr. HAYWOOD. Our own inspectors collect our own samples, except in cases where samples of a particular product are specially desired and where our inspector does not happen to be in the place where it can be obtained, and we then write to the Bureau of Chemistry and ask if they will have their inspector collect the sample for us.

The CHAIRMAN. It occurs to me that your two branches ought to cooperate in the collection of samples.

Dr. HAYWOOD. They do to a very considerable extent.

The CHAIRMAN. We are very much obliged to you, Dr. Haywood.

Activities under lump-sum item, enforcement of the insecticide act.

Projects.	Allotment, 1920.	Estimate, 1921.	Increase.
Administration, including inspection and collection of samples.....	\$14,591	\$17,791	\$3,200
Expenses incident to trial of cases.....	¹ 11,000	¹ 11,000
Chemical, microscopic, and bacteriological examination of insecticides and fungicides (including disinfectants) other than those used on horses, cattle, sheep, swine, or goats.....	39,386	43,126	3,740
Testing of efficacy of fungicides and action on foliage of insecticides and fungicides.....	11,362	13,662	3,500
Testing of efficacy of insecticides and their action on foliage.....	11,798	14,598	2,800
Chemical and bacteriological examination of insecticides and fungicides used primarily on horses, cattle, sheep, swine, or goats, and efficacy tests of same.....	6,653	11,383	44,730
Total.....	94,790	² 111,560	² 17,970

¹ Each year the Insecticide and Fungicide Board sets aside a sum of \$11,000 for expense incidental to the trial of cases in court. It is not desirable to use any of this sum for current expenses, but the liability must remain set up until the very end of the fiscal year, since it is impossible to determine when a large part of the money will be needed for the trial of one or more important cases. As a consequence, it is necessary to refund a considerable portion each year to the Treasury, with the result that the board does not have the use of the money for current operations, and the appropriation is therefore to all intents and purposes nearly \$11,000 less than it appears on paper.

² Includes \$1,200 transferred to statutory roll.

AFTERNOON SESSION.

THURSDAY, DECEMBER 18, 1919.

COOPERATIVE FIRE PROTECTION OF FORESTED WATERSHEDS OF NAVIGABLE
STREAMS.

**STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF
OF THE FOREST SERVICE, DEPARTMENT OF AGRICULTURE.**

The CHAIRMAN. Have you any items other than the one for fighting and preventing forest fires, which we have discussed?

Mr. GRAVES. That was discussed this morning.

There is an item on page 272, item No. 3, "for cooperation with any State or group of States in the protection from fire of the forested watersheds of navigable streams," etc. There was appropriated in 1911, for the period from 1911 to 1915, \$200,000. That was the Weeks act of March 1, 1911, which appropriated \$200,000 for cooperation with the States in protection from fire. In 1915 the first annual appropriation was made, and this item has been continued from year to year in the annual appropriation bills. I am suggesting an addition to that of \$100,000 to extend this work, so as to increase the contributions to the individual States that are now cooperating and to enable us to cooperate with other States which have not yet qualified. We are now cooperating with 24 different States, to which we make contributions in varying amounts up to \$7,000 a year. The original law carried the provision that the States should appropriate at least as much as the Federal Government.

The value of this work has been in educating and stimulating States to undertake fire-protection work; a number of States have undoubtedly undertaken that as a direct result of this work, and others have extended their own appropriations and their own activities.

The CHAIRMAN This has reference to the Weeks Act exclusively?

Mr. GRAVES. This has reference to the Weeks Act only in that the initial appropriation was a part of the original Weeks law.

The CHAIRMAN. Is it confined to the States where you have acquired lands under the Weeks law?

Mr. GRAVES. No, sir.

The CHAIRMAN. It applies to the whole country?

Mr. GRAVES. To the whole country; yes.

The CHAIRMAN. The Federal Government cooperating with the States?

Mr. GRAVES. Yes, sir.

Mr. JONES. With how many States are you now working in cooperation?

Mr. GRAVES. Twenty-four.

Mr. JONES. How many States did you have right after the appropriation was made?

Mr. GRAVES. In the calendar year 1911 there were 11 States and in 1915 there were 20 States with which we cooperated.

Mr. JONES. Your appropriation has not increased?

Mr. GRAVES. No, sir.

Mr. JONES. And you have diminished the amount for each State?

Mr. GRAVES. Yes, sir.

Mr. JONES. As the number of States increased you have had a less amount for each State?

Mr. GRAVES. Yes, sir; also the cost of fire protection has increased probably 25 to 50 per cent.

Mr. JONES. If you had \$100,000 available for 20 States in 1915 and still have \$100,000 for 24 States, you have a less amount for each State, haven't you?

Mr. GRAVES. Yes, sir; we have reduced the amount in practically every State.

Mr. McLAUGHLIN of Michigan. During the last year, when the loss from fire was so large, was there much loss from fire in the Appalachian country, where the Weeks Act operates?

Mr. GRAVES. No, sir; we did not have a severe season in the East.

The CHAIRMAN We will take up the next item.

AFTERNOON SESSION.

WEDNESDAY, JANUARY 14, 1920.

The CHAIRMAN. What is next, Mr. Harrison?

Mr. HARRISON. Mr. Chairman, there are two other items on pages 273 and 274. One of these relates to experiments and demonstrations in connection with the development of live-stock production in the cane-sugar and cotton districts and the other to experiments in dairying and live-stock production enterprises in the semiarid and irrigated districts of the western United States. There is no change

in either of these items and I do not know whether the committee wishes to have them discussed. If so, Dr. Taylor will be glad to give you any information you may desire.

Mr. ANDERSON. We would like to know whether you can dispense with some of the money.

The CHAIRMAN. Would it cripple the work if we were to cut it in two?

Mr. HARRISON. I will ask Dr. Taylor to answer that question.

The CHAIRMAN. Very well, Dr. Taylor.

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE.

EXPERIMENTS AND DEMONSTRATIONS IN LIVE-STOCK PRODUCTION IN THE CANE-SUGAR AND COTTON DISTRICTS OF THE UNITED STATES.

Dr. TAYLOR. Possibly it may help the committee in that matter to know that \$22,000 was returned to the Treasury from the sale of products produced in the experimental phase of this activity in Louisiana last year, and practically the same amount the year before, so that the net expenditure there—the net cost to the Treasury under the appropriation—is about \$38,000 instead of \$60,000. We, of course, could not get along, however, without that margin, because we have to buy feeders and to some extent feed. We shall have to do this during the coming year, for there has been a very unfavorable crop season in Louisiana due to the prolonged and extremely heavy rains.

The CHAIRMAN. Does this work come under your bureau?

Dr. TAYLOR. No, sir; this really should be discussed by Mr. Rawl, but he is out of the city, and, as I am somewhat familiar with the work, I came over.

Mr. ANDERSON. Doctor, I notice that some \$13,500 of the \$60,000 is proposed to be used for new construction.

Dr. TAYLOR. The construction work is noted at the foot of page 273. The first item is a wooden silo at the stock farm, at an estimated cost of \$600.

Mr. TINCER. How big a silo is that?

Dr. TAYLOR. The dimensions are 14 by 36 feet, containing 5,542 cubic feet, at 10.8 cents a cubic foot. This is to supplement the battery of silos already there, as one of the main features of the work at the farm is a comparison of the different forage crops in the form of silage. It may refresh your recollection to remember that this work was planned some years ago in an effort to determine with some definiteness whether live-stock production can be profitably developed in a practically one-crop country—the cane-sugar belt—which has been dependent on the ups and downs of sugar, both as to yield and as to price, and has had a very fluctuating experience. Apparently the key to live-stock production there is going to be the question whether a silage and pasture element in the maintenance of the live stock can be developed that will be comparable with the silage and pasture elements in the more northern country.

Mr. McLAUGHLIN of Michigan. What do they put into the silos there?

Dr. TAYLOR. We are trying, in the first place, cane tops, which is a waste product of cane-sugar production—that is, the tops and leaves, both straight and in combination with such crops as corn, soy beans, and to some extent cowpeas; Japanese cane, which is a type of cane not extensively grown in this country heretofore for sugar or sirup, though beginning to be grown for sirup production, and the saccharine sorghums. The nonsaccharine sorghums do not thrive in that country of heavy rainfall.

Mr. TINCHER. Do you think it is well for the Government to spend \$600 on a silo of that size? If the farmers were to get an idea that it cost the Government such a figure it would discourage them.

Dr. TAYLOR. The intention is merely to have a good, durable silo which will hold the silage in such condition that it will be of experimental value.

Mr. TINCHER. Do you know what kind of wooden silos they have on the farm now?

Dr. TAYLOR. I can not tell you whether they are built of cypress or not, but my impression is that they are made of cypress; there are also two or three concrete silos. My impression is that there are one or two wooden silos and that they are of cypress.

Mr. TINCHER. The way to get the farmers to build silos is first to demonstrate to them that they can have a silo without going bankrupt. I am in sympathy with the silo proposition, but it is not necessary to spend so much money to build a silo. Tell them to take some 4 by 4's and set them upright and then just line it inside with good flooring in circular form—set it in a circle. They can build a silo, with high-priced material, at 70 cents a ton. This silo that you have described would cost about \$100, maybe \$105, at the present high prices for material. That is the way to encourage farmers to build silos. No farmer would want to spend \$600. I have built silos every year for 15 years, and it is not a good thing to get the farmer to spend five or six times as much on a silo as he ought to spend.

Dr. TAYLOR. These are being built definitely with a view to durability and to tightness and efficiency from the experimental standpoint.

Mr. TINCHER. The kind I spoke of is more durable than the average. It is not as durable as the ones that the Government builds for \$600, of course, but it is built for durability.

Dr. TAYLOR. The next item of construction is an extension to the beef cattle barn, to be one-story, frame, with prepared roofing (that is, a fireproof roofing, which is considered advisable— asbestos shingle roofing), containing 34,500 cubic feet, at approximately 7 cents a cubic foot, \$2,400. These are the figures current in that section.

The CHAIRMAN. Can it be built for that?

Dr. TAYLOR. Unless there is a material increase beyond the prices that prevailed in October. Of course, this work will not be undertaken before next July. This is our best guess on the material and labor situation at that time.

The CHAIRMAN. You estimate \$1,000 for two lean-to sheds.

Dr. TAYLOR. Yes. That covers two lean-to frame sheds, each 20 by 134 feet, at 2.3 cents per cubic foot to broaden the existing building. As the structural material there is much lighter there will be a lower cost.

One-horse barn, 48,960 cubic feet, at 7.2 cents per cubic foot, \$3,500. That is the most expensive single item.

The CHAIRMAN. That is 7.2 cents?

Dr. TAYLOR. Yes. These figures were, I think, furnished by our architects.

The CHAIRMAN. The next are six Negro cabins.

Dr. TAYLOR. Yes; one-story frame buildings containing 5,460 cubic feet each, at 11 cents per cubic foot. It has been found increasingly necessary to house Negro labor on the place in order to hold competent help.

The CHAIRMAN. Who holds the title to this land?

Dr. TAYLOR. The title to this land rests in the State of Louisiana, which by act of its legislature authorized the board of control of the State penitentiary to convey it to the Federal Government for this use for so long a time as it may be needed.

The CHAIRMAN. Was no specific time mentioned?

Dr. TAYLOR. No; so long as needed; no specified time was stated.

The CHAIRMAN. It is impracticable to go on and spend a lot of money on other people's land. Would it not be better for the Government to purchase the land and own it?

Dr. TAYLOR. I hardly think so in this case, unless it is desirable to invest a good deal of capital in land there. There are 500 acres held in that way, and we have the use of approximately an equal acreage adjacent to it, owned also by the State.

The CHAIRMAN. It seems to me that we ought to have title to land where we put up expensive buildings on it.

Dr. TAYLOR. That is the exact situation here. The land is a part of the State plantation upon which one of the State penitentiaries is built, and still stands, and which is operated by the State as a sugar and rice plantation.

The CHAIRMAN. Do they turn it over to the Government free?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. The whole plantation?

Dr. TAYLOR. Yes, sir; these 500 acres.

The CHAIRMAN. How much have we spent on buildings up to this time?

Dr. TAYLOR. I shall have to have a statement prepared for insertion in the record to show that.

The CHAIRMAN. When we first went into this, the suggestion was that the State should furnish the land.

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. It was not understood that we were going to put buildings on land owned by others.

Dr. TAYLOR. Yes, sir; the land is owned by the State of Louisiana.

The CHAIRMAN. It was never understood that we were to put buildings on land owned by others.

Mr. McLAUGHLIN of Michigan. Ordinarily that is forbidden by law.

Dr. TAYLOR. The question of the legality of this was passed upon by our department solicitor, and my impression is that it was passed upon by the Attorney General, and the act of the Louisiana Legislature was regarded as protecting the Government sufficiently.

The CHAIRMAN. That did not give the Federal Government authority.

Will you furnish us with a statement of the money expended for buildings there, and also a copy of the act of the State Legislature?

Dr. TAYLOR. Yes, sir; I can do that. I have also a summary of the live-stock work in Louisiana, which I can insert.

(The statements referred to follow:)

Copy of act No. 252 of the General Assembly of the State of Louisiana, authorizing (in sec. 8) the board of control of the State penitentiary to dedicate certain portions of the State plantations to the United States Government (act approved by governor of Louisiana July 9, 1914):

[Act No. 252. By Mr. Butler and Senator Burke.]

AN ACT To authorize the penitentiary board to establish and maintain demonstration farms, both agricultural and stock raising, on Monticello, Oakley, and Hope plantations; to prohibit the sale of at least 500 acres of land on each of said plantations; to name said demonstration farms; to authorize the board of control to purchase live stock and the equipment and operation of said farms; to employ scientific and expert help; to provide for the keeping of records and the publication of bulletins; to authorize the sale and disposition of stock or farm products, equipment, etc., in the regular order of administration; to make an appropriation to aid in accomplishing the purposes of this act; to authorize the dedication of certain portions of said plantations to the United States Government; and to prescribe the terms and conditions thereof.

SECTION 1. *Be it enacted by the General Assembly of the State of Louisiana,* That the board of control of the State penitentiary shall establish and maintain on Hope plantation, Oakley plantation, and Monticello plantation a general system of demonstration of agricultural and stock-raising operations, to which at least 500 acres of land on each of said properties should be dedicated from the area of each of said properties; and the said board of control may, in its discretion and to meet the requirements of the purposes herein set forth, increase said area. And no portion of said land so dedicated shall be sold by the governor of the State by virtue of the authority of any legislative act now permitting the same.

SEC. 2. *Be it further enacted,* That the properties so dedicated shall be known and designated as the "State demonstration farm at Hope" and the "State demonstration farm at Monticello" and the "State demonstration farm at Oakley."

SEC. 3. *Be it further enacted,* That the said board of control shall purchase and maintain on said demonstration farms such live stock and shall engage in such general farming and agricultural operations as in its judgment will best demonstrate the proper operation of agricultural and stock farms in the respective sections in which they are located; and to this end it shall as rapidly as possible equip and maintain on said properties modernly equipped farm and stock implements, fixtures, and buildings, and in general do such things as will be required to make effective the provisions of this act.

SEC. 4. *Be it further enacted, etc.,* That the said board of control shall have the authority and it shall be the duty to employ such scientific and expert help as it may decide as advisable or necessary.

SEC. 5. *Be it further enacted, etc.,* That the said board of control shall keep an accurate and detailed record of all work, experiments, demonstrations, and enterprises undertaken or conducted by it, which record shall at all times be accessible to the general public; and, further, that it shall at stated intervals issue bulletins advising the public of its operations and the result thereof, and the same to publish either through the press or otherwise.

SEC. 6. *Be it further enacted, etc.,* That the said board of control shall have the authority to market, sell, trade, or dispose of any of the animal or agricultural products of said farms, whether it be for the maintenance thereof or with the aim upon proper and commensurate compensation to aid in the promotion of the agricultural and stock-raising industries of the State.

SEC. 7. *Be it further enacted, etc.,* That there is hereby appropriated from the general fund and to be available to said board with which to inaugurate the work hereinabove authorized the sum of \$25,000.

SEC. 8. *Be it further enacted, etc.,* That in the event the Government of the United States should undertake at any time to establish, keep, and maintain in either of the parishes in which the State farms hereinabove named may be situated, any agricultural, cattle, stock, or other demonstration farm or station, for the purpose of promoting in any manner the animal industries or agricultural interests of the people of this State or of any section or portion thereof, and

for the purpose of so doing should require the requisite lands to be given or the use thereof dedicated to it, the board of control of the State penitentiary under the authority of the governor of the State of Louisiana, shall be, and it is hereby, authorized in the name of the State of Louisiana to dedicate and transfer to the Government of the United States under said act, from either or both of the farms herein above named an acreage of not more than that which the said State board of control will have dedicated on either of said farms to the purposes hereinabove set forth or which under the authority herein given it may dedicate; the use and enjoyment thereof to remain with and in the Government of said agricultural, cattle, stock, or other demonstration farm as above outlined: *Provided*, That in the event of such transfer the board of control of the State penitentiary shall exercise no further rights upon the property so transferred and shall not be required to conduct and operate upon the particular farm or farms thus dedicated to the uses of the United States Government the demonstration work herein first outlined.

SEC. 9. *Be it further enacted, etc.*, That all laws or parts of laws in conflict herewith are hereby repealed.

L. E. THOMAS,
Speaker of the House of Representatives.

THOMAS C. BARRET,
Lieutenant Governor and President of the Senate.

Approved July 9, 1914.

L. E. HALL,
Governor of the State of Louisiana.

A true copy.

ALVIN E. HEBERT,
Secretary of State.

(2) Copy of resolution of board of control of the State penitentiary of Louisiana authorizing C. Harrison Parker, president of the board, to execute in behalf of the board an act of conveyance as authorized by section 8 of act No. 252 of the year 1914 to the Government of the United States of a tract of land consisting of 500 acres, being a part of Hope State farm, situated in the parish of Iberia, dated October 7, 1914:

At a special meeting of the board of control of the State penitentiary, held in its office on October 7, 1914, all members being present, the following resolution was unanimously passed and adopted:

Be it resolved by the board of control of the State penitentiary, That C. Harrison Parker, president, be, and he is hereby, authorized to execute in behalf of the board an act of conveyance as authorized and to the extent only of the authorization conferred thereby by section 8 of act No. 252 of the acts of the General Assembly of the State of Louisiana of the year 1914 to the Government of the United States of a tract of land consisting of 500 acres, being a part of Hope State farm, situated in the parish of Iberia, in contemplation of and pursuant to the act of the Congress of the United States, entitled "An act making appropriations for the Department of Agriculture for the fiscal year ending June 30, 1915," approved June 30, 1914, and more particularly described as follows:

That certain tract of land situated in the parish of Iberia, State of Louisiana, on the east side of Bayou Teche, being a part of the property belonging to the Hope State farm; the rear boundary line being at a distance of 64.84 chains from Bayou Teche; above, by property known as the estate of Albert Olivier; and below, by property belonging to various parties, known as the Little Wood negro colony; the entire tract containing 500 acres, having a frontage of 77.11 chains, all as is more definitely and accurately set forth in the map thereof made by Charles O. Babin, civil engineer, under date of New Iberia, La., August 31, 1914; a blue print of which map is annexed to the act of conveyance hereinabove authorized to be executed and made part thereof, paraphed "Ne Varietur" for identification.

C. HARRISON PARKER, *President.*
G. A. KILLGORE, *Secretary.*

I, G. A. Killgore, secretary of the board of control of the State penitentiary, do hereby certify that the above and foregoing is a true and correct copy of the

resolution adopted by the board of control of the State penitentiary on this the 7th day of October, A. D. 1914.

G. A. KILLGORE, *Secretary.*

I do hereby certify the foregoing to be a true and correct copy from the original, on file in my office.

L. R. TILLY, *Deputy Clerk of Court.*

Deed of dedication and transfer of portion of Hope State farm to the Government of the United States by C. Harrison Parker, president board of control State penitentiary, and L. E. Hall, governor of the State of Louisiana, October 12, 1914:

STATE OF LOUISIANA, *Parish of East Baton Rouge:*

Be it remembered that on this 12th day of October, A. D. 1914, personally came and appeared before me C. C. Bird, jr., a notary public of the above parish and State, C. Harrison Parker, president of the board of control of the State penitentiary, authorized hereunto by a resolution of the said board, a certified copy whereof is attached to and made part of this act, the said board of control acting in the presence in virtue of the authority conferred by section 8 of act No. 252 of the acts of the General Assembly of the State of Louisiana, at its regular session in the year 1914; and also appeared Luther E. Hall, governor of the State of Louisiana, for the purpose of authorizing the board of control hereunto as required by the said act No. 252 of 1914, who declared and acknowledged that in the name of the State of Louisiana they hereby dedicate and transfer to the Government of the United States the right of possession and due of the following-described tract of land, to wit:

That certain tract of land situated in the parish of Iberia, State of Louisiana, on the east side of Bayou Teche, being a part of Hope State farm, bounded in front by Bayou Teche, in the rear of the property belonging to the Hope State farm, the rear boundary line being at a distance of 64.84 chains from Bayou Teche, above by property known as the estate of Albert Olivier, and below by property belonging to various parties known as the Little Wood negro colony; the entire tract containing 500 acres, having a frontage of 77.11 chains, and a depth of 64.84 chains, all as is more definitely and accurately set forth in the map thereof made by Charles O. Babin, civil engineer, under date of New Iberia, La., August 31, 1914, a blue print of which map is hereto annexed and made part hereof, paragraphed Ne Varietur for identification.

The object of this conveyance and the consideration hereof is the undertaking by the United States, through the Department of Agriculture, of the establishment on the said premises of a farm for experiments and demonstrations in live-stock production pursuant to the terms of the act of the Congress of the United States, entitled "An act making appropriations for the Department of Agriculture for the fiscal year ending June 30, 1915," approved June 30, 1914, and the possession, occupation, and use of the said premises by the United States shall continue so long as the same shall be devoted to the objects and purposes authorized by the said act of Congress.

In testimony whereof, the parties hereunto have subscribed their names, together with D. F. Bacot and A. B. Whitlow, lawful witnesses, and me, the said notary, on the day and date hereinabove first written.

C. HARRISON PARKER,
President Board of Control, State Penitentiary.

L. E. HALL,
Governor of the State of Louisiana.

Witnesses:

D. F. BACOT.

A. B. WHITLOW.

C. C. BIRD, JR., *Notary Public.*

In addition to the 500-acre portion of the Hope State farm dedicated by the board of control of the penitentiary, it was found advisable to secure a tract of 4.658 acres on the south side of Bayou Teche to furnish a suitable outlet to the main improved highway and upon which to locate two cottages and the bridge house sheltering the tender of a bridge across Bayou Teche, built by the Iberia parish to provide suitable, convenient, and independent access to the

farm. This tract of 4.658 acres, more or less, was conveyed to the United States of America by Leonidas H. Conrad, February 7, 1918, upon payment to him of \$500 in cash furnished by citizens of the parish interested in the adequate and suitable development of the live-stock field station. A copy of this deed as recorded in the office of the clerk of court for the parish of Iberia February 13, 1918, follows:

UNITED STATES OF AMERICA,

State of Louisiana, Parish of Iberia.

Be it known that on this 7th day of the month of February in the year of our Lord 1918, before me, C. M. Compton, a notary public in and for the parish of Iberia, State of Louisiana, duly commissioned and qualified, and in the presence of the witnesses hereinafter named and undersigned.

Personally came and appeared Mr. Leonidas H. Conrad, a married man, whose wife's maiden name was Miss Aimee Broussard, a resident of the parish of Iberia, State of Louisiana, who declared and said that, for the consideration, and on the terms and conditions hereinafter expressed, he did and does, by these presents grant, bargain, sell, convey, transfer, assign, set over, and deliver, with all legal warranties, and with a full guarantee against all troubles, debts, mortgages, claims, evictions, donations, alienations, or incumbrances whatsoever, until the United States of America, the tract or parcel of land hereinafter described, to be used by the Department of Agriculture of the United States in conducting experiments and demonstrations in live-stock production in the cane-sugar and cotton districts of the United States, the said United States of America being represented by Mr. J. R. Quesenberry, who, having authority to appear herein, for and in the name and behalf of the United States of America, to be used for homes and necessary outhouses in connection with said farm here present, accepting and purchasing for said United States of America acknowledging delivery and possession thereof, the property of which the following is a description, to wit:

A certain tract of land, situated in the parish of Iberia, State of Louisiana, being a part of section 33 in township 12 south, range 7 east, Louisiana meridian, and more particularly described as beginning at an iron pin on the southerly side of Bayou Teche and other line of the vendor; thence following the meander of said Bayou Teche, approximately south 53 degrees east, 318 feet to an iron pin on the southerly side of Bayou Teche; thence south 40 degrees 30 minutes west, 639 feet to a point on a road designated as model road; thence north approximately 53 degrees west 318 feet to the land of vendor; thence north 40 degrees 30 minutes east, 536 feet to the point of beginning, containing 4.658 acres, more or less; all of said bearings in the foregoing description being turned from the Louisiana meridian.

It is distinctly understood that this sale is made on the expressed condition and with the distinct understanding that the property above described, as herein sold to the United States of America, shall be used for the purposes of conducting experiments and demonstrations of live-stock production by the Department of Agriculture of the United States of America, and that upon said Department of Agriculture ceasing permanently to use said tract or parcel of land for that purpose, the same shall revert to the vendor. It is hereby mutually agreed and understood, however, that the United States of America, the vendee herein, by its officers, agents, and employees, may, upon breach of the conditions above stipulated and within a reasonable delay thereafter, remove or cause to be removed from said tract or parcel of land any and all structures, buildings, and other improvements of any nature or kind whatsoever, which may be erected or placed thereon by the vendee.

And now to these presents personally came and appeared, Mr. Peter E. Sandager, a married man whose wife's maiden name was Miss Dora Olson, a resident of the parish of Iberia, and declares that he has taken cognizance of the above and foregoing act of sale, and as the holder and owner of a certain vendor's lien and privilege against the property herein sold, does hereby declare that he did and does waive said lien and privilege and mortgage held by him against the vendor and bearing upon the property herein transferred, in so far as his said lien and vendor's privilege and mortgage bears against the property herein transferred, which said lien and vendor's privilege so waived on the property herein sold being recorder in mortgage book A, folio —.

And to these presents personally appeared, the Citizen's Bank, of Jeanerette, a corporation under the laws of the State of Louisiana, domiciled at Jeanerette, La., herein represented by its president, Dr. C. A. McGowan, duly authorized herein by resolution of the board of directors of said Citizen's Bank, of Jean-

erette, and declares that he has taken cognizance of the above and foregoing act of sale and as the holder and owner of three certain notes, secured by special mortgage, executed by Peter E. Sandager, to the Citizen's Bank, of Jeanerette, identified with act before C. M. Compton, notary public, of date November 5, 1917, and recorded in mortgage book A, folio —, does hereby declare that he did and does waive said mortgage held by said Citizen's Bank, of Jeanerette, against the said Peter E. Sandager and which bears against the property herein transferred. It being the intention to cancel said mortgage only in so far as it relates to and affects the property herein transferred containing 4.658 acres, and no further.

To have and to hold the said described property herein conveyed unto the said purchaser, with full and general warranty of title, and with full subrogation to all the rights of warranty, and all other rights as held therein by said vendor.

The vendor declared that all the taxes assessed against said property herein conveyed are paid.

The parties hereto agree to dispense with the production of the certificate required by Article 3364 of the Civil Code of this State, and to exonerate me, the undersigned notary, from all liability in the premises.

This sale is made and accepted for and in consideration of the price and sum of \$500 cash, which amount the said purchaser has paid in ready current money unto the said vendor who hereby acknowledges receipt thereof and gives full acquittance for the same.

Thus done and passed at may office in New Iberia, parish of Iberia, State of Louisiana, on the day, month, and year first above written, in the presence of Messrs. Leonard Lyon and E. S. Broussard, good and competent witnesses, residing in this parish, who have signed these presents with the parties and me, notary, after due reading of the whole.

LEO CONRAD.
C. A. MCGOWAN,
For Citizen's Bank.
P. E. SANDAGER.

SUMMARY OF EXPERIMENTS AND DEMONSTRATIONS IN LIVE-STOCK PRODUCTION IN THE SUGAR CANE AND COTTON DISTRICTS OF THE UNITED STATES.

DEMONSTRATION WORK.

The live-stock demonstration work, which constitutes one feature of this project, has been done under the direction of Prof. W. D. Dodson, State director of extension in Louisiana. This work is done through field agents, in cooperation with county agents, farms being selected for live-stock demonstrations, which are visited at certain intervals by the field specialists and county agents the giving of directions for the selection of breeding stock, management of animals, methods of feeding, production of forage crops, marketing of products, etc. As was contemplated from the beginning, the expenditures upon the extension work relating to live stock have been decreasing from year to year and the larger proportion of the funds have been used for investigational work at the Iberia live-stock field stations. The amount to be used for extension work during the current fiscal year is approximately \$5,000, leaving approximately \$55,000 for the investigational work.

INVESTIGATIONAL WORK.

From the beginning the experimental work has been enlarged and changed as information relative to crops and live-stock condition were obtained. Each experiment has been recorded in detail and the results published as they were completed.

The experimental work, as planned from the start, has been conducted under four projects, as follows:

Horses and mules.—This division of the farm contains 72 acres of land. The main objects sought in this division are, first, to supply the work stock for the entire farm and to feed it; second, to compare the efficiency of brood mares which bring colts once a year with that of the ordinary "sugar" mule, in order to ascertain both the amount of feed consumed by the mare, as compared with that consumed by the mule, and the amount of work that the mare can do in the climate as compared with that done by the mule; third, to determine the relative cost of producing a first-class mule and whether or not mules of high quality can be raised under such conditions as are found in this region.

Beef cattle.—In the beef-cattle division, containing 276 acres, the accomplishment of two distinct purposes is sought, namely, to ascertain the cost of raising a steer, using pasturage as much as possible and wintering largely on some of the various kinds of silage which can be produced in that region; also to ascertain the cost of finishing the steer under the various local conditions. One method is to finish the animals largely on grass, supplemented by cottonseed cake. Another, to keep the animals on grass until they can be turned into the corn and pea fields, allowing them to graze off the crops. Still another, to finish lots of steers in the feed yard with various kinds of silage, including corn, sugar cane, sugar-cane tops, Japanese cane, sorghum, and other crops.

In this division of the farm an effort is made to determine the possibilities of producing beef independently of cane production; also of producing it as an adjunct to cane raising. A certain amount of cane is grown on this part of the farm in rotation with other crops; this provides the cane for use in feeding experiments.

Hogs.—The hog division of the farm is devoted to determining the cost of pork products, using, as largely as possible, various rotations of hog crops combined with pasturage. Fifty-three acres is devoted to this purpose and as many brood sows kept as it will carry.

Dairying and hogs.—This section of the farm contains 74 acres and is devoted to producing dairy products and hogs. A small dairy herd is being developed as practically and economically as possible, using, largely, selected native cattle as a foundation and breeding them to a high-class bull. Some pure-bred animals have been secured. Studies are being made in feeding and management of dairy cattle under the conditions of cropping in this section.

The whole purpose of these plans is to establish as definitely as possible the opportunities for handling live stock, either as an independent industry or as an adjunct to some other industry. It is the object to establish, within a few years, methods of live-stock handling that can be adapted to the different systems of farming suitable for that region.

Future work.—The plan for the future is to enlarge certain lines of experimental work that seems most useful and to give added attention to certain special crops for feeding live stock. The additional improvements that are needed are better roads about the farm and to the main road and the improvement of sheds used for the feeding steers. On account of the heavy rains it is desirable to cover considerable portions of the yards in order to keep the cattle out of the mud and also to conserve the manure. There is also need of an additional horse barn to carry on experiments with horses and mules.

RESULTS.

The following are brief statements of results and progress of the major experiments that have been conducted by the experimental farm:

Actual feed and labor costs have been used in obtaining these cost figures, however, accurate records of feed, pasturage, and labor have been kept, and can be applied to any changing values and basic essentials of the work maintained even though values of the above change.

Horses and mules.—It costs \$209.47 per year to maintain a mule working 239 days, or an average of 88 cents per day worked.

It costs \$235.04 per year to maintain a mare working 139 days, or an average cost of \$1.70 per day worked.

After crediting mares with foals that have reached working age, the mares earned per year \$94.63 less than the mules.

This difference in earning power is due to the small number of colts produced and the large mortality among mares and colts. These factors will be eliminated as the diseases become more under control and nonbreeding mares are disposed of. If the mares had raised a 100 per cent colt crop they would have earned an average of \$10 per head more than the mules.

The average cost of raising 9 mule colts to a working age of 2½ years was \$192.66. Their market value was \$320.

The average cost of 17 mules, at 1 year of age, averaging in weight 610 pounds, was \$42.85.

The average cost of 12 mules at 2 years of age, averaging in weight 905 pounds, was \$130.53.

Mules of high quality can be raised under such conditions as are found in this region.

Beef cattle.—The average yearly maintenance cost per cow is \$30.84.

The cost of producing a feeder steer weighing 860 pounds, with a value of \$130.20, was \$62.08, a profit of \$41.12.

That the operation of growing and fattening steers can be economically carried on has been clearly demonstrated. Steers with an average marketing weight of 1,074 pounds were grown and fattened at an average cost of \$103 per head, or at \$9.59 per hundred pounds. These steers having a net market value of \$123 per head make a net profit on the operation of \$20 per head.

The cost of raising heifers to breeding age of 30 months was \$88.83.

The order of efficiency of the various silage crops as measured by the average daily gains produced on steers is as follows:

	Pounds, live weight.		Pounds, live weight.
Corn and soy beans	2.32	Corn sorghum, cowpeas, and soy beans	1.96
Sorghum and soy beans	2.3	Sugar cane	1.58
Corn	2.2	Japanese cane	1.48
Corn and sorghum	2.09	Cane tops	1.36
Sorghum	1.97		

Results indicate that cattle feeding may be successfully done under southern coastal conditions; that cane tops may be utilized as a feed by making them into silage; that sorghum is the most profitable single silage crop available; that the adding of soy beans to either corn or sorghum increased its value as a silage crop for fattening steers; that Japanese cane, while only producing fair gains for cattle, should have an important place in any cattle feeding scheme in this region because of the large tonnage that can be produced per acre, making it a cheap silage.

Hogs.—Pigs at weaning time average in weight 27.95 pounds, and cost \$2.82 each or 10 cents per pound. Four hundred and fifty-three pigs have been marketed for pork, having a total market weight of 77,807 pounds. Feed production cost amounted to \$13.12 per 100 pounds, and their net selling value was \$17.75 per 100 pounds.

Rice polish when fed alone to fattening shoats has proven to be an excellent feed, producing gains at \$2.79 less than when fed with tankage, and \$1.04 less than was produced by shelled corn and tankage.

As winter grazing crops, oats, barley, and rye rank in the order named.

Crops that failed to give favorable results as grazing crops are sorghum, sweet corn, June corn, cowpeas, and velvet beans.

Dairy.—For ordinary feeding practices in the Southern States where legume hay and sorghum silage are used, results show that velvet-bean meal may be considered as practically equal in feeding value to cottonseed meal for dairy cows in milk.

The cost of raising 8 dairy heifers to one year of age has been found to be \$80.59 per head.

The dairy has been in operation since May, 1917. The feed and labor cost of producing a gallon of milk has been ascertained for the two years. During the first year 16,706.5 gallons of milk were produced at a cost of 26 cents per gallon. During the second year 15,025.82 gallons were produced at a cost of 34 cents per gallon. These charges are for feed and labor only. Overhead expenses amount to approximately 10 cents per gallon additional, making the milk cost for the last year 44 cents per gallon.

Nine pure-bred Jersey cows have been officially tested and placed in the register of merit since being acquired by the station.

EXPERIMENTS IN DAIRYING AND LIVE-STOCK PRODUCTION IN THE SEMI-ARID AND IRRIGATED DISTRICTS OF THE WESTERN UNITED STATES.

The CHAIRMAN. Kindly take up the other item.

Dr. TAYLOR. The other item is for experiments in dairying and live-stock production in the semiarid and irrigated districts, which is the dairy and animal husbandry work in the Great Plains region.

The CHAIRMAN. On what page is that?

Dr. TAYLOR. Page 274. We are asking for \$40,000, the same amount that was appropriated this year.

The CHAIRMAN. Does that come under your bureau?

Dr. TAYLOR. No. It is under the Bureau of Animal Industry, Mr. Rawl looking after it. He is out of the city, and as this work is done at field stations which were established by the Bureau of Plant Industry primarily for crop-production work, I may be able to answer questions regarding it.

The CHAIRMAN. Are they making progress?

Dr. TAYLOR. I think so. We feel that the work has a good start and that they are sure to secure results that will be of benefit to the irrigation and dry-farming sections. There are some hard problems involved, in view of the fluctuating feed supply from year to year in the dry country, but some one has to work these out, and we feel that the department should do it.

The CHAIRMAN. Is this largely a plant proposition, seeking to find a stem that will produce two blades instead of one?

Dr. TAYLOR. Partly that.

The CHAIRMAN. Is that practically the whole program?

Dr. TAYLOR. No; there is the question of determining whether they can effectively utilize the forage crops that can be grown there in that dry country.

The CHAIRMAN. In what respect do their crops vary, except that they are light, from any others?

Dr. TAYLOR. They vary in this respect, that they fluctuate from year to year tremendously, with the rainfall, and we have got to work out means of steadying the supply by carrying over in the

form of silage or other forage the surplus of the bumper crop years.

The CHAIRMAN. It is a question of nutrition?

Dr. TAYLOR. No.

The CHAIRMAN. Straw in that country has the same value as in Iowa?

Dr. TAYLOR. Yes; presumably.

I think that is about all, except that I have a brief summary of this live-stock work which I will put in the record if the committee cares to have it go in.

The CHAIRMAN. Very well.

(The summary referred to follows:)

SUMMARY OF EXPERIMENTS IN DAIRYING AND LIVE-STOCK PRODUCTION IN SEMI-ARID AND IRRIGATED DISTRICTS OF THE WESTERN UNITED STATES.

The allotment for live-stock production studies in 1918-19 was \$28,000 for dairying and \$12,000 for beef cattle, swine, and sheep.

DAIRYING.

The dairy work has progressed along the same lines as in the previous year and has been extended. Practically all the building work had been completed, but it was necessary to do some additional construction work at the Ardmore and the Huntley stations. On account of the high cost of materials and the difficulty of securing labor, buildings for the new stations were not constructed during the past year, and therefore \$7,810 was unexpended from this appropriation.

Ardmore station (Ardmore, S. Dak.).—At the Ardmore station, a pit silo was dug and filled with silage. This was done for two reasons: First, to furnish silage during the very severe weather, because during several of the winter months it is difficult to dig out the frozen silage and it is inconvenient to feed it; second, to increase the silage capacity at this station so that in a good year enough silage may be stored to last through a period of drought. Some minor changes have been made in the milk house and other buildings.

An experiment with various pasture-grass mixtures was undertaken, but, on account of unfavorable weather, a stand was not secured.

The dairy herd at Ardmore now consists of a pure-bred Holstein bull, 16 pure-bred Holstein females, and 13 grades. Semiofficial records have been conducted with 6 of the pure-breeds, and they have made creditable records.

Huntley station (Huntley, Mont.).—At the Huntley station additional space was constructed during the year additional shed space and several box stalls for the herd. A part of the expense of constructing a manure pit was also paid from these funds.

The experimental work consisted of continued studies with sunflower silage as compared with corn silage; an experiment to ascertain the capacity of different mixtures for irrigated pastures, and to determine the maximum carrying capacity of tame-grass mixtures. In spite of the high price of sugar beets and other inducements in crop production, there has been much progress made in dairying in the Huntley region. During the year a carload of pure-bred cows was shipped from the East to the farmers in that neighborhood.

The herd now consists of 2 pure-bred bulls, 22 pure-bred Holstein females, and 9 grades. One of the pure-bred Holsteins produced last year 24,075 pounds of milk and 692.82 pounds butter fat, on official record. One pure bred, in an experiment in which she was fed roughage alone, produced 14,210.1 pounds of milk and 470.24 pounds of butter fat.

The herds at Ardmore and at Huntley are used in connection with the general breeding project of the department and 10 bulls have been loaned to dairymen in that region under special arrangement, whereby records will be kept so that the prepotency of the bulls may be ascertained and used in the future breeding work.

The expenditures from these farms for the fiscal year 1918-19 were as follows:

	Ardmore.	Huntley.
Salaries.....	\$2,001.25	\$1,813.25
Wages (farm and dairy).....	1,997.70	2,136.91
Travel.....	290.95	227.20
Equipment and material.....	2,498.56	1,832.83
Miscellaneous (including feed, live stock, fencing, etc.).....	2,728.50	4,663.09
Total.....	9,516.96	10,673.38

Receipts returned to the Treasury in 1918-19 for dairy products sold are as follows:

Ardmore station.....	\$1,823.45
Huntley station.....	2,235.82
Total.....	4,059.27

BEEF, CATTLE, SWINE, AND HOGS.

Huntley station (Huntley, Mont.).—A comparison was made with sows and litters on alfalfa pasture, receiving a 2.5 per cent by weight ration of corn alone and corn and tankage. The lot of sows receiving corn and tankage gave a return of 1,269 pounds gain per acre against 850 pounds gain per acre without tankage. The grain per pound of gain was 256 pounds with tankage and 363 pounds without.

A comparison was also made with sows without litters running on alfalfa pasture, one lot receiving no grain, another receiving 1 per cent corn, the third lot receiving 1 per cent of corn and tankage mixture, tankage being one-sixth of the concentrates. The lot receiving no grain lost one-half pound per day, while the others gained practically one-half pound per day. The addition of 116 pounds of tankage for five sows on alfalfa pasture gave an additional total gain of only 5 pounds, saving no corn.

A test was made with spring pigs on alfalfa pasture, the different lots receiving 1, 2, and 4 per cent rations by weight, one lot being self-fed. The self-fed lot required less grain and made more rapid gains than any of the other lots. The pounds of grain for 100 pounds gain was 248 pounds self-fed, 294 in the 3 per cent ration, 285 in the 2 per cent, and 262 in the 1 per cent ration. These hogs were later finished out in a dry lot where the hogs which had received the 3 per cent ration made the most economical gains.

A test was conducted hogging-off corn with no supplement and with alfalfa hay in a rack. With alfalfa hay in the rack, it required 515 pounds of corn for 100 pounds gain against 634 pounds without hay. Eight hogs in 60 days consumed 100 pounds of hay.

In finishing hogs in a dry lot it was found that corn alone required 733 pounds for 100 pounds gain, while corn and tankage required 486 pounds for 100 pounds gain.

Newel Station (Belle Fourche Project, S. Dak.).—Various grain rations for fall pigs on alfalfa pasture were tested out. Two per cent rations of barley and corn were practically equal, while a 2 per cent ration of shorts was slightly superior to barley or corn. The addition of tankage to a 2 per cent ration of corn for fall pigs on alfalfa pasture showed no advantage. In this experiment, lots receiving corn in the self-feeder and corn and tankage in the self-feeder produced practically identical results. The rate of gain was higher than in the 2 per cent rations. It required 340 pounds of grain for 100 gain in the self-fed lot, compared with 250 pounds grain in the lots receiving 2 per cent rations.

Similar experiments were conducted with spring pigs. Two per cent rations of corn and barley and shorts were practically equal. With spring pigs, corn in the self-feeder gave gains of .93 pound per day, while the 2 per cent ration gave gain of only 0.45 pound per day. The pigs on self-feeder required more corn for 100 pounds gain than the lot receiving 2 per cent corn, but it was reported that the corn was of very poor quality.

Tests were conducted carrying sows on alfalfa pasture with no grain and with a 1 per cent ration of barley, corn, and corn and tankage. The lot of sows receiving no grain lost $\frac{1}{2}$ pound daily and the test was unsatisfactory. The lots receiving 1 per cent ration of barley and corn gained .58 and .49 pounds daily, while the lot receiving 1 per cent ration of corn 14 parts and tankage 1 part showed an average daily gain of 1 pound.

A test was made of sows with litters on alfalfa pasture receiving 2 $\frac{1}{2}$ per cent rations of shorts, barley, corn alone, and corn with tankage. The lots receiving shorts and barley required 354 and 355 pounds grain for 100 pounds gain, while the lot receiving corn alone required 294 and lot receiving corn and tankage only 244 pounds grain for 100 pounds gain.

Four one-half acre lots of irrigated land were hogged off. The first lot received no supplement, the second had access to alfalfa hay in the rack, the third to alfalfa pasture, and the fourth to tankage in self-feeder. The lot receiving corn alone required 573 pounds on 100 pounds gain, corn with alfalfa hay 515 pounds, corn with alfalfa pasture 430 pounds, and corn with tankage self-fed 363 pounds. The lot receiving tankage in the self-feeder was the outstanding lot, making an average daily gain of 2.11 pounds, against 1.37 pounds corn with alfalfa pasture, which was the second highest lot.

Ardmore Station (Ardmore, S. Dak.).—The experimental work at the Ardmore field station has been largely confined to beef-cattle production by the use of native pastures and forage crops.

This work has involved the use of about fifty 3-year-old steers. For the purpose of experimental work these steers have been divided into four separate bunches. One lot of 10 head has been running in a pasture of 150 acres; another lot of 10 head has been running in a pasture of 80 acres; and 20 head have had the use of 160 acres. In this 160-acre pasture 20 head are run on alternate pastures. The pasture season has been approximately six months—that is, from the first of May until the last of October. About 10 head have been carried in reserve and have had the use of a large reserve pasture. During the winter these cattle have been carried in a small pasture which has been supplemented by the use of forage crops and cheap feeds produced on the station.

Valuable data have been collected regarding the carrying capacity of pastures under varying conditions. Extensive botanical studies have been made in connection with this grazing experiment. While these experiments have not been in progress long enough to make possible definite conclusions, the results obtained indicate that the 10 steers on the 150-acre pasture have an excessive amount of feed. The lot of 10 head on the 80-acre pasture, on the other hand, are using the pasture to its maximum capacity. Better results are obtained from the 20 head which graze two 80-acres alternately. Results indicate also that it is an economical practice to run the cattle through the winter on forage crops (sorghum and corn fodder) and other cheap feeds.

A small bunch of hogs has been carried on the experimental farm with a view to developing a larger herd of pure-bred swine, which is to be used in the experimental work during the coming year.

The expenditures for the beef cattle, swine, and sheep work on these farms for the fiscal year 1918-19 were as follows:

	Salaries.	Miscellaneous.	Total.
Huntley, Mont.....	\$3,871.12	\$1,649.69	\$5,520.81
Ardmore, S. Dak.....	390.00	2,551.74	2,941.74
Newell, S. Dak.....	1,479.27	1,146.74	2,626.01
Scottsbluff, Nebr.....	721.50	721.50
Washington, D. C.....	114.59	114.59
Miscellaneous experiments, all stations.....	28.91	28.91
Total.....	6,576.48	5,377.08	11,953.56

PURCHASE AND MAINTENANCE OF MOTOR-PROPELLED VEHICLES.

(This item is discussed in general statement by Mr. F. R. Harrison covering various items in the miscellaneous section of the estimates.)

EXCHANGE OF PARTS OF AUTOMOBILES.

(This item is covered in general statement of Mr. F. R. Harrison relative to the miscellaneous section of the estimates.)

ERADICATION OF FOOT-AND-MOUTH AND OTHER CONTAGIOUS DISEASES OF ANIMALS.

(See statement of Dr. John R. Mohler relative to this item under Bureau of Animal Industry section of these hearings.)

THURSDAY, JANUARY 8, 1920.

AFTERNOON SESSION.

ERADICATION OF PINK BOLLWORM.

STATEMENT OF MR. C. L. MARLATT, CHAIRMAN OF THE FEDERAL HORTICULTURAL BOARD, DEPARTMENT OF AGRICULTURE.

(After discussion of estimates of the Federal Horticultural Board:)

The CHAIRMAN. We will take up item 9, on page 282, "for the eradication of the pink bollworm."

Mr. ANDERSON. You have some transfers to the statutory roll of the Federal Horticultural Board from the lump sum for the eradication of the pink bollworm. Is that pink-bollworm work likely to be continuous?

Mr. MARLATT. The field work in Texas may possibly be continued about on the present basis for two or three years more, but the quarantine service will have to be maintained indefinitely to protect against entry of the insect from Mexico and against its entry with imported cotton at New York, Boston, and elsewhere. Part of it is, therefore, continuing work unless we should be so unfortunate as to get the insect established in this country.

Mr. HARRISON. We are suggesting, Mr. Anderson, a reduction of approximately \$200,000 in that item.

Mr. ANDERSON. The only thing I had in mind was that, if the work itself is not permanent, there is no use in making permanent the clerical services connected with it.

Mr. HARRISON. We merely followed the usual practice in reporting these transfers.

Mr. McLAUGHLIN of Michigan. From what foreign places do you find this cotton infected with the pink bollworm imported?

Mr. MARLATT. The pink bollworm occurs practically in every cotton-producing country of the world, except the United States, and hence all import cotton must be disinfected.

Mr. McLAUGHLIN of Michigan. If the insect becomes established in the United States, would its ravages be as great here as in those other countries?

Mr. MARLATT. Its ravages here might be even greater than in these other countries. The principal cotton-producing country that is now

affected by this insect is Egypt, Brazil next, then China, and other countries, including India. The damage in Egypt, where the insect has now been for about 12 years, is reckoned at 18 to 20 per cent of the crop, but that is under a very expensive method of control which can be carried out in Egypt, but I doubt very much whether it could be carried out in this country. Abundant and cheap labor makes it possible in Egypt for the Government to enforce, at the end of each crop season or a little before the end of the season, the uprooting of all the cotton in the field. Such uprooted cotton stalks constitute an important fuel item of Egypt, and to eliminate the pink bollworm the uprooted cotton plants are drawn over a comb-like machine which strips from the plants all the unripe bolls and the buds—that is, the parts that contain the insect—and all the stripped-off material is promptly burned. The cleaned cotton stalks are then piled up in the village centers and inspected by the Government inspectors to see that all the bolls or flower parts have been removed. It is apparent that such a process, though efficient in destroying a large percentage of the insects, is expensive. By that means the crop of Egypt is maintained with a minimum loss. In addition to that, the Government controls and disinfects the cotton seed and distributes disinfected seed for planting. The whole process is expensive and elaborate, one which under our labor conditions would be prohibitive in cost. In Brazil—I think I may have mentioned this at a former hearing—the insect was introduced by the Government unwittingly. The Government in its endeavors to increase and benefit the cotton crop of Brazil imported a lot of cotton seed from Egypt just about the time the insect was getting a foothold there, and by the same system of seed distribution which we have in this country, and which also is similarly dangerous, this insect was distributed and established throughout the principal cotton-growing States of Brazil. Recent reports indicate that it is fully as destructive in Brazil as in Egypt.

Mr. JACOWAY. Is the pink bollworm more destructive than the cotton-boll weevil of the South?

Mr. MARLATT. It apparently is a more destructive insect and carries its work further than the boll weevil, destroying the seed as well as the lint.

Mr. HEFLIN. It eats out everything.

Mr. JACOWAY. If you had this elaborate program for port inspection which you have outlined in the estimates for the Federal Horticultural Board, would the citrus canker ever have gotten any very great foothold in the citrus fruit-growing districts of this country? Would not that have prevented this economic loss in Florida, Alabama, Texas, and elsewhere?

Mr. MARLATT. It undoubtedly would.

The committee will recall that the pink bollworm became established in portions of Texas as a result of its getting a foothold in Mexico, and the beginning of this work of control in Texas in 1917 and 1918. The entry of the insect into Mexico, as in the case of other countries, was through the agency of cotton seed imported from Egypt. In the effort to get a better quality of seed certain individuals made importations of seed from Egypt, thus bringing this insect into Mexico, and particularly into the Laguna district, a mountain valley in the interior of northern Mexico about 50 miles

in diameter, and the principal area of cotton production in that Republic.

Mr. McLAUGHLIN of Michigan. How far from our border?

Mr. MARLATT. Two hundred or three hundred miles. We had thought up to that time that Mexico, like the United States, was free from this insect, and we were permitting a certain amount of interchange of cotton products with Mexico, restricted, however, as to cotton seed, which was allowed to be brought in for milling purposes only. When we discovered in 1916 that the pink bollworm was in this district in Mexico, further entry of cotton seed from Mexico was stopped by quarantine and an intensive inspection and clean-up was given to all mills which had received Mexican seed. This work has already been recounted before your committee and was undertaken under the original appropriation of \$50,000. That work was very thoroughly done and apparently was successful in the case of every mill, some 12 mills altogether, except 2. In the case of the mill at Herne, Tex., there was a very limited infestation started apparently from the mill. In the case of the mill at Beaumont, Tex., a larger area of infestation was started, due to the fact that the mill owner violated his contract and sold for planting some of the imported seed. Later on it was found that the insect had gained a large foothold about Galveston and Trinity Bays. This has all been explained to your committee in former years. As a result of these findings Congress gave an appropriation of \$250,000 for clean-up work in Texas and elsewhere. This work was carried out with great thoroughness in the fall and winter of 1917-18—very much after the methods which I have described for Egypt—the plants being uprooted and burned, and in some instances the ground being burned over.

Mr. McLAUGHLIN of Michigan. Has there been any recurrence?

Mr. MARLATT. That is what I wish now to describe. During the season of 1918, that is, last year, no cotton was allowed to be grown in any of the districts which had been infested and cleaned up. A lot of difficulty was experienced in enforcing that prohibition. It was a State prohibition; the Department of Agriculture cooperated with the State authorities in its enforcement. Fully 95 per cent of the planters concerned complied with the order, but others planted cotton, largely on the advice of certain attorneys who promised to defend such planters. There was a fee in it for these attorneys. Such contraband cotton was grown, but of the whole area in the Trinity Bays district of many hundreds of square miles—larger than the State of Connecticut—only in certain limited areas. All this contraband cotton eventually was taken under the control of the State and was cleaned up in the fall and the seed crushed and the lint exported through the port of Galveston.

Mr. McLAUGHLIN of Michigan. Did you find anything?

Mr. MARLATT. No pink bollworm was found in the State of Texas during the season of 1918 as a result of thorough inspection work, which included also the uprooting and destroying of all volunteer cotton throughout the infested districts. We were very hopeful, therefore, that the problem had been solved. If it had been thus solved, it would probably have been the biggest piece of work of that kind that the world has ever seen.

Mr. JACOWAY. What was your appropriation to start this work?

MR. MARLATT. The original appropriation was \$50,000, for inspection and the border quarantine to prevent entry from Mexico. That was before we knew we had the insect. When the pink bollworm was found in Texas in the fall of 1917-18, we were given an emergency appropriation for clean-up work of \$250,000. This was followed, as already noted, with an appropriation for the fiscal year 1918-19 of \$500,000, and for the current fiscal year of \$600,000.

In the eradication work of 1917-18 the farmers and planters of the large districts involved cooperated with us in the main very patriotically and heartily. At the end of this season of 1918 they made representations to the State and to our agents that, as they had given us this cooperation and as no recurrence of the insect had been found, they wanted to be permitted to grow cotton the next year.

MR. HEFLIN. How close to the Mexican line was this contraband cotton grown?

MR. MARLATT. It was grown in the Trinity Bays district near the Louisiana line and hundreds of miles from the Mexican border.

This demand to be permitted to grow cotton could not be very well denied. In point of fact, if it had been denied, I doubt whether the State would have been able to enforce prohibition of the growth of cotton. The growth of cotton under restrictions as to disposal of crop was therefore authorized in the quarantined areas for the season of 1919, with the understanding that if the pink bollworm should develop again that year in these areas the planters would be willing to abandon the growth of cotton for such term of years thereafter as the State and the Federal authorities should deem necessary. This cotton was kept under very careful inspection all summer, and no infestation was found until late in October, 1919. There has since been found a very slight and scattering infestation over the Trinity Bays area—much less than in 1917.

For the purpose of bringing the situation as a whole in Texas before you, I will postpone the consideration of the reinfestation in eastern Texas and discuss the two new areas of slight infestation in western Texas determined late in 1918, namely, in the Great Bend of the Rio Grande and in the Valley of the Pecos.

The Great Bend infestation was scattered over a distance of 150 miles in small valleys at the base of the mountains, representing altogether only a few hundred acres, and appears to have resulted from an original infestation on the Mexican side of the river, from planting seed brought by Mexican farmers from the Laguna district of Mexico.

The Pecos Valley infestation was traced to some of this Mexican cotton which had been carried from the Great Bend district to a gin at Barstow, Tex., and presented a rather serious situation in that the insect was here brought into a district where cotton is commercially grown on a fairly large scale. Fortunately, the infestation was limited to comparatively few fields.

Active work was immediately undertaken to exterminate the insect along the lines which had been so successfully followed in eastern Texas. The area cleaned in the Pecos Valley involved about 5,000 acres. In this work the War Department rendered valuable assistance by loaning camp equipment for the housing of labor. An intensive survey made of the entire Rio Grande and Pecos Valley districts revealed no other infested cotton.

Neither of these new regions, on account of their remoteness from other areas of cotton culture, present the same risk to the cotton industry of the South as did the outbreak in eastern Texas. In view of this fact and for the reason that alfalfa, the only other dependable crop in this district, could not be successfully established in the spring of 1919, a plan was devised permitting the planting of cotton in the Pecos district in 1919 under adequate safeguards and provision for the full control of the crop by the State cooperating with Federal authorities. The planters agreed that after 1919 this district should become a strictly noncotton zone for such period as may be determined to be necessary.

A noncotton zone was immediately established for the Great Bend district. This action was taken under State law on account of the known infestation on the Mexican side of the river.

Mr. McLAUGHLIN of Michigan. How far away is the Pecos district from Mexico?

Mr. MARLATT. About 200 miles. A bale or two of unginned cotton carried the insect to this region in the Pecos Valley.

Mr. McLAUGHLIN of Michigan. It was not discovered in the bales?

Mr. MARLATT. No; we had no knowledge of this movement. In fact, the cotton in question had been grown in Mexico and had been smuggled across the border. I am sorry to say that one of our citizens, with whom we have had much trouble since, is believed to have been a party to this action.

These new regions in western Texas have also been under close inspection throughout the season of 1919.

As already noted, the State of Texas issued an order prohibiting the growth of cotton in the Great Bend district altogether. This same individual who had been largely responsible for the introduction of the insect into the Pecos Valley, however, planted a field of 100 acres. The State has had the matter in hand all summer, and just at the time of harvest that cotton is being destroyed. Naturally there has been trouble and ugly feeling on account of this action.

As a result of the season's intensive inspections in the Pecos Valley district, but a single larva was found, and that late in the fall.

Mr. McLAUGHLIN of Michigan. Does that larva mean a bunch of them?

Mr. MARLATT. One boll with one worm in it is the entire finding in the Pecos Valley district.

This finding was after very intensive plant to plant inspection of many weeks, and therefore indicates that the insect had been here practically exterminated. The findings in the Trinity Bays district, as already noted, have been very scattering as compared with the 1917 crop. While it is very disappointing to find these bollworm reappearing where we had some reason to hope that the insects had been exterminated, the situation, on the other hand, has some favorable features. In the first place, the insect has been enormously reduced in eastern Texas and practically exterminated in western Texas. It indicates, further, that the men who are doing the work are alert and on the job, so that they were able to find the one worm in the Pecos section, where possibly that worm was the only one. The finding of that one worm was the result of over 200 days of inspection, one man working 200 days, or five men working 40 days,

whichever it might be. After that one worm was found, the district was given another 100 days inspection without finding another.

Mr. McLAUGHLIN of Michigan. Is that worm found in the boll?

Mr. MARLATT. It is in a boll.

The CHAIRMAN. Is the pink bollworm practically exterminated?

Mr. MARLATT. Unfortunately, it is not; but we have made a big start. We are now engaged in concluding the work of cleaning up these reinfested areas of 1919. It has involved the employment of hundreds of laborers to clean up these areas, including the burning of every stalk of cotton and the picking up of every boll. The State is now considering the prohibition of the growth of cotton for a period of at least two years in the Trinity Bay area. In the Pecos Valley cotton will be permitted to be grown again under restriction as to the crop produced. The finding of but a single larva and the isolation of the district warrants this action.

With regard to the recurrence of this insect in 1919 various explanations are given which seem reasonable. In the first place, a 100 per cent perfect clean up in one year is probably not possible. Furthermore, this larva unfortunately has the ability to live over one year without transforming to the butterfly or moth stage. Apparently this is a provision of nature which may have been necessary in India to maintain the existence of the insect; at any rate, the insect will occasionally live over in cotton seeds to the second year before it transforms. It is evident that one noncotton year is insufficient. On the whole, however, I think the work has been very encouraging and it promises ultimate extermination in Texas if we keep it up along the lines we have been following.

The CHAIRMAN. Does the worm subsist on anything but cotton?

Mr. MARLATT. It can be forced to feed on a number of other related plants, but we have never found it on such plants in Texas.

The CHAIRMAN. The plan, then, is to starve it?

Mr. MARLATT. To destroy by clean-up as many as possible and starve the balance.

Mr. HEFLIN. In the summer of 1917 I was invited by the State legislature of Texas to speak on this subject. I urged cooperation between the State of Texas and the Federal Government in establishing a noncotton zone along the Rio Grande River. This was for the purpose of starving out the pink bollworm moth before he could get across this noncotton zone from Mexico into Texas. The legislature of Texas adopted my suggestion and passed the act necessary to establish the noncotton zone.

Mr. MARLATT. The subject is one which has a lot of detail. For example, I have not discussed the cotton-free zones being maintained between Texas and Mexico. Naturally, these zones are on the American side.

Mr. HEFLIN. The idea, as I have said, in keeping cotton from being grown in that zone was to starve the pink bollworm moth before he got through the noncotton zone into Texas.

Mr. MARLATT. That is the idea.

Mr. HEFLIN. Texas is still maintaining her law on that subject.

Mr. MARLATT. The zone or zones do not extend the whole length of the border. The law provides for a zone where and when necessary. Whenever the pink bollworm reaches a point near the American border, Texas under her law can establish a zone in the neighboring

border counties. There are such zones in the neighborhood of Eagle Pass, and covering the Great Bend area.

Mr. HEFLIN. Texas passed this law when we asked her to establish these noncotton zones.

Mr. MARLATT. Yes.

Mr. HEFLIN. And we have saved the cotton producers and the Government of the United States millions of dollars.

Mr. JACOWAY. How fast does this worm travel in a year?

Mr. MARLATT. We are not giving it an opportunity to travel in this country. It may be widely distributed by seed, and even by baled cotton, but not very rapidly by flight of the moths. It is not a strong flyer, or, at least, keeps close to the ground. During heavy winds it is apt to keep to cover, and hence we believe that a zone one county wide will be sufficient to starve it out and prevent any insects from getting across.

Mr. JACOWAY. That would be about 60 miles.

Mr. MARLATT. Yes; 50 or 60 miles.

Mr. HUTCHINSON. Is this pink boll worm more destructive than the boll weevil?

Mr. MARLATT. It is believed to be more destructive than the boll weevil.

Mr. HUTCHINSON. What precautions do you use with the ordinary boll weevil?

Mr. MARLATT. I think that was discussed in the hearings under the Bureau of Entomology. The same work that has been done in the past is being continued and some new phases of the work are being developed, particularly in the line of poisoning.

Mr. HUTCHINSON. Are you spending the \$500,000?

Mr. MARLATT. The appropriation for the pink boll worm has been looked upon by us as an emergency appropriation, to be spent only as the needs warranted. In point of fact, we have turned back to the Treasury every year a considerable portion of the appropriations. It is spent for such emergencies as the new outbreaks in the Pecos Valley and in the Great Bend and the reinfestation in eastern Texas. It has covered the intensive inspection which it is necessary to maintain throughout Texas, and even in other States, the border quarantine service, and the research and other work in Mexico.

The CHAIRMAN. Kindly give the amount turned back into the Treasury.

Mr. MARLATT. The appropriation of \$250,000 for 1918 was largely expended in the very extensive clean-up of the scattering cotton fields over an area in eastern Texas as already noted larger than the State of Connecticut. Some \$17,000 of this appropriation, however, was unexpended. Of the appropriation of \$500,000 for 1919, upward of \$160,000 was turned back to the Treasury. The heavy expenditures of that year were caused by the intensive inspection of all the old infested areas, including the uprooting and destruction of all volunteer cotton and also the inspection of the region surrounding all the seed and spinning mills in Texas and elsewhere which had received cotton seed or cotton lint from Mexico. It also covered the extensive clean-up necessitated by the development of the insect in western Texas in the Great Bend and Pecos areas.

We expected this year (1919-20) to turn back a much larger portion of the appropriation, because we hoped that the insect would

not reappear in Texas. The work we have been compelled to do this fall and winter in clean-up in the areas I have described will, however, take up a great deal of the current appropriation. You will notice that we have reduced our estimate by \$200,000 for the next fiscal year. This estimate was prepared before the insect had been rediscovered in the old areas in eastern Texas. But with the efficient work of this winter the reduced appropriation may still be sufficient for the needs of next year.

Mr. McLAUGHLIN of Michigan. You speak of a very large number of men. Are they employed by you and paid out of this fund?

Mr. MARLATT. They are employed by the department and paid from this fund.

Mr. McLAUGHLIN of Michigan. What is the State doing except to establish zones and prohibit the growth of cotton?

Mr. MARLATT. The State has not appropriated large sums of money, but it has incurred a large obligation which it will have to meet. For example, the State is obligated to pay for all cotton destroyed in the course of the work, and I was advised yesterday that the value of the cotton destroyed this fall amounts to some \$50,000, which the State will have to meet. So the State is and will cooperate in quite a large way in the work. We have no fund to reimburse planters for crops destroyed.

Mr. HUTCHINSON. That is under the pink-bollworm appropriation?

Mr. MARLATT. Yes.

Mr. McLAUGHLIN of Michigan. It seems to me they ought to cooperate in the employment of this labor.

Mr. HEFLIN. They feel that they are doing enough to give up the production of cotton in that area.

The CHAIRMAN. The States cooperate in the eradication of citrus canker.

Mr. MARLATT. Yes; they cooperate in that.

Mr. McLAUGHLIN of Michigan. When the Federal Government furnishes all the expert scientific work it looks as though the manual labor, or part of it, at least, should be supplied by the State.

Mr. MARLATT. This is the problem: If that insect becomes established in Texas, it will very shortly be distributed throughout the whole cotton-growing area of the South. Its control, therefore, affects the whole United States, and this is, I think, a legitimate instance where the Federal Government is perhaps more interested than the State. But in this particular case I think the State, with the liability it is assuming for all crops destroyed, is fully meeting its share of the burden, and in addition to that, the entire department of agriculture of the State is cooperating extensively in direction, quarantine, and general overhead work.

Mr. McLAUGHLIN of Michigan. As against an appropriation of \$500,000, that \$50,000 is not a very large contribution.

Mr. MARLATT. But that is a contribution which may have to be made not only this year but every year when any destruction of the crops occurs.

Mr. HEFLIN. This is distinctly a Federal proposition. The whole cotton-producing area of the United States is involved. If the pink bollworm gets into Texas, it is in the cotton belt, and ultimately the Government would have to spend 10 to 40 times as much to destroy this pest as it now spends to keep it out; is not that true?

Mr. MARLATT. I think so.

Mr. HEFLIN. Take the gipsy moth and other pests like that. The States are not doing anything.

Mr. McLAUGHLIN of Michigan. The gipsy-moth States have contributed large sums of money. The State of Massachusetts contributed \$2,000,000.

Mr. MARLATT. I do not think they contribute anything now. They did originally contribute large sums of money—a million or more dollars.

Mr. McLAUGHLIN of Michigan. You are not using large sums now for the gipsy-moth work?

Mr. MARLATT. Some \$300,000 a year, but the entire work that is being done up there in the line of control is Federal work. I say that, leaving out, of course, the work of the individuals and the towns. The towns are doing some work and individuals are doing a great deal of the work; but, as far as I know, the State is doing practically nothing.

Mr. McLAUGHLIN of Michigan. Why has the State stopped? Is it because the gipsy moth is under control or eliminated, or what?

Mr. MARLATT. The Federal work is not so much in the interest of Massachusetts as it is in the interest of the whole country. The Federal aim is to prevent wide jumps of the insect; that is, a cleaning up of the roadside to prevent the carriage of the insects to other States in interstate traffic. The Federal funds are spent also in inspection and certification of products for interstate traffic and for the general enforcement of the moth quarantine. This work is of no special value to New England but is of value to the surrounding States and the United States, and in that regard the work must necessarily be looked upon as Federal work rather than State work. But the State work is represented by this local clean-up now left to towns and cities. Each town has its fund and its gipsy-moth commissioner, and individuals are spending a great deal of their own money in cleaning up their premises, but that, of course, is local work. This Federal work is really for the benefit of the whole country and to prevent wide jumps and interstate movement of the insects.

In the moth control in New England we are simply attempting to prevent spread. In the case of the pink bollworm work in Texas, we are attempting extermination, and we believe that we will ultimately be successful in this effort. The State of Texas has shown extraordinary earnestness in its cooperation and support of this work in the passage of necessary legislation, the promulgation and enforcement of necessary quarantines and restrictions on the growth of cotton, actual appropriations of money, and cooperation in the overhead and inspection work. The great majority of the planters in the quarantined and restricted districts have accepted hitherto the prohibition on the growth of cotton, their principal money crop, and have actively cooperated in the necessary clean-up work and in the maintenance of the restrictions.

Mr. McLAUGHLIN of Michigan. They have approved the expenditure of Federal money for that purpose?

Mr. MARLATT. And have provided also for the expenditure of the State money and the State moneys might have exceeded the Federal moneys very largely if this insect had been found two or three months earlier instead of after much of the crop had been harvested.

Mr. HEFLIN. And they complied with the Federal Government's request and set aside that noncotton zone to cooperate with the Federal Government to keep the pink bollworm out entirely.

Mr. MARLATT. That is quite true.

The CHAIRMAN. You are making progress?

Mr. MARLATT. Very great progress has been made, Mr. Chairman.

The CHAIRMAN. Has it come up to your expectations?

Mr. MARLATT. Rather more than my expectations originally. Our hopes were raised high when we found no worms in 1918; and again in this Pecos Valley district, which is a fairly large area and where the work of one year has so eliminated the insect that only a solitary worm was found this year.

The CHAIRMAN. You feel certain it will be exterminated?

Mr. MARLATT. Yes.

The CHAIRMAN. How long will it take?

Mr. MARLATT. I hope this year's work will finish it, but we want this emergency fund that we have asked for, for the destruction of volunteer cotton in the noncotton zones of 1920 and for the necessary inspection work, border work, etc. We need it also to take immediate hold of any outbreaks which may occur in the next year's crop.

The CHAIRMAN. Can the appropriation be cut off entirely?

Mr. MARLATT. Not at this time unless we loose all that we have gained. After we are sure of our success in extermination the inspection and clean-up work in Texas will be discontinued entirely, but we will have to maintain as continuing work our quarantine on the Texas border and also at the northern ports with respect to import cotton and a certain amount of inspection in Texas and other States and near the border in Mexico.

The CHAIRMAN. What is the expense?

Mr. MARLATT. This pink-bollworm work is divided into four heads. The first is the quarantine work, mentioned on page 282; about \$50,000 is appropriated for that work. It appears here as \$148,560, but \$48,560 is the regular appropriation for the quarantine work.

The CHAIRMAN. That is what you estimate for next year?

Mr. MARLATT. That is for the general administration of the border work. \$100,000 is for chemicals and labor, which goes back into the Treasury of the United States. Our annual or continuing needs are for the overhead and the maintaining of the quarantine stations at some six or eight ports on the Mexican border, and this is covered by the \$48,560. The \$100,000, as you are aware, was allowed by Congress last year for the purchase of chemicals for disinfection of cars and freight entering the United States from Mexico.

The CHAIRMAN. What is the total expenditure and what amount is likely to be turned into the Treasury?

Mr. MARLATT. The total expenditure will probably be fully the \$148,560 for the quarantine work on the Mexican border.

The CHAIRMAN. Of that \$100,000 is to be turned back into the Treasury?

Mr. MARLATT. The \$100,000 will be recovered in charges for fumigation of cars and freight and will go back to the Treasury.

The CHAIRMAN. The entire cost will be \$50,000?

Mr. MARLATT. Yes.

The CHAIRMAN. What are the fees?

Mr. MARLATT. This inspection has hitherto been done by private persons who made their own charges. We supervised the work.

The CHAIRMAN. Do you propose to charge for the service?

Mr. MARLATT. That work was poorly done and we asked authority to build fumigating houses into which cars could be run and disinfected as to both cars and contents. Those houses are now built and in operation.

The CHAIRMAN. How much did they cost?

Mr. MARLATT. They cost in the neighborhood of \$60,000 to \$75,000. That is the investment which the Government has made.

Mr. McLAUGHLIN of Michigan. Up to this time the individuals have done their own fumigating?

Mr. MARLATT. No. There was a company organized to do the work. At that time the cars were given merely interior fumigation. Each car was sealed up as well as could be; a fumigating pot was put into the car, and the charge was let off in the car. As a matter of fact, the cars have more or less cotton seed on the outside and we had to go over the cars and spray them and sweep them, and the results were unsatisfactory and imperfect. It became evident that for good results it was necessary to fumigate the cars as entireties. The local men who had been doing the work were not willing to make an investment for such fumigation.

Mr. McLAUGHLIN of Michigan. You now have the equipment and building and you make a charge for the work?

Mr. MARLATT. The Government does all the work. The charge is simply for the labor and chemicals. No charge is made for the plants and the overhead.

Mr. McLAUGHLIN of Michigan. What is the charge per car?

Mr. MARLATT. The charge per car now is \$5.

Mr. McLAUGHLIN of Michigan. What has it been in the past?

Mr. MARLATT. By the older and what should have been much cheaper process the charge was \$5 to \$7. We are charging less, but we are doing a great deal more work, fumigating the entire car instead of the interior and using twice as much acid and cyanide.

Mr. McLAUGHLIN of Michigan. Besides the fumigating which you do, is there not some inspection of the car that costs money and for which you have made a charge?

Mr. MARLATT. Our inspectors at these ports inspect all the cars and all freight, but no charge is made for that. The charge is limited to the actual cost of the chemicals and rough labor connected with the fumigating of the cars.

Mr. McLAUGHLIN of Michigan. Has there been talk about imposing a charge for the inspection of cars and freight? Have you suggested to the people interested that you ought to make a charge for the inspection of cars and freight and that you intended to do so later?

Mr. MARLATT. For this overhead charge? We are now charging the cost of chemicals.

Mr. McLAUGHLIN of Michigan. Not for fumigating, but for inspection and service?

Mr. MARLATT. We are making no charge for that and have made no such suggestion. The suggestion has come the other way, that the Government should take over the cost of fumigation.

Mr. HEFLIN. You stated that in this noncotton zone where the people of Texas have agreed to plant no cotton, conforming to the statute of Texas, 90 per cent of them have ceased to grow cotton in that area. Do the people who are growing potatoes and other things on which the pink bollworm does not feed and who sell those potatoes in Mexico have to pay for this fumigation of cars when they come back for another load of potatoes?

Mr. MARLATT. There is no charge for any traffic going into Mexico. All those charges occur in connection with Mexican products coming into the United States.

Mr. HEFLIN. Will a car going across this noncotton zone into Mexico come back for inspection and fumigation?

Mr. MARLATT. It possibly might not come back at all. Few American cars go into Mexico except certain lines of ore cars and oil cars. American freight cars are seldom sent into the interior of Mexico at this time.

Mr. HEFLIN. They would forget to send them back.

Mr. MARLATT. Yes. Practically all freight is transferred at the border. The freight that comes through direct is chiefly ore and oil. The American freight goes down to the border and is transferred to the Mexican car. That American car does not require disinfection if it is returned the same day. The Mexican car comes to the American border and transfers to the American car but such car and contents are disinfected before it leaves the border for the interior of the United States. Sometimes also the ore cars are disinfected, because when the ore is stored in an ordinary freight car that is foul with cotton seed, the ore may have more or less of cotton seed in it. As a rule, the ore is carried by cars especially designed and used for that purpose, and those cars go through under certification and are not disinfected.

Mr. HEFLIN. Is it the policy of the Government now to require importers of everything to pay those charges?

Mr. MARLATT. I understand that has been the general policy of the Government. I have not gone into it very deeply, but cattle and other live stock which are imported from abroad are usually held in quarantine at detention yards provided by the Government just as our disinfecting plants on the border are provided by the Government.

The CHAIRMAN. Are charges made for that?

Mr. MARLATT. The overhead charges are all paid by the Government, but the feeding of the cattle, their care, and their disinfection, if that is required, are all done at the cost of the importer.

The CHAIRMAN. Who feeds the cattle?

Mr. MARLATT. The importer feeds them.

Mr. HEFLIN. Are there any items of commerce now coming into the United States that you can recall where the Government pays these charges and the importer is exempted from paying the inspection fees?

Mr. MARLATT. I know of no such commodities. There may be, however. We import a great many rags and things of that sort, but I fancy that the cost of disinfecting that may be required by the Public Health Service or other authority is paid by the importer.

The CHAIRMAN. How about nursery stock?

Mr. MARLATT. The costs in relation to disinfection of nursery stock are paid by the importer, but in the case of all these the Government has furnished the overhead and the inspection and very often, as in the case of livestock, it furnishes the equipment.

The CHAIRMAN. Exactly as you do in this instance?

Mr. MARLATT. Following the same principle.

The CHAIRMAN. Has it been as high as \$8 a car?

Mr. MARLATT. I think in some cases it has been fully that before we took it over. In fact, I think one of the ore companies made provision for the disinfection of its own cars and has charged \$10 for other cars.

The CHAIRMAN. Your charge is \$5 a car?

Mr. MARLATT. We intend to keep the charge at actual cost. We started it at \$5, basing this on an estimate of the cost of the chemicals and labor. We have to be safe because we wish to turn back this \$100,000 to the Treasury. We started at \$5, but I am advised that we may be able to reduce it to \$4 or less. The present system has been in operation only a few months, but the volume of business and a lessened cost of the chemicals now makes it possible for us to reduce the charge to \$4 per car.

The CHAIRMAN. You are required to make a charge?

Mr. MARLATT. The act making the appropriation provides for such charge.

Mr. HEFLIN. Mr. Garner of Texas mentioned that matter to me and suggested that this charge ought not to be made against the importers. He stated to me that it was a burden on the commerce of the country that ought not to be placed on it. That was his contention.

Mr. McLAUGHLIN of Michigan. Mr. Marlatt says it is customary in other similar cases.

Mr. MARLATT. I am of the opinion, gentlemen, that if the Government would undertake to assume the cost of disinfection which is required by Federal quarantine, it would be an advantage to the commerce of the United States. For example, in relation to the disinfection of import cotton at New York and Boston, when the big private plants were built, some of them costing \$500,000, the operating companies fixed a charge of \$3 a bale, which they thought would reimburse them within a year or two at the most. They suggested at that time that they would probably be able ultimately to reduce that charge to \$1 a bale. Instead, this rate was maintained at \$3 a bale and, in fact, increased to \$4 in several instances. We have no control over these charges. They amount to a tax on the commerce of this country, a tax which is probably excessive. Under Government operation the charge would be the actual cost, possibly \$1 or \$1.50 per bale.

Mr. HUTCHINSON. That keeps the price of Southern cotton up, does it not, by charging these fees?

Mr. MARLATT. It amounts to a mild form of protection.

Mr. HUTCHINSON. Then it is really a protection to Texas, is it not?

Mr. MARLATT. I do not think any foreign cotton is excluded by it.

Mr. HEFLIN. Nothing but the long-staple cotton comes in, and we do not produce that.

Mr. McLAUGHLIN of Michigan. How is this pink bollworm getting along in Mexico?

Mr. MARLATT. In Mexico it remains, with minor exceptions, in this Laguna district. It is known to be at two other points in Mexico near the Texas border. In the Laguna district this year it caused a loss of about 20 per cent of the crop.

Mr. McLAUGHLIN of Michigan. Is it spreading?

Mr. MARLATT. It covers practically the whole Laguna district. This is a limited area, an old lake bed, surrounded by mountains. There was not only an opportunity there to restrict it, but to get rid of it for good, because this area is isolated by a hundred miles or more from other cotton. If Mexico had undertaken for that area what we have done in Texas it would probably have been possible to have freed North America from this pest.

Mr. McLAUGHLIN of Michigan. Does not one of these items provide for doing some work in Mexico?

Mr. MARLATT. The second and third items of this appropriation provide for work in Mexico—survey and clean-up work, and also research work. We asked for authority to do some clean-up work along the border in Mexico, and thus safeguard the United States. As a matter of fact, we have made no expenditures for such clean-up work.

The CHAIRMAN. You have not spent any for that purpose?

Mr. MARLATT. No; because we have not been able to secure cooperation on the part of the Mexican Government and the Mexican planters, and we therefore have not been able to get any of the benefits which we hoped to derive from that authority. For the reasons noted, this item has been reduced from \$25,000 to \$10,000. This second item covers not only clean-up work but also survey work along the border in Mexico to determine the needs of local restrictions on traffic and as a basis for the fixing of border cotton-free zones under the Texas law.

The CHAIRMAN. What are you going to do under the third item?

Mr. MARLATT. The third item authorizes investigation in Mexico or elsewhere of the pink bollworm as a basis for control measures. It is a research item. We want to know the habits of the insect and how to control it. For this purpose we have maintained a research station in the Laguna district for the past two seasons. Our men have taken some little risk from bandits, and so forth. I have some photographs showing bandits who were taken in time hanging from telegraph poles in front of the station. This research work is now practically completed. The men engaged in this work have been withdrawn from Mexico within the last few days. The expenditures under this item have not exceeded \$10,000 a year.

Mr. McLAUGHLIN of Michigan. There are many more bandits to be hanged down there. You had better keep them there.

Mr. MARLATT. We would like to retain for any necessary additional research work the amount of \$5,000, and the estimate for this item is now put at that sum. We may have need for it in Texas or in Porto Rico or Hawaii or, perhaps, in Mexico.

The CHAIRMAN. How about the \$225,000?

Mr. MARLATT. The \$225,000 item is a reduction from the \$400,000 item of last year and relates to the surveys and clean-up work in Texas and other States which I have already described in some detail. We look upon this item in part as an insurance fund for the

next fiscal year. We hope we will not have to spend all of it, but, if the need arises, the money should be available, because it is too late to come to Congress for it after the emergency develops. As elsewhere explained, a considerable amount of inspection and clean-up of volunteer cotton will have to be maintained.

The CHAIRMAN. That finishes up with the bollworm.

Mr. MARLATT. Yes; Mr. Chairman.

The CHAIRMAN. We are very grateful to you, Mr. Marlatt.

AFTERNOON SESSION.

THURSDAY, DECEMBER 18, 1919.

PURCHASE OF LAND UNDER THE WEEKS FORESTRY LAW.

STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF OF THE FOREST SERVICE, DEPARTMENT OF AGRICULTURE.

The CHAIRMAN. What is next, Col. Graves?

Mr. McLAUGHLIN of Michigan. Just a word about the purchase of land under the Weeks Act. You do not ask for any appropriation for that purpose this year, do you?

Mr. GRAVES. Last year that was a matter which was not presented by the Secretary in his estimates, but the recommendation was made by the National Forest Reservation Commission in its annual report to Congress.

Mr. McLAUGHLIN of Michigan. And the last bill carried \$600,000?

Mr. GRAVES. Yes, sir.

Mr. McLAUGHLIN of Michigan. How much of that will be spent before the end of the fiscal year 1920?

Mr. GRAVES. It will practically all be spent. Nearly half of that \$600,000 has already had liabilities set up against it.

Mr. McLAUGHLIN of Michigan. So that at the beginning of the fiscal year, on the 1st of next July, there will be no money in the fund for the purchase of land?

Mr. GRAVES. Unless an appropriation is made this year. The National Forest Reservation Commission has made a report to Congress, in which it recommends a general policy of extension of the fund in the amount of \$10,000,000, making \$2,000,000 available each year.

Mr. McLAUGHLIN of Michigan. One of the reasons urged for the \$600,000 appropriation, which was the amount provided for that purpose, for the current fiscal year, was that the commission had looked over considerable areas of land and had entered into or had options on it, and had contracts in process of execution, and they needed money for the purpose of making good on what they had undertaken. What is the situation now? Have they gone on making contracts?

Mr. GRAVES. In order properly to carry out a program of building up holdings such as these in the different purchase areas where land is being bought under the Weeks law, there is no question but that we ought to have continuity. In the first place, we have an organization which has been trained in the work of appraisal and negotiation for the purchases, which, if the work were interrupted, would

be broken up, and it would take some time to train a new organization.

In the second place, there are lands which have been examined and which are in various stages of negotiation. All of that work would be practically lost.

Mr. McLAUGHLIN of Michigan. Can not all those be taken care of during this fiscal year when that \$600,000 will be available?

Mr. GRAVES. Hardly. The \$600,000 is for the current year, sir.

Mr. McLAUGHLIN of Michigan. Will not all those options be taken care of—those tracts that you have looked over?

Mr. GRAVES. No; because a good many of them are large tracts and in all stages of negotiations. It often takes two or three years to complete a purchase.

RATES FOR HIRE OF MOTOR-PROPELLED VEHICLES.

STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF OF THE FOREST SERVICE, DEPARTMENT OF AGRICULTURE.

The CHAIRMAN. I believe there are some other items in which you are interested, Col. Graves?

Mr. GRAVES. Yes, sir; the item for motor-propelled vehicles, page 285, item 12, providing that "whenever during the fiscal year ending June 30, 1921, the Secretary of Agriculture shall find that the expenses of travel can be reduced thereby, he may, in lieu of actual traveling expenses, under such regulations as he may prescribe, authorize the payment of not to exceed 3 cents per mile for a motor cycle or 7 cents per mile for an automobile, used for necessary travel on official business."

Last year we requested an increase in the authority for reimbursing forest officers using their own automobiles for official work on the basis of mileage.

The CHAIRMAN. You want it continued for another year?

Mr. GRAVES. We would like to have it continued for another year, and we would like also to have the maximum rate for automobiles increased to 10 cents and the rate for motor cycles raised to 4 cents.

The CHAIRMAN. You mean the amount per mile?

Mr. GRAVES. Yes, sir.

Mr. ANDERSON. What has been the result of that policy? Have we saved any money by it?

Mr. GRAVES. Without any question we have. I will say, in the first place, that my own belief is that we should not embark on a policy of furnishing Government automobiles to forest officers. I believe it will be desirable in the long run to have trucks on the forests where the hazard of fire is large, for transporting materials and men to fires and for similar work; but, so far as the transportation of the officer himself is concerned, I feel about the automobile as I do about the horse. We don't furnish horses to the forest officers for their own travel, but we do furnish forage. They furnish their own horses, and many forest officers have purchased automobiles, which they use for their official work. I believe that encouraging them to buy cars results in a great deal of efficiency. A forest officer located where there

are roads, as in many of our California forests, is able to cover a great deal larger territory in a given length of time where he uses an automobile, and his inspection is a great deal more efficient than where he undertakes to ride a horse over the long distances traversable by roads in the mountains.

The present rates are not large enough to cover the actual cost of operation of the car, and the men have to go into their own pockets for the cost of official travel. I have some figures here showing the experience during the past summer with a number of automobiles. For example, in the case of 18 Fords the average cost of operation was 7.7 cents per mile. That is the lowest. That, of course, does not include such items as depreciation, taxes, etc., but is only the operating cost.

There were six Dodge cars, which had an average cost of 8.6 cents per mile; four Buicks, 9 cents; two Overlands, 9.6 cents; two Reos, 10 cents; four Studebakers, 10.3 cents; one Paige, 8 cents.

Mr. ANDERSON. Does that include repairs?

Mr. GRAVES. That includes the ordinary repairs, tires, gas, oil, etc. It does not include depreciation.

Mr. ANDERSON. Does it include interest?

Mr. GRAVES. It does not include interest, taxes, depreciation, or licenses.

I should like to be able to reimburse these men at least for what it actually costs them to run their cars while on official work. If a man is going to get a car and use it for official business, knocking around those mountains, I feel that we should at least pay the cost of running the car.

Mr. McLAUGHLIN of Michigan. Have you data there showing the miles traveled?

Mr. GRAVES. I think the original data from which I took this show the miles traveled.

The CHAIRMAN. Will you put the table in the record?

Mr. GRAVES. I will be very glad to put that in the record, with the addition of the miles that they went.

I feel that this allowance should be at least 10 cents.

Mr. McLAUGHLIN of Michigan. Have you any information that would enable you to make a comparative statement of the miles traveled when they are using automobiles, as against the miles traveled when they were using horses?

Mr. GRAVES. I don't know that I have got any accurate figures on that. It would have to be an estimate from my knowledge of the activities of the rangers. I haven't any exact tabulation at this time.

Mr. ANDERSON. What was the average mileage of these automobiles during the year?

Mr. GRAVES. I would have to work out the averages from this table.

The CHAIRMAN. Will you work it out and include that in your statement?

Mr. GRAVES. Yes, sir.

(The statement referred to follows):

Statement of operating cost of personally owned automobiles used on national forest work during spring and summer of 1919, exclusive of depreciation, license, taxes, insurance, and interest.

Make of car.	Num-ber.	Miles.	Cost.	Average cost per mile.					
				Total.	Gas.	Oil.	Tires.	Repairs.	Miscel-laneous.
Ford.....	18	33,053	\$2,572.36	\$0.0778	\$0.0229	\$0.0051	\$0.0267	\$0.0227	\$0.0004
Dodge.....	6	16,499	1,433.55	.0869	.0179	.0037	.0367	.0244	.0042
Buick.....	4	23,523	2,113.91	.0895	.0206	.0027	.0355	.0238	.0069
Overland.....	2	3,624	540.79	.0962	.0232	.0046	.0468	.0216
Reo.....	2	8,754	878.62	.1004	.0296	.0046	.0393	.0252	.0017
Studebaker.....	4	6,273	647.62	.1032	.0284	.0082	.0440	.0223	.0003

If to the above mileage costs were added the rate per mile for the items of depreciation, license, taxes, insurance, and interest (all of which are legitimate items in the maintenance of an automobile), the cost per mile would be increased by at least 2 cents. The following is a complete statement of all costs as accurately kept by Assistant District Forester Don. P. Johnston from the date of purchase of a Buick automobile, March 11, 1916, to date of sale, June 30, 1919 (3½ years), and it is representative of the loss to many forest officers now using their cars on official business under the current maximum of 7 cents per mile:

Cost of automobile f. o. b. Santa Fe, N. Mex., \$1,085.

Actual operating cost:

License, insurance, taxes, and storage.....	\$289.70
Depreciation.....	385.00
Interest, 6 per cent on investment, 3½ years.....	213.55
Tires, tubes, and vulcanizing.....	657.45
Gasoline.....	379.50
Repairs.....	497.75
Oil and grease.....	42.75
Other supplies (accessories, etc.).....	161.70

Total expense..... 2,627.40

Car sold June 30, 1919, for \$700.

Total mileage, 19,036 miles.

Cost per mile, \$0.138.

So-called "operating" cost:

Miles per gallon gasoline, 17.57; mileage cost.....	\$0.0200
Mileage cost for oil.....	.0022
Mileage cost for tires.....	.0345
Mileage cost for repairs.....	.0267
Mileage cost for other supplies.....	.0084

Operating cost per mile (3½ years)..... 0.0918

(First year, \$0.0792; second year, \$0.0846.)

Personal use, 9,942 miles:

Mileage on Forest Service work, 9,094 miles, at \$0.07 ¹	\$636.58
Actual cost.....	1,254.97

Loss on Forest Service work..... 618.39

Personal travel at \$0.138..... 1,371.99

Personal expense (including loss on Forest Service work)..... 1,990.38

Resultant cost for the personal use, \$0.20 per mile.

Other forest officers carried 5,429 miles.

At \$0.20 per mile (commercial rate), \$1,085.80 saving to general expense travel allotments.

¹The new rate of 7 cents is used instead of the 6-cent rate at which reimbursement was actually made, which means that a loss of \$689.32 was actually met for travel on Forest Service work.

MR. GRAVES. During the fiscal year 1919 the Forest Service owned and operated three automobiles—all Fords—and the cost of operation and repairs (without depreciation) was 7.7 cents per mile. The Reclamation Service, on the Minidoka project, Idaho, uses 24 Government-owned Fords, and accurate account has been kept for the cost of operation. It was found that for a total of 342,488 miles, the cost, including depreciation, was 9.9 cents per mile, the travel being over much more level roads than are to be found on the average national forest. Also the Reclamation Service operated its own garage, bought gasoline, oil, etc., at wholesale prices, and had no taxes or license expenses to meet.

The requested increase in maximum rate to 10 cents is justified when the conditions of mountain travel are considered—steep grades, rough roads, abnormal tire wear, and often excessive cost of gasoline (45 cents and 50 cents in some instances) and other supplies, all of which increases the operating cost enormously in comparison with travel in the East and Middle West and the valley travel of the West. With the increase in the maximum, many car owners would still be given a rate below it, as before a rate is authorized in any specific case full consideration is given to all factors entering into cost of operation in each case, as type of car, conditions of roads, cost of gasoline and other operating supplies in the locality, etc., as, for instance, with the present 7-cent maximum, rates were authorized at rates below this figure in the case of 2 Fords at 5 cents, 4 Fords at 5½ cents, 56 Fords at 6 cents, 18 Fords at 6½ cents, 1 Buick at 6 cents, 3 Dodges at 6½ cents, 1 Maxwell at 6½ cents, 1 Elgin at 6½ cents, 1 Chevrolet at 6½ cents, and 1 Saxon at 6½ cents. But where conditions are such that the cost of operation does exceed 7 cents, it is desired to reimburse the owners the full amount of operation so that the cars may be used on official business without a resultant loss in operating expenses to the forest officer by whom owned. An increase in the maximum to 10 cents for automobiles and 4 cents for motor cycles is requested.

MR. HARRISON. Mr. Chairman, perhaps I may say for the record that the suggestion made by Col. Graves meets with the Secretary's approval.

THE CHAIRMAN. This would apply to other bureaus, too?

MR. HARRISON. It would apply to the whole department.

THE CHAIRMAN. The amount allowed would depend on the condition of the roads and the locality?

MR. HARRISON. Yes. You will recall that last year we asked that you give the Secretary discretion to fix the rates so that they might be adjusted according to the travel to be performed, the section of the country to be covered, and the kind of machine used. The committee did not approve the suggestion, but did allow a slight increase in the rates. The increase made last year, however, did not meet the situation. Even if you make the maximum 10 cents for the automobiles and 4 cents for the motorcycles; of course we will not fix those rates for all machines. The amount allowed in any particular case will depend upon the travel to be performed and the kind of machine that is used.

MORNING SESSION.

THURSDAY, JANUARY 8, 1920.

INVESTIGATION AND PREVENTION OF PLANT-DUST EXPLOSIONS AND FIRES.

STATEMENT OF DR. CARL L. ALSBERG, CHIEF OF THE BUREAU OF CHEMISTRY, DEPARTMENT OF AGRICULTURE.

The CHAIRMAN. What is the next item?

Mr. HARRISON. There is an item on page 285, No. 13, Mr. Chairman, "for investigation and prevention of plant-dust explosions and fires," which we would like to have Dr. Alsberg discuss.

Dr. ALSBERG. That item has been put in separately, because it is a cooperative item in which three bureaus take part. That item is "to enable the Secretary of Agriculture to cooperate with State officials, farmers, operators of cotton gins, grain mills, and elevators, and other warehouses, manufacturers, and operators of farm machinery in investigating causes of, and in developing and putting into general practice methods for protection against grain dust, smut dust, or other plant-dust explosions, and resulting fires, including fires in cotton gins and oil mills; to devise and demonstrate methods for destroying or preventing the widely dissemination of smut spores; and to study the problem of cleaning and handling grain in thrashing machines, grain mills, and elevators."

The amount estimated is \$100,000. This work, as I have said, originated in the Bureau of Mines a long time ago. There was a big explosion in a mill up in Buffalo which killed a large number of people. The Bureau of Mines sent a man up there, because they thought he might learn something about coal-dust explosions in studying the cause of the explosion in this mill. The millers asked the Bureau of Mines to carry on some investigational work. The Bureau of Mines said that it did not have authority in its organic act to do any of that kind of work. They said that they were limited to minerals ultimately, and they acted as an intermediary. So that a cooperative project was undertaken with the Bureau of Mines, the Bureau of Chemistry, and the millers, looking to the study of explosions and the causes that produced them in mills and elevators.

While we were beginning those investigations we received complaints from the people up in the Northwest that the I. W. W's were placing dynamite in wheat shocks up in the Palouse country. I at once recognized the probability that these explosions were due to dust.

We sent some men up there, and proved that the criminal use of explosives had nothing to do with the matter. The atmosphere was very dry, and the wheat straw in going over the cylinder in the machine—developed electricity from the friction in the machine. You could get 40,000 volts, but, of course, there was but a small amount of it. It would develop a spark on the inside of the thrasher, and as the inside of the thrasher was full of dust suspended in air, the dust would explode just like gasoline or any other combustible material when it is mixed with air in the right proportion. Three hundred thrashers were blown up, and the total loss was about \$1,000,000.

So temporarily we shelved this millwork and sent our people up there to teach the thrashers how to ground their machines. Also, we constructed a perfectly simple little automatic extinguisher. We got the thrashing-machine manufacturers to put these devices on their machines, and in that country during the last year there were practically no explosions. I do not have the figures here with me. At any rate, this year there were practically no explosions in that territory.

On the other hand, we have had reports of explosions in other parts of the country, and it seems advisable not to carry on new investigational work but to carry on the educational work in those sections.

Then we have work in devising methods for preventing explosions in grain mills and elevators. That work, I think, has been very successful. A large number of men have been at work on it. During the war the Secretary set aside from the emergency fund a considerable sum of money for this work. I do not recall just how much it was, but a considerable sum for carrying out measures to prevent fires and explosions in grain elevators and flour mills.

We had a large staff of men who went into the individual mills and to the individual grain elevators to demonstrate the explosiveness of dust. They went to most of the elevators and they went to most of the mills. They went to the head miller, or the superintendent, and showed him where he was taking chances. They got the employees to sign pledge cards and had those pledge cards acknowledged over the signature of Mr. Hoover and the Secretary, Mr. Houston, by which the employees pledged themselves not to do certain things.

As a result, the loss due to fire and explosions in the mills and elevators during that period of the demonstrations was reduced to 35 or 40 per cent of what it had been ordinarily.

The work was discontinued on the 1st of July last because the emergency fund was no longer available, and the force engaged in that work was laid off.

The Grain Corporation, with which we had been cooperating, learned that we were about to discontinue this work, or that the work had been discontinued. They felt that this was the cheapest sort of insurance that they could obtain, and, therefore, asked the Secretary of Agriculture whether he would have any objection to their taking on their rolls the men who had been laid off by the Bureau of Chemistry, and the Bureau of Markets. Of course, there was no objection and those of the force that had been laid off, that had not in the meantime found other jobs for themselves, were taken over on the rolls of the Grain Corporation and have been working on this grain-dust problem—on this explosive prevention and fire prevention work for the Grain Corporation.

Now, up to the 20th of May last, whether it was due to this campaign, or whether it was due to good luck, we had no explosions; there wasn't a considerable fire or explosion in the United States in that kind of a plant.

On the 20th of May, however, there was an explosion in a mill of the Smith-Perry Corporation, mill and elevator, in which three lives were lost and four men injured, with a property damage of \$150,000.

On the 22d of May there was an explosion at Cedar Rapids, Iowa, but not in a mill, and not in an elevator, and not in the kind of plant with which we have been cooperating. It was in the plant of the Douglas Starch Co., in which 43 men were killed and 30 men were injured. There was a damage of over three million dollars of property which was said to have been destroyed. This, of course, was a starch explosion. We had had a previous explosion in the Corn Products plant, at Edgewater, which took place in 1914.

The CHAIRMAN. How did that occur?

Dr. ALSBERG. I can not tell you, Mr. Haugen, but I can send you the report of our engineer who went there and made an investigation.

The CHAIRMAN. You are of the opinion that it could have been prevented?

Dr. ALSBERG. Yes, sir.

Mr. HUTCHINSON. How?

Dr. ALSBERG. I can't tell you that, in this particular case. I do not recall the details of the explosion. If you are interested, I have the report, and I will send it to you.

The CHAIRMAN. Without objection you may incorporate it in the record as a part of your statement.

Dr. ALSBERG. I will do that.

(The statement referred to follows:)

RESULTS OF INVESTIGATION OF EXPLOSION AT DOUGLAS STARCH WORKS, CEDAR RAPIDS, MAY 22, 1919.

This explosion resulted in the loss of 43 lives and complete property damage. The engineers conducting the investigation—owing to the lack of testimony from survivors—were compelled to base their conclusions on the evidence available. While the cause of the fire preceding the explosion could not be positively established because of the completeness of the destruction, the investigation showed that the fire originated in the dry-starch section of the plant. Two possible causes stand out prominently:

1. A rupture, 8 by 3 inches, in the front of the screen of the Andre starch-grinding machine, broken outward, indicated that foreign metallic substances had been dropped into the grinder and driven through the screen by the centrifugal force. Sparks produced by the foreign material passing through the grinding machinery ignited the dust within the machine and spread through the conveyor leading from this grinding machine, propagating through the entire conveyor system, with the result that a disastrous explosion followed.

2. The possibility of a chokeup within the dry-starch elevator. The investigation showed that this elevator did not have sufficient capacity to handle all material that could be discharged by the conveyor which led into it, even when the conveyor was working to full capacity. Chokeups under similar conditions, however, had produced similar fires within this elevator.

A number of other possible causes were advanced, but the results of the investigation indicate that one of the two causes given might have been responsible.

Dr. ALSBERG. The explosion which took place at Edgewater in the Corn Products plant was due to the fact that their material—I think it is starch—was going into one of the machines with which you are familiar, a reel or sieve of wire gauze. This was a cylindrical sieve of wire netting. The friction of the starch impinging on the metal generated enough electricity to cause the explosion, probably. That has been about four or five years ago, and I do not remember the details.

The CHAIRMAN. What is the remedy?

Dr. ALSBERG. The remedy would be merely to construct the reel so that it would be grounded.

Mr. HUTCHINSON. Doctor, isn't this work absolutely a duplication?

Dr. ALSBERG. Of what?

Mr. HUTCHINSON. All the insurance companies have men who go around and examine the mills and investigate the explosions generally. They examine these mills and elevators regularly and determine with regard to something like that.

Dr. ALSBERG. Yes; but the insurance companies would not believe anything about static electricity or anything about these causes of explosions. We are really teaching them something about their business. They knew quite a little about it, but they did not know all about dust explosions.

Mr. HUTCHINSON. They have the best men in the country seeing to this work, and this is absolutely a duplication.

Dr. ALSBERG. The insurance companies did not know about this.

Mr. HUTCHINSON. They do know about this work.

Dr. ALSBERG. This is one of the things that they did not know about.

Mr. HUTCHINSON. The employees of the department going around over the country and visiting these different mills do not do any good. The ones most interested in this are the insurance companies, and they look after this matter at regular intervals, several times a year.

Mr. HEFLIN. The insurance company people did not prevent the explosions, did they?

Dr. ALSBERG. No; and during the year that these demonstrations were being conducted the explosions and fires were reduced to from 35 to 40 per cent of what they had been before.

Mr. ANDERSON. You know all about the methods that will prevent these explosions and fires?

Dr. ALSBERG. We do not know all about all of them, because we haven't studied anything but the mills. We have not studied these starch plants, and we think that the same degree of protection ought to be extended to them.

Mr. ANDERSON. Just what do you propose to do with this \$100,000?

Dr. ALSBERG. With reference to the mill and elevator explosions we want to investigate the possibility of introducing a gas like flue gas, which has little oxygen in it, into the machinery so that no explosion can occur in them. We want to improve the method of grounding machinery, which isn't entirely simple when the machinery is moving. We want to study the efficiency of different types of asperating systems, like different kinds of vacuum cleaning systems, because some of them are dangerous and do more harm than good; we want to develop effective methods to prevent machinery getting choked up, elevators getting choked up, either by having an automatic device to prevent it, or else by some signaling system, because one of the common causes of these fires is that the elevator legs become choked up. The pulleys continue revolving in these belt conveyors, when there is a choke while the belt is hung and does not move. Now, frequently the pulley rubbing against the conveyor belting causes the belt to catch fire. The conveyor belt burns through. The belt with its buckets drops down to the bottom

of the shaft, stirring up a cloud of dust. This cloud of dust is ignited by the fire of the belt, and the result is that the explosion runs through the building, and the whole building may be blown up.

We also want to study the methods of improving cleaning machinery. We want to study the prevention of fires in attrition mills, because a great many times fire originates in such mills on account of foreign material getting into the mill. We want to study the efficiency of dust-collecting systems. We want to study the methods for protecting the electrical equipment in such plants. We want to investigate methods of cleaning grain without danger of fire. We want to develop and construct such machines, and we want to cooperate with the Bureau of Mines in studying the inflammability of different types of dust, because they are interested in this kind of work. We also want to develop methods of determining how much dust accumulates.

Now, that is the investigational work that we want to do for the mills and elevators.

On the thrasher work we want to do educational work in parts of the country where we have not been before. We want to determine the value of installing fans for cleaning grain on the thrashing machines: we want to study the methods of collecting the smut which comes out of the thrashing machines and of destroying it so it will not be scattered over the fields, and in that way contribute to the further spread of the smut in the territory. That is what we want to do on the thrasher part of the work.

The CHAIRMAN. You want to prevent the spread of the smut?

Dr. ALSBERG. We want to investigate with regard to the spread.

The CHAIRMAN. For the next year's crop?

Dr. ALSBERG. That is only important where you have summer fallow, as they have up in Washington, Idaho, and Oregon.

The third line of work that we have is only just beginning. That hasn't been mentioned as yet. It is the work in connection with cotton-gin fires. Perhaps the best way that I could get it before you is to read two or three pages of this statement.

The results which have been obtained through the investigation of cotton gins by us in Texas have been sufficiently encouraging to make it seem advisable to continue with this work until the cause of fires in cotton gins has been determined. The investigations have been conducted in the northwestern part of the State of Texas and in western Oklahoma. There is hardly a cotton gin in that section that goes through the season without some sort of a fire, if the season is a dry one. There are certain sections of the country where practically every gin will have experience with fires. They may have from two to four fires a day.

Mr. HEFLIN. What are the causes of these fires?

Dr. ALSBERG. We think that the main cause of these fires in cotton gins is the generation of electricity by the cotton itself in going through the conveyors and rubbing up against their walls. Now, these fires cause a great deal of damage in the dryer sections of the Southwest, especially when the season is a dry one. They have to have a man at the point where the fire is likely to happen, to watch out for it. He has to extinguish the fire, and every time they have a fire they had to shut down the gin.

Some of the cotton gets wet; some of it gets scorched; some of it gets burned up, so that a certain amount of cotton is lost; also they lose certain ginning time.

Mr. JACOWAY. Is it not a fact, with respect to these cotton gins, that it is almost impossible to get insurance?

Dr. ALSBURG. It is; and the only insurance they can get in some sections of the country is by mutual companies.

We have been investigating some of the causes of these fires. The insurance companies knew nothing about the causes—knew nothing of the origin of these fires—and we had the hardest time in the world in convincing some of the underwriters that we knew some of the causes of these fires that they had overlooked. We can be of assistance in saving in every dry year property running into the thousands and millions with a relatively small expenditure.

We did, during the last season, ground a number of gins in certain sections. They were equipped with grounding devices in Oklahoma and in northwestern Texas. As a matter of fact, we grounded 30 gins; and, so far as we know, we had only one fire in these gins, and the cause of that fire is unknown. The gins around in the neighborhood were having fires continuously.

The CHAIRMAN. That is largely educational work?

Dr. ALSBERG. We don't know, Mr. Chairman; we don't know the cause of all those fires; we need to carry on investigations.

The CHAIRMAN. It is largely educational?

Dr. ALSBERG. It is largely educational; yes, sir.

If any of you would like to see how a dust explosion is produced, if you will step out in the hall we will be glad to demonstrate it to you.

The CHAIRMAN. Thrashing-machine fires occur while the thrashing machine is running?

Dr. ALSBERG. Yes, sir.

The CHAIRMAN. Do they occur occasionally when the machine is standing idle?

Dr. ALSBERG. There may, of course, be fires when the machine is not in operation, but I have never heard of an explosion.

The CHAIRMAN. On the 4th of July last I passed a place near the District of Columbia at about 10 o'clock in the morning. The machine was standing idle, and the machine caught fire. What would you say was the cause of that fire?

Dr. ALSBERG. I would not know what that might have been. I could not say about that. It might have been caused by some oily waste or something of that kind.

Mr. JACOWAY. Doctor, are any fires occurring in cotton gins due to the fact that they gin excessively wet cotton?

Dr. ALSBERG. I haven't any information on that; I do not know. I should think that that would be a factor that would prevent the fires, because usually when the humidity is high there will be a drop in the number of fires; so I should think that that would work just the opposite.

Mr. Chairman, if the committee would like to see how these dust explosions occur, if they will step out in the hall, we will be glad to show them.

The CHAIRMAN. We will be glad to do so. Are you through with your statement?

Dr. ALSBERG. I am through.

The CHAIRMAN. Thank you, Doctor.

(A demonstration was given as to the inflammability of flour dust and mill dust.)

(See also statement of Dr. William A. Taylor relative to this item under the Bureau of Plant Industry section of these hearings.)

AFTERNOON SESSION.

FRIDAY, DECEMBER 19, 1919.

PER DIEM ALLOWANCE FOR TRAVELING EXPENSES.

STATEMENT OF DR. L. O. HOWARD, CHIEF OF THE BUREAU OF ENTOMOLOGY, DEPARTMENT OF AGRICULTURE.

Dr. HOWARD. Mr. Harrison has asked me to say a word in regard to a request of the Secretary for an increase in the subsistence and traveling expenses of the people for the whole department. You will find this set out in item 14, page 286, and item 15, page 287. This is a matter which intimately concerns every man in the department who travels.

Some time ago a letter was drawn up and signed by all of the bureau chiefs in regard to it and submitted to the Secretary, and I understand that the Secretary took the matter up at a Cabinet meeting and found that other department heads were making similar requests on Congress, and he himself has forwarded a request that the travel and subsistence allowances be increased from \$4 to \$6 a day and that the allowance for actual expenses be increased from \$5 to \$7 a day. I have traveled a great deal for the Government. I find that, although I only get \$4 back, it costs me from \$6 to \$7 a day to travel under present conditions. Some of my men, who are relying solely on their salaries, have great difficulty in getting along. Take my own case, for instance. You were good enough last year to raise my salary \$500 a year. I thank you. I appreciate it greatly. But if I travel much, as I should, that \$500 does not come to me.

The CHAIRMAN. It does not go to you?

Dr. HOWARD. Yes; it goes to the hotel men and not to me. I would like to add as a part of my statement to the Secretary a letter which was submitted to all the bureau chiefs and signed by them, in favor of an increase in the travel allowance.

(The letter referred to follows:)

WASHINGTON, D. C., September 4, 1919.

Memorandum for the Secretary.

DEAR MR. SECRETARY: A condition has developed in connection with the official travel which department employees are required to do in the prosecution of their work which recently has assumed serious proportions because of the statutory limitations on the amounts per day that can be reimbursed for such expenditure. At present the maximum reimbursement per day for subsistence expenses actually incurred is \$5, while the maximum per diem permitted in lieu of subsistence is \$4. While these amounts were fairly adequate when they were fixed by Congress in 1914, the rapidly increasing cost of subsistence during the past two or three years has left them quite inadequate, especially for subsistence in larger cities.

In our administration of the work of our respective bureaus we have been deeply impressed during the last few months with the injustice which these inadequate reimbursements of personal funds expended in the performance of official work by those of our men who are required to travel, and feel that the nonreimbursement of expenditure above these rates, which many of the most useful men of the department service experience, constitutes an injustice to them when they are engaged in field service. Not infrequently it occurs that the minimum cost of lodging and subsistence is from \$7.50 to \$9 or \$10 per day, where work in the larger cities is involved, so that the matter is of distinct financial importance to the individuals affected. It obviously is a source of dissatisfaction on the part of workers, which increases the difficulty of retaining qualified men in the service.

We realize that the existing statutory limitation is applicable to all employees of the Government and that it probably would not be practicable to secure legislation increasing the maximum rates for the Department of Agriculture alone. It has occurred to us, however, that in as much as other branches of the Government service are probably experiencing similar difficulty, that it might be possible through concerted action of the heads of the several departments to so present the question to Congress that the necessity for a reasonable increase would be recognized and authorized.

The necessity for increase over the existing maximum rates is not so much with respect to the larger portion of the department's travel expenditure, which, in the main, is in the smaller towns and farming districts, but in those types of work which necessitates considerable travel expense in the larger cities. If the rate could be left discretionary with the heads of departments, up to some carefully determined maximum, it is believed that economy of expenditure would in no way be jeopardized and that the efficiency of work through the retention of qualified experienced men in the service would be safeguarded.

Yours, very truly,

C. F. Marvin, Wm. A. Taylor, J. R. Mohler, L. O. Howard, Milton Whitney, C. L. Alsberg, H. S. Graves, W. C. Henderson, A. C. True, Thos. H. MacDonald, George Livingston, J. K. Haywood, C. L. Marlatt, H. C. Taylor, Leon M. Estabrook.

Dr. HOWARD. I have in mind many men who have traveled for the Department who have had the same experience that I have had. I remember one man who told me that he had to pay \$225 out of his own pocket to make up the excess over and above what he got from the Government on a single trip to the Pacific coast; and his expenses were supposed to be paid by the Government.

The CHAIRMAN. There is no question but that expenses have greatly increased.

Dr. HOWARD. Yes. To a man who is getting a salary of only \$1,800 or \$2,000 a year, and who is subject to being sent to travel on investigations it becomes a serious matter.

Mr. McLAUGHLIN of Michigan. Please explain what "subsistence" and "per diem expenses" mean in these paragraphs.

Dr. HOWARD. We are allowed a per diem rate, if we keep an itemized account of every single item of expense, of \$5 a day. If we do not wish to keep all those accounts we are allowed a flat rate of \$4 a day. That is the present regulation.

The CHAIRMAN. If this was increased, would it apply to all or would it be allowed only in instances where necessary?

Dr. HOWARD. It would be allowed only where it was necessary. Of course, the Secretary or the bureau chief, in issuing the letter of authorization to a man to travel, if he is being sent into a territory where there are only small hotels and living is cheap would restrict him. This new provision allows the rate, where approved by the bureau chief or the Secretary of Agriculture, to go as high as \$6 per diem.

The CHAIRMAN. And that amount would be allowed only where it was needed?

Dr. HOWARD. Only where it was needed.

Mr. HARRISON. The per diem rates now allowed run all the way from \$1.20 a day to \$4.

Mr. McLAUGHLIN of Michigan. Give us an estimate of about what it is.

Mr. HARRISON. I could not give you an estimate as to the number who received the different rates, but I could give you the different scales.

The CHAIRMAN. Will you give the high allowance and the low allowance?

Mr. HARRISON. That depends on where the employees are traveling. If a man is going on a trip where he is required to cover the large cities, he would be allowed \$4. If he is traveling in rural districts, he would receive a per diem much lower than that.

The CHAIRMAN. If traveling in Iowa, for instance, what would he get?

Mr. HARRISON. If you will let me read this, I think it will give you the information you desire. This is quoted from a general letter of authorization to one of the bureau chiefs. [Reading:]

In directing travel under this authorization you may grant per diem in lieu of actual subsistence; but, in selecting the rate or rates applicable in any specific instance, due regard must be given to the character of the work to be performed, the section or sections of country to be visited, the time which will be spent in cities or other localities where living expenses are commensurate with those in cities, and such other circumstances as will, as nearly as practicable, insure the allowance of a rate which will not result in reimbursement in excess of actual and necessary traveling expenses as defined by the fiscal regulations of the department. For your guidance, the following per diem rates are prescribed for the character of travel indicated:

- | | |
|--|--------|
| (1) Travel mainly in and between cities or towns where the cost of living is commensurate with that of cities..... | \$4.00 |
| (2) Travel mainly in rural districts, involving stopovers of less than a week in any one place..... | 3.50 |
| (3) Travel mainly in rural districts, involving stopovers of more than a week in any one place..... | 3.00 |
| (4) Travel involving details at points away from the permanent headquarters of the traveler, such as temporary assignment to stations..... | 2.50 |
| (5) Travel by field parties (other than scouting parties)..... | 2.40 |
| (6) Travel by scouting parties..... | 1.50 |
| (7) Camping parties, pack trains, and the like..... | 1.20 |

(The rates prescribed in (4), (5), (6), and (7) shall be increased to \$3 during any period in excess of 24 hours in which travel by train or other common carrier is being performed.)

Provided, That for any day on which the traveling employee is in a subsistence status for a period of less than 24 hours the rates shall be as follows: If the subsistence status period is 6 hours or less, one-quarter of the rate selected by you from the schedule prescribed above; if more than 6 hours and not more than 12 hours, one-half of said rates; if more than 12 hours and not more than 18 hours, three-quarters of said rate; if more than 18 hours, said rate.

It is appreciated that unforeseen contingencies may operate to modify the circumstances under which your selection of a rate may have been made, but this shall not serve to affect the applicability of the rate to the travel. Factors of this character should receive appropriate consideration when the necessity for amendment of a travel authorization arises, but a rate once indicated in a letter of authorization should not be changed after travel thereunder has been performed.

Mr. McLAUGHLIN of Michigan. When a man renders his accounts, does he give an itemized statement of his actual expenses?

Mr. HARRISON. There are two plans. One is what is known as the "per diem in lieu of subsistence." Under that plan, the employee gets the per diem regardless of the expenditures he incurs, and he does not have to itemize his accounts. He simply claims the per diem, which has been fixed in advance, for the period covered by the travel.

The other plan is known as the actual-expense system, where the employee is required to itemize all his expenditures, and there is a limit of \$5 a day on the amount for which he may claim reimbursement.

The advantage of the per diem plan is that it saves a great deal of work in the auditing of accounts and, in the long run, I imagine it saves the Government some money.

Mr. McLAUGHLIN of Michigan. Who decides whether they shall receive the per diem allowance, which does not require the rendering of itemized accounts or the other plan?

Mr. HARRISON. The bureau chief usually determines that.

The CHAIRMAN. It has resulted in a saving?

Mr. HARRISON. It saves the time of the employee in keeping track of his expenditures and also a great deal of auditing and bookkeeping work.

The CHAIRMAN. I inferred from what Dr. Graves said that the Government furnished subsistence.

Mr. HARRISON. That is done only under certain conditions. For instance, in connection with survey parties in the national forests. Of course, when employees are furnished with subsistence they do not receive any per diem.

The CHAIRMAN. Have you anything else?

Dr. HOWARD. I have nothing else to offer.

The CHAIRMAN. We are very grateful to you.

MORNING SESSION.

THURSDAY, JANUARY 8, 1920.

STATEMENT OF DR. CARL L. ALSBERG, CHIEF OF THE BUREAU OF CHEMISTRY, DEPARTMENT OF AGRICULTURE.

The CHAIRMAN. What is next Dr. Alsberg?

Dr. ALSBERG. There is another factor that I wish to bring to your attention, and that is the per diem for travel. At present we have to travel on \$4 a day, irrespective of where or when or how. It is perhaps unnecessary to point out that certainly in the big cities, and usually in the medium-sized cities, it is impossible to travel on \$4 a day and break even. I have never succeeded in doing it.

Mr. McLAUGHLIN of Michigan. I wish you would explain for the record your different ways of compensating men for travel.

Dr. ALSBERG. There are only two—

Mr. McLAUGHLIN of Michigan. There is the per diem and the actual expenses?

Dr. ALSBERG. There are only two ways. A man is sent on a trip and we fix a flat daily rate which may be \$4 or less.

Mr. McLAUGHLIN of Michigan. That has nothing to do with his transportation?

Dr. ALSBERG. That does not include the transportation. It does not include his Pullman or certain special charges such as the Pullman porter fee and one or two items like that. The \$4 is allowed him for subsistence. That covers his room and lodging and his food and laundry. He gets in addition his railway expenses, his Pullman expenses, such things as porter fees, telegraphing, telephoning. Of course, if he has to use a team or requires a machine, that is not included in the per diem. The \$4 covers essential lodging, food, and laundry.

Mr. McLAUGHLIN of Michigan. Have you a way of sending your men out, allowing them the actual expenses and doing away entirely with the per diem allowance?

Dr. ALSBERG. Yes.

Mr. McLAUGHLIN of Michigan. I want to have that in the record.

Dr. ALSBERG. The other method consists of actual expenses. Under these circumstances the man is paid what he actually expends provided it does not exceed \$5. On the days that he expends more than \$5 he loses the difference. On the days that he expends less than \$5 he gets only what he expends.

Mr. McLAUGHLIN of Michigan. When a man is sent out do you determine by which plan he shall travel?

Dr. ALSBERG. In the Bureau of Chemistry we have in the last five years only followed the per diem for lodging and subsistence plan. We have not followed the actual expenses plan for the reason that we thought that we saved money by following the \$4 a day plan when we considered the great amount of bookkeeping that is necessary on the actual expense plan. An inspector, for example, every week when he makes up his expense account has to spend considerable time in making out the account when he is traveling on actual expenses of \$5. That account is sent in and audited. Several clerks must audit these accounts, and if there is some item that he is not entitled to the account goes back to the inspector; he has to explain it, and it comes back, and there is a lot of correspondence and clerical work and bookkeeping. We feel that when we take into consideration the bookkeeping expense, the loss of time of the men in making accounts, that it was more economical to follow the per diem plan, and that plan we have followed in the bureau exclusively for the last two years. It lies within the power of the chief of the bureau, subject to the approval of the secretary, to select the plan that he prefers or to have certain classes of employees follow one plan and certain other classes follow another plan. In our bureau we follow only the per diem plan for the reasons that I have given you. Our men now are complaining bitterly and stating that in most cases they are losing money when they travel. I think you will admit that traveling in large cities to-day on \$4 a day for room and board, where a man does not stay long enough to make special arrangements, means that he will lose money.

Mr. McLAUGHLIN of Michigan. What increase are you asking?

Dr. ALSBERG. The Secretary is asking for \$6 a day as a maximum for per diem in lieu of actual expenses, and \$7 a day as a maximum where actual expenses are paid.

Mr. HARRISON. Most of the other departments have made somewhat similar requests, the amount ranging as high as \$8.

Dr. ALSBERG. This does not mean, of course, that if Congress should grant the request that everybody would travel on \$6 and \$7. Where a man travels in the country through small towns with American plan hotels, the per diem would be less, according to the best judgment of the executive officer who had its determination. Three or four years ago we had men traveling on as low as \$1.50.

Mr. HARRISON. I inserted in the record the other day the present per diem rates, running from \$4 to \$1.20 a day, depending upon the section in which employees travel and the character of the work upon which they are engaged.

The CHAIRMAN. Does that include meals?

Dr. ALSBERG. No.

The CHAIRMAN. The meals are paid for out of the \$4?

Dr. ALSBERG. The meals are covered by the \$4.

The CHAIRMAN. How about porters' tips.

Dr. ALSBERG. A man puts that on the expense account and has an extra reimbursement for that. I have reference to the 25 cents you pay the porter when you spend the night on the train. It is limited to 25 cents for each 24 hours. I do not have reference to the tip you give the man at your meals; that goes as part of the subsistence. The tip you have to give hotel employees is regarded as subsistence. It is not allowed. On the other hand, if you have to take along heavy equipment or apparatus and have to employ the help of a porter at the railroad station to take care of that sort of thing, that is not counted in the \$4.

Mr. HARRISON. Nothing that is connected with transportation is included within the \$4, while everything that is connected with subsistence is included.

Dr. ALSBERG. Anything connected with food and lodging is included in the \$4. One of our inspectors recently resigned from the bureau, stating in his letter of resignation that he had kept a careful record of his expenses during the year. We have just received his resignation. He states that his actual living expenses while at home and traveling exceeded by \$300 the total of his salary and travel per diem which he received from the Government, and that was the reason he resigned.

AFTERNOON SESSION.

THURSDAY, DECEMBER 18, 1919.

STATEMENT OF MR. HENRY S. GRAVES, FORESTER AND CHIEF OF THE FOREST SERVICE, DEPARTMENT OF AGRICULTURE.

The CHAIRMAN. Are there other items, Col. Graves?

Mr. GRAVES. There are several items in the miscellaneous portion of the estimates which apply to the entire department in which the Forest Service is interested. I presume you will not care to have

me discuss there in general, but I would like to express myself as feeling that they should be given serious consideration by the committee, because the experience of the Forest Service is the same as that of other bureaus.

On page 286, for example, is a request for increased authority for maximum travel expenses, increasing it from \$5 to \$7 per day. There are a great many circumstances in which it is not possible to keep within the present limit.

Mr. McLAUGHLIN of Michigan. What is it now?

Mr. GRAVES. Five dollars.

The CHAIRMAN. I believe all of us are familiar with the increased cost.

(See also statement of Mr. E. W. Nelson relative to this item under the Bureau of Biological Survey section of these hearings, also general statement of Mr. F. R. Harrison covering miscellaneous items.)

LEAVE FOR FIELD EMPLOYEES.

The CHAIRMAN. Next is item 16.

Mr. GRAVES. On page 287, item 16, is an item granting the Secretary discretion to give leave of absence to field employees up to 30 days. At the present time the field employees of the department are allowed only 15 days. I am interested in that, as about 90 per cent of the Forest Service employees are in the field.

The CHAIRMAN. They get only 15 days?

Mr. GRAVES. They get 15 days, while those who are in Washington are allowed 30 days. I never could feel that it was just to give the employees of the Government living in one city different privilege from those elsewhere; and I may say that in most of the departments, if not all of them, they grant the 30-day privilege.

Mr. HARRISON. Yes.

(See also general statement of Mr. F. R. Harrison covering miscellaneous items.)

CUMULATIVE LEAVE FOR EMPLOYEES IN INSULAR POSSESSIONS.

The CHAIRMAN. Do you desire to discuss item 17?

Mr. GRAVES. On page 288, item 17, is a provision which extends to the whole of the Department of Agriculture a privilege which is already granted to the States Relations Service, with regard to cumulative leave for employees assigned to permanent duty in Alaska, Hawaii, Porto Rico, Guam, and the Virgin Islands. We have employees in Porto Rico and in Alaska, and I would like to record my desire to see this privilege, which has been granted the States Relations Service, extended to our employees as well.

The CHAIRMAN. They are in the same territory?

Mr. GRAVES. Yes, sir.

(See also general statement of Mr. F. R. Harrison covering miscellaneous items.)

PROTECTION OF EMPLOYEES OF FOREST SERVICE AND BUREAU OF BIOLOGICAL SURVEY.

The CHAIRMAN. What is the next item?

Mr. GRAVES. On page 289, item 24, is a new provision extending to the officers or employees of the Forest Service and the Biological

Survey a privilege which has already been granted to the Bureau of Animal Industry.

Mr. ANDERSON. Wasn't this authority asked for all the employees of the Department of Agriculture last year?

Mr. HARRISON. We asked for it last year only in the case of the Bureau of Biological Survey, Mr. Anderson. Mr. McLaughlin raised the question the other day as to whether the provision should not be made applicable to some other branches of the service. Since that time I have looked into the situation and find that there are no other bureaus which especially need the authority, with the possible exception of the Federal Horticultural Board. This board has certain men engaged in the enforcement of quarantine regulations and the chairman tells me that it would be desirable to extend the authority to cover them.

Mr. ANDERSON. We extended some such authority as this with relation to the enforcement of several of the acts which are enforced by the Department of Agriculture.

Mr. HARRISON. You have in mind the authority included in appropriation bill, under the Bureau of Markets, with reference to the examination of books and papers and the calling of witnesses in connection with matters relating to the regulatory acts enforced by the department.

Mr. GRAVES. We have had several rather distressing incidents where forest officers in the pursuance of their duty have been attacked by some disgruntled person, and there has been no adequate redress. A short time ago, for example, one of our men, in the administration of one of the timber sales, had a difference of opinion in regard to the scale of logs. Our officer endeavored to adjust it amicably and reach an agreement by going out and looking over the ground with the man personally. He thought he had the matter settled, even though there was still some difference of opinion about it, but the following day this forest officer was attacked by the man without any provocation and given a severe beating up. The man was brought before a local court and was fined \$25. There was no other redress. Inasmuch as this authority has already been granted in the case of the Bureau of Animal Industry, I think it would be of benefit to extend it to the Forest Service as well as the Biological Survey.

Mr. CANDLER. What is the penalty?

Mr. JACOWAY. He may be fined not over \$1,000.

Mr. GRAVES. Or imprisoned for not over one year, or both.

Mr. CANDLER. You want to make an attack upon an officer in the discharge of his duty a Federal offense?

Mr. GRAVES. Yes, sir.

The CHAIRMAN. Is that all, Colonel?

Mr. GRAVES. Mr. Harrison has just handed me an item. Mr. Harrison, what is this?

Mr. HARRISON. It is a letter addressed to the chairman of the committee, in which we suggest the insertion in the bill of an additional provision giving certain employees of the Forest Service and of the Biological Survey power to arrest trespassers on bird reservations and on the forests in connection with the protection of game.

The CHAIRMAN. You desire it inserted in the record?

Mr. GRAVES. I would like to file it and urge its approval by the committee.

(The letter referred to follows:)

DEPARTMENT OF AGRICULTURE,
Washington, December 17, 1919.

HON. GILBERT N. HAUGEN,
*Chairman Committee on Agriculture,
House of Representatives.*

DEAR MR. HAUGEN: There is urgent need for legislation to authorize Federal wardens and forest officers to make arrests and otherwise enforce the laws and regulations for the protection of game on Federal game preserves or reservations.

The only existing statute authorizing officers of the department to make arrests for violations of the laws and regulations governing these reservations is the act of February 6, 1905 (33 Stat., 700). This act authorizes persons employed in the Forest Service to make arrests for violations of regulations relating to forest reserves. This, however, is not broad enough to cover violations of the laws for the protection of game within the game preserves or reservations.

That the need for this legislation is urgent is shown by the following circumstances which have come about during the last few months on the Pisgah National Forest, which was established by presidential proclamation on October 17, 1916, and on the National Bison Range, in Montana, authorized by act of Congress of May 23, 1908 (35 Stat., 251), and amended by act of March 4, 1909 (35 Stat., 1039), and on the Winter Elk Refuge, in Wyoming, established by act of Congress of August 10, 1912 (37 Stat., 293), and act of March 4, 1913 (37 Stat., 828).

The Pisgah game preserve is administered by the Forest Service and the other two by the Bureau of Biological Survey.

Recently Forest Guard Weldon English in the course of his patrol discovered a hunter in possession of the carcass of a deer within the Pisgah game preserve. Not having authority to arrest the man and take him before a magistrate, he did the only thing possible under his authority, namely, took the man's name and address and reported the trespass to his superior officer. It turned out that the name and address were fictitious, and, as a consequence, this flagrant violation of the law escaped punishment. The trespasser is still at large, with little or no hope of his apprehension. Soon after this a game warden found two men on Rich Mountain, a section within the game preserve in which deer are very abundant; they, too, gave assumed names and fictitious addresses, and thereby managed to escape arrest and trial.

Less than three weeks ago a case was called in the Federal court at Asheville, N. C., in which the United States district attorney asked for a nolle prosequi, stating that the name "Herman Bailey," given by the trespasser to the game warden who discovered the trespasser, could not be found.

On November 26 Game Warden Ashe, employed to protect the Pisgah game preserve, while on the preserve in the discharge of his duties and trying to prevent trespass was shot and severely injured by one Andrew Jackson on Beaver Dam Creek, near Candler, N. C. Since the game warden did not have the power to arrest, no charge of resisting arrest can be lodged against Jackson, and he can not be brought to trial before a Federal court.

The better class of people, particularly those in western North Carolina, who took an active part in bringing about the establishment of the Pisgah game preserve, are keenly interested in the protection of the game within the area. This protection can hardly be had unless the officers charged with the care of the game preserves are authorized to arrest those who violate the regulations governing it.

During the past year, on the Montana Bison Range, 10 antelope have disappeared. One carcass was found partly dismembered, the hams having been cut off and carried away, indicating very clearly that the animal had been killed by a poacher. Careful search of the reservation failed to reveal the remains of the others, and it is believed that most of them were killed and carried away by poachers. At present there are 35 antelope remaining on this refuge, but, unless it is possible to prevent poaching, the future outlook for the protection of these interesting and rapidly disappearing animals, as well as the other game animals on this and other reservations, will be impossible. The original supply of ante-

lope on this refuge was purchased and donated to the Government by sportsmen's organizations. These animals are extremely valuable, and it would be deplorable if they could not be properly safeguarded.

On the winter elk refuge near Jackson, Wyo., recently, one of the elk being fed on the Federal refuge was shot and killed by a local hunter. I am advised by the solicitor's office that the action of the hunter in killing this animal was not a violation of any Federal statute, although the refuge is maintained at considerable expense to the Government for the express purpose of feeding the elk, which are driven there by hunger in severe winter weather.

These occurrences emphasize the importance of having suitable Federal legislation enacted to protect the animals and Government property on the bird and game refuges.

The Forest Service is charged with the administration of several game refuges located in the national forests. The Bureau of Biological Survey is charged with the administration of 74 national reservations, 5 of which, including the Niobrara refuge, which was originally created as a bird reservation, are big game preserves and the remaining 69 are bird reservations. On the big-game preserves the Government maintains, in the aggregate, a large number of animals, including buffalo, elk, deer, and antelope. In the administration of these reservations there have been constructed necessary fences, wardens' quarters, and other buildings. Other Government property is located on the reservations, including horses and farming equipment used in the production of hay and other forage crops. Injury to or destruction of this property would not, as it is understood, constitute a violation of any Federal statute. It is manifest that these reservations should be protected by suitable penal statutes.

Section 84 of the Penal Code makes it a misdemeanor to hunt, trap, capture, willfully disturb, or kill birds of any kind, or to take the eggs of any such birds on any lands of the United States which have been set apart or reserved as breeding grounds for birds, except under rules and regulations prescribed by the Secretary of Agriculture. There is no similar statute protecting the big-game preserves and there is no penal statute prohibiting any act of trespass upon the bird reservations which could not be shown to be a violation of section 84 of the Penal Code. The bird reservations are scattered from Florida to Alaska. Most of these in the United States are small in area, while several of those in Alaska are quite extensive. Some of them, particularly in the United States, are visited each year by large numbers of people who go there for recreation, as in the case of Sullys Hill National Park; some for the purpose of fishing, as in the case of the Big Lake Reservation in Arkansas; others, perhaps, for the purpose of observing the habits of the birds on the reservations. On most of the reservations visitors should be permitted under proper supervision. The department, however, should have the authority to make regulations for the administration and protection of these reservations similar to the power vested in the Secretary by the act of June 4, 1897 (34 Stat., 11), applicable to the national forests; and the employees of these bureaus should have the power to make arrests similar to that conferred upon employees of the Forest Service by the act of February 6, 1905 (35 Stat., 700).

To meet this situation I urgently recommended that the following provision, a separate copy of which is attached, be included in the miscellaneous section of the agricultural appropriation bill for the fiscal year 1921:

"And hereafter all lands of the United States heretofore or hereafter reserved or set aside by law, proclamation, or Executive order for use of the Department of Agriculture for breeding grounds for birds or as ranges, refuges, or reserves for wild animals shall be controlled and administered in accordance with the following provisions: The Secretary of Agriculture is hereby authorized and directed to make provisions against depredations upon such reservations and the molestation or destruction of the birds and other wild animals thereon, and he may make such rules and regulations and establish such service as will insure the objects of such reservations, namely, to regulate their use, to prevent depredations thereon, and to preserve the birds and other wild animals thereon from molestation and destruction; and whoever shall violate any of the provisions of this act or of such rules and regulations shall be fined not more than \$500 or imprisoned not more than six months, or both; but nothing herein contained shall prohibit any person from entering upon such reservations for all proper and lawful purposes, provided that such persons comply with the rules and regulations covering such reservations. Employees of the Department of Agriculture designated by the Secretary of Agriculture for the purpose shall have authority to make

arrests for violations of the laws and regulations relating to the aforesaid reservations, and any person so arrested shall be taken before the nearest United States commissioner within whose jurisdiction the reservation is located, for commitment; and upon sworn information by any competent person, any United States commissioner within the proper jurisdiction shall issue process for the arrest of any person charged with the violation of said laws and regulations."

Very truly, yours,

D. F. HOUSTON, Secretary.

(See also statement of Mr. E. W. Nelson relative to this item under the Bureau of Biological Survey section of these hearings.)

AFTERNOON SESSION.

WEDNESDAY, JANUARY 14, 1920.

STATEMENT OF MR. F. R. HARRISON, ASSISTANT TO THE SECRETARY, DEPARTMENT OF AGRICULTURE.

DIVISION OF ACCOUNTS AND DISBURSEMENTS.

The CHAIRMAN. What is next, Mr. Harrison?

Mr. HARRISON. We have not yet discussed the estimates of the Division of Accounts and Disbursements. They provide for only one change in the statutory roll—the addition of five clerks at \$1,200 in item 9, page 191. As I am sure the committee will appreciate, the work of the division has very greatly increased with the growth and development of the activities of the department, and additional assistance is urgently required in order to keep the work current and up to date.

EXCHANGE OF PARTS OF AUTOMOBILES.

With few exceptions, all the items under the heading "Miscellaneous" have been referred to at different stages of the hearings.

Item 7, on page 281, relates to the exchange of parts of automobiles. We are simply asking that you give us authority to exchange used parts, accessories, tires, and equipment in part payment for new parts, accessories, tires, and equipment. We now have similar authority with reference to the exchange of passenger-carrying vehicles and typewriters. At present the department is compelled to pay the full market price for replacement parts. Manufacturers of automobile tires, as you know, guarantee a certain mileage for each tire and usually agree to exchange and make replacement upon a mileage basis if any tire fails to furnish its guaranteed service. Automobile storage batteries are guaranteed for a definite period, usually one and a half or two years. When replacements are necessary, the old batteries have an exchange value of which private owners and commercial houses avail themselves. Similar conditions prevail in respect to many other important parts of automobiles, but the department, under existing law, is unable to take advantage of the exchange privilege. It is compelled to condemn old parts or accessories, sell them for what they will bring, turn the proceeds into the Treasury, and pay the full price for new parts or accessories. It is

believed that, if the authority proposed is granted, it will result in considerable saving to the Government in many directions.

The CHAIRMAN. You ask for the same authority for exchanging parts of automobiles that you now have for exchanging entire automobiles?

Mr. HARRISON. For authority similar to that which we now have with reference to the exchange of typewriters and passenger-carrying vehicles. We are now authorized, as I have indicated, to exchange old passenger-carrying vehicles in part payment for new machines, but we can not do this with reference to old parts and accessories.

PURCHASE AND MAINTENANCE OF MOTOR VEHICLES.

The paragraph relating to motor-propelled and horse-drawn passenger-carrying vehicles, item 6, on page 274, as you know, does not appropriate any money. It merely gives authority to expend a specified amount of the funds included in the appropriation bill for the purchase, maintenance, repair, and operation of motor-propelled and horse-drawn passenger-carrying vehicles. A similar provision has been included in the bill for several years and is made necessary by the act of July 16, 1914 (38 Stat., 454), which prohibits any expenditures for the purposes indicated without specific authority from Congress. The note under the item sets forth fully what we propose to do with the amount suggested in the authorization, and I do not think that it needs any further discussion.

PER DIEM ALLOWANCE FOR TRAVELING EXPENSES.

The various chiefs of bureaus, as they have appeared before the committee, have discussed item 14, on page 286, and item 15, on page 287. Their purpose is to increase the amounts that may be paid, both for per diem in lieu of subsistence and for actual expenses, to employees traveling on official business. The act of August 1, 1914 (38 Stat., 609), now limits the per diem allowance to \$4, and the act of April 6, 1914 (38 Stat., 312), limits the actual expense allowance to \$5. We are suggesting that the former be increased to \$6 and the latter to \$7. The committee, I think, fully appreciates the necessity for these changes. They are made necessary by the great increases that have occurred during the past two or three years in the cost of traveling. As I have already pointed out, if the committee adopts the recommendation of the department, all employees traveling on official business will not be paid \$6 or \$7, as the case may be. The rate will be fixed in each case according to the character of travel to be performed and the conditions prevailing in the section or sections of the country to be visited.

LEAVE FOR FIELD EMPLOYEES.

There is another item on page 287, No. 16, in which we suggest that you authorize the department, in the discretion of the Secretary, to grant 30 days' annual and 30 days' sick leave to field employees. Under the present law these employees are limited to 15 days' annual and sick leave, while employees in Washington may be allowed 30 days.

Mr. TINCHER. What do you think about that proposal to grant 30 days' leave to field employees instead of 15 days when there is such a great shortage of labor everywhere?

Mr. HARRISON. The purpose of the item, Mr. Tincher, is merely to place the field employees on exactly the same basis as the employees in the city of Washington. It seems to us that it is merely a matter of justice to our field employees. I may say, in this connection, that, as I understand it, annual leave is granted on the theory that the more time an employee has for rest and recuperation the better service he is likely to render during the remainder of the year. The field employees of many branches of the Government service, as indicated in the note under the item, now may be granted 30 days' leave, and we think our employees ought to have the same privilege.

CUMULATIVE LEAVE FOR EMPLOYEES IN INSULAR POSSESSIONS.

There is still another item, Mr. Chairman, No. 17, on page 288, which relates to cumulative leave of employees of the department in Alaska and the insular possessions. You will recall that last year, upon the recommendation of the department, the following provision was inserted in the appropriation bill

Provided further, That hereafter employees of the Department of Agriculture assigned to permanent duty in the Virgin Islands shall be entitled to the same privileges as to leave of absence as are conferred upon employees assigned to Alaska, Hawaii, Porto Rico, and Guam by the act of June 30, 1914 (38 Stat., p. 441), and if any employee of the agricultural experiment stations of the United States in Alaska, Hawaii, Porto Rico, Guam, or the Virgin Islands shall elect to postpone the taking of any or all of the annual leave to which he may be entitled under the said act of June 30, 1914, he may, in the discretion of the Secretary of Agriculture, subject to the interests of the public service, be allowed to take at one time unused annual leave which may have accumulated within not to exceed four years, and be paid at the rate prevailing during the year such leave of absence has accumulated.

This provision, as you will note, authorizes the Secretary, in his discretion, to permit employees of the agricultural experiment stations in Alaska, Hawaii, Porto Rico, Guam, and the Virgin Islands to "take at one time unused annual leave which may have accumulated within not to exceed four years." The purpose of item 17 is to extend the same privilege to employees of other branches of the department, including especially the Forest Service, the Weather Bureau, and the Bureau of Chemistry, all of which have employees either in Alaska or in one of the insular possessions.

This completes the consideration of the estimates, Mr. Chairman. I want to take this opportunity to express our appreciation of the patience with which the committee has listened to the discussion of the various items and of the generous amount of time you have given us in which to present them. We hope that you will be equally generous when you come to act upon the department's recommendations.

The CHAIRMAN. We are very grateful to you for the comprehensive manner in which you have presented the estimates, Mr. Harrison.

Mr. HARRISON. It has been a real pleasure to meet with the committee, and I shall, of course, hold myself in readiness at all times to render any assistance you may desire.

The CHAIRMAN. We will do the best we can to meet the suggestions and the requirements of the department. We thank you very much.

(Thereupon, at 6 o'clock, the committee adjourned.)

AFTERNOON SESSION—Continued.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Wednesday, January 14, 1920.

VITICULTURAL INVESTIGATIONS IN CALIFORNIA.

The committee met, pursuant to recess, Hon. Gilbert N. Haugen (chairman), presiding.

The CHAIRMAN. You may proceed, Dr. Taylor.

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE.

Mr. McLAUGHLIN of Michigan. You have a rather disagreeable situation in California now where you had some experiment stations on raisin lands, and where the leases have expired. I understand you have very extensive improvements there that will be lost unless the Government pays a large amount of money to acquire the title.

Dr. TAYLOR. That is not in the nature of buildings. It is the planted vines. The Government's interest there is wholly in the perennial crop which is established on the lands.

Mr. McLAUGHLIN of Michigan. Has not the Government erected some of the buildings on the land?

Dr. TAYLOR. No, sir; not even a shack or a fence. There are certain trellises for the grapevines.

Mr. McLAUGHLIN of Michigan. Mr. Curry, of California, is very much interested in the proposition out there. Have you ever made a statement in regard to that to this committee?

Dr. TAYLOR. No, sir. That is a feature which has developed in its acute form within the last few weeks, since it has become evident that the effect of the prohibition amendment will be to radically and permanently change a very large part of the California viticultural industry; so that many of the owners of vineyards that were planted specifically with wine grapes, which are of doubtful value for other purposes, are going out of grape production and disposing of their holdings. This leaves the department unprotected in that feature of its experimental work.

Mr. McLAUGHLIN of Michigan. Is it desired that you carry on some experiments out there?

Dr. TAYLOR. What the viticultural industry has in mind as desirable to do is the continuation of the work which the department began under reimbursement contracts, not under leases, but under contracts under which experiment vineyards were planted upon privately-owned lands. The owners of the lands were at that time maintaining large vineyards alongside and making available their full

personnel of skilled labor and their full equipment of horses, implements, facilities, buildings, and all that for the department's use.

Mr. McLAUGHLIN of Michigan. I have understood that if the Government gave that up, did not make an appropriation and acquire title to the property, the Government would suffer a large financial loss.

Dr. TAYLOR. The financial loss would be through the interruption of the investigational work practically at its highest point of efficiency and promise of useful results.

Mr. McLAUGHLIN of Michigan. The Government would not have a loss by stopping the work?

Dr. TAYLOR. No; except through the impairment of results by premature termination of the investigational work.

Mr. McLAUGHLIN of Michigan. Is there not some property that would be of some value if your work is continued but which, if you stopped your work, would fall into disuse and waste?

Dr. TAYLOR. No; if we stop our work the property would immediately be devoted to other uses, commercial in lieu of experimental.

Mr. McLAUGHLIN of Michigan. Does the Government claim title to all that is growing on the land?

Dr. TAYLOR. We have full contract ownership in the plant material on the land.

Mr. McLAUGHLIN of Michigan. Stuff that can not be removed?

Dr. TAYLOR. Yes.

Mr. McLAUGHLIN of Michigan. If you quit your work, you cripple it, and your experimental plantings would go to the owners of the land?

Dr. TAYLOR. Yes; and it has no commercial value to them or anyone as a profit-producing plantation.

Mr. McLAUGHLIN of Michigan. How much money was it suggested that you use out there?

Dr. TAYLOR. I have had that very carefully studied and estimated within the last few days, and, while I have not the figures here, my recollection is that the purchase and equipment would involve an expenditure of \$87,750.

Mr. McLAUGHLIN of Michigan. That would enable you to acquire title in fee to how much land?

Dr. TAYLOR. About 30 acres in one holding in northern California, where the Oakville vineyard is, and about 36 acres near Fresno, where the more southern vineyard is; including also the provision of water supply, fencing, and the erection of three or four necessary buildings at each place; also provision for such implements and operating equipment as the department would have to own.

Mr. McLAUGHLIN of Michigan. Must this \$87,000 be put up to acquire title and make all the improvements that you speak of?

Dr. TAYLOR. Yes, sir.

Mr. McLAUGHLIN of Michigan. That is for the purpose of experimenting and determining whether or not some other use can be made of the products of the soil—the vines, and so on—out there?

Dr. TAYLOR. Yes, sir; including the continuation of the work which was started, not for that purpose, but for the insuring of an enduring vineyard industry at a time when it was threatened with destruction by phylloxera.

Mr. McLAUGHLIN of Michigan. The endurance, if that is the proper use of the word, of the vineyard was dependent on the use of the fruit for wine, was it not?

Dr. TAYLOR. Partially. The fundamental questions are the same as they have been, namely, the determination of the desirable varieties of grape stocks to be grown there in the presence of the root-destroying phylloxera, an insect which can be combated only by growing the fruiting varieties grafted on phylloxera-resistant stocks. The first question to determine is what phylloxera-resisting stocks will endure and thrive there for sufficient time to base an enduring industry on, and, secondly, which ones of these stocks are congenial enough to the various fruiting varieties, such as those from which they make raisins and those from which we expect also we shall be able to make the "currants" which we have been importing by many millions of pounds from Greece.

Mr. McLAUGHLIN of Michigan. Are you able to estimate the length of time that will be required to carry on the experiments?

Dr. TAYLOR. We have not undertaken to look into the future that far. Roughly, I should say, however, that it would be approximately 30 or 40 years in total. We now have been working approximately 15 years.

Mr. McLAUGHLIN of Michigan. It would require a long time and involve considerable appropriation each year?

Dr. TAYLOR. It is a long-time task, and the maintenance of it, additional to this acquisition of the land and the providing of the necessary permanent improvements, would involve an increase in our present appropriation for the operation of the viticultural work, which is \$20,000 to \$27,500, an increase of \$7,500. So that the initial purchase and improvement appropriation would be \$87,750 and the continuing appropriation for maintenance and operation would be \$7,500 more than it now is, making a total of \$115,250.

Mr. McLAUGHLIN of Michigan. If 15 years is the length of time to determine whether or not that is a success or not, you have lost your entire investment if it is a failure at the end of that time, have you not?

Dr. TAYLOR. In terms of vines; but we will have it in terms of useful knowledge; that is, the farmers and the country will have it.

Mr. McLAUGHLIN of Michigan. Will the land or the structures be worth anything?

Dr. TAYLOR. The land presumably would be worth what it is to-day.

Mr. McLAUGHLIN of Michigan. Then, what is the use of doing anything if the land is going to continue of equal value or at a value equal to what it is to-day?

Dr. TAYLOR. You understand that what I say as to land values is a random guess.

Mr. McLAUGHLIN of Michigan. On the information I got, unless you discover something to save that country out there, the land will not be worth anything.

Dr. TAYLOR. You mean the wine-grape lands in general. I missed your point, Mr. McLaughlin. I thought you were referring to the land in these particular experiment vineyards. Your question re-

lated to the value of vineyard lands—the 175,000 acres now planted with wine grapes.

Mr. McLAUGHLIN of Michigan. No; you are going to acquire certain lands out there for the purpose of carrying out experiments to see whether or not something can be done to save that country—the establishment of some industry along the fruit line which is threatened on account of the prohibition amendment.

Dr. TAYLOR. Yes.

Mr. McLAUGHLIN of Michigan. If you are successful, the value of those lands will be kept up?

Dr. TAYLOR. Oh, yes.

Mr. McLAUGHLIN of Michigan. If they are unsuccessful, your first answer was that the lands are worth just as much at the end of the time as they are now.

Dr. TAYLOR. I was referring to these particular tracts, the 30 and 36-acre tracts, that we are now using, which, while of the same general character as the wine-grape vineyards on the side hills, because of their location are not subject to the same changes in value as the lands on which a large proportion of the wine-grape vineyards are located. Your question, I see, had to do with the value of these 175,000 acres of wine-grape vineyards—the land now in wine vineyards. The wine vineyards are for the most part located on lands off the valley floors, and up to the present time no other successful agricultural use has been found for them. Vineyards grow well there, and it is the value of the vines on those lands that gives the value to the property and not the soil itself.

Mr. McLAUGHLIN of Michigan. Unless you discover something of value for them, those lands will fall materially in value, will they not?

Dr. TAYLOR. Inevitably, I should say, for they are lands which in a very large degree are not suitable for any other profitable agricultural or horticultural use that has been discovered.

Mr. McLAUGHLIN of Michigan. And up to this time, on account of the use of the products of the soil, the lands have been very valuable?

Dr. TAYLOR. Fairly valuable, and fairly profitable to a large number of farmers who settled there specifically to raise grapes for wine and brandy production, expecting that that condition would continue.

Mr. McLAUGHLIN of Michigan. Mr. Curry of California has spoken to me about the matter two or three times. He is very much interested in it, and he sees trouble if this is not done, falling values, and loss to his people; but I believe he has talked with you and others of your department, and he is very hopeful that something may be done and is anxious to have an effort made by the Government to do something.

Dr. TAYLOR. I have not discussed the matter with Mr. Curry, but the department has received appeals from thoroughly representative organizations in California in considerable number during recent weeks. As the result of a careful study of the existing conditions, I think we are in a position to furnish the committee a very definite statement of what would be required to meet the situation as we see it.

Mr. McLAUGHLIN of Michigan. Mr. Curry himself is not very well. I suggested that he come over and make a statement to the committee. At the time I suggested that he did not feel able to come. He may be able to come later, but, on account of his great interest, and you being here, I thought I should ask you to tell us about it. Do you want to make any further statement about it?

Dr. TAYLOR. I think a definitely particularized statement would be more illuminating than what I might say offhand. We could furnish that to the committee if it is desired.

Mr. McLAUGHLIN of Michigan. I do not know enough about it to bring out all the facts. I ask questions rather at random.

The CHAIRMAN. Doctor, is the purpose of the investigation to ascertain the value of the land for other purposes than growing grapes?

Dr. TAYLOR. No; rather to determine whether it is not possible to produce and utilize types of grapes other than the wine grapes, which now constitute practically the sole investment.

The CHAIRMAN. When the prohibition law was under consideration there was great concern shown over the grape industry of California. Are grapes now worth more than ever before, and are they selling at higher prices?

Dr. TAYLOR. That has been true of the table and raisin grapes, which constitute a very large and important element of the total production of grapes in California.

The CHAIRMAN. Will that be true in the future?

Dr. TAYLOR. It is the wine-grape industry, in distinction from the table grape and raisin industries, that is jeopardized. The grapes of California are almost entirely of the old-world type (*Vitis vinifera*), the vine of the Scriptures, and of the whole south European and Mediterranean country. These grapes are, in the main, of three different types. One of those is used chiefly for and is chiefly adapted to raisin production. Another is—

The CHAIRMAN. What is done with the wine grape now?

Dr. TAYLOR. The wine grapes are the juicy and rather seedy ones, for which no other important use than wine and brandy production has yet been discovered, unless there should be developed some "moonshine" use, which is not impossible, or some underground system of marketing in the shape of a dried or otherwise preserved product suitable for wine or brandy making. It would not be raisins.

The CHAIRMAN. Do you know what they are being used for?

Dr. TAYLOR. This year a considerable quantity of them have been dried. A considerable quantity, some 4,000 carloads, have been shipped East in the fresh state, in the condition in which they were when taken from the vineyards, for whatever use the ultimate purchaser cared to make of them. Some of these are known to have been used for the production of wine in eastern cities.

The CHAIRMAN. Are they selling at higher prices than before?

Dr. TAYLOR. I do not think that is true of the wine grapes generally.

Mr. McLAUGHLIN of Michigan. I do not think that is true of the wine grape.

Mr. TINCHER. One Congressman claims they do.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Friday, January 16, 1920.

SPECIAL HEARINGS ON VITICULTURAL INVESTIGATIONS IN CALIFORNIA
REQUESTED BY MEMBERS OF THE CALIFORNIA DELEGATION IN
CONGRESS.

The committee assembled at 10.30 o'clock a. m., Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. At the request of a number of members of the California delegation we have reopened the hearings so as to give them an opportunity to be heard on item 102, page 95, which is as follows:

For the investigation and improvement of fruits, and the method of fruit growing, harvesting, and, in cooperation with the Bureau of Markets, studies of the behavior of fruits during the processes of marketing and while in commercial storage, \$88,200: *Provided*, That \$20,000 of said amount may be used for investigating and developing new grape industries and methods of utilizing grapes heretofore used for the production of alcoholic beverages, \$88,200.

Do you desire to be heard first on the item, Representative Barbour?

Mr. BARBOUR. We have some representatives of the Department of Agriculture here, Mr. Chairman, and they will be able to present this matter much more intelligently than the Members of Congress from California can.

The CHAIRMAN. The matter has been fully covered by the representatives of the department. However, some of the representatives are here. Would you prefer to have the committee hear them first?

Mr. BARBOUR. I think they can cover the whole matter, so that it will not be necessary for you to hear from the Members of Congress.

The CHAIRMAN. Dr. Taylor, will you testify first?

Dr. TAYLOR. You will remember that just before the close of the hearings day before yesterday some questions were asked by Mr. McLaughlin which I could not answer at that time.

The CHAIRMAN. It has been suggested that some one from the department having this work in charge be given an opportunity to supplement what has already been said. Do you care to be heard further on the item and answer the questions referred to?

FURTHER STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF
THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE.

Dr. TAYLOR. I have prepared and have here a succinct and comprehensive statement of the situation with respect to the existing experimental vineyards in California, the purchase of which was the subject of Mr. McLaughlin's questions.

The CHAIRMAN. Dr. Husmann, who is in charge of that work, is here this morning, is he not?

Dr. TAYLOR. Yes, sir; Mr. Husmann, who has immediate charge of that work, is present.

The CHAIRMAN. Does he wish to be heard?

Mr. HUSMANN. I think if Dr. Taylor is allowed to read his statement it will cover the matter very completely.

Dr. TAYLOR. It is about seven typewritten pages, and, if it is agreeable and the committee desires it, I will read this statement, as I think it would be shorter than an offhand statement.

The CHAIRMAN. We will be glad to hear the statement.

Dr. TAYLOR. The profound changes now in progress in the viticultural industry of the Pacific coast, as a result of the adoption of the eighteenth amendment, make it necessary to consider radical changes in the viticultural work of this bureau, which has been in progress for a number of years. When this work began a number of years ago the dominant phase of the industry was the production of wines and brandies, though there was also a large production of raisins and table grapes in certain sections. The varieties of grapes involved are practically all of the Old World type (*Vitis vinifera*) which is not successfully grown in the open air to any extent east of the Rocky Mountains. Some of the most complex and important problems are those involved in the determination of the adaptability of phylloxera resistant stocks to the radically different soil and climatic conditions of the important grape-growing districts, the varieties producing desirable fruit requiring to be grafted upon such stocks to be successfully grown in the presence of this root-destroying insect. These varieties constitute the sole sources of our national supply of American-grown raisins, now amounting to about 300,000,000 pounds of raisins per annum, and the entire table-grape production of California, the shipments of which now amount to from 180,000 to 200,000 tons per year. In addition to the fruit marketed in these forms, from 300,000 to 550,000 tons per annum have heretofore been utilized for the manufacture of wines and brandies. Much of the fruit thus utilized is of varieties developed especially for these purposes and not suitable for other known uses. Apparently the vines producing this fruit must be grafted over (where possible) or replaced with table or raisin varieties if the industry is not to be disastrously damaged and many of the wine-grape growers financially ruined.

In view of the resolutions passed by the Sacramento Valley Development Association, the California State Association of County Horticultural Commissioners, the California Fruit Exchange, and the fifty-second State fruit growers' and farmers' convention transmitted by Senator Phelan, Representative Kahn, and others, urging that the cooperative experiment vineyards which for a number of years have been maintained by this bureau at Fresno and Oakville, Calif., be purchased by the Government and equipped and maintained permanently as field stations, a careful study has been made of the existing situation with a view to intelligently estimating what the cost of such purchase would be, and also the cost of equipping and operating these vineyards as department field stations.

The experiment vineyards in question comprise 20 acres at each place. The plantings have been made progressively during the past 15 years on privately owned land under contracts through which the owners made the land available to the department without rental, the owners furnishing the necessary labor, equipment, team power, etc., for use as needed, and being reimbursed by the department in the actual cost of the labor, etc., as required for the effective carrying

on of the numerous experiments under way in them. This arrangement, when made, of course contemplated a continuance of the then existing and steadily enlarging wine and brandy industries in which the owners of the land were largely engaged. A large part of the experimentation, however, was with grapes intended for raisin, "currant," and table-grape utilization in addition to those grown exclusively for wine and brandy production. The vineyards now contain approximately 700 varieties of resistant-stock and edible fruited varieties collected from all the vine-growing regions of the world and constitute the largest and most valuable collection of grape varieties now known to exist.

As the owners of these particular tracts are going out of business as grape growers, and selling off their land, it is evident that if these very valuable collections of vines are to be maintained during the critical period of reconstruction of the grape industry which the adoption of the constitutional amendment has made necessary, they will need to be taken over and operated by the department or some public agency.

As accurate estimates as are practicable of the probable cost of the land in each vineyard, and of the improvement and equipment which would be necessary for their effective operation by the department have been prepared. While only 20 acres of land at each place have thus far been controlled by the department, it would be highly desirable that about 16 acres additional at Fresno and 10 acres additional at Oakville be obtained to provide for necessary enlargements and readjustments of the experimental work now under way and contemplated. These estimates which cover the purchase of the land and the provision of necessary improvements and equipment to make possible the effective independent operation of each experimental vineyard indicate that \$47,900 would be required for the Oakville vineyard and \$39,850 for the one at Fresno. The improvements essential to the effective operation of the vineyards, such as a barn, cottage and small laboratory at each place, and a dry house at Oakville which would need to be provided, should be largely of concrete construction. While somewhat more expensive than wood, under existing conditions in California, it is regarded as cheaper in the long run because of lower upkeep.

Maintenance and operation of the vineyards by the department will make necessary the purchase of certain equipment including a tractor, scales, plows, harrows, cultivators, hand tools, lug boxes, drying trays, and a light motor truck at each place, the estimated cost of which is \$3,550 for Fresno and \$3,350 for Oakville.

The details of the estimates for the two vineyards are shown on the enclosed sheets.

The CHAIRMAN. What is your estimate on buildings at Fresno?

Dr. TAYLOR. At Fresno, a laboratory building, estimated to cost \$3,500, a barn, \$2,500, and a cottage, \$4,500.

Mr. McLAUGHLIN of Michigan. Would the amount that you estimate for the laboratory equip it and supply it?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. For what is the barn to be used?

Dr. TAYLOR. Chiefly as housing for implements and storage for the lug boxes and other paraphernalia of vineyard operations.

The CHAIRMAN. It would practically be a storehouse, would it not?

Dr. TAYLOR. Yes, sir; there would be no farm crops grown. [Reading:]

The land values are estimated on the basis of recent sales in the near vicinities of the vineyards.

The CHAIRMAN. In that case what was the selling price?

Dr. TAYLOR. In that case, it is \$600 an acre, in the near vicinity of Fresno city.

Mr. YOUNG. Are these people who are in the vineyard business selling out?

Dr. TAYLOR. Yes, sir.

Mr. YOUNG. On the basis of \$600 an acre for that particular transaction?

Dr. TAYLOR. Yes, sir.

Mr. YOUNG. If they are going out of the vineyard business, what is the present purchaser figuring on doing with that valuable land?

Dr. TAYLOR. As I understand it, the lands which are planted and have been planted in vineyards specifically for wine and brandy production in the past, are now being cut up into small farms and being devoted by the small owners, probably, in part, to raisin production, as those are varieties which largely could be converted into raisins, and presumably, to other lines of agricultural production.

So much for this purchase and equipment proposition. [Reading:]

If these vineyards are purchased and the improvements made so that they can be maintained and operated as independent field stations, it will be necessary to add to the \$20,000 viticultural proviso in the subappropriation for pomological investigations \$7,500 as a continuing maintenance item.

The CHAIRMAN. How much is to be added to item 102, which now carries \$88,200?

Dr. TAYLOR. Our suggestion as to the most practicable method is to deduct the \$20,000 proviso from item 102 and frame a new paragraph, which would cover that work, with a \$7,500 increase for annual maintenance, and an increase of the amount previously stated, \$87,750, for the purchase and equipment.

The CHAIRMAN. What would be the total?

Dr. TAYLOR. The total would be the sum of those amounts—\$87,750 plus the amount in the present proviso, \$20,000, and plus \$7,500; it would be a total of \$115,250.

The CHAIRMAN. What would the new paragraph carry?

Dr. TAYLOR. That would carry \$115,250, including \$20,000 from the old paragraph.

Mr. JONES. Then the two paragraph together would carry how much?

Dr. TAYLOR. \$115,250 for the grape work, and \$68,000 for the general pomological investigations.

Mr. JONES. That \$68,000 would be the paragraph that now calls for \$88,000?

Dr. TAYLOR. Yes, sir.

The CHAIRMAN. That will involve a net increase, then, in the two items of \$95,250?

Dr. TAYLOR. \$95,250.

Mr. ANDERSON. What is the necessity for maintaining these two stations? Is there a difference in the character of the work, in the character of the country, or what?

Dr. TAYLOR. There is a radical difference in the character of the country. The viticultural territory of California is divided, roughly, into two distinct climates—the Bay region, in which the Oakville vineyard is located, and the great San Joaquin Valley, in which Fresno is located. San Joaquin Valley has a high temperature and is very largely an irrigated section. The Bay region has a comparatively cool temperature and is without irrigation.

Mr. RUBEY. How far is that from San Francisco, and in what direction?

Dr. TAYLOR. The Oakville vineyard is northeast of San Francisco, in Napa County.

Mr. RUBEY. About how far is the Oakville vineyard from San Francisco?

Dr. TAYLOR. I will ask Mr. Husmann to answer that.

Mr. HUSMANN. It is about 40 miles from San Francisco in an air line; 64 miles by rail.

Dr. TAYLOR. And the Fresno district; how far is that?

Mr. HUSMANN. The Fresno district is in the geographic center of the State of California; it is about 200 miles south of San Francisco.

Dr. TAYLOR. The increase in the maintenance item to which I have referred is chiefly necessary to meet the very greatly increased cost of labor and materials, which during the present year shows an increase of nearly 100 per cent over the maintenance cost per acre at the time when these plantings were started.

The work under way at these stations is of fundamental importance to the viticultural industry of the Pacific coast. It includes the determination of the adaptability of resistant stocks to the soil and climatic conditions of the grape-growing regions, and the equally important question of determining the congeniality of the leading commercial fruiting varieties to these resistant stocks. It also includes the determination of the adaptability and value of the fruiting varieties themselves for curing into raisins or "currants," and for utilization as table grapes, either fresh from the vines or after various periods of storage, to supply the consuming demands during the winter season.

There is a definite probability that we shall be able to develop the production of the long-keeping type of grape which we have been importing from Spain, in kegs or cork dust, ever since any of us can remember, as well as develop this production of the dried currants.

Mr. ANDERSON. May I ask a question? You were suggesting, as I understood you, an increase in the acreage at these two stations. Do you propose to abandon the work which you have heretofore done on the wine and brandy grapes?

Dr. TAYLOR. Yes, sir.

Mr. ANDERSON. Why do you need more acreage when you are abandoning part of the project?

Dr. TAYLOR. It will not be an abandonment of the land; it will be a reutilization of the space and, in some cases, a grafting over of the vines.

Mr. ANDERSON. As I understand you, you have been doing work with both wine grapes and raisin grapes, and now you propose to abandon the work with the wine grapes—to which nobody has any objection, I suppose. When you abandon the work on the wine grapes, I can not understand why you need more land?

Dr. TAYLOR. We need more land to undertake certain of these activities on the basis of a commercial-size unit—not of a commercially operated unit, but in commercial-size plats—in which there will be specifically determined the adaptability of the stocks to the soil.

Mr. MCKINLEY. Do you not have to have more space on which to erect the buildings?

Dr. TAYLOR. No; the space required for the buildings would be only about half an acre.

Mr. HUSMANN. I would like to state also that one of the most important problems we have confronting us now is to find some other use for these wine grapes. On this Oakville vineyard, to which the gentleman has just referred, our plans already exist for these various varieties in which the people are interested, and we propose to use those crops which we are producing on that acreage in trying to find other uses for them.

Dr. TAYLOR. All possible ways of accomplishing the solution of these important problems have been considered and, in view of the economic crisis which now confronts the industry, no other practical way is seen of carrying this work through to a successful conclusion. No provision for either the purchase or the financing of the increased maintenance cost is made by the estimates now before Congress.

The features necessary to be considered may be summarized as follows:

Appropriations necessary if vineyards are purchased.

FRESNO VINEYARD.

Purchase of 36 acres of land, at \$600	\$21, 600
Buildings, fences, well, and improvements	14, 650
Farm and laboratory equipment	3, 600
	<hr/>
	\$39, 850

OAKVILLE VINEYARD.

Purchase of 30 acres of land, at \$750	22, 500
Buildings, fences, well, and improvements	22, 050
Farm and laboratory equipment	3, 350
	<hr/>
	47, 900

Appropriation required for purchase and equipment	<hr/> <hr/>
	87, 750

DETAILS OF FRESNO VINEYARD.

Land, 36 acres, at \$600	21, 600
Improvements, buildings and fences:	
Laboratory building	\$3, 500
Barn	2, 500
Cottage for superintendent	4, 500
Fencing, 245 rods (with concrete posts)	1, 000
	<hr/>
	11, 500
Water supply:	
Well	1, 000
Pump	150
Reservoir	1, 500
Power	500
	<hr/>
	3, 150

Equipment, farm and laboratory:	
Tractor-----	\$1, 500
Plows-----	150
Harrows-----	100
Cultivators-----	100
Hand tools-----	250
Motor truck (1-ton)-----	750
Scales, lug boxes, drying trays-----	750
	\$3, 600
Total-----	* 39, 850

DETAILS OF OAKVILLE VINEYARD.

Land, 30 acres, at \$750-----	22, 500

Scales, lug boxes, drying trays-----	500
	3, 350
Total-----	47, 900

There is an additional building required at Oakville, in the form of a drying house suitable for the curing of grapes in a climate which does not permit of sun-curing, as the Fresno climate does.

The CHAIRMAN. You have not conducted these experiments without the equipment and the buildings to which you refer?

Dr. TAYLOR. We have had the use, practically without cost, of the equipment which has existed on the large adjacent vineyards, which either have gone or are going out of business; and that will not be available to us, therefore, in the future.

The CHAIRMAN. Does the purchase price of the lands include the buildings?

Dr. TAYLOR. No; there are no buildings on this land.

The CHAIRMAN. On the lands which you propose to buy, there are no buildings?

Dr. TAYLOR. No, sir. We have had the use of the buildings which have existed on the commercial plantations.

Mr. CORBETT. These were really the headquarters buildings of the large plantations, and we have had the benefit of the use of the headquarters and all of the equipment that was maintained to operate the large commercial units.

The CHAIRMAN. You propose to buy the land without buildings?

DR. TAYLOR. To buy the land without buildings; yes.

THE CHAIRMAN. You estimate for equipment, do you not?

DR. TAYLOR. Yes, sir; this estimate includes that.

THE CHAIRMAN. Is it for additional equipment?

DR. TAYLOR. This is to be provided by the department instead of the commercial equipment formerly available on the plantations.

Those items which I have read for the two vineyards make up the \$87,750 required for purchase and equipment of those vineyards as a going concern, in the shape of department field stations. [Reading:]

"If the above purchases and equipment are made, the maintenance and operation of the vineyard by the department will make necessary an increase in the \$20,000 viticultural proviso of the sub-appropriation for pomological investigations of \$7,500."

MR. LEE. Who owns these improved tracts, the 20-acre plots that you speak of? Are they privately owned or are they owned by the vineyard people?

DR. TAYLOR. The one at Fresno is owned by the Fresno Vineyard Co., which was the owner of the entire tract, all of which they have sold except this particular tract occupied by us and the land back of it.

MR. LEE. Have they gone out of business?

DR. TAYLOR. They have gone out of business; yes, sir.

MR. RUBEY. What percentage of the acreage that has heretofore been devoted to these wine-producing grapes has been disposed of by the owners?

DR. TAYLOR. I could not tell you.

MR. RUBEY. Can anybody present give the committee an idea of how much of that acreage has been disposed of?

MR. HUSMANN. I think very little has been disposed of up to the present time, due to the unusual conditions which have prevailed and the unusually high prices for everything in the fruit line, including grapes, that have existed this year. The wine-grape growers have gone to work the same as in previous seasons and have pruned and plowed and gotten their vineyards in shape and simply expected Providence to take care of them. They always do expect Providence to take care of them; that is characteristic of that industry; they have not been in the habit of looking for a market for those grapes until the grapes are ripe and ready to come off the vines. The same thing occurred this year, in spite of the serious conditions that confronted them, and things simply took a turn afterwards that caused a demand for all those grapes at very high prices. I think a good many of the questions asked by the members of the committee might be made clear, Mr. Chairman, if Dr. Taylor would make a statement to the committee relative to our relations with the parties owning the lands on which our vineyards have been located. These experiment vineyards, in other words, have been located on property belonging to private parties. They are under a contract agreement under which the Secretary of Agriculture has the privilege of the use of these lands for a period of years, and an agreement has been entered into with the owners whereby they have done the work under the direction of the department, the department reimbursing them at the end of the fiscal year for expenditures incurred.

I think that answers your questions, gentlemen, in so far as they relate to equipment, buildings, etc. We have, in other words, simply had a piece of land set aside at each one of these places, the places belonging to these various owners, and there is absolutely nothing in the way of buildings or anything else on those lands. They were simply farm lands as they were turned over to us.

Mr. WILSON. Has the Agriculture Department purchased any of these lands?

Mr. HUSMANN. No.

Mr. WILSON. What is the object of purchasing them now? Why do not the people who are interested in this new development lease this land to the Department of Agriculture for a nominal sum and get the benefit of the experiment station there? That seems to me to be the proper thing for those people to do.

Dr. TAYLOR. The problem there, Mr. Wilson, at the present juncture, is the maintenance of the investigational work in the future, now that the owners of the lands are going out of business and are subdividing and selling their property for other uses. This leaves the department without buildings or equipment, and those must be provided.

Mr. RUBEY. The statement has been made repeatedly that those owners have sold their land and are going out of business. If a considerable percentage of those men have sold their lands and have gone out of business, leaving only a small number that are continuing in business, then why is it necessary for the Government to take up this particular phase of the work? That is what I want to get at.

Dr. TAYLOR. I think that situation is simply in this shape, that the people who are going out of business are all large concerns who have been doing business in large units, owning their own wineries and doing their own distribution of products through the East: and that the people who have not sold, because they have not had purchasers, are the very large number of small owners, who are just as heavily involved, relatively, as the large ones, but who are left stranded.

Mr. HUSMANN. I would say, further, in answer to that argument, that very few people are going out of the vineyard business, whether it is wine grapes or table grapes. These large concerns have sold out to people who are now subdividing this property and selling it in small tracts to persons who will still continue in the business. The Fresno property, however, happens to be an exception to that; that has changed hands; and the party who has purchased it is parcelling it out in 20 and 16 acre blocks.

Mr. JONES. How many propositions have been made to sell the property to the Government for any purpose that the Government wants it for?

Dr. TAYLOR. I could not say; none have come to my knowledge.

Mr. TINCHER. There are three kinds of grapes produced in California. The Government has destroyed the market for the wine grape; that is the theory, is it not?

Dr. TAYLOR. Roughly; yes, sir.

Mr. TINCHER. The lands on which these grapes grow is worth \$600 an acre at the present time, is it?

Dr. TAYLOR. No; not generally; not the typical vineyard land: these particular sites are.

Mr. TINCHER. The lands that you propose to buy for the Government will cost \$600 an acre?

Dr. TAYLOR. Yes, sir.

Mr. TINCHER. There has not been any depreciation of the land on which the wine grape is grown in California, has there?

Dr. TAYLOR. Speaking in broad general terms?

Mr. TINCHER. Yes.

Dr. TAYLOR. I do not know.

Mr. TINCHER. The lands on which they grow the wine grape will grow the table grape, or they will grow the raisin grape; is not that true?

Dr. TAYLOR. The climate is the determining factor in the raisin-grape question.

Mr. TINCHER. I am talking about the soil?

Dr. TAYLOR. We do not know as to that.

Mr. HUSMANN. I would like to answer that question a little further, if I may be pardoned for interrupting so often. When you come to the consideration of wine-grape vineyard, you find that a large portion of those lands are absolutely unfit for horticultural purpose.

Mr. TINCHER. Except for the growing of the wine grape?

Mr. HUSMANN. Yes, sir.

Mr. TINCHER. I understood you to say a little while ago that those large plantations have been cut up into small vineyards and sold?

Mr. HUSMANN. Not into small vineyards. That particular property is being parceled off into small holdings. The parties who are buying those holdings are going into all kinds of business; what it may be, I do not know.

Mr. TINCHER. What do they pay an acre for that land?

Mr. HUSMANN. I consider \$600 an acre in the neighborhood of our vineyard exceedingly reasonable.

Mr. TINCHER. Is there a market for that land at \$600 an acre; are individuals coming in and buying it?

Mr. HUSMANN. Yes.

Mr. TINCHER. Do you think the Government ought to appropriate money for assistance to those people by reason of the fact that the adoption of the eighteenth amendment to the Constitution deprived them of a market for their wine grapes, when the men who want to go in there and buy those lands have to pay \$600 an acre for them? Ought we to make this appropriation for that purpose?

Mr. HUSMANN. I do not quite understand your question.

Mr. TINCHER. I understand that you ask for an additional appropriation of about \$100,000 by reason of the adoption of the Eighteenth Amendment to the Constitution having injured the property and business of the California wine-grape growers. I understand that the men affected by that amendment are the men who own the wine-grape vineyards and that they are cutting them up and selling them in small tracts at prices of about \$600 an acre?

Mr. HUSMANN. No; the wine-grape growers are not cutting them up into small holdings; and, with the exception of this particular property on which the department's experiment vineyard is located, the people who are buying the lands, as near as I can ascertain (and I am quite sure that I have the correct information in regard to the

great majority of the holdings) are going right ahead in the grape business.

Mr. TINCHER. Those people are growing what kind of grapes?

Mr. HUSMANN. They are mostly table and raisin grapes.

Mr. TINCHER. I understand that you are asking for more than \$100,000 now by reason of the effects of the Eighteenth Amendment on the wine-grape industry?

Mr. HUSMANN. Yes, sir.

Mr. TINCHER. What I would like to get at, before I would be willing to vote for spending the Government's money for such a purpose, is just what is the reason for spending the money? I realize, for example, that the distillers in Kentucky and other places will have to make other uses of their property from those which they made before the adoption of that amendment.

Mr. CORBETT. May I answer that question?

Mr. HUSMANN. Yes.

Mr. CORBETT. The situation, as it occurs to me, is this: What we are asking for, or what is proposed in this proposition, is an appropriation to preserve the valuable collections of vines which the Government has brought together on these two particular tracts, and it has nothing to do with the general economic condition which you are discussing. What is proposed in this is to make it possible to continue the work for the benefit of the general industry of California, which is based, as Dr. Taylor has told you, upon the European varieties—for the benefit of the general grape industry there rather than to attempt to reimburse anybody for losses growing out of the constitutional amendment.

Mr. TINCHER. Let us be specific now. I do not know what you scientists have in mind. What do you intend to do? Do you intend to keep on growing the wine grape? Is that what you mean—to preserve the wine grape?

Mr. HUSMANN. One of the big problems at the present time is to find out if there are other uses for those wine grapes. We do not want to destroy the wine-grape vineyards if we can find a use for those grapes.

Mr. TINCHER. You do not want the Government to appropriate money to encourage the retaining of the wine-grape vineyards—and not to change them to some other kind of vineyards, but to find a use for the wine grape?

Mr. HUSMANN. Of course, there is a large investment in wine-grape vineyards in California.

Mr. TINCHER. I understand that the wine grape is selling for more to-day than it did before the adoption of the constitutional amendment.

Dr. TAYLOR. That is the grape grown down in the Fresno country; that is entirely different.

Mr. TINCHER. That is the wine grape, is it not?

Dr. TAYLOR. That is the sweet wine grape. Up in Mr. Lea's district they grow a very different kind of grape from that grown in the Fresno section.

Mr. TINCHER. That is a sour wine grape, is it?

The CHAIRMAN. Do you desire to be heard, Congressman Lea?

STATEMENT OF HON. CLARENCE F. LEA, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA.

Mr. LEA of California. I think I can make that a little plainer, Mr. Chairman. My district grows the same kind of grape as Mr. Curry's district, in which it is proposed to locate one of the experimental vineyards. Under existing conditions the cost of a vineyard in that section, putting the vines in, etc., is about \$250 an acre.

The great problem now is to take those grapes, which have heretofore been useless except for sour wine, and convert them into some commercial product so that those vineyards that are now useless can be utilized.

As to the price; a good price has been realized generally for grapes this year, and the grapes from our district bring the highest price of any sour grapes in California. The other day I saw a man from our home district, who told me that he had sold his grapes for \$28 a ton; and the grapes have been sold there, I think, at prices ranging from \$20 to \$50 a ton; there has been a great variety in the prices.

Mr. HUSMANN. They have sold as high as \$85 a ton.

Mr. LEA of California. This man that I spoke of, followed those grapes up to New York and found that those same grapes were sold in New York at \$100 a ton. There were 35,000 car loads of grapes shipped out of California, which largely went to prohibition territory and were used by individuals in making wine. Of course that is not a satisfactory market for our grapes. The people of California can not depend on a violation of the law to furnish them a market for the product of their vineyards; and it would be a great thing for our grape-growing industry if it could find some method of utilizing those grapes. We have 170,000 acres of wine-grape vineyards in California that cost us somewhere around \$250 an acre; and it would be a great contribution to the prosperity of the State if those vineyards could be utilized for some legitimate commercial purpose.

Mr. TINCHER. It would hardly be proper, however, for the Government to appropriate money having for its object encouraging the continuance of the production of the sour-wine grape, because we know that the only use of them will probably be illegal use for wine making.

Mr. LEA of California. That is a very pertinent question. The object of this is just the contrary. Not to use those vineyards for the purposes for which they have hitherto been used, to continue to use them for that purpose, is a thing that ought not to be done and can not be done; but the proposition here is to use those vines for a lawful purpose, and if we can find a way to use them in some other way than for wine, they would supply food products for the people of the Nation and for foreign markets.

Mr. TINCHER. I would like to ask how much money the State of California has appropriated for that purpose?

Mr. WILSON. I was about to ask the same question.

Mr. LEA of California. The State of California began appropriating money for the development of the grape industry 40 years ago and has appropriated about a quarter of a million dollars for that purpose.

Mr. ANDERSON. Has the State any experimental vineyard or anything of that sort?

Mr. LEA of California. Nothing, except the Davis Experiment Farm.

Mr. WILSON. Why does not the State take this matter up and work it out? Why do they want the United States Government to do it?

Mr. LEA of California. The agricultural department in California is working on this problem, which is simply one of a number of industries that the agricultural department encourages. The various States of the Union are doing what they can along various lines, but the efforts along this line are entirely analagous to other efforts made by the Federal Government to encourage and develop industry. There is no problem that is presented to this committee where there is a more specific object to be attained or where a more definite accomplishment is highly desirable.

The CHAIRMAN. Thank you very much, Mr. Lea. Dr. Taylor, how many experiment stations are maintained in California by the Federal Government?

Dr. TAYLOR. Only one, the Plant Introduction Garden at Chico. There are in this viticultural work a number of small cooperative vineyards, occupying a few acres in each place, which will now have to be abandoned.

The CHAIRMAN. Will any be abandoned?

Dr. TAYLOR. They will all be abandoned except these two now under construction. If this purchase were authorized, it would leave the department owning the plant introduction garden at Chico and these two viticultural field stations.

The CHAIRMAN. Were they supported out of this item?

Dr. TAYLOR. They were supported jointly by the department and the owners of the land.

The CHAIRMAN. The ones to be abandoned?

Dr. TAYLOR. They were supported out of that, but the support there was a matter of only \$200 or \$300 a year at each place.

Mr. CORBETT. Some of them were only \$50 or \$75 a year.

Mr. ANDERSON. Dr. Taylor, do we understand correctly that the figures that you are giving are in the nature of an estimate; I mean, is the department officially recommending the expenditure?

Dr. TAYLOR. The situation is this, Mr. Anderson: The question came to a head after the estimates were submitted. The California organizations began to put up to the department the question of the continuance and development of this work through their Senators and Representatives. We have made a careful study of the situation, and on the 10th of this month I submitted what is substantially this statement [indicating] to the Secretary, who yesterday, following the reference to the matter in the hearings the day before yesterday, authorized me to present this to the committee.

The CHAIRMAN. As a supplemental estimate?

Dr. TAYLOR. It is not submitted as a supplemental estimate by the Secretary, but is placed before the committee for its information.

Mr. ANDERSON. What I want to know is whether the department is recommending this estimate or not?

Dr. TAYLOR. The Secretary has not formally recommended this expenditure. That would require the submission of a supplemental estimate through the Secretary of the Treasury.

Mr. JONES. Why should not the Government mark that up to profit and loss in the same way that private interests have to do under the operation of this constitutional amendment as to the amounts already invested in that State?

Mr. McKINLEY. The Government has not invested anything out there.

Mr. JONES. They certainly have investments out there that they want to preserve.

Dr. TAYLOR. In so far as the monetary part of it is concerned, that is a minor element in it. If there is anything in this work at all, the value of the work is in the increase of knowledge which can be applied practically in the production of useful products.

Mr. TINCHER. Dr. Taylor, there is one county in my State that has been a great apple-growing county ever since I can remember, the conditions being peculiarly adapted to the growing of apples suitable for making applejack. Do you think that an experimentation should be made in that county to show the people there some other use to which they can put those apples?

Dr. TAYLOR. I do not happen to know the circumstances. I do not know whether they have invested large sums of money and are dependent on the sale of applejack for their bread and butter.

Mr. TINCHER. Some of them have become millionaires by selling applejack or by selling apples to the manufacturers of applejack. Of course, now they will have to find some other use for those apples.

Mr. LEA of California. May I answer that question, Mr. Tinchler? I think the question very well illustrates the gist of this matter that is being presented. The situation in the two cases is entirely different. There are many ways of using the apples to which you have referred without making applejack out of them. In the case of these wine grapes in California, we have there 170,000 acres of those grapes, a large portion of which can not be used for any other purpose, unless some method of using them is found as a result of these experiments.

Last year those vineyards produced \$20,000,000 worth of products. If you can take those wine grapes that can not be used for the manufacture of wine and use them in making some food product that would be worth \$20,000,000, it would be a very good investment for Congress to make this appropriation.

Mr. ANDERSON. Is it a fact that these lands upon which the wine grapes are grown are not useable for producing anything else?

Mr. LEA of California. As to part of them that is true. Part of those are good lands and part of them are of no value for any other purpose. In my home county, for example, one company had 5,000 acres of land which originally was of no value; it was actually waste land; it was so much waste land that it was not assessed. The company spent hundreds of thousands of dollars in preparing that land for vineyards, and recently they sold that property for 20 per cent of what it cost them to improve it, and the vineyard company went out of existence. That land will be taken up eventually by small holders. But a lot of that land is good land. What I want to call to your attention is the fact that the vineyard which was put on the land to which I referred was worth much more than the land itself; and that is frequently the case.

Mr. TINCHER. That goes back to this proposition, that what the California vineyard owner wants is for the Government to fix some way by which he will not have to abandon his land for the growing of sour grapes, such as are grown in your district, but can keep on growing those grapes and find some other use for the grapes?

Mr. LEA of California. No. The idea is to take that vine and, by grafting, develop a type of grape that will be a food-producing grape instead of a wine grape. The purpose is to protect the industry in the same way that you spend money to eradicate the cattle tick, or destroy rust, or anything of that kind.

Mr. ANDERSON. These vineyards can not continue indefinitely. If you are going to do anything, you should do it in the right way. What is the use of putting \$100,000 into a permanent station? It will take them a year to get the buildings erected, if they work in the way they work on these buildings here in Washington; and by the time you get the information desired it will be of practically no value, and you will have spent the money in maintaining your offices and get nothing out of it.

Mr. LEA of California. The situation is not quite as bad as that. For instance, a man in my district can produce his wine grapes and depend on the markets of South America and Japan. In these hill lands that I spoke of the vineyard is worth four times the value of the land on which it is planted. Rather than sacrifice four-fifths of his investment, a man will struggle along for three or four years, hoping that this industry will reach a successful commercial state when he can realize on his investment; but if he destroys his vineyard, he has destroyed four-fifths of his investment.

Mr. WILSON. Have those people sold their vineyards?

Mr. LEA of California. No; the sales do not amount to 1 per cent of the holdings.

Dr. TAYLOR. I would like to say that it is a fact that the sales have been of the larger holdings and that the people who are primarily concerned in this item and who are facing the greatest injury to their business are the smaller producers.

Mr. JONES. The people who have bought this 1 per cent of the land that the gentleman speaks of—what do they propose to do with it? Do they propose to continue the vineyards?

Dr. TAYLOR. In places where they see any chance of being able to convert their vineyards into the production of raisins, I should say they would go right ahead with raisin production.

Mr. JONES. You say about 1 per cent of those lands have been split up into smaller tracts. What are the purposes of the purchasers? Do they propose to keep up the wine vineyards?

Dr. TAYLOR. Those particular vineyards are growing a grape which produces raisins as well as sweet wine and brandy.

Mr. JONES. Then the wine-grape vineyards are not changing hands very rapidly?

Dr. TAYLOR. The big ones are breaking up; the small ones are not salable.

Mr. MCKINLEY. Is not the reason for the proposition that is being presented that one-half the wine-grape industry is in the hands of small holders, on lands that they can not use for other purposes, and they feel that the United States Government, having put them out

of business, ought to assist them, at least, to develop their grapes into some kind of grapes that can be used for raisins or something of that kind?

Mr. LEA of California. That is the real problem. I live among those vineyards; there are 16,000 acres of those vineyards in my county. A large percentage of them is on land that is of little value for any other purpose. The people who have the vineyards on the best of those lands do not excite my sympathy so much, because they can convert their lands into the production of other products in a few years; into a prune orchard, for example, or something like that; they have solved their problem. But the poor fellow who went up into the mountains and worked there 20 years and dug up the rock and put the labor of his life into those vineyards, in which four-fifths of the value of the vineyards is in the vines—the small farmer who, just as you suggest, conducts the greater portion of the whole industry, is the man who deserves the most consideration.

The CHAIRMAN. Your suggestion is to find a substitute for the wine grape that he has been growing?

Mr. LEA of California. Yes, sir; and not to use it for wine.

Mr. ANDERSON. In order to accomplish that result do you think it necessary to put this on a permanent basis by the purchase of land and the erection of concrete buildings on the land?

Mr. HUSMANN. I would like to answer that question, if I may. The department's viticultural work on this particular plot, in which Mr. Lea's district is particularly interested, has been going on since 1903. We have made all these plantings and have done all of that work; and right now, at the crucial time, when we should get busy and show those people what to do with those grapes, the property is to be taken away from us. The experiment vineyard, as stated before, is on leased property.

Mr. ANDERSON. Has that lease expired?

Mr. HUSMANN. Not on that particular plot, but it will expire in three years. In the case of the Fresno land, that has changed ownership and we are unable to renew our lease. So that we are really squarely up against it with the Fresno plot and will be up against it with the Oakville proposition. We do not feel, from a department standpoint, that we should squander the Government money in conducting investigations on lands on which we know we can not conduct them long enough to get any results.

Mr. ANDERSON. That is exactly what you have done. You have put money into the establishment of the vineyard, where, you say, you are now confronted with the probability, or practical certainty, of losing the land. That is exactly what you have done, and that is what I am complaining about. After you have started a practically impossible proposition, you come here and insist on our taking it off your hands with an additional appropriation.

Mr. LEA of California. They probably did not look forward to the adoption of the constitutional amendment.

Mr. HUSMANN. Exactly; that is the fact; and this work is of a progressive nature. When this work was started in California, there were two problems confronting California. They had the California vine disease, which was not destroying the vineyards as slowly as the phylloxera has done but was wiping them out by thousands of acres.

Nobody knew what to do to prevent that. The phylloxera was doing the same thing. In one season alone at least 75,000 acres of vineyards were cut off, due to those agencies. When the department first got busy out there we had to do the best we could under the circumstances. We had to do something to help out the industry, and the only way we could do it was to locate this work at those places.

The CHAIRMAN. Thank you, Mr. Husmann. Are you through, Dr. Taylor?

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE—Continued.

Dr. TAYLOR. I would like to read a suggestion for a provision to cover this item. But, first, I would like to say that Mr. Anderson has stated the case exactly, and we accept full responsibility for not foreseeing in 1903 the eighteenth amendment to the Constitution.

Mr. JONES. Why not mark it off and charge it to profit and loss?

Dr. TAYLOR. In so far as our expenditures are concerned, that would be a mere matter of bookkeeping.

The CHAIRMAN. What would be the loss to the Government?

Dr. TAYLOR. We could determine how much we have spent in the whole work during the period.

The CHAIRMAN. What it is worth would be the loss?

Dr. TAYLOR. So far as the monetary value, the selling value of the vines that are there, is concerned, they have no selling value; they can not be transplanted.

The CHAIRMAN. What would be the loss?

Dr. TAYLOR. The loss to the Government would be the interruption of the work.

The CHAIRMAN. The interruption of the work?

Dr. TAYLOR. And the prevention in large part of the beneficial results likely to accrue from it.

Mr. McLAUGHLIN of Michigan. The land is covered and filled with vines in all stages of development, is it?

Dr. TAYLOR. Yes, sir.

Mr. McLAUGHLIN of Michigan. You have all the different grades and varieties which you have developed?

Dr. TAYLOR. We have the largest and most complete collection of vinifera grapes in the world.

Mr. McLAUGHLIN of Michigan. And if you do not continue the work you will lose all those plants and the advantages of all those experiments, as far as you have carried them?

Dr. TAYLOR. Not all of them, because many of the results that have been attained have already gone into the California horticultural industry as they have become evident, but a very large part of the potential value of the work would be sacrificed.

The CHAIRMAN. What do you estimate to be the value of the holdings of the Federal Government?

Dr. TAYLOR. We have no holdings there, Mr. Chairman.

The CHAIRMAN. You have the plantings?

Dr. TAYLOR. They would have no selling value, any more than laboratory material in Washington would.

The CHAIRMAN. What would it cost to replace them?

Dr. TAYLOR. To replace them, to bring those plantings up to their present stage, at the present cost of doing that sort of thing, would amount, I would say, to at least three or four hundred thousand dollars; but they would not have that selling value, because they are not commercial material. My suggestion to the committee is that a practical way of handling the matter would be to merge the existing proviso in the present subappropriation, "For the investigation and improvement of fruits," etc., in a new paragraph providing substantially as follows:

For investigating and developing grape production, including the development of new grape industries and methods of utilizing grapes heretofore used for the production of alcoholic beverages, \$115,250: *Provided*, That of this amount the Secretary of Agriculture is authorized to expend \$87,750, or so much thereof as may be necessary, for the purchase, improvement, and equipment of lands occupied by the department's experiment vineyards near Fresno and Oakville, Calif., now maintained under contracts with the owners: *Provided further*, That the land purchased for the Fresno vineyard shall not exceed 36 acres, at a cost not to exceed \$21,600, and for the Oakville vineyard not to exceed 30 acres, at a cost not to exceed \$22,500: *And provided further*, That the limitations in this act as to the cost of farm buildings shall not apply to this paragraph.

Of the total of \$115,250 carried by this new paragraph, \$87,750 would be required for the purchase of the two vineyard sites, totaling \$44,100, and their improvement and equipment at a cost of \$43,650. Of the remaining \$27,500, \$20,000 represents the present appropriation for viticultural work, and \$7,500 the increased expenditure necessary to carry on the work under present-day conditions. As several of the buildings needed would, under existing conditions, cost more than \$1,500 each, it would be necessary to have an exception made in the limitations of the act as to the cost of farm buildings. This is provided for in the last proviso of the proposed paragraph.

Should the above provision be adopted and incorporated in the bill, the now existing \$20,000 proviso in the subappropriation "For the investigation and improvement of fruits," etc., should be eliminated and the amount carried by that paragraph be reduced from \$88,200 to \$68,200.

The CHAIRMAN. Thank you, Dr. Taylor.

STATEMENT OF HON. HUGH STEEL HERSMAN, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA.

The CHAIRMAN. We will next hear Representative Hersman, of California.

Mr. HERSMAN. Mr. Chairman, I only want to say a few words by way of supplementing the statements that have already been made relative to the purchase of these vineyards, and to answer a few questions.

One of the last questions asked by Mr. Anderson was what loss would be entailed if we gave this work up. At present, there are no buildings on this property. It has only been under the control of the department, and the Federal Government has put nothing

on it but vines. Our monetary loss would be very little if we gave them up.

But can we afford to give them up? That is the question which this committee is confronted with. What have those vineyards, that have no buildings on them, but only vines—what have they meant to the State of California and to the Nation?

The very fact that the Department of Agriculture has conducted experiments on these two little plots in California has possibly saved to the State of California their whole grape industry, both raisin grapes and wine grapes, by finding something that could combat the phylloxera that was destroying the vineyards. I have seen thousands of acres cut down in a few years. The experiments conducted by the State of California and the Federal Government have shown the method to be used and have saved \$40,000,000 worth of property.

MR. ANDERSON. Will you allow me to ask you a question? My whole objection to this proposition is involved in the Government buying this land and erecting these buildings; that is, establishing a permanent station which the Government itself will have to maintain for all time to come.

If the State of California, or somebody else, wants to buy this land I am perfectly willing that the Government shall furnish all the expert assistance, all the scientists, and everything else that is necessary to cooperate with the State to do this work; but I am not willing for the Federal Government to go out and establish two new stations—to buy the lands and maintain them perpetually.

MR. HERSMAN. Let me answer your question under these two heads: First, can we afford to lose the benefit of 13 years of experimental work; and, second, who should pay for these vineyards? The United States Government has spent 13 years in experimenting on these two tracts and, as a result, if these vineyards are not secured, this most valuable work will be lost. Either the Federal Government or the State of California should see that these vineyards are purchased while it is possible to do so.

MR. WILSON. Why not let the State of California purchase this plant, as Mr. Anderson suggests, and then let us furnish the expert assistance?

MR. HERSMAN. I am going to answer the two following questions: First, can we afford to lose them; and, second, should the Federal Government purchase them? For 13 years the Federal Government has had direct charge of these two tracts. The Fresno tract is near the city of Fresno, one of the richest sections in California. This land was owned originally by the California Wine Association, which owned 600 acres in one large vineyard, and in this same section a short distance away owned 3,000 acres in another vineyard. They gave the United States a long lease upon this land in order that experiments should be carried on, not only for their own benefit, but for the benefit of every grape grower in the Nation.

Now, under the Eighteenth Amendment to the Constitution, the California Wine Association finds itself in a position where it is forced to dispose of all its holdings and is proceeding to do so. Just who will get these particular tracts or what disposition will be made of them is hard to say. The time to purchase is now, while it can be

done, in order to save the valuable work that has been carried on by the Federal Government.

There are at present 210,000 acres of raisin and also 180,000 acres of wine grapes in the State of California, besides large areas of grapes in other States. Unless some method is found to utilize the wine grapes of the Nation by converting them into sirups or beverages or by drying them, all these 180,000 acres will be an economic loss to the Nation. Only through scientific experimentation can this be hoped to be done, and it must be done at once; otherwise the vineyardists will not be able to continue the cultivation of their vineyards under the uncertain conditions.

The Legislature of the State of California does not meet for two years. It will take 60 days after its adjournment before any law would go into effect. It would take at least until the spring of 1922 before any relief could possibly be expected from the State of California, and as this work must be done at once, the Federal Government having already undertaken and carried it on for 13 years, it would seem to me incumbent upon us to continue this work that means so much not only to the State of California but to other States and the Nation, and to save this great loss that will surely come about unless a method is quickly discovered by which this large acreage of wine grapes can be converted to some other economic use.

Last year under war-time prohibition it was possible to ship the fresh grapes East and have them made up by individuals into wine; under national prohibition, this can not be done. The owners of these vineyards are confronted with absolute loss unless some relief is immediately undertaken.

The second question, who should purchase these vineyards, I have partly answered. Four years ago no one could have looked forward to the speed with which prohibition has swept this Nation. At least, no one expected that the wine industry of the Nation would be so completely wiped out in such a short time. Up to the present time the Federal Government has lent every encouragement to increasing the acreage of wine grapes. All the State governments have encouraged their people in planting and securing the right varieties, have kept experts in the field, and by every means have lent their aid an encouragement to the planting and increasing the acreage of wine grapes in the Nation. This has resulted in California having 180,000 acres in wine grapes. The men who own these vineyards are in large part small, individual owners whose only means of livelihood is derived from the cultivation of their vineyards, and with national prohibition they are threatened with bankruptcy with no means except the labor of their hands to educate and provide for their families.

So it seems to me that there is a moral obligation resting upon the whole people to see whether some method can not be devised to utilize these grapes so that the innocent people should not suffer from a decision that the Nation felt must be brought about. One hundred thousand dollars is very little to appropriate with the idea in view of saving many millions of dollars' worth of property, and it seems to me that there is a moral obligation resting upon the people of this Nation to do everything they possibly can to save this property which, through no fault of the owners, is now being taken away from them. As I have intimated, it is impossible to secure

this relief from the Legislature of the State of California. There is no other agency to which we can appeal but the Federal Government, and I have every belief that they will do justice to the unfortunate vineyardists of this Nation.

Mr. JONES. Would you go to the extent of reimbursing everyone who has suffered loss by reason of the adoption of the eighteenth amendment?

Mr. HERSMAN. No; I am not advocating that.

Mr. JONES. Where would you draw the line between the California wine growers and anyone else who has suffered by the adoption of that amendment?

Mr. HERSMAN. I would not draw the line. If anything can be done, as Mr. Tincher suggests, to save the apples grown in his district that have been used for the manufacture of apple jack—if they can be saved by a small appropriation—I say I believe it should be undertaken. The moral obligation rests upon us all to pay a little more taxes, to try to find a way by which this property can be saved. Not only that, but I believe it is a splendid investment for the Nation to appropriate a small amount of money in order to save a vast sum to the resources of the Nation. Ordinary business judgment would prompt a business man to appropriate a small sum in order that a large sum may be secure. Those who advocated national prohibition should have been willing to say, "I not only believe in it, but I am willing to put my hand in my pocket and help to pay for something that I believe will not only do me good but will do the Nation good." This compensation was not provided for under the eighteenth amendment, but there is a way by which a little money can now be advanced which possibly may result in saving a large part of this investment which otherwise would be lost to the Nation.

Mr. RAINY. The people of California are very seriously interested in this matter. What objection is there to the State taking over this land and having the Government appropriate sufficient money to develop it?

Mr. HERSMAN. There is a very serious objection. I say I believe it is the duty of the Federal Government to do it. At this time it is the only agency that can do it. I believe it is the duty of the Federal Government under the circumstances to appropriate at least the \$100,000 requested, and I thoroughly believe that we can not afford to lose this experimental work that has been going on for 13 years. It is of great value to the future development of the grape interests of the Nation.

The CHAIRMAN. Thank you, Mr. Hersman.

Mr. WILSON. I would like to know what the State of California has done along this line. Nothing has been said about that.

Mr. JONES. And what it proposes to do.

The CHAIRMAN. We will now hear Mr. Barbour.

STATEMENT OF HON. HENRY ELLSWORTH BARBOUR, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA.

Mr. BARBOUR. I would like to reply to that question and to Mr. Anderson's question a few minutes ago.

The State of California has spent a great deal of money in the interest of the grape industry. They carry on the work at various stations. I do not know whether you would call them experiment

stations or not, but that is what they are in fact. They have one large vineyard just outside of Fresno which was willed to them by a wealthy citizen of the State, who died and left the property to the University of the State of California for experimental purposes and for the purpose of developing and bringing to a high state of perfection the vineyard industry.

The principal lines of activity that the State has been engaged in have been in connection with the management and operation of vineyards; for instance, correct cultural methods, the proper way to prune the vines, and so on. The State is very active along those lines. At the present time it is the policy, and in recent years has been, for representatives of the State of California to go down through the vineyard districts and hold demonstrations in the various sections. The farmers from the neighborhood gather together on certain days, and the experts from the State agricultural department are there to show them how to prune their vines and so forth. At the head of that activity is Prof. Biolotti, who is considered the foremost expert in the world on this question of pruning of vines.

Then the State's representatives instruct the grape growers in the manner of cultivating their vineyards, sulphuring their vines to protect them against mildew, red spiders, and so forth. All those activities are carried on by the State of California. The State is not idle, and is not penurious in doing what it can to help this industry along.

Mr. ANDERSON. I have always thought that the State of California was very liberal in internal matters of every sort.

Mr. BARBOUR. I believe it is.

Mr. ANDERSON. I have always thought that, and I could not just see why you were asking now that the Federal Government undertake this proposition as a permanent, continuous proposition, involving the ownership of the land, the construction of the buildings and everything else.

Mr. BARBOUR. For 15 or 16 years the Federal Government has carried on this work, and, as Dr. Taylor has said, they have the finest experimental station of this kind existing anywhere in the world. The work is carried on under the supervision of the experts of the Department of Agriculture, who are better qualified than anyone else. It seems to me that, if your position is a logical one, we could simply say, "Let the eradication of the cattle tick be left to the State of Texas or the State of Mississippi; let the cotton-boll weevil be left to the Southern States," and we could go right down the list and wipe out all these activities of the Department of Agriculture that are carried on in the interest of the farmers of the country. The same process of reasoning that would apply in one case would apply in the other.

Mr. ANDERSON. I do not think those cases are analogous at all. I think that might lead to the conclusion that the experiment stations in the various States should be owned by the States in every instance, and I am not so sure that that is not the proper policy.

Mr. BARBOUR. I would not contradict you on that proposition; it might be a good policy.

Mr. YOUNG. AS I understand it, one of these leases has expired or is about to expire?

Mr. BARBOUR. The lease will expire in three years, I believe, as to the station in Napa County, and the other one, at Fresno, has already expired or is about to expire by reason of the sale of the property.

Mr. YOUNG. That is what I am getting at; the Government has all of those vines, etc., on those two leased properties?

Mr. BARBOUR. Yes, sir.

Mr. YOUNG. So that in the case where the lease has already expired, or is about to expire, if this sale of the property is made, the Government will lose all that it has done on these experimental farms?

Mr. BARBOUR. Absolutely.

Mr. YOUNG. And the lease on the other property will be in the same position in three or four years?

Mr. BARBOUR. Yes, sir.

Mr. YOUNG. So that, as far as the Government itself is concerned, it is vitally interested in this proposition, in view of the fact that it has the result of 14 years' work on these plots?

Mr. BARBOUR. Yes, sir.

Mr. YOUNG. And to some extent it is a matter for us to consider what the Government is going to do to protect the vital interest which it now has on these plots of land?

Mr. BARBOUR. Yes, sir.

Mr. YOUNG. And somebody should carry on that work, whether it be the Federal Government or the State of California?

Mr. BARBOUR. Somebody should do it. The Federal Government has been carrying on that work, and naturally the people of California are looking to the Federal Government, which already owns what is there in the way of improvements and the vines that exist, to continue to carry it on.

The question has been asked as to what those vines would be worth in dollars and cents if they were pulled out and sold. They would be worth nothing. But when it comes to their value as a matter of education that they afford to the people engaged in the vineyard industry, you can not measure their value in dollars and cents.

Mr. JONES. When the Government started to make these plantings and these vineyards it was on leased land, was it not?

Mr. BARBOUR. Yes, sir.

Mr. JONES. They knew or thought at the expiration of the lease that they were going to lose all the improvements that they had made on the land, or did they start to make the improvements upon the theory that ultimately they would buy the lands?

Mr. BARBOUR. I do not think they had any theory of that kind.

Mr. JONES. When a man makes improvements on leased land, he knows that at the expiration of his lease he is going to lose his improvement, does he not?

Mr. BARBOUR. I do not think that was done in this case, for the reason that the vineyards were on property owned by the California Wine Association, which was engaged in producing wine grapes and manufacturing them into wine on a very large scale—probably on as large a scale as anybody. That was the business in which they were engaged. This was part of the property upon which they were producing the grapes to manufacture into wine. Nobody foresaw that prohibition was coming along and that the California Wine Association would have to go out of business.

Mr. ANDERSON. Somebody must have foreseen it, because the lease itself contained a provision that the lease was void in that event.

Mr. BARBOUR. I understand that was the arrangement.

Mr. ANDERSON. The people who own the land must have had some expectation of that.

Mr. BARBOUR. But the company has provided in its contract for the sale of this property for the right to reserve the 36 acres of land for sale to the Government at a price of \$600 an acre; fortunately, they have reserved it at the price of \$600 an acre.

Mr. JONES. What I am getting at is this: If the Federal Government made a lease for 13 years, is it not to be presumed that that was the life of the experiments they proposed to make? If I lease property for 5 years, or 10 years, or any other term, I try to fix the term according to the use I intend to make of the property. The Government leased the land for 13 years, or whatever the period was; and was it not the thought of the Government that that would be the time that they intended to carry on the experiments?

Mr. BARBOUR. I do not think it follows that the term of a lease determines the period of activity of the lessee. In the case of a merchant, it does not indicate that he intends to go out of business in five years if he makes a lease of property for five years. The Government went into this thing on a small scale, and it has grown and grown and has become a much bigger thing than anybody foresaw.

Mr. WILSON. Mr. Chairman, I think we have gone into this matter about as far as we can to-day, have we not? There are several other Members of Congress to be heard.

Mr. RUBEY. Mr. Chairman, Representative Osborne, of California, desires to be heard on this proposition.

Mr. BARBOUR. I want to add, in reply to Mr. Jones's statement, that the Government has paid nothing for these lands.

The CHAIRMAN. Thank you Mr. Barbour. The committee will now hear Mr. Osborne.

STATEMENT OF HON. HENRY Z. OSBORNE, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA.

Mr. OSBORNE. Mr. Chairman and gentlemen of the committee, this is a great committee, having to do with a great department of the Government. It is a department of the Government in which the agricultural and growing interests of the country are deeply interested. You do a great work; you have done a great work in lines that are analogous to this in which we are now seeking to interest you.

This industry in California, figuring on the value of the land involved, represents somewhere in the neighborhood of \$50,000,000, without including anything for the value of wineries and other accessories of this industry. We in Congress have done something that affects this industry in a very serious way; it does not entirely eradicate it, but very largely so.

While you are looking around for things to do that will be of value to the farming community, why is it not well to look at those things where you can avoid evil; where you can avoid the evil consequences of what has been done in a conscientious way? Mr. Chairman, I have always felt reluctance, and I presume every Member

here has, to voting even on what appeared to be a great principle, where it would have the effect of ruining or greatly injuring large bodies of our people. I have felt as if in some way we ought to make reparation.

I will go back further than the present; I will go back to the Civil War, and say that in my heart I believe we as a country may have done a great injustice to the South when we freed the Negroes in the South and abolished that enormous property interest without giving any compensation for it. Its only justification is that it was done as a war measure—as an act of belligerency. That we did so then—that we did that which was at least questionable—is not a good reason for doing another act which is questionable.

My point is this: The people of California have produced, I think, something like 90 per cent of the wine of the country; so that it is not a fair comparison when you compare that industry with the industry that produces applejack in a county in Kansas. In this case you are dealing with millions of dollars, and in the other you are dealing with hundreds or thousands.

Now, gentlemen, a great deal of good is done in these agricultural experiments in one way or another. I have in mind a wonderful example that occurred in California many years ago. At one time, about 35 or 40 years ago, I remember that the orange orchards of the southern part of California were attacked by what is known as cotton cushiony scale. They sent a man all the way to Australia to find a remedy for that scale. It looked as though the whole industry was going to pieces. The orange orchards were as white as snow with this cotton cushiony scale that had fastened itself on the leaves and bark of the trees. The insect would lay about a million eggs; those eggs would hatch out, and then those insects would lay millions more of eggs, so that in a short time the orchards were completely covered by the scale, and eventually they must have died. So they sent out to Australia—either the United States Government or the State of California; I think they did it jointly. They brought back a parasite which attacked this cotton cushiony scale and destroyed it, and it absolutely saved the citrus-fruit industry in California and made it what it is to-day. At that time we were shipping out about 1,500 carloads of oranges annually. This last year we have shipped out 50,000 carloads of oranges. That salvation of the citrus-fruit industry was all due to the wiping out of that cotton cushiony scale and other insect pests.

I regard this present question from the broad standpoint of doing what we can to ameliorate what is admittedly a hard situation. In the southern part of California we are not quite in such a bad situation as they are in the north, because our grapes are sweet grapes and can be utilized to a greater extent than theirs. In the northern part of the State the grapes are worthless unless they can find some new way of using them.

I sincerely hope that the committee will do what my friends in the northern part of the State have asked, which seems to be a reasonable thing, and which will probably, in some degree, mitigate the terrible losses with which they are threatened.

You understand that the largest portion of these lands are owned by poor people, in small tracts. There are a few very large tracts;

but the great bulk of the vineyards are owned by poor people, who have been encouraged equally by the State of California and the National Government, through this very Agricultural Department, to carry on that industry. You have done very valuable and interesting work on the subject of horticulture, and you have encouraged the industry; and now it seems to me that there is a sort of a moral obligation that you should do what you can to remedy the evil, which you did not intend as an evil, but which has proved so to those people.

The CHAIRMAN. There seems to be no question as to the importance of this proposition. You will recall, however, that a number of years ago the Federal Government committed itself to a certain policy with respect to experiment stations, which was to contribute to the support of one experiment station in each State. If we now decide upon adding two more California would have four while the other States of the Union, with a few exceptions, have only one.

The question seems to be whether we are justified in establishing four experiment stations in California, when we have only one each in most of the other States. Could the matter be disposed of by the Federal Government making a liberal appropriation to carry on experiments for this particular work without committing it to a number of stations which are to be made permanent and which will have to be appropriated for annually? I wish you would give the question thought.

Mr. OSBORNE. I could not pass judgment upon that for the committee. I am not prepared to do that; but I will say that the stations that are proposed to be continued are in the very heart of the national grape industry and that the benefit of the experiments would not be confined to the State of California.

The CHAIRMAN. That is true of every station, of course. We are grateful to you for your statement, Mr. Osborne.

We will hear Judge Raker next.

STATEMENT OF HON. JOHN E. RAKER, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA.

THE AMERICAN NUT-PRODUCING INDUSTRY AND WHAT IT NEEDS FROM CONGRESS.

Mr. RAKER. The United States last year produced approximately twenty-seven million dollars' worth of Persian (English) walnuts, pecans, and almonds, its three most important nut species. There were also produced probably some two or three million dollars' worth of minor nuts, such as black walnut, hickories of the various kinds, butternuts, filberts, and chestnuts, making a total of close to thirty million dollars' worth of nuts. It annually imports twelve or thirteen million dollars' worth of foreign nuts. Therefore the total consumption in this country is probably between forty and forty-five million dollars' worth.

Production and consumption of nuts are being greatly stimulated in this country by virtue of the decreased grazing areas on which to produce beef and the necessity on the part of greatly increased population to find other sources of protein, fat, and carbohydrates. Farmers are finding the production of nuts one of the most profitable

uses to which suitable soils can be put. Many are becoming wealthy out of this industry, while others are losing money for lack of intelligent information as to proper section in which to plant, proper kinds, reliable sources from which to obtain planting stock, knowledge as to cultural needs, or, finally, a ready market.

The Federal Department of Agriculture has done much toward obtaining and disseminating the needed information of this character. Several of the States have likewise made important contributions along the same line, particularly California, in aiding both the walnut and almond industries. There is still much to be done. In fact, the greater and more important these various industries become, the more they need the assistance of the best possible expert investigation that can be had. There are successive stages of development through which these industries, in common with all horticultural industries, must pass to become substantially successful on a large scale. At present the Persian walnut industry is ahead of all others in development and organization. The almond industry ranks second and that of the pecan third. Production of black walnuts, hickories, and others of the northeastern quarter of the United States is strictly in the experimental stage as an industry.

Beginning with the new industries and continuing through to those most highly developed, some of these successive stages are as follows:

1. The merits of the species must first be determined. It must prove to have a product worthy of time and money by intelligent farmers.

2. The most perfect types or varieties must be selected and made available. Many thousands of farmers are to-day producing varieties of nuts of second or third-class merit. Such varieties are equally as expensive or difficult to grow as are others producing a product worth several dollars more per tree. Every dollar's worth of a food product that a tree produces less than it might produce is a dollar added to the cost of production and therefore to the high cost of living.

3. The question as to where the species will succeed must be determined. Next it must be shown which varieties will succeed best in the various parts of a general geographic territory. For example, the Persian walnut has been found at the expense of the growers themselves to be quite unsuited to growth in the Southern States and hardly capable of adaptation in any State east of the Rocky Mountains. It is not profitable on the Pacific coast except in certain localities. Within these localities there are such differences of local conditions that varieties which are highly successful in one place will not necessarily succeed in another. Southern California, where approximately 97 per cent of the total American crop is produced, confines itself to a South American type, whereas in the Northwest types from western Europe succeed best. With the almond, the situation is much the same, except that it is even more exacting in its requirements. It does not succeed east of the Rocky Mountains and is highly exacting as to conditions on the coast. It blooms with the first approach of spring over a period extending from late January in some years till early March in others. It must be grown, so far as possible, in localities in which there is a minimum of danger from

killing temperatures after the buds begin to swell. Very few of its varieties are capable of pollinating their own pistillate flowers. They must be intelligently interplanted to insure interpollination from the staminate flowers of other varieties blossoming at the same time. The pecan covers a tremendous area—practically the southern half of the country east of the Rocky Mountains. It is either indigenous or has been planted in every State between New Jersey and Texas and from Iowa to Florida. Yet Florida varieties will not succeed in New Jersey or Iowa, or vice versa. Texas varieties do not succeed in Florida, but Florida varieties do succeed in Texas.

4. How to cultivate and care for nut trees is the next problem. Very often, two farmers on adjoining land, having similar types of soil, the same varieties, trees from the same nursery, planted the same year and on the same day of the month may have entirely different results. One may succeed and the other fail. One may have planted his trees too close together or he may have plowed too close and so broken the roots. He may have used a wrong fertilizer or he may not have known how to combat natural enemies, such as insects, diseases, rodents, or predatory birds. He may have undertaken to grow too many other crops on the same land or he may not have understood the importance of drainage. He may even have produced as good or better crops than his neighbor, but have failed to sell to good advantage. He may have lost his crop by improper care after it was harvested.

5. Beyond the ordinary details of culture, as these nut industries have progressed, there come special problems of too great depth for the farmer to solve or for even the facilities of ordinary research. Already the nut farmer has been compelled to desist from the adequate use of commercial fertilizers, such as he employed before the war. He finds organic fertilizers too expensive, as the materials formerly used in their manufacture are now going into stock and chicken feeds. The mineral fertilizers are similarly high because potash is not yet coming from Germany in quantity and American potash is risky because of borax. The nut farmer is now endeavoring to work out his own salvation by the use of leguminous crops which can be turned under. There, again, particularly in the South, he finds trouble. Certain legumes are highly subject to nematodes, which feed upon their roots, multiply rapidly, destroy the crop, and then attack the roots of the nut trees. Another important problem is that of pruning. Investigations are lately demonstrating that unintelligent pruning often cuts off branches in which food material has been stored for the next season's crop and as a result there can be no crop. Or bad pruning may stimulate wood growth and effectively check the process of storing up crop material for the next year.

6. Business management is a crying need with a high percentage of the nut farmers. The simple taking of individual tree records in orchards has often demonstrated that a great majority of the trees are not paying their way. In such cases it is frequently quite possible to improve the cultural conditions affecting these trees so that their orchard performance can be converted into an asset instead of a liability. Without advice it is easy for the farmer to overexpend in fertilizers, pruning, spraying, or even in labor. He must rely upon the scientist, who advises him in regard to special problems, to

keep also in mind that he (the farmer) is dependent upon the net outcome of his orchard and that if greater profit could be derived from the land by some other use, or combination of uses, he wants to be so told.

7. As the successful production of a crop calls for highly specialized knowledge, so at the present time the marketing of nuts is a highly specialized line. The time has come that without organization there can not be even an approximate standard of condition in which the product is put upon the market or of prices asked or received. The walnut and almond industries are now so organized that approximately 80 per cent of those crops are sold under a standard of grade, package, and price through nonprofit cooperative organizations. The managers of these associations are highly paid efficient men of training and experience. The California Walnut Growers' Association, which is just now completing the marketing of nearly \$15,000,000 worth of nuts, maintains its own staff of investigators, who especially during the war accomplished a great deal in the combating of natural enemies and in developing new uses for walnuts and walnut products. As a result of research work by this staff, that association is now organizing a subsidiary branch of itself for the manufacture and sale at cost to its members of a dust spray which it has perfected.

The nut industry as a whole appears to be but in its infancy. The more highly developed of its American branches have made much progress, but it is safe to say that no horticultural industry of equal importance and so pregnant with possibilities has received so little attention at the hands of the State and Federal departments of agriculture. Over the entire country people are eating nuts as never before, not merely as condiments, but as staple articles of food. Farmers and landowners everywhere are planting nut trees and clamoring for information as to what to plant. Michigan has passed a State law providing for planting nut and other food-producing trees along its highways. Various organizations about the country are advocating the planting of nut trees as memorials to fallen soldiers in France. Thousands are being so planted and it is important that wise selections should be made.

Each nut industry has its special problems which if solved in time will mean the saving of many thousands of dollars to the farmers engaged in this important industry. The almond growers of California are confronted by special problems at this time. One of these is that of varieties. It has a superabundance of varieties. The Exchange reports that about 80 varieties are being grown in the State. The trade knows but five or six. Many of the 80 are so like the 5 or 6 that they can be mixed and sold under such names, although there are differences in their character and merit, especially in the orchard, which are apparent upon close examination. A great majority of the odd varieties are of mediocre value and bring a less price in the market than do the five or six, although they cost more to be sold. The Federal Department of Agriculture has taken up this problem of standardizing varieties of almonds and promises soon to point out their comparative merits in such a way that future planters will be discouraged in using any but the best sorts.

Another problem confronting the almond industry is that of foreign competition. The American market ordinarily consumes al-

monds in the shell only during the fall and early winter, whereas it accepts almond kernels or "shelled" almonds as they are known, for practically the whole year. The cheapness of labor in foreign countries makes it possible for almonds to be cracked by hand before they are exported to the United States and placed here at a price far below that which can possibly be met by the American product, under present conditions. The almond growers have expended approximately \$100,000 in developing machinery for cracking the home product, but thus far without satisfactory success. It needs the assistance of the best engineers in the Government to perfect such a machine. It is imperative that such a machine be developed for this purpose in the near future as during the past five years almond planting in California has taken place at a rate that the home product must be enabled to enter the shelled, or the 12-month market, or production will inevitably soon exceed the supply. Apparently, the development of such a machine depends upon the question as to whether the home product is to enjoy a part of the 4-month trade only or whether it will successfully compete with the foreign product in the 12-month or the shelled market as well.

The California Almond Growers Exchange is urgently calling upon the Federal department to assist it in perfecting still better varieties than those already existing. It asks that this be done by searching the almond districts of southern Europe for varieties better than those already known here; also that crosses be made between varieties, so as to emphasize the strong points of good varieties and to eliminate the weak ones. The perfect variety has not yet been known in this country.

Other problems affecting the almond industry are bound to arise, in the anticipation of which it is exceedingly important that the Federal Department of Agriculture be given facilities for linking up its forces with the industry in effective manner. Present funds are quite inadequate for the purpose.

The CHAIRMAN. Are there any others who desire to be heard this morning?

We will be glad to hear Mr. Lannen.

STATEMENT OF MR. THOMAS E. LANNEN, ATTORNEY AT LAW, CHICAGO, ILL.

Mr. LANNEN. My name is Thomas E. Lannen. I reside in Chicago. I dropped into this committee room simply to get some information. I did not know what subject was under discussion. That subject, as I understand it, has to do with the establishment of more experimental stations in the State of California to promote the grape-growing industry in that State.

For a number of years, up until this prohibition law was passed, I have been the general counsel of the wine and fruit-growing industry of the Mississippi Valley, including Arkansas and Ohio, and for a number of years those people have been endeavoring to get Congress to give some attention to the growing of grapes in the Mississippi Valley, Ohio, Arkansas, and New York. We have never had any attention paid us here in the East, and while I am heartily in sympathy with the position of the California grape growers in trying to save their grapes out there, and I do not want to be understood as

opposing that at all, I simply want to say that some little consideration ought to be given to the grape-growing industry of the East.

Down through the Ozark Valley, in Arkansas and Missouri, and also in Ohio, they have important grape-growing regions. The Ohio grape sections are in the vicinity of Sandusky. Those people are trying to use their product for making grape juice. They have the Catawba, Concord, and other grapes. There are also a number of grape growers in New York and up in Michigan; a large area of land is devoted to those vineyards.

Mr. McLAUGHLIN of Michigan. What is your suggestion?

Mr. LANNEN. I was taken by surprise; I did not know that this matter was to come up.

Mr. JONES. Any experimentation anywhere would inure to the benefit of all grape growers, would it not?

Mr. LANNEN. Not at all, because the situation is entirely different. The California grape mentioned here this morning is an imported grape; our grapes here in the East are native grapes. The grapes that they grow out there are known as the vinifera grapes, and any experiments made there would not do us any good here in the East.

Mr. McLAUGHLIN of Michigan. Those people for whom you are speaking can take care of themselves; and when this committee finds anybody who is willing and able to take care of their own business the committee is inclined to let them do it.

Mr. LANNEN. I am not so sure that they are able to take care of themselves in the present situation. They did not know that this matter was coming up before this committee.

Mr. ANDERSON. I suppose we will be expected to establish an experiment station in Arkansas, one in Missouri, one in Ohio, one in New York, and so on; is that what you have in mind?

Mr. LANNEN. We have always contended that there should be one station in the East to take care of our native grapes, but we have never been able to get it.

Please do not misunderstand me. I do not wish to oppose the request of the people of California. I am in sympathy with that. I appreciate the long fight they have had over many years to make a success of the industry out there.

The CHAIRMAN. Your contention is that if we do anything for the grape growers of California we should also do something for those of the Middle West and the East?

Mr. LANNEN. You should at least consider it.

The CHAIRMAN. We will take the matter under consideration.

DEVELOPMENT OF SWEET CORN FOR CANNING.

FRIDAY, JANUARY 16, 1920.

STATEMENT OF DR. WILLIAM A. TAYLOR, CHIEF OF THE BUREAU OF PLANT INDUSTRY, DEPARTMENT OF AGRICULTURE.

The CHAIRMAN. I desire to call the attention of the committee to a letter from Mr. Merritt Greene, chairman of the seed committee of the Iowa-Nebraska Cannery Association, relative to the development of sweet corn for canning.

Dr. Taylor has a word to say on this subject.

Dr. TAYLOR. This letter from Mr. Greene is an urgent recommendation for the appropriation of sufficient funds to make possible the experimental development of sweet corn specially adapted for the canning industry. It is one which I think I can best respond to through a short statement to be prepared and forwarded to the chairman of the committee.

The CHAIRMAN. And you will incorporate it with your remarks on the bill?

Dr. TAYLOR. Yes, sir; so that it can be incorporated in the hearings. I think the project has merit. It has not been provided for in the estimates as they stand.

The CHAIRMAN. Have you funds to take care of it?

Dr. TAYLOR. No, sir.

The CHAIRMAN. Would there be any money available for this purpose under any of the other items in the appropriation bill?

Dr. TAYLOR. No, sir.

The CHAIRMAN. If you will submit a statement, the matter will be given very careful consideration.

(A statement of the work proposed is covered in the following letter to the chairman of the committee:)

JANUARY 17, 1920.

HON. GILBERT N. HAUGEN,

*Chairman Committee on Agriculture,
House of Representatives.*

DEAR MR. HAUGEN: Referring to the letter of Mr. Merritt Greene, jr., Marshalltown, Iowa, chairman of the seed committee of the Iowa-Nebraska Cannery Association, urging that provision be made for constructive work in the development of pure and desirable strains of sweet corn for commercial canning, which you called to my attention at the close of the hearing yesterday, I would say that the question is one to which this bureau has given such attention in the past as its appropriations permitted. Our specialists, however, have not been able to devote much more than incidental attention to this problem during the last two or three years because of lack of men and funds.

Enough has been done in an experimental way to make clear that very much improvement in the production of corn for canning purposes can be accomplished through the development of pure strains of sweet corn of high producing capacity adapted to the regions where the crop is to be grown for canning. It has been determined that the best results are obtained by growing the sweet corn intended for seed in fields especially devoted to the production of seed rather than by selecting for seed the superior ears in fields grown for canning or from the corn left in such fields after the cannery product has been harvested.

The corn-canning industry has in recent years attained a magnitude which makes this product a very important item in our food supply. The States which lead in the production of sweet corn for canning purposes are Iowa, Illinois, Maine, Ohio, Maryland, New York, Wisconsin, Indiana, and Minnesota, with an acreage and pack approximately as follows:

Table showing sweet-corn acreage and pack for leading States.

State.	1918		1919	
	Acreage.	Pack.	Acreage	Pack.
		<i>Cases.</i>		<i>Cases.</i>
Iowa.....	57,361	2,833,636	40,880	2,338,336
Illinois.....	46,712	2,746,660	39,803	2,117,528
Maine.....	13,583	722,624	13,257	1,410,556
Maryland and Virginia.....	39,351	2,392,544	32,426	2,282,784
Ohio.....	34,939	1,760,920	20,188	1,469,692
New York.....	21,051	578,900	17,880	1,162,200
Indiana.....	23,055	839,204	15,863	494,986
Minnesota.....	9,016	563,500	7,636	534,525
Wisconsin.....	8,080	384,608	7,626	555,184

The total acreage devoted to sweet corn in the United States in 1918 was 280,186; in 1919 the total acreage was 217,900.

The question raised by Mr. Greene is therefore one of wide importance to the sweet-corn growers and the canning interests of the country. It is believed that if work is to be undertaken it should be inaugurated upon a basis which would be broadly applicable to the corn-canning industry of the country as a whole, including the eastern and northern regions, as well as those of the corn belt proper.

While the improvement work in Iowa would be of some value to the sweet-corn growers of other States, the varieties of this crop are so profoundly modified by the climatic conditions under which they are grown that work would need to be to some extent duplicated in the other important regions to be fully applicable to them.

Our specialists are in touch with those of the Iowa Experiment Station referred to by Mr. Greene and the work they have under way, and this bureau could cooperate very effectively and beneficially in that work in such a way as would insure effective prosecution and applicability of results to the several important sweet-corn canning regions. Additional funds to the extent of \$5,000 would be required over those carried by the Book of Estimates. This would necessitate an increase of the plant industry subappropriation for horticultural investigations (item 104, p. 97, of the committee print) by that amount. No change of wording of the paragraph would be required, as the project is directly in line with other work on the improvement of truck crops for consumption either in the fresh state or for canning.

Very truly, yours,

WILLIAM A. TAYLOR, *Chief of Bureau.*

UTILIZATION OF BY-PRODUCTS OF THE SWEET POTATO.

STATEMENT OF HON. CHARLES R. CRISP, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF GEORGIA.

The CHAIRMAN. Are there any others who desire to be heard?

Mr. LEE. Mr. Chairman, Representative Crisp is here and would like to make a short statement to the committee in regard to the sweet-potato industry.

The CHAIRMAN. We will be glad to hear Mr. Crisp.

Mr. CRISP. Gentlemen of the committee, I thank you for this privilege, and I will take only a few minutes of your time. I know that it is the policy of those in charge of legislation to try to curtail expenditures. I am in sympathy with that proposition, and I have that in view when I appear before you and ask for a small appropriation for the purpose of making this investigation; but, in my judgment, the great commercial possibilities involved abundantly justify the expenditure.

I have a resolution pending before your committee asking that an appropriation be made for the Department of Agriculture to make an experiment as to the possibility of developing a commercial industry from sweet potatoes.

With the permission of the committee I will read my resolution:

[H. J. Res. 529, Sixty-sixth Congress, second session.]

JOINT RESOLUTION Providing for an investigation leading to establishment of industry for manufacture of sugar and kindred products from sweet potatoes.

Whereas there is a world's shortage of sugar, which is causing the people of the United States much inconvenience and seriously injuring the business of manufacturers of soft drinks, candies, confections, and other lawful industries; and

Whereas it is the duty of the Government to exercise all of its powers to aid legitimate business and contribute to the comfort and necessities of its citizens; and

Whereas sweet potatoes can and will be grown in large quantities at small expense in the southern part of continental United States, if a steady commercial demand is established for them; and

Whereas sweet potatoes contain 10 per centum of sugar, much starch, glucose, and dextrin, all useful commercial commodities, which, if produced in large quantities at an economical cost, will tend to reduce the high cost of living: Therefore be it

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the sum of \$100,000, or so much thereof as may be necessary, is hereby appropriated, out of any money in the Treasury of the United States not otherwise appropriated, to be immediately available, to enable the Secretary of Agriculture to conduct thorough investigations and experiments with a view to ascertaining if it be possible to establish a profitable commercial industry for the manufacture of sugar, sirup, starch, glucose, and dextrin from sweet potatoes.

Before introducing the resolution, I talked with Dr. Alsberg, Chief of the Bureau of Chemistry, who advised me that sweet potatoes contain about 10 per cent of cane sugar. I think that was about as much sugar as the sugar beet originally contained before it was developed. The sugar beet has now about 14 or 15 per cent of sugar.

The sweet potato contains many other properties which, I hope, are capable of being developed into a commercial industry. Dr. Alsberg stated to me that he was very much interested in the development of the sweet potato; that from past experiments he thought a splendid table sirup could be made from it; that it contained more starch than the white potato; and he thought it very probable that a starch industry could be developed from the sweet potato. He further stated that the sweet potato contains an adhesive known as dextrin, which was necessary for the mucilage used by the Government on postage and revenue stamps, the dextrin used in this country now being imported. Judging from my conversation with him, it was his opinion that some appropriation for this service would be well expended, and he thought there was great likelihood that a fine commercial industry could be established as a result of experimentation along these lines.

Dr. Alsberg recently appeared before this committee. I have just read his testimony, which has not yet been printed; but I ask the committee, when it is printed, to please do me the kindness to read Dr. Alsberg's testimony on this proposition.

I would like to read also to the committee a letter that I received from the Horticulturist of the Southern Railroad Development Service. You understand, of course, that all these great railroad lines are very much interested in developing agriculture in the sections along their lines; and this is from the horticulturist of one of the big railroad lines in the South. The letter addressed to me is as follows:

I note with deep interest the resolution you have offered providing for an investigation of the various possibilities of by-products that can be obtained from the sweet potato.

I have given this subject more or less study for the past several years and have become impressed with the thought that, in the range of products which can be made from this vegetable, it is remarkable that its possibilities have only been touched upon, embracing not only those of sirup and sugar but substitutes for chicory, rubberoid, rubber substitutes, dyes, vinegar, and other non-perishable food products.

That letter is signed by George E. Murrell, Horticulturist, Southern Railway Lines.

I do not know what the production per acre of sugar beets is; but in my section of Georgia we can raise anywhere from 200 to 400 bushels of sweet potatoes per acre, and they can be raised at very little cost. They are not raised now in very great quantities because there is no market for them. They are perishable in nature, and therefore the farmers do not raise them in any great quantity.

As the members of this committee know, the cotton boll weevil has been in Georgia and the South for several years. That simply means that the people have to diversify their crops in my section. In fact, they have already commenced to diversify. It is very hard for us to find a money-producing crop. We are beginning to raise peanuts and are beginning to go into the raising of hogs and cattle. We all realize that it is absolutely necessary to diversify, and I think that one of the greatest possibilities that we have is the development of the sweet potato. If paying commercial industries can be established with sweet potatoes as a basis, they can be raised in great quantities in Georgia and the South and will furnish a money crop for us, and will add to the commerce, industry, and prosperity of the United States.

Mr. RUBEY. What appropriation does your resolution contemplate?

Mr. CRISP. In the resolution which I introduced I ask for \$100,000. I leave the amount to the committee. Anything that the committee will give us will be thankfully received—"small favors thankfully received, larger ones in proportion."

Mr. McLAUGHLIN of Michigan. Mr. Crisp, has Dr. Alsberg made any estimate of the amount of money that he can properly use in this line of work?

Mr. CRISP. No, sir; he has not. I have just read his testimony. It has not yet been printed, but the clerk gave me the typewritten pages, and I read it over hurriedly.

Mr. PURNELL. I wonder if the same thing is true of all varieties of sweet potatoes.

Mr. CRISP. I should think so. Down in our section we have two or three varieties of sweet potatoes. Some people say that one is a little sweeter than the others, and some claim that one is a little more palatable than others as a table product, but I think they must be about 95 per cent the same, all of them.

The CHAIRMAN. Without objection, the extract from Dr. Alsberg's testimony will be inserted.

(The extract is printed as follows:)

DR. ALSBERG. Yes. May I bring up one other thing that has to do with future work, not under this item, but related to it? It is the utilization of the sweet potato. There have been inquiries on the part of people in the sweet potato producing sections of the country for some work which will utilize the cull sweet potatoes and the overproduction. I wish to bring that to the attention of the committee, because Representative Crisp is one of the gentlemen who has consulted me on this matter. Of course we have no funds for the work at present. I believe it to be possible to establish ultimately a very valuable agricultural industry, using sweet potatoes as its raw material. Sweet potatoes contain naturally 10 per cent of cane sugar, and it is possible by treating sweet potatoes with a small amount of malt to convert the starch in the sweet potato into malt sugar, and thus to make a most delicious sirup for table use.

The sweet potato contains more starch than the white potato. It is one of the cheapest sources of starch, so that it should be possible to establish a sweet-

potato starch industry in the United States. If you have starch, of course you can produce from it malt sugar and glucose and a material known as dextrine, which is used as an adhesive to gum postage stamps, envelopes, and the like.

* * * * *

It is more palatable and more uniform. We offered sirup that we made from sugar cane grown in south Georgia on the New Orleans Molasses Exchange, simply stating that it was a cane sirup. They did not know that it was made by the United States Government or by whom it was made. That sirup brought 10 cents a gallon more than the highest market price for any other sirup of that type during that season. Of course we did not own that sirup. It was made under our supervision by the manufacturers. We found, down where it was made, that the neighbors had bought up all there was of it, because it was superior to anything else they could get in that neighborhood. We have not been able to close that investigation because we need yeast.

Mr. LEE of Georgia. I have listened to your statement with much interest, and, realizing the great possibilities that may be developed from this investigation, I hope the committee will act favorably on your request and make an appropriation.

The CHAIRMAN. We thank you for your statement, Mr. Crisp.

COMMITTEE ON AGRICULTURE,
HOUSE OF REPRESENTATIVES,
Thursday, December 18, 1919.

The committee met at 2 o'clock p. m., pursuant to recess, Hon. Gilbert N. Haugen (chairman) presiding.

The CHAIRMAN. The committee will come to order. We have with us to-day Gen. Hulings, who desires to be heard on H. R. 10130, "A bill to provide for the establishment of a bureau of production and distribution in the Department of Agriculture." Gen. Hulings, we will be glad to hear you.

STATEMENT OF HON. WILLIS J. HULINGS, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF PENNSYLVANIA.

Mr. HULINGS. Mr. Chairman, this bill has been presented by me at the request of a gentleman out in my home town who is a very intelligent man, a thoughtful fellow, and a man of large experience in affairs. He sent the bill to me, and when I looked it over I thought it was one of the most foolish things I had seen for a long time, but I presented it by request. About a week or two ago I was back home and had a talk with him about it, and I believe that about two-thirds of this bill can be cut out.

I might say, first, that the leading thought in the bill is for the Department of Agriculture to establish in each county an agent who shall act as a go-between between the producer and the consumer of food products. He has incorporated in the bill something about slaughterhouses and all that sort of thing which I thought had better be cut out, but I do believe that an examination of the bill, or, rather, the contemplation of the idea that he has in mind, might give the committee some valuable ideas or suggestions.

There is one scheme providing for the cooperation of these agents with the Farm Loan Board or to provide for actual statements as to the number of men employed in agriculture. I was looking over the census reports required; and if those reports were fully made it

would give the Government a very accurate idea of the agricultural interests of the country, the amount of land, the amount of cultivated land, good land, and all that sort of thing. As you know very well, that sort of information is now provided in a slipshod kind of way. The thing he proposes could be done so that you would have practical and actual results.

A scheme of having a Government agent who would cut out to a very large degree the middleman between the producer and the consumer, or the retail dealer, could be carried out at a very small expense and, I believe, at a great saving to the ultimate consumer, without affecting the price the producer would receive.

The CHAIRMAN. The purpose is to put the producer in closer touch with the consumer?

Mr HULINGS. It just brings them right in touch. Here is an agent who makes it his business to know what is being produced in the county and who is producing it; he knows what can be produced in his county, and he makes these sales to the retailer or to the consumer, simply acting as a middle man.

There are a lot of proposals here, as you will see, such as provision for a commission which shall be established, which he calls a bureau, in the Department of Agriculture, to be governed by a commission on production and distribution consisting of the Secretary of the Treasury, the Secretary of Agriculture, and the director; and then his bill goes on and makes the director responsible for everything. I think those powers of the director should be cut out and that they should all be lodged in the commission itself and the director, who is appointed by the President.

Now, gentlemen, I can not give you any ideas about what this might comprehend, because, in your investigations and study of this great subject, you know more about it than I or he does, but I just wanted to have the opportunity to ask you, if you feel disposed to look into the matter, to give the author of the bill an opportunity to be heard at some subsequent time.

The CHAIRMAN. We will try to make arrangements later. You may say to your constituent that the matter will be given careful consideration.

Mr. HULINGS. I want to say that since this bill has been presented, scores of wholesale dealers and meat people who have heard about this bill have called to see me, indicating that they regard at least some of the ideas suggested in the bill as being meritorious.

The CHAIRMAN. Thank you, Gen. Hulings. The committee will now adjourn.

(Thereupon, the committee adjourned until further call of the chairman.)

AGRICULTURE APPROPRIATION BILL.

FEBRUARY 3, 1920.—Committed to the Committee of the Whole House on the state of the Union and ordered to be printed.

MR. HAUGEN, from the Committee on Agriculture, submitted the following

REPORT.

[To accompany H. R. 12272.]

The Committee on Agriculture submits the following report to accompany bill (H. R. 12272) making appropriations for the Department of Agriculture for the fiscal year ending June 30, 1921.

The committee held hearings extending over a period of six weeks on the estimates presented by the department. Representatives of the Department of Agriculture and others interested appeared before the committee and discussed in detail the various items.

The total sum carried by the present bill is \$30,540,034. This is a decrease of \$3,359,727 below the appropriation act for the fiscal year 1920, a decrease of \$7,132,823 below the regular and supplemental estimates submitted by the department, and a decrease of \$11,558,204 below the estimates of the bureaus. The committee has not been unmindful of the valuable work of the Department of Agriculture and the need for supporting and enlarging many important activities for the benefit of the farmers, but, in view of the unusual financial conditions confronting the country at the present time, the committee believes it imperative to economize in every possible way and has endeavored to accomplish this result in the present bill without seriously crippling the work of the department. While the decreases are large, they have been made principally in regulatory and administrative items rather than in items providing for food-production activities. Increases have been provided in a number of the items, but in each case only after a very thorough investigation of the necessity therefor, and these increases are recommended by the committee.

The following table shows the appropriations for the present fiscal year, the estimates submitted by the various bureaus and offices to the Secretary of Agriculture, the regular and supplemental estimates submitted by the Department of Agriculture to the committee, the amount carried in this bill, the increases and decreases of the bill as compared with the estimates submitted by the department, and the increases and decreases of the bill as compared with the appropriation for the present fiscal year.

Estimate of appropriations, 1921, United States Department of Agriculture.

Bureau or office.	Appropriation in Agricultural act, 1920.	Bureau or office estimates, 1921.	Department estimates, 1921.	Reported by House committee.	Increase over (+) or decrease below (-) department estimates, 1921.	Increase over (+) or decrease below (-) 1920 appropriations.
Office of the Secretary.....	\$500,520	\$477,140	\$475,860	\$466,940	- \$8,920	- \$33,580
Office of Farm Management.....	302,590	611,990	611,990	322,130	- 289,860	+ 19,540
Weather Bureau.....	1,880,210	2,465,670	2,228,150	1,879,010	- 349,140	- 1,200
Bureau of Animal Industry.....	5,783,231	6,921,287	6,118,451	5,327,236	- 791,215	- 455,995
Bureau of Plant Industry.....	3,379,688	3,920,098	3,606,888	3,038,639	- 568,259	- 310,999
Forest Service.....	5,966,869	7,063,127 1 39,755	6,557,895 1 39,755	5,777,842	- 519,808	- 189,027
Bureau of Chemistry.....	1,391,571	1,502,411	1,424,511	1,321,591	- 102,920	- 69,980
Bureau of Soils.....	491,235	621,045	620,095	541,035	- 79,060	+ 49,800
Bureau of Entomology.....	1,371,360	2,163,940 2 105,000	1,219,260 2 105,000	1,073,450	- 250,780	- 297,880
Bureau of Biological Survey.....	742,170	1,282,655	978,005	782,170	- 195,835	+ 40,000
Division of Accounts and Disbursements.....	44,620	50,620	50,620	48,220	- 2,400	+ 3,600
Division of Publications.....	240,140	379,030	362,480	372,570	+ 10,090	+ 132,430
Bureau of Crop Estimates.....	371,102	1,164,715	967,782	322,856	- 644,926	- 48,246
Library.....	50,160	61,080	61,080	50,880	- 10,200	+ 720
Miscellaneous expenses, Department of Agriculture.....	175,500	153,000	141,000	136,000	- 5,000	- 39,500
Print in the District of Columbia.....	100,000	150,000	150,000	164,666	+ 14,666	+ 64,666
States Relations Service.....	4,905,820	4,973,500	4,968,540	4,866,120	- 102,420	- 39,700
Bureau of Public Roads.....	594,320	774,320	748,120	490,620	- 257,500	- 103,700
Bureau of Markets.....	2,811,365	3,453,845	3,023,395	2,478,569	- 544,826	- 332,796
Insecticide and Fungicide Board.....	123,940	141,910	141,910	115,350	- 26,560	- 8,590
Federal Horticultural Board.....	129,000	246,500	236,500	169,050	- 67,450	+ 40,050
MISCELLANEOUS APPROPRIATIONS.						
Demonstrations on reclamation projects.....	48,600	47,000	47,000	30,000	- 17,000	- 18,600
Fighting and preventing forest fires.....	1,000,000	1,000,000	1,000,000	250,000	- 750,000	+ 250,000
Cooperative fire protection of forested watersheds of navigable streams.....	100,000	500,000	200,000	75,000	- 125,000	- 25,000
Experiments and demonstrations in live-stock production in the cane-sugar and cotton districts of the United States.....	60,000	60,000	60,000	46,500	- 13,500	- 13,500
Experiments in dairying and live-stock production in semiarid and irrigated districts of the western United States.....	40,000	40,000	40,000	30,000	- 10,000	- 10,000
Eradication of the foot-and-mouth and other contagious diseases of animals.....	1,000,000	1,000,000	1,000,000	50,000	- 950,000	- 950,000
Eradication of pink bollworm.....	595,800	573,300	388,560	288,560	- 100,000	- 307,240
Acquisition of lands under the Weeks laws.....	600,000					+ 600,000
Plant dust explosions and fires.....		155,000	100,000	25,000	- 75,000	+ 25,000
Agricultural exhibits.....	100,000					- 100,000
Grand total, Department of Agriculture.....	33,899,761	42,098,238	37,672,857	30,540,034	-7,132,823	-3,359,727

¹ Supplemental estimate for administration of the Thunder Mountain area, Idaho.

² Supplemental estimate for control of the Japanese beetle.

REVENUES AND RECEIPTS.

In considering the above table it should be borne in mind that the annual, permanent, and emergency appropriations of the Department of Agriculture are offset to some extent by certain revenues and receipts resulting from or incident to its activities. These revenues and receipts during the fiscal year 1919 amounted to \$15,607,150.98, and were covered into the Treasury. They include the following items:

Receipts from national forests, \$4,358,414.86.—The receipts from the national forests were derived from the following sources, and represent an increase of \$783,484.79 over the year 1918:

(a) Timber, \$1,526,188: Sales of all classes of stumpage on the national forests, payments for timber destroyed on rights of way or other uses, payments for timber cut or removed without previous permit, and damages assessed against persons setting fire to forest areas.

(b) Grazing, \$2,609,169.85: Payments for grazing privileges on national forest ranges for cattle, horses, swine, sheep, and goats, and for unauthorized use of grazing areas.

(c) Special uses, \$223,057.01: Payments for use of forest lands for various purposes, such as residences, camps, cabins, hotels, rights of way, agriculture, wharves, water power, telegraph and telephone lines, reservoirs, conduits, etc., and use of forest areas for turpentine extraction.

Benefits derived by States from receipts from national forests.—Under existing law 10 per cent of the forest receipts is expended by the Secretary of Agriculture in the construction of roads and trails, and 25 per cent of the forest receipts is paid to the States by the Federal Government for the benefit of county schools and roads. The amounts expended in or paid in each State during the fiscal year 1919 are shown below:

States.	School and road moneys payable to States.	Road and trail moneys expendable by Secretary of Agriculture.
Alabama.....	\$123.08	\$49.23
Alaska.....	25,456.77	10,182.71
Arizona.....	113,152.97	45,261.18
Arkansas.....	16,563.88	6,225.55
California.....	129,259.73	51,703.89
Colorado.....	115,048.98	46,019.59
Florida.....	4,075.77	1,630.31
Georgia.....	1,049.99	419.99
Idaho.....	115,767.60	46,307.04
Maine.....	446.50	178.60
Michigan.....	146.72	58.69
Minnesota.....	2,944.25	1,177.70
Montana.....	95,042.81	38,017.13
Nebraska.....	3,601.01	1,440.40
Nevada.....	30,688.39	12,275.36
New Hampshire.....	4,930.03	1,972.01
New Mexico.....	84,661.05	33,864.42
North Carolina.....	5,559.45	2,223.78
Oklahoma.....	1,327.17	530.87
Oregon.....	115,405.74	46,162.30
South Carolina.....	220.36	88.15
South Dakota.....	16,784.41	6,713.76
Tennessee.....	2,134.17	853.67
Utah.....	68,650.64	27,460.25
Virginia.....	3,283.14	1,313.26
Washington.....	54,772.57	21,909.03
West Virginia.....	238.77	95.51
Wyoming.....	58,550.93	23,420.37
Total.....	1,069,886.88	427,954.75

Additional benefits derived by Arizona and New Mexico from receipts from national forests.—The States of Arizona and New Mexico received additional shares of national-forest receipts for their school funds on account of school lands included within national forests, as follows: Arizona, \$58,775.83; New Mexico, \$20,091.49.

Telegrams over Government lines, \$6,146.75.—These receipts are derived through the transmission of private messages over Weather Bureau telegraph lines in isolated regions where commercial lines are not yet available.

Sale of cotton standards, \$5,665.31.—These receipts are derived through the sale of practical forms of the official cotton standards prepared by the department to the various exchanges, spot-market dealers, merchants, cotton mills, agricultural colleges, and textile schools.

Cost of cotton-futures disputes, \$10,454.20.—These receipts are derived through the settlement of disputes referred to the department from time to time by either party to a contract of sale of cotton for future delivery, for determination as to the quality, grade, or length of staple of the cotton, in accordance with the provisions of the United States cotton-futures act.

Sale of loose cotton, \$34,693.24.—In the preparation of practical forms of the official cotton standards it is necessary for the department to purchase in the open market considerable quantities of cotton in order to match the various types and classes of cotton. A large quantity of the cotton thus purchased is found unsuitable for use in making copies of the official cotton standards, and this is disposed of to dealers at the best price obtainable.

Cost of grain-standards appeals, \$7,545.91.—These receipts represent charges made for the settlement of appeals from the grading of grain by licensed inspectors; also disputes as to the correct grade of grain entering into interstate commerce between noninspection points referred to the Department of Agriculture in accordance with the provisions of the United States grain-standards act.

Cost of inspection of perishable food products, \$19,227.56.—These receipts are derived from the inspection of perishable food products authorized in the general expense appropriation made to the Bureau of Markets for carrying on such work.

Costs of classification of cotton, \$1,491.75.—These receipts represent charges made for classifying cotton pursuant to the seventh subdivision of section 5 of the United States cotton-futures act. The receipts are made a revolving fund as provided in said act under the head "Classification of cotton, wheat-price guaranty act of March 4, 1919."

Sale of photo prints, lantern slides, etc., \$688.47.—These receipts are derived through the sale of photo prints, lantern slides, transparencies, blue prints, and motion-picture films to State institutions, publishers, and individuals for use in lecture work and in connection with the preparation of publications bearing on agriculture and related subjects.

Sale of hearings, \$178.70.—These receipts are derived through the sale of hearings conducted by the department from time to time in connection with the enforcement of regulatory acts, particularly the food and drugs act and the insecticide and fungicide act. These hearings are sold to corporations, firms, and individuals desiring them at the rate of 10 cents per folio to cover the cost of preparing them.

Sale of card indexes, \$202.75.—These receipts are derived through the sale of card indexes of experiment station literature to various agricultural colleges, experiment stations, educational institutions, and libraries throughout the country.

Sale of other miscellaneous property and collections, \$244,606.16.—This covers the sale of unserviceable property owned by the department which has been passed upon and condemned by a board of survey appointed by the Secretary of Agriculture. It also covers the proceeds derived through the sale of farm products obtained at the various experiment stations of the department, other than the insular experiment stations; animals and animal products no longer needed in the work of the department; forest maps and maps and publications of the Weather Bureau; pathological and zoological specimens; samples of pure sugars and naval stores; microscopical specimens, etc.

Sale of products, agricultural stations, Alaska, Hawaii, Porto Rico, Guam, and the Virgin Islands, \$4,284.40.—These receipts are derived through the sale of agricultural products obtained on the land belonging to the agricultural experiment stations in Alaska, Hawaii, Porto Rico, island of Guam, and the Virgin Islands.

Sale of seeds to farmers, \$859,650.48.—These receipts are derived through the sale of seeds to farmers for cash, at cost, in sections where, on account of drought or other unfavorable conditions, such assistance was needed. Such sales are specifically provided for in the food-production act.

Sale of nitrate of soda to farmers, \$8,768,268.85.—These receipts are derived through the sale of nitrate of soda to farmers for cash, at cost, in sections where a special need for such assistance existed. Such sales are specifically provided for in the food-control act.

Miscellaneous items, \$1,285,631.59.—This amount includes \$547,928.89 from contributions toward cooperative work in forest investigations; \$441,678.21 from refunds on mileage and scrip books, and \$296,024.49 from other executive departments of the Government in payment of supplies furnished and services rendered by the Department of Agriculture.

The following table shows the appropriations for the Department of Agriculture for the current fiscal year:

Titles of appropriations.	Total of appropriations for 1920.
Agricultural appropriation act.....	\$33,899,761
Permanent annual appropriations.....	28,235,000
Cooperative construction of rural post roads (Post Office appropriation act for fiscal year 1920).....	75,000,000
Federal forest road construction (Post Office appropriation act for fiscal year 1920).....	3,000,000
Protection of lands involved in California and Oregon railroad forfeiture suit (sundry civil).....	25,000
Printing and binding (sundry civil).....	600,000
Rent of buildings (sundry civil).....	41,509
Grand total of all appropriations for the Department of Agriculture.....	140,801,270

In the following pages the reasons for all increases in appropriations are given, and all changes in amounts in the statutory rolls are indicated.

OFFICE OF THE SECRETARY.

STATUTORY SALARIES.

(P. 2, line 3.)

The statutory roll of the office of the Secretary carries a decrease of \$33,580, as indicated in detail in the following table:

Places dropped:	
1 assistant secretary	\$5,000
4 firemen, at \$720 each	2,880
1 carriage driver	600
	\$8,480
Transfers to statutory roll, Division of Publications, and the Secretary's roll correspondingly reduced:	
1 assistant in charge of information	3,000
1 assistant	2,000
1 assistant editor	2,000
4 assistant editors, at \$1,800 each	7,200
1 assistant editor	1,600
1 expert on exhibits	3,000
1 assistant in exhibits	2,000
4 clerks, class 2	5,600
4 clerks, class 1	4,800
2 clerks, at \$1,000 each	2,000
1 laborer	600
1 messenger boy	600
2 messenger boys, at \$480 each	960
	35,360
Transfers from extra labor fund, office of the Secretary, and that fund correspondingly reduced:	
2 charwomen, at \$240 each, 1 to statutory roll, Division of Publications, and 1 to statutory roll, Bureau of Crop Estimates	480
Reduction in "extra labor" fund on account of transfers to statutory roll, office of the Secretary	6,080
Reduction in "extra labor" fund	960
	7,520
	51,360
Transfers from funds of other bureaus, which funds have been correspondingly reduced:	
10 firemen, at \$1,080 each, 1 from meat inspection, Bureau of Animal Industry; 1 from black and stripe rust, 1 from blister rust control, and 1 from administrative expenses, Bureau of Plant Industry; 2 from food and drugs act, Bureau of Chemistry; 1 from deciduous fruit insects, Bureau of Entomology; 1 from farmers' cooperative demonstrations in North and West, States Relations Service; 1 from food supply investigations, and 1 from cotton futures act, Bureau of Markets	\$10,800
1 skilled laborer, from dairy industry, Bureau of Animal Industry	900
	11,700
Transfers from lump fund for extra labor to statutory roll, office of the Secretary, and the lump fund correspondingly reduced:	
1 superintendent of telegraph and telephones	2,000
1 chief engineer	1,800
1 foreman of stable	1,080
1 skilled laborer	960
1 charwoman	240
	6,080
	17,780
Actual decrease	33,580

OFFICE OF FARM MANAGEMENT.

STATUTORY SALARIES.

(P. 4, line 17.)

The statutory roll of the Office of Farm Management carries a decrease of \$12,300, as indicated in the following table:

Places dropped:	
9 clerks, at \$900 each.....	\$8, 100
5 clerks or map tracers, at \$840 each.....	4, 200
	<hr/>
Actual decrease.....	12, 300

GENERAL EXPENSES.

Farm management and farm practice investigations (p. 5, line 6).—There is an increase in this item of \$31,840. This amount has been added to the sum set aside in the proviso for ascertaining the cost of production of the principal staple agricultural products, as has \$23,160, which is deducted from the amount heretofore available for general farm-management work, the committee being of the opinion that a large appropriation should be devoted to this important investigation.

WEATHER BUREAU.

STATUTORY SALARIES.

(P. 5, line 18.)

The statutory roll of the Weather Bureau carries an apparent increase of \$4,020, but there is an actual decrease of \$1,200, as indicated in detail in the following table:

Places dropped:	
4 firemen, at \$720 each.....	\$2, 880
New places:	
2 firemen, at \$840 each.....	1, 680
	<hr/>
Actual decrease.....	\$1, 200
Transfers from lump funds of this bureau, which have been correspondingly reduced:	
2 clerks, class 1, from aerological stations.....	2, 400
1 supervising instrument maker, from aerological stations.....	1, 620
1 repairman, from station salaries.....	1, 200
	<hr/>
	5, 220
Apparent increase.....	4, 020

GENERAL EXPENSES.

Expenses outside of Washington (p. 9, line 10).—There is an apparent decrease in this item of \$1,200, but, as that amount has been transferred to the statutory roll, there is actually no change.

Aerological investigations (p. 9, line 18).—There is an apparent decrease in this item of \$4,020, but, as that amount has been transferred to the statutory roll, there is actually no change.

BUREAU OF ANIMAL INDUSTRY.

STATUTORY SALARIES.

(P. 10, line 2.)

The statutory roll of the Bureau of Animal Industry carries an apparent increase of \$103,240, but there is no actual increase, as indicated in detail in the following table:

Transfers from lump funds of this bureau, which funds have been correspondingly reduced:

1 executive clerk, from inspection and quarantine.....	\$2,000
3 clerks, class 4, 2 from dairy industry, and 1 from meat inspection.....	5,400
1 clerk, class 3, from diseases of animals.....	1,600
4 clerks, at \$1,500 each, 1 from inspection and quarantine, 1 from dairy industry, 1 from eradicating hog cholera, and 1 from meat inspection.....	6,000
2 clerks, class 2, 1 from eradicating hog cholera and 1 from meat inspection.....	2,800
1 clerk, from meat inspection.....	1,380
1 clerk, from eradicating cattle ticks.....	1,320
1 clerk, from meat inspection.....	1,260
39 clerk, class 1, 1 from inspection and quarantine, 8 from tuberculosis eradication, 5 from eradicating cattle ticks, 2 from dairy industry, 2 from eradicating hog cholera, and 21 from meat inspection.....	46,800
11 clerks, at \$1,100 each, 1 from inspection and quarantine, 1 from eradicating cattle ticks, 1 from tuberculosis eradication, 4 from animal husbandry, 3 from eradicating hog cholera, and 1 from meat inspection.....	12,100
4 clerks, at \$1,030 each, 1 from inspection and quarantine and 3 from tuberculosis eradication.....	4,320
1 clerk, from eradicating hog cholera.....	1,020
7 clerks, at \$1,000 each, 3 from tuberculosis eradication, 2 from dairy industry, and 2 from eradicating hog cholera.....	7,000
1 skilled laborer, from abortion of animals.....	1,200
1 skilled laborer, from tuberculosis eradication.....	1,000
1 skilled laborer, from dairy industry.....	900
2 messengers or laborers, at \$840 each, 1 from dairy industry and 1 from animal husbandry.....	1,680
1 messenger boy, from tuberculosis eradication.....	660
9 messenger boys, at \$480 each, 1 from inspection and quarantine, 2 from tuberculosis eradication, 1 from dairy industry, 1 from animal husbandry, 1 from diseases of animals, 1 from abortion of animals, 1 from eradicating hog cholera, and 1 from meat inspection.....	4,320
1 charwoman, from meat inspection.....	480
Apparent increase.....	103,240

GENERAL EXPENSES

Inspection and quarantine (p. 13, line 3).—There is an apparent decrease in this item of \$5,360, but, as \$7,360 has been transferred to the statutory roll, the actual increase is \$2,000. This amount will be used for the inspection and testing of animals for export. This work is constantly increasing. In recent months there has been an unusual demand for the bureau inspectors to test animals for export and to inspect the vessels carrying such animals.

Tuberculosis of animals (p. 13, line 13).—There is an apparent decrease in this item of \$200,000, but, as \$19,560 has been transferred to the statutory roll, the actual decrease is \$180,440. The decrease is due to a reduction of \$500,000 in the indemnity fund. The experience of the past year has shown that less money will be required

for indemnities and a larger amount for administrative and operating expenses. The committee therefore increased the amount for administrative and operating expenses from \$500,000 to \$800,000, \$100,000 of which it recommends be made immediately available; and decreased the amount for indemnities from \$1,000,000 to \$500,000.

The word "*hereafter*" has been added to the third proviso, on page 15, relative to the interstate shipment of cattle for immediate slaughter; this will make the legislation permanent and obviate the necessity of repeating the language annually in the appropriation bill.

Tick eradication (p. 16, line 3).—There is an apparent decrease in this item of \$60,820, but, as \$8,420 has been transferred to the statutory roll, the actual decrease is \$52,400. This amount has heretofore been used for live-stock and dairy demonstration work, in cooperation with the States Relations Service, but the committee recommends that this work be discontinued. The language pertaining to this work has therefore been omitted. The proviso has also been amended so as to prohibit the purchase of animals, as well as materials, in connection with tick-eradication demonstrations.

Dairy investigations (p. 16, line 13).—There is an apparent decrease in this item of \$50,370, but as \$11,720 has been transferred to the statutory roll of the bureau, and \$900 to the statutory roll of the Secretary's Office, the actual decrease is \$37,750.

Animal husbandry investigations (p. 16, line 17).—There is an apparent decrease in this item of \$58,500, but as \$5,720 has been transferred to the statutory roll, the actual decrease is \$52,780, \$16,940 in the amount set aside for experiments in breeding and maintenance of horses for military horses, \$33,640 in the amount set aside for poultry feeding and breeding, and \$2,200 in the amount for general animal husbandry work.

Animal disease investigations (p. 17, line 11).—There is an apparent decrease in this item of \$18,160, but as \$3,760 has been transferred to the statutory roll, the actual decrease is \$14,400.

Inasmuch as the amount set aside in the proviso for the investigation of contagious abortion has been reduced \$24,400, however, there is thereby released for other work the sum of \$10,000, which the committee recommends be used for the investigation of roundworm of hogs. These parasites are responsible for losses among young pigs amounting to millions of dollars each year.

Hog cholera (p. 17, line 21).—There is an apparent decrease in this item of \$131,045, but, as \$12,100 has been transferred to the statutory roll, there is an actual decrease of \$118,945.

Dourine eradication (p. 18, line 11).—There is a decrease in this item of \$23,600.

MEAT INSPECTION.

(P. 18, line 19.)

There is an apparent decrease in this item of \$11,380, but, as \$35,680 has been transferred to statutory rolls, there is an actual increase of \$24,300 to be used for salaries.

The language of the paragraph has been amended by inserting the words "*including the purchase of tags, stamps, and labels printed in course of manufacture.*" The language of recent enactments relative to printing, strictly construed, prevents the department from securing

such supplies from any other source than the Government Printing Office, except with the previous consent of the Joint Committees on Printing. Attention is invited to the fact that similar authority has been carried in the legislative, executive, and judicial appropriation acts for a number of years, covering like supplies for the Treasury Department, this item reading: "For stationery, including tags, labels, and index cards printed in course of manufacture." These articles are used for the marking of coins and other articles—uses which appear to be exactly comparable with those to which the meat-inspection supplies are devoted.

The provisions regarding the inspection of equine meat and for the payment of overtime work in packing establishments have been omitted, being permanent legislation, but proper reference has been made thereto by the addition of the following words: "*as extended to equine meat by the act of July 24, 1919 (public No. 22, 66th Cong.)*."

BUREAU OF PLANT INDUSTRY.

STATUTORY SALARIES.

(P. 19, line 5.)

The statutory roll of the Bureau of Plant Industry carries an apparent increase of \$35,680, but there is an actual decrease of \$1,200, as indicated in detail in the following table:

Transfers from lump funds of this bureau, which funds have been correspondingly reduced:	
1 executive clerk, from administrative expenses.....	\$1,980
3 clerks, class 4, 1 from blister-rust control, 1 from black and stripe rust investigations, and 1 from purchase and distribution of valuable seeds.....	5,400
3 clerks, class 3, 1 from citrus canker eradication, 1 from crop physiology, 1 from barberry eradication (and 1 from demonstrations on reclamation projects).....	4,800
1 clerk, from forage crop investigations.....	1,500
3 clerks, class 2, 1 from blister-rust control and 2 from black and stripe rust investigations.....	4,200
12 clerks, class 1, 1 from forest pathology, 1 from blister-rust control, 2 from cotton and truck diseases, 1 from cereal investigations, 2 from black and stripe rust investigations, 1 from barberry eradication, 1 from alkali and drought resistant plants, 1 from western irrigation agriculture, 1 from new and rare seeds, and 1 from purchase and distribution of valuable seeds.....	14,400
1 clerk, from blister-rust control.....	1,080
1 messenger or laborer, from black and stripe rust investigations.....	720
1 general mechanic, from Arlington Farm.....	1,400
1 mechanical assistant, from horticultural investigations.....	1,400
	\$36,880
Place dropped:	
1 blacksmith.....	1,200
Actual decrease.....	1,200
Apparent increase.....	35,680

GENERAL EXPENSES.

Citrus canker (p. 21, line 21).—There is an apparent decrease in this item of \$86,600, but, as \$1,600 has been transferred to the statutory roll, the actual decrease is \$85,000.

Forest pathology (p. 22, line 14).—There is an apparent decrease in this item of \$1,200, but, as that amount has been transferred to the statutory roll, there is actually no change.

White-pine blister rust (p. 22, line 14).—There is an apparent decrease in this item of \$6,560, but as this amount has been transferred to statutory rolls, there is actually no change.

Cotton, truck, and forage crop investigations (p. 23, line 11).—There is an apparent increase in this item of \$7,600, but, as \$2,400 has been transferred to the statutory roll, the actual increase is \$10,000. This amount will be used for investigating a number of serious potato diseases, including a study of the potato wart in cooperation with the Federal Horticultural Board. There is a decrease of \$14,700 in the appropriation for the eradication of the potato wart under the Federal Horticultural Board. A group of potato diseases classed as "mosaic" also presents a series of difficult problems, including a determination of the exact nature of the cause of the diseases and of questions relating to their transmission by insects. The importance of this work is indicated by the fact that losses in infected fields frequently exceed 20 per cent.

Crop physiology (p. 23, line 13).—There is an apparent decrease in this item of \$8,400, but, as \$1,600 has been transferred to the statutory roll, the actual decrease is \$6,800.

Soil-fertility investigations (p. 23, line 22).—There is an increase of \$10,000 in this item. This amount will be used in meeting the increasing demands for information regarding new fertilizer materials. During the past few years heavy losses have resulted to farmers through the application of fertilizers regarding which no experience from their use was available. Many of these fertilizer materials were of comparatively little value and some were actually injurious. New nitrogen products will undoubtedly appear in fertilizers during the next few years, and these should be investigated promptly. It is proposed to investigate and give field tests to all materials representing new sources of potash, phosphoric acid, and nitrogen as they appear in the fertilizer market from time to time.

Crop acclimatization and fiber-plant investigations (p. 24, line 1).—There is a decrease in this item of \$18,000. The provision setting aside \$3,000 for experiments in the production of New Zealand flax has been eliminated, as has also the proviso increasing the limit on the cost of farm buildings under this item.

Drug-plant and poisonous-plant investigations (p. 24, line 9).—An increase of \$1,000 has been provided in this item for the extension of the investigations of stock-poisoning plants, in cooperation with the Bureau of Animal Industry.

Cereal investigations (p. 25, line 4).—There is an apparent decrease in this item of \$92,800, but, as \$12,800 has been transferred to statutory rolls, the actual decrease is \$80,000. This includes a reduction of \$50,000 in the proviso for the investigation and control of black rust, leaf rust, and stripe rust.

The provisos setting aside \$40,000 for the study of corn improvement and methods of corn production and \$25,000 for the investigations of corn root and stalk diseases have been eliminated. This is done in order to simplify the language of the paragraph, and also to reduce the amount of clerical and overhead expenses, but it is the committee's intention that the work heretofore carried on under these provisions should be continued.

Alkali and drought resistant plant investigations (p. 26, line 3).—There is an apparent decrease in this item of \$4,200, but, as \$1,200

has been transferred to the statutory roll, the actual decrease is \$3,000.

Sugar-plant investigations (p. 26, line 5).—There is a decrease in this item of \$9,115.

The provisos setting aside \$10,000 for the development and improvement of American strain of sugar-beet seed and for investigations in connection with the production of cane and sorghum sirups have been eliminated. This merely eliminates superfluous language in the item, but it is the thought of the committee that the work should be carried on along present lines.

Dry-land agriculture investigations (p. 26, line 13).—There is a decrease in this item of \$9,000.

Western irrigation agriculture investigations (p. 26, line 24).—There is an apparent decrease in this item of \$21,200, but, as \$1,200 has been transferred to the statutory roll, there is an actual decrease of \$20,000.

Pomological investigations (p. 27, line 9).—There is an increase in this item of \$27,000. This amount will be used for the purchase of land for two stations in California for the conduct of viticultural work. A proviso authorizing this purchase has been added. The proviso in the present act setting aside \$20,000 for investigating and developing new grape industries has been eliminated.

Horticultural investigations (p. 28, line 6).—There is an apparent decrease in this item of \$1,400, but, as this amount has been transferred to the statutory roll, there is actually no change. The committee recommends that \$5,000 of this appropriation be used for the development of pure and desirable strains of sweet corn for commercial canning.

Nursery investigations (p. 28, line 13).—This is a new item. The necessity of restricting under the plant-quarantine act the importation of much of the nursery stock and other closely allied plant material hitherto brought into the United States in large quantities, in order to give adequate protection to horticultural and pomological interests against the introduction of dangerous insect pests and fungous diseases, together with the serious reduction during the past year or two in the usual supplies of stocks obtained under normal conditions from France and elsewhere, has served to emphasize the importance of developing domestic supplies of these materials.

Arlington farm (p. 28, line 19).—There is an apparent decrease in this item of \$1,400, but as that amount has been transferred to the statutory roll, there is actually no change.

Foreign seed and plant introduction (p. 29, line 1).—There is a decrease in this item of \$50,000. Inasmuch as the appropriation for the current fiscal year, however, includes \$50,000 for the purchase of land, erection of buildings, etc., in connection with the establishment of a plant inspection and detention station, which amount is omitted in this bill there is actually no change in the funds available for conducting the work under this item.

New and rare seed, forage-crop investigations (p. 29, line 8).—There is an apparent decrease in this item of \$9,780, but as \$2,700 has been transferred to the statutory roll, the actual decrease is \$7,080.

Administrative expenses (p. 29, line 17).—There is an apparent decrease in this item of \$3,060, but, as \$1,080 has been transferred to the statutory roll of the Secretary's office, the actual decrease is \$1,980.

PURCHASE AND DISTRIBUTION OF VALUABLE SEEDS.

(P. 29, line 24.)

There is an apparent decrease in this item of \$119,564, but as \$3,000 has been transferred to the statutory roll, the actual decrease is \$116,564.

FOREST SERVICE.

STATUTORY SALARIES.

(P. 32, line 16.)

The statutory roll of the Forest Service carries an actual increase of \$2,520, as indicated in detail in the following table:

New places:		
1 forest supervisor.....	\$3, 240	
1 forest supervisor.....	2, 880	
8 forest supervisors, at \$2,500 each.....	20, 000	
16 forest supervisors, at \$2,380 each.....	38, 080	
44 forest supervisors, at \$2,180 each.....	95, 920	
60 forest supervisors, at \$1,980 each.....	118, 800	
5 forest supervisors, at \$1,780 each.....	8, 900	
1 deputy forest supervisor.....	1, 980	
4 deputy forest supervisors, at \$1,880 each.....	7, 520	
25 deputy forest supervisors, at \$1,780 each.....	44, 500	
28 deputy forest supervisors, at \$1,680 each.....	47, 040	
15 deputy forest supervisors, at \$1,580 each.....	23, 700	
11 forest rangers, at \$1,620 each.....	17, 820	
23 forest rangers, at \$1,520 each.....	34, 960	
78 forest rangers, at \$1,420 each.....	110, 760	
288 forest rangers, at \$1,320 each.....	380, 160	
590 forest rangers, at \$1,220 each.....	719, 800	
		\$1, 676, 060
1, 198 total new places.		
Places dropped:		
1 forest supervisor.....	3, 040	
1 forest supervisor.....	2, 700	
8 forest supervisors, at \$2,400 each.....	19, 200	
20 forest supervisors, at \$2,200 each.....	44, 000	
49 forest supervisors, at \$2,000 each.....	98, 000	
66 forest supervisors, at \$1,800 each.....	118, 800	
5 forest supervisors, at \$1,600 each.....	8, 000	
1 deputy forest supervisor.....	1, 800	
4 deputy forest supervisors, at \$1,700 each.....	6, 800	
28 deputy forest supervisors, at \$1,600 each.....	44, 800	
31 deputy forest supervisors, at \$1,500 each.....	46, 500	
18 deputy forest supervisors, at \$1,400 each.....	25, 200	
11 forest rangers, at \$1,500 each.....	16, 500	
23 forest rangers, at \$1,400 each.....	32, 200	
78 forest rangers, at \$1,300 each.....	101, 400	
288 forest rangers, at \$1,200 each.....	345, 600	
630 forest rangers, at \$1,100 each.....	693, 000	
100 forest guards, at \$1,100 each, for periods not exceeding six months in the aggregate.....	55, 000	
40 forest guards, at \$1,100 each, for periods not exceeding three months in the aggregate.....	11, 000	
		1, 673, 540
1, 402 total places dropped.		
Actual increase.....		2, 520

GENERAL EXPENSES.

Introductory paragraph (p. 35, line 1).—The limitation on the cost of any building erected on the national forests has been increased from \$800 to \$1,000.

The following new proviso has been inserted: "Provided further, That hereafter the charge for grazing permits upon each of the national forests shall be not less than the appraised value of pasturage upon such national forests as determined by the Secretary of Agriculture from time to time, but at least every five years, beginning with the calendar year 1921, upon the basis of the commercial rates charged for pasturage upon lands of similar character, taking into account the advantages and disadvantages of the respective areas: And provided also, That the Secretary of Agriculture may allow free of charge the grazing of milch, work, or other animals used for domestic purposes not exceeding a total of ten head owned and in use by bona fide settlers residing in or near a national forest; or animals in actual use by prospectors, campers, and travelers; or saddle, pack, and work animals actually used in connection with permitted operations on the national forests."

The receipts from grazing during the fiscal year 1919 amounted to approximately \$2,600,000. It is estimated that the new grazing fees will practically double this sum. The testimony before the committee shows that the average rate for cattle grazing this year is \$1.20 a head for the entire year. Where the grazing is for only a few months the rate is one-tenth of the annual rate per month. The average period during which cattle have been on the forests this year is six months. The average amount collected is 72 cents per head. The sheep rate is 25 per cent of the cattle rate.

The average period the sheep have been on is about four months. The average fee collected from sheep grazing is about 12 cents per head.

Twenty-five per cent more is charged for horses than for cattle. The average rate collected for horses is about 90 cents per head.

The number of swine is very small.

The following table shows the grazing permits issued and number of stock grazed:

State.	Cattle, horses, and swine.			Sheep and goats.			
	Permits issued.	Number of stock grazed.			Permits issued.	Number of stock grazed.	
		Cattle.	Horses.	Swine.		Sheep.	Goats.
Alabama.....	2	59					
Arizona.....	1,570	360,011	6,509	637	160	364,853

Total.....	32,528	2,135,527	93,251	5,154	6,624	7,935,174	

Salaries of forest supervisors, rangers, and guards (p. 37, line 9).—This appears as a new item and carries an increase of \$125,000. Its purpose is to provide for the salaries of part-time employees heretofore carried on the statutory roll and for the employment of emergency labor incident to the administration of all the national forests.

National forests and general administration (p. 37, line 15).—There is a decrease in this item of \$439. Two forests have been increased, the Idaho National Forest by \$14,980 and the Payette National Forest by \$9,350, a total increase of \$24,330, due to the addition of the Thunder Mountain area in central Idaho, comprising 1,095,022.11 acres, in accordance with the provisions of Public No. 69. Six forests have been decreased, as follows:

Colville National Forest, Washington, by \$2,784.

Eldorado National Forest, California and Nevada, by \$2,250.

Kaniksu National Forest, Idaho and Washington, by \$6,943.

Monterey National Forest, California, \$3,547, having been consolidated with the Santa Barbara National Forest.

Sioux National Forest, South Dakota and Montana, by \$2,640, as it will be consolidated with the Custer National Forest during the present fiscal year.

Tusayan National Forest, Arizona, by \$4,085, a total decrease of \$22,149.

The Minam National Forest has been omitted, as it is proposed to consolidate this forest with the Whitman National Forest during the current fiscal year, the latter being increased correspondingly. In addition the appropriation for use in the District of Columbia has been decreased \$2,520.

Land classification and entry surveys (p. 45, line 12).—There is a decrease in this item of \$20,000. New language has been added permitting the survey of lands involved in exchanges authorized by law.

Supplies and equipment (p. 46, line 1).—There is a decrease in this item of \$11,100.

Range investigations.—This item, amounting to \$35,000, has been omitted.

Tree planting on national forests (p. 46, line 14).—There is a decrease in this item of \$25,000. The proviso authorizing the purchase of land for a forest nursery site on the Michigan National Forest has been omitted, as the site will be purchased during the current fiscal year.

Silvicultural investigations (p. 46, line 18).—There is a decrease in this item of \$43,728.

Reconnaissance of forest resources (p. 46, line 23).—There is an increase in this item of \$25,000. This amount will be required for the necessary estimating and appraising of the grazing resources of the national forests incident to the changed program provided in this bill.

Miscellaneous forest investigations (p. 47, line 3).—There is a decrease in this item of \$6,280.

Improvement of the national forests (p. 47, line 7).—There is a decrease in this item of \$50,000. The provisos prohibiting the use of funds from this appropriation for the payment of traveling expenses except on official business and for the preparation or publication of any newspaper or magazine article have been broadened to include all funds appropriated for the Forest Service. The word "hereafter" has also been inserted in each proviso. These provisions have been included in the appropriation acts since 1911, and it is now proposed

to make them permanent legislation so that it will not be necessary to repeat the language from year to year.

The following table shows the expenditures of the Forest Service during the fiscal year ending June 30, 1919:

Regular expenditures from annual appropriation:	
Field expenses connected with the national forests.....	\$4, 801, 794. 67
General expenses connected with the Washington office.....	472, 403. 22
Research and recording of results.....	388, 023. 68
Total.....	5, 662, 221. 57
Emergency fire expenditures, derived in 1919 from the national security and defense fund.....	650, 000. 00
Cooperative contributions for work on national forests, including protection, improvements, and brush burning.....	522, 840. 05
Cooperation with States in fire protection outside the national forests.....	99, 921. 13
Cooperative contributions from Army and Navy for military research in wood.....	372, 233. 81
Construction of roads, from the 10 per cent fund (total available, \$350,533.75).....	279, 055. 63
Construction of roads, section 8, Federal-aid road act and Post Office appropriation act (total available, \$4,000,000).....	548, 764. 80
Amount paid to States representing 25 per cent of gross receipts.....	1, 069, 886. 88
Special apportionment for Arizona and New Mexico for school lands within national forests.....	78, 687. 32
Total expenditures.....	9, 285, 611. 19
Total receipts.....	4, 358, 414. 86
Deficit.....	4, 927, 196. 33

BUREAU OF CHEMISTRY.

STATUTORY SALARIES.

(P. 48, line 21.)

The statutory roll of the Bureau of Chemistry carries an apparent increase of \$14,520, but there is an actual decrease of \$1,300, as indicated in detail in the following table:

Transfer from lump funds of this bureau, which funds have been correspondingly reduced:	
2 clerks, class 4, from food and drugs act.....	\$3, 600
1 clerk, from food and drugs act.....	1, 440
2 clerks, class 2, from food and drugs act and poultry and egg investigations.....	2, 800
1 machine operator, from food and drugs act, with change of title.....	1, 100
1 laboratory helper, from food and drugs act.....	1, 000
1 laboratory helper, from food and drugs act.....	840
1 laborer, from food and drugs act.....	780
2 laboratory helpers or laborers, at \$720 each, from color investigations and poultry and egg investigations.....	1, 440
1 sampler, from food and drugs act.....	1, 200
1 skilled laborer, from food and drugs act.....	900
1 messenger boy, from food and drugs act.....	720
	\$15, 820
Places dropped:	
8 food and drug inspectors, at \$1,400 each.....	\$11, 200
Transfer to statutory roll, Division of Publications:	
1 clerk.....	900
	12, 100
New places:	
2 food and drug inspectors, at \$2,000 each.....	4, 000
2 food and drug inspectors, at \$1,800 each.....	3, 600
2 food and drug inspectors, at \$1,600 each.....	3, 200
	10, 800
Actual decrease.....	1, 300
Apparent increase.....	14, 520

GENERAL EXPENSES.

Investigations in agricultural chemistry (p. 50, line 21).—This item is a combination of three existing subappropriations, (1) the application of chemistry to agriculture, (2) the biological investigation of food and drug products, and (3) the study and improvement of methods of utilizing by-products of citrus fruits. The amount carried by these three items for the current fiscal year aggregates \$70,400, so that the total sum provided for the fiscal year 1921 for these activities represents an actual decrease of \$4,000.

Poultry, egg, fish, and oyster investigations (p. 51, line 7).—This item is a combination of the present subappropriations for (1) poultry and egg investigations, and (2) fish and oyster investigations, the appropriations for which aggregate \$65,000. There is, therefore, an apparent decrease for this work of \$12,120, but, as \$2,120 has been transferred to the statutory roll, the actual decrease is \$10,000.

Color investigations (p. 51, line 13).—There is an apparent decrease in this item of \$31,740, but, as \$720 has been transferred to the statutory roll, the actual decrease is \$31,020.

Sirup investigations (p. 51, line 19).—There is an increase in this item of \$3,000, making the total appropriation for sirup investigations \$15,000. Of this amount the committee recommends that \$7,500 be set aside for the investigation of the sweet potato as a source of sirup production.

Enforcement of the food and drugs act (p. 51, line 23).—The item for investigating the character of the chemical and physical tests applied to American food products in foreign countries, carrying an appropriation of \$4,280, has been added to the item for the enforcement of the food and drugs act, the total appropriations for both items for the current year being \$624,501. There is an apparent decrease in the total appropriation for this work of \$45,140, but, as \$15,140 has been transferred to statutory rolls, the actual decrease is \$30,000.

Insecticide and fungicide investigations (p. 52, line 21).—There is a decrease of \$5,000 in this item.

Dehydration investigations (p. 53, line 1).—There is a decrease in this item of \$26,500.

Utilization of wool-scouring wastes (p. 53, line 6).—There is a decrease in this item of \$3,000.

ENFORCEMENT OF THE TEA-IMPORTATION ACT.

(P. 53, line 9.)

A new paragraph, carrying an appropriation of \$40,000, has been added, providing for the transfer from the Treasury Department to the Department of Agriculture of the powers and duties relating to the administration of an act entitled "*An act to prevent the importation of impure and unwholesome tea, approved March 2, 1897, as amended by the act of May 16, 1908.*" The logical place for this work is believed to be in the Department of Agriculture, and the proposed transfer has been approved by the heads of the departments concerned.

BUREAU OF SOILS.

STATUTORY SALARIES.

(P. 54, line 14.)

The statutory roll of the Bureau of Soils carries an apparent increase of \$3,900, but there is no actual increase, as indicated in the following table:

Transfers from lump funds of this bureau, which funds have been correspond-	
ingly reduced:	
1 administrative assistant, from potash investigations.....	\$2, 100
1 soil cartographer, from soil survey	1, 800
Apparent increase.....	3, 900

GENERAL EXPENSES.

Soil chemical investigations (p. 55, line 16).—There is a decrease in this item of \$2,500.

Investigation of fertilizer resources (p. 56, line 3).—There is an increase in this item of \$5,500, which is to be used for the development of phosphate fertilizer resources. Phosphate rock and phosphate fertilizer investigations have been confined largely during the past year to furnace treatment of phosphate rock. The process in course of development has for its object the production of highly concentrated phosphoric acid and phosphate fertilizers from low-grade raw materials. This process also gives promise of conserving vast quantities of phosphate materials now thrown away or lost in the present systems of mining and preparing the rock for the market. The preliminary work accomplished has been highly satisfactory, and a modified blast furnace of semicommercial size is in course of construction. It is anticipated that the results will furnish data from which it will be possible to determine the cost of producing phosphate fertilizer by the new process. From time to time it will be necessary to run this plant continuously for protracted periods, requiring two or three shifts of men, thereby necessitating additions to the present force. Repairs and changes must also be made as the work progresses.

Soil survey investigations (p. 56, line 6).—There is an apparent decrease in this item of \$19,300, but, as \$1,800 has been transferred to the statutory roll, the actual decrease is \$17,500.

Classification of agricultural lands (p. 56, line 12).—There is a decrease in this item of \$3,100.

Potash investigations (p. 56, line 16).—There is an apparent increase in this item of \$65,300, but, as \$2,100 has been transferred to the statutory roll, the actual increase is \$67,400. This amount is necessary in order to provide for new apparatus, additional supplies, acid for char extraction, and to meet the advance in the cost of labor in operating the experimental kelp potash plant at Summerland, Calif. It is estimated that \$101,000 will be realized from the sale of products at this plant for the current fiscal year. For the fiscal year 1921 it is believed that the receipts will more than cover all expenses, including the heavy overhead now entailed by a large and expensive force of chemists, engineers, and construction and repair men.

Following is an estimate of receipts for 1921 on the basis of 300 days of operation:

150 units of potash per day, at \$2 per unit.....	\$90,000
1 ton of carbon per day, at \$300 per ton.....	90,000
20 pounds of iodine per day, at \$4 per pound.....	24,000
1,600 pounds of sulphate of ammonia per day, at \$4 per hundredweight.....	19,000
Total.....	223,000

The results so far obtained indicate that the production of potash from kelp can be made a commercial success, but a number of questions need more complete investigation before the matter can be finally submitted to the public. This will take at least another year. It has been demonstrated that not less than 500,000 tons of raw kelp per annum are available in the vicinity of the department's plant at Summerland. It is assumed, therefore, that, if it is conclusively shown what profits are obtainable from the treatment of kelp by the process developed by the department, plants will be established sufficient in capacity to utilize the raw material available. The benefit to the public, therefore, from the successful outcome of these experiments seems to be assured and certainly justifies the appropriation recommended.

BUREAU OF ENTOMOLOGY.

STATUTORY SALARIES.

(P. 57, line 4.)

The statutory roll of the Bureau of Entomology carries an apparent increase of \$8,800, but there is an actual decrease of \$800, as indicated in detail in the following table:

Places dropped:	
7 entomological preparators, at \$600 each.....	\$4,200
New places:	
1 clerk class 4.....	\$1,800
1 clerk class 3.....	1,600
	<hr/>
	3,400
Actual decrease.....	800
Transfers from lump funds of this bureau, which funds have been correspondingly reduced:	
2 clerks class 3, from truck crop insects.....	\$3,200
2 clerks class 2, 1 from cereal and forage insects and 1 from preventing spread of moths.....	2,800
3 clerks class 1, 1 from bee culture, 1 from forest insects, and 1 from deciduous fruit insects.....	3,600
	<hr/>
	9,600
Apparent increase.....	8,800

GENERAL EXPENSES.

Deciduous fruit insect investigations (p. 58, line 10).—There is an apparent increase in this item of \$72,720, but, as \$2,280 has been transferred to statutory rolls, the actual increase is \$75,000. This additional amount will be used for extending the work in the control of the Japanese beetle. The allotment for this work under the present appropriation is \$25,000, which with \$30,000 to be made

immediately available provides a total of \$55,000 for this purpose during the fiscal year 1920. The remaining \$45,000 of the increase, together with \$25,000 allotted for the control of the Japanese beetle from the present appropriation, will make \$70,000 available for combating this pest during the next fiscal year.

The Japanese beetle, introduced from Japan, has become in this country a serious enemy of many kinds of plants, including orchards, vineyards, truck crops, ornamental plants, various weeds, shade trees, etc. It is now established in Burlington and Camden Counties, N. J., and covers an area, according to present surveys, of about 15,000 acres. It is extremely important that everything feasible be done to prevent the further spread of this insect, and it is believed that money expended in this work will be a very profitable investment because it will protect other parts of the country from the ravages of the insect and obviate the necessity for considerable larger expenditures in connection with control measures over much greater areas.

Cereal and forage insect investigations (p. 58, line 15).—There is an apparent decrease in this item of \$1,400, but, as that amount has been transferred to the statutory roll, there is no actual change.

The committee recommends that \$20,000 of the amount carried by this item be used for the extension of alfalfa weevil investigations.

Control of the European cornborer.—This item has been omitted pending action by Congress on the deficiency estimate for \$500,000 covering this work which has recently been submitted by the department.

Southern field-crop insect investigations (p. 58, line 18).—There is an increase in this item of \$24,600, which is desired for extending the experiments for the control of the cotton-boll weevil. The possibility of practical control of the weevil in the Mississippi Delta region by the use of calcium arsenate in dust form has been demonstrated. In some instances the per acre yield of cotton has been doubled by the application of this insecticide. New types of both hand and power machines for applying the poison have also been developed. Further improvement in both poison and machines in the interest of economy is possible, and investigations to this end should be made.

Forest-insect investigations (p. 58, line 23).—There is an apparent decrease in this item of \$8,790, but, as \$1,200 has been transferred to the statutory roll, the actual decrease is \$7,590.

Truck-crop and stored-products insect investigations (p. 58, line 24).—There is an apparent decrease in this item of \$24,960, but, as \$3,200 has been transferred to the statutory roll, the actual decrease is \$21,760. The committee recommends that \$10,000 of the total appropriation be used for the investigations of the grain moth.

Bee culture investigations (p. 59, line 4).—There is an apparent decrease in this item of \$1,200, but, as this amount has been transferred to the statutory roll, there is actually no change.

Investigations of tropical and subtropical plant insects (p. 59, line 6).—The item is a combination of three existing appropriations, (1) investigations of insects affecting tropical and subtropical fruits, (2) investigations and control of the Mediterranean and other fruit flies, and (3) investigations of the camphor thrip. It involves a net decrease of \$2,000.

Miscellaneous insect investigations (p. 59, line 9).—There is a decrease in this item of \$10,000.

Administrative expenses (p. 59, line 14).—There is a decrease in this item of \$1,600.

PREVENTING SPREAD OF MOTHS.

(P. 59, line 18.)

There is an apparent decrease in this item of \$104,050, but, as \$1,400 has been transferred to the statutory roll, the actual decrease is \$102,650.

BUREAU OF BIOLOGICAL SURVEY.

STATUTORY SALARIES.

(P. 60, line 17.)

The statutory roll of the Bureau of Biological Survey carries an apparent increase of \$12,900, but there is no actual increase, as indicated in detail in the following table:

Transfers from lump funds of this bureau, which funds have been correspondingly reduced:

2 clerks, class 4, 1 from food habits of birds and mammals and 1 from protection of migratory birds.....	\$3, 600
1 clerk, from game preservation.....	1, 500
3 clerks, class 2, 2 from food habits of birds and mammals and 1 from suppression of rabies.....	4, 200
3 clerks, class 1, 2 from food habits of birds and mammals and 1 from protection of migratory birds.....	3, 600

Apparent increase.....	12, 900
------------------------	---------

GENERAL EXPENSES.

Sullys Hill game preserve (p. 61, line 24).—The language of this paragraph has been amended by inserting the words “*and maintenance*” after the word “*improvement*” and by changing the word “*preserves*” to “*preserve.*” There is only one game preserve in the Sullys Hill National Park. The present language limits the expenditure of funds under this paragraph to improvement work. At present the maintenance of the preserve is paid for from the appropriation for the general maintenance of reservations and is an additional charge on that fund. The paragraph carried in the appropriation act for 1918 provided for the “*maintenance and improvement*” of the Sullys Hill game preserve. It is believed to be a more satisfactory arrangement to have both the improvement and maintenance work provided for under one item. It is proposed to use from \$1,500 to \$2,000 of this appropriation for maintenance and the balance for improvement work.

Food habits of birds and mammals (p. 62, line 6).—There is an apparent decrease in this item of \$8,400, but, as that amount has been transferred to the statutory roll, there is actually no change. This paragraph has been revised in order to clarify the language.

Enforcement of the migratory-bird treaty act (p. 62, line 20).—There is an apparent decrease in this item of \$4,500, but, as that amount has been transferred to the statutory roll, there is actually no change.

Reindeer investigations and protection of land fur-bearing animals in Alaska (p. 63, line 10).—This is a new item and carries an appropriation of \$40,000. It provides for investigation, experiments, and demonstrations for the welfare, improvement, and increase in the reindeer industry in Alaska, in cooperation with the Bureau of Education; for the enforcement of section 956 of the Revised Statutes so far as it relates to the protection of land fur-bearing animals in Alaska; and for the transfer from the Department of Commerce to the Department of Agriculture of the powers and duties with respect to the protection of land fur-bearing animals, which transfer has the approval of the heads of the departments concerned. Of this appropriation \$25,000 is to be used for the reindeer and \$15,000 for the fur-bearing animals.

The first lot of reindeer in Alaska, numbering 171, was imported from Siberia in 1892. It is estimated that that number has increased to about 200,000 at the present time, and that through the proper development of the industry it may be increased to 10,000,000. The building up of the reindeer herds into larger animals producing more meat can be readily brought about by capturing wild caribou bulls in interior Alaska and using them to grade up the domestic animals. This it is proposed to do with a portion of the appropriation, and also to investigate several diseases reported to occur among reindeer, as it will readily be seen that a serious outbreak of some contagious disease might have disastrous effects on the industry, which has grown to be one of the chief sources of food in that northern country.

DIVISION OF ACCOUNTS AND DISBURSEMENTS.

STATUTORY SALARIES.

(P. 65, line 2.)

The statutory roll of the Division of Accounts and Disbursements carries an increase of \$3,600, as indicated in the following table:

New places:	
3 clerks, class 1.....	\$3, 600
Actual increase.....	3, 600

DIVISION OF PUBLICATIONS.

STATUTORY SALARIES.

(P. 65, line 13.)

The statutory roll of the Division of Publications carries an increase of \$46,950, as indicated in detail in the following table:

New places:	
1 artist and designer.....	\$2, 500
1 clerk, class 2.....	1, 400
2 messenger boys, at \$720 each.....	1, 440
2 messenger boys, at \$600 each.....	1, 200
1 laboratory aid.....	900
1 assistant in charge of motion-picture activities.....	3, 000
1 assistant photographer.....	960
1 lantern-slide colorist.....	900
18 clerks, at \$1,100 each.....	19, 800

New places—Continued.

40 clerks, at \$960 each.....	\$38,400	
15 clerks, at \$900 each.....	13,500	
1 folder.....	1,200	
2 folders, at \$1,000 each.....	2,000	
6 skilled laborers, at \$1,100 each.....	6,600	
		\$93,800

Places dropped:

6 clerks, at \$840 each.....	5,040	
2 messenger boys, at \$480 each.....	960	
2 messenger boys, at \$420 each.....	840	
2 messenger boys, at \$360 each.....	720	
1 laboratory aid.....	270	
1 assistant photographer.....	900	
1 lantern-slide colorist.....	840	
18 clerks, at \$1,000 each.....	18,000	
40 clerks, at \$900 each.....	36,000	
15 clerks, at \$840 each.....	12,600	
1 folder.....	1,000	
2 folders, at \$900 each.....	1,800	
6 skilled laborers, at \$1,000 each.....	6,000	
		84,970

8,830

Transfers from funds of other bureaus, which funds have been correspondingly reduced:

1 assistant in charge of exhibits, from statutory roll, Secretary's office, with change of title.....	\$3,000	
1 assistant in charge of information, from statutory roll, Secretary's office.....	3,000	
1 assistant in charge of motion-picture activities, from general administration, Forest Service.....	2,520	
1 assistant in exhibits, from statutory roll, Secretary's office.....	2,000	
1 assistant, from statutory roll, Secretary's office.....	2,000	
1 assistant editor, from statutory roll, Secretary's office.....	2,000	
3 assistant editors, at \$1,800 each, from statutory roll, Secretary's office.....	5,400	
1 assistant editor, from statutory roll, Secretary's office.....	1,600	
1 clerk, class 4, from statutory roll, Secretary's office, with change of title.....	1,800	
4 clerks, class 2, from statutory roll, Secretary's office.....	5,600	
4 clerks, class 1, from statutory roll, Secretary's office.....	4,800	
2 clerks, at \$1,000 each, from statutory roll, Secretary's office.....	2,000	
1 messenger or laborer, from statutory roll, Secretary's office, with change of title.....	600	
1 messenger boy, from statutory roll, Secretary's office.....	600	
2 messenger boys, at \$480 each, from statutory roll, Secretary's office.....	960	
1 charwoman, from extra labor, Secretary's office.....	240	
		38,120
Actual increase.....		46,950

GENERAL EXPENSES.

Labor-saving machinery (p. 67, line 1).—There is an increase in this item of \$1,000. This amount will be used for the purchase of additional equipment and supplies necessitated by the centralization in this division of the duplicating and automatic addressing work of the department as a whole and the consequent increase in such work by the Division of Publications.

●*Stationery and materials* (p. 67, line 3).—There is an apparent increase in this item of \$1,500, but this merely provides for the transfer of that amount from the appropriation for "Miscellaneous

Expenses," which fund has been correspondingly reduced. It represents the amount that has been allotted from this appropriation to the Office of Information during the fiscal year 1920 for the purchase of paper and envelopes. With the merging of this office with the Division of Publications, it will simplify the accounting and add to the convenience of administering expenditures to have this transfer of funds made.

Photographic equipment (p. 67, line 5).—*The word hereafter has been added in the proviso so as to make the authority to loan, rent, or sell films permanent legislation.*

Miscellaneous expenses (p. 67, line 19).—There is an increase in this item of \$350, which amount is necessary to provide for miscellaneous expenses of the Office of Information heretofore paid from the appropriation "Miscellaneous Expenses," and to meet the general advance in the cost of all items coming within the scope of this appropriation.

Agricultural exhibits (p. 67, line 22).—This item has been transferred from the miscellaneous section of the bill and the amount decreased from \$100,000 to \$70,000. The exhibit work is a valuable means of bringing the latest developments in agriculture directly to the public, and many thousands of people are reached in this way who would not otherwise come in touch with the results of the department's work. Exhibits were shown at 57 fairs and expositions this year.

The clause regarding the National Dairy Show at Chicago, Ill., has been omitted, as this has reference to the show which took place during the fiscal year 1920, but an exhibit similar to the one this year will be provided next year. The provision fixing at \$5,000 the maximum expenditure that may be incurred in connection with any one fair also has been omitted, so as to leave the apportionment of funds discretionary with the department, to be determined by the requirements in each case.

The following language has also been added to the paragraph: "*in cooperation with other departments of the Government.*"

Emergency employments (p. 68, line 1).—There is an increase in this item of \$15,000. This amount will be required for the employment of emergency laborers and assistants in connection with the preparation of the agricultural exhibits mentioned in the preceding item.

BUREAU OF CROP ESTIMATES.

STATUTORY SALARIES.

(P. 68, line 6.)

The statutory roll of the Bureau of Crop Estimates carries an increase of \$240, as indicated in the following table:

Transfer from lump fund for extra labor, Secretary's office, which fund has been correspondingly reduced:	
1 charwoman	\$240
Actual increase.....	\$240

GENERAL EXPENSES.

Introductory paragraph (p. 68, line 15).—The language of this paragraph has been amended by the addition of the words “*in cooperation with the States Relations Service.*” The committee believes that the county agents should be utilized in estimating crops.

Field investigations (p. 69, line 1).—There is a decrease in this item of \$48,486.

LIBRARY, DEPARTMENT OF AGRICULTURE.

STATUTORY SALARIES.

(P. 69, line 7.)

The statutory roll of the Library carries an apparent increase of \$720, but there is an actual decrease of \$480, as indicated in the following table:

Transfer from lump fund for general expenses, which fund has been correspondingly reduced:	
1 clerk, class 1.....	\$1,200
Place dropped:	
1 messenger boy.....	\$480
Actual decrease.....	480
Apparent increase.....	720

GENERAL EXPENSES.

(P. 69, line 14.)

There is no apparent change in this item, but, as \$1,200 has been transferred to the statutory roll, the actual increase is \$1,200.

MISCELLANEOUS EXPENSES.

(P. 69, line 23.)

There is an apparent decrease in this item of \$39,500. This decrease is due in part to the elimination of the provision of \$33,000 for repairs to the department's power plant, which repairs will be made during the current fiscal year, and the transfer to the Division of Publications of \$1,500 heretofore allotted from this appropriation for the purchase of envelopes and miscellaneous supplies in connection with the informational and exhibit work of the department, which it is proposed to merge with the Division of Publications.

RENT IN THE DISTRICT OF COLUMBIA.

(P. 70, line 16.)

There is an apparent increase in this item of \$64,666. This amount includes the transfer of the \$41,509 item for rent carried in the sundry civil act for the current fiscal year, and \$14,666 to cover items for rent that are now being paid from certain lump funds of the department. The committee has eliminated from these lump funds the

authority for the payment of rent in the District of Columbia, and its action in transferring to this item the amounts carried in the Agricultural act which are used for the payment of rent effects a consolidation in one paragraph of all items for the rental of additional office space in the District of Columbia for the next fiscal year which can not be furnished by the Public Buildings Commission in Government buildings.

STATES RELATIONS SERVICE.

STATUTORY SALARIES.

(Page 71, line 2.)

The statutory roll of the States Relations Service carries an apparent increase of \$32,000, but there is no actual increase, as indicated in detail in the following table:

Transfers from lump funds of this bureau, which funds have been correspondingly reduced:

1 clerk, class 4, from farmers' cooperative demonstrations in North and West.....	\$1,800	
1 executive clerk, from home economics.....	1,740	
4 clerks, class 2, from farmers' cooperative demonstrations in North and West.....	5,600	
16 clerks, class 1, 4 from colleges and stations and 12 from farmers' cooperative demonstrations in North and West.....	19,200	
1 clerk or artist-draftsman, from farmers' cooperative demonstrations in North and West.....	1,200	
1 clerk or machine operator, from farmers' cooperative demonstrations in South.....	1,200	
24 clerks, at \$1,100 each, 3 from colleges and stations, 10 from farmers' cooperative demonstrations in North and West, 8 from farmers' cooperative demonstrations in South, 2 from farmers' institutes and agricultural schools, and 1 from general administrative expenses.....	26,400	
1 messenger boy, from farmers' institutes and agricultural schools.....	600	
5 charwomen, at \$240 each, 2 from farmers' cooperative demonstrations in North and West, 1 from farmers' cooperative demonstrations in South, 1 from farmers' institutes and agricultural schools, and 1 from home economics.....	1,200	
		\$58,940
Places dropped:		
25 clerks, at \$900 each.....	22,500	
1 clerk or lantern-slide colorist.....	900	
1 clerk.....	720	
1 messenger or laborer.....	600	
2 messengers or laborers, at \$480 each.....	960	
1 messenger boy.....	360	
3 messenger boys, at \$300 each.....	900	
		26,940
Actual decrease.....		26,940
Apparent increase.....		32,000

GENERAL EXPENSES.

Administration of the Hatch, Adams, and agricultural extension acts (p. 72, line 11).—There is an apparent decrease in this item of \$8,100, but as that amount has been transferred to the statutory roll, there is actually no change.

Farmers' cooperative demonstrations outside of the cotton belt (p. 73, line 9).—There is an apparent decrease in this item of \$35,560, but

as that amount has been transferred to statutory rolls, there is actually no change.

Farmers' cooperative demonstrations in the South (p. 73, line 13).—There is an apparent decrease in this item of \$10,240, but as that amount has been transferred to the statutory roll, there is no actual change.

Supplementary Smith-Lever appropriation (p. 73, line 24).—There is no change in the amount of this item. However, the following table shows that there will be available during the next fiscal year under the Smith-Lever act \$500,000 more than during the current year:

Statement showing the Federal appropriations for extension work, also funds required to be offset by States, for the fiscal year 1921.

Federal funds:	
Smith-Lever Act (\$500,000 increase over fiscal year 1920)	¹ \$3,580,000
Appropriation carried in Agricultural act to supplement Smith-Lever funds.....	1,500,000
Farmers' cooperative demonstration work (Agricultural act) outside of the cotton belt and in the South.....	² 1,350,520
Offset required of States	4,600,000
Total.....	³ 11,030,520

The following table shows the allotment of Federal and State extension funds by lines of work, 1919-20:

Project.	Farmers' cooperative demonstration work.	Smith-Lever, 1919-20.				Total.	Miscellaneous funds not used as offset to Federal funds.	Total.
		Regular.		Supplementary.				
		Federal.	State.	Federal.	State.			
County agent	\$590,462	\$1,079,785	\$1,041,566	\$901,232	\$1,064,943	\$4,087,526	\$2,751,608	\$7,429,596
Home demonstration	279,918	521,024	441,413	341,714	288,393	1,595,544	696,263	2,571,725
Club work.....	130,844	186,774	153,147	121,682	34,955	496,558	232,222	859,624
Specialists	36,000	749,047	625,537	40,272	28,336	1,443,192	792,400	2,271,592
Publications.....		89,939	73,023	2,000	2,000	166,962	40,095	207,057
Administration.....	15,601	453,431	262,314	11,727		727,472	171,277	914,350
Total	1,052,825	3,080,000	2,600,000	1,418,627	1,418,627	8,517,254	4,683,865	14,253,944
Washington supervision	99,340							
Field service	209,155							
Envelopes	35,000							
Total farmers' cooperative demonstration work.....	¹ 1,396,320							

¹ This includes \$751,280 for work in 33 Northern and Western States and \$645,040 for work in 15 Southern States.

Farmers' institutes and agricultural schools (p. 74, line 14).—There is an apparent decrease in this item of \$4,240, but, as \$3,040 has been transferred to the statutory roll, there is actually a decrease of \$1,200.

¹ States not required to offset \$480,000 of this amount.
² Requirement for offset of this amount by States left discretionary with the Secretary of Agriculture.
³ Exclusive of amounts contributed by States in addition to Smith-Lever offsets, and funds contributed by counties, local organizations, and miscellaneous sources. As county agents are now located in 2,000 counties, the average amount allotted to each county from this fund for extension work is \$5,515.

Insular experiment stations (p. 75, line 1).—There is a decrease in this item of \$10,000, which is accounted for by a reduction in the appropriation for the Guam experiment station. Of the \$75,000 for the Alaska experiment stations, \$11,800 has been made immediately available for the erection of necessary *buildings* and the purchase of breeding live stock, in connection with the stock breeding experiments on the island of Kodiak and at the Matanuska station. This is an increase over the amount provided for the current fiscal year of \$1,800.

The proviso granting leaves of absence to employees on duty at insular stations has been eliminated as it is permanent legislation.

Home economics investigations (p. 75, line 21).—There is an apparent decrease in this item of \$1,980, but, as that amount has been transferred to the statutory roll, there is actually no change.

Administrative expenses (p. 76, line 5).—There is an apparent decrease in this item of \$1,580, but, as \$1,100 has been transferred to the statutory roll, there is actually a decrease of \$480.

BUREAU OF PUBLIC ROADS.

STATUTORY SALARIES.

(P. 76, line 14.)

The statutory roll of the Bureau of Public Roads carries an apparent increase of \$4,260, but there is an actual decrease of \$2,500, as indicated in detail in the following table:

Transfers from lump funds of this bureau, which funds have been correspondingly reduced:

1 clerk, class 3, from road building and maintenance.....	\$1,600
1 clerk, from road building and maintenance.....	1,500

6,760

Place dropped:

1 editor.....	\$2,500
Actual decrease.....	2,500

Apparent increase..... 4,260

GENERAL EXPENSES

Road-management investigations (p. 78, line 3).—There is an apparent decrease of \$2,040 in this item, but as \$840 has been transferred to statutory rolls there is actually a decrease of \$1,200.

Road-building and maintenance investigations (p. 78, line 6).—There is an apparent decrease in this item of \$35,920, but as \$5,920 has been transferred to the statutory roll there is an actual decrease of \$30,000, which has been added to the item for road-material investigations.

Road-material investigations (p. 78, line 10).—There is an increase in this item of \$30,000. This amount has been deducted from the item for road building and maintenance. In the suddenly expanding program of new road construction the highway engineer is facing the problem of road design without adequate data from which to form definite conclusions as to the types, the strength, or the

materials which can be most economically used. Motor-driven traffic has now become the chief factor in determining the services that will be required of our highways, and the rapidity with which this character of traffic has developed has not permitted the gradual evolution of road types, as was the case with the prevailing road types developed to take care of the animal-drawn traffic. With the suddenly revolutionized methods of highway transportation, road surfaces which were adequate under former demands are failing to meet the greatly increased numbers and weights of motor vehicles. At the same time the cost of highway construction has materially increased. Highway construction, it is apparent, will be one of the greatest public activities which has ever been undertaken, and appropriations running into the hundreds of millions of dollars have already been made to finance that large program. The increased appropriation requested under this item will provide for conducting a comprehensive series of laboratory and field tests designed to give information which will permit of the selection of the right type and right design of road to economically serve the purpose for which intended. It is proposed to conduct a large number of such experiments, in cooperation with the various State highway departments. A part of the increase will also be needed to provide additional testing equipment and employ additional assistance to take care of the increased volume of routine testing and research work in the Washington laboratory. The language in the paragraph has been amended so as to indicate more clearly the character of work contemplated.

Field experiments.—The item of \$60,000 for conducting field experiments and building experimental roads has been omitted.

Farm irrigation (p. 78, line 15).—There is a decrease in this item of \$20,000.

Farm drainage (p. 79, line 4).—There is a decrease in this item of \$20,000.

BUREAU OF MARKETS.

STATUTORY SALARIES.

(P. 80, line 9.)

The statutory roll of the Bureau of Markets carries an apparent increase of \$43,320, but there is an actual decrease of \$20,800, as indicated in detail in the following table:

Transfers from lump funds of this bureau, which funds have been correspondingly reduced:

1 executive clerk, \$2,000, from market inspection of perishable foods.....	\$2,000
1 clerk, from cotton futures act.....	2,000
1 clerk, class 3, from collecting and distributing market information.....	1,600
25 clerks, at \$1,100 each, 8 from collecting and distributing market information, 1 from market reports on live stock and meats, 2 from dairy and poultry products, 3 from grain, hay, feed, and seeds, 1 from food supply investigations, 1 from market inspection of perishable foods, 1 from cotton testing, 1 from State cooperation in marketing, 1 from grain standardization, 2 from cotton futures act, and 4 from grain standards act.....	27,500
7 clerks, at \$1,000 each, 3 from marketing and distributing farm products, 2 from dairy and poultry products, 1 from food supply investigations, and 1 from grain standards act.....	7,000

Transfers from lump funds of this bureau, etc.—Continued.

1 custodian, from grain standardization.....	\$1,200

1 messenger.....	480	
1 messenger boy.....	480	
		20,800
Actual decrease.....		20,800
Apparent increase.....		43,320

GENERAL EXPENSES.

Marketing and distributing farm products (p. 82, line 7).—There is an apparent decrease in this item of \$41,540, but, as \$7,600 has been transferred to the statutory roll, there is an actual decrease of \$33,940. A proviso has been added setting aside \$25,000 of this appropriation for the development of markets in the South American countries for agricultural products of the United States, chiefly live stock, by sending representatives to South America.

Regulation of stockyards.—This item, carrying an appropriation of \$75,000, has been omitted.

Market news service on live stock and meats (p. 82, line 18).—There is an apparent decrease in this item of \$16,000, but, as \$9,700 has been transferred to the statutory roll, there is actually a decrease of \$6,300.

Market news services (p. 83, line 11).—This item represents a combination of the items for market news service on (1) fruits and vegetables, (2) peanuts, (3) dairy and poultry products, and (4) grain, hay, feeds, and seeds, aggregating \$392,600 for the current year. The apparent decrease is \$78,000, but, as \$25,620 has been transferred to the statutory roll, there is an actual decrease of \$52,380.

Food supply investigations (p. 83, line 17).—There is an apparent decrease in this item of \$3,180, but, as that amount has been transferred to statutory rolls, there is actually no change.

Food products inspection service (p. 83, line 24).—There is an apparent decrease in this item of \$8,300, but, as \$3,100 has been transferred to the statutory roll, there is an actual decrease of \$5,200.

Cotton standardization investigations (p. 84, line 12).—There is an apparent decrease in this item of \$5,920, but, as \$1,100 has been transferred to the statutory roll, the actual decrease is \$4,820.

Rural cooperation.—This item, carrying an appropriation of \$15,780 for studies of cooperation among farmers in the United States, has been omitted.

State cooperation in marketing work (p. 84, line 21).—There is an apparent decrease in this item of \$37,750, but, as \$1,100 has been transferred to the statutory roll, the actual decrease is \$36,650.

Grain standardization investigations (p. 85, line 1).—There is an apparent decrease in this item of \$14,900, but as \$3,300 has been transferred to the statutory roll there is an actual decrease of \$11,600.

Enforcement of the United States cotton-futures act (p. 85, line 16).—There is an apparent increase in this item of \$10,831, but as \$5,280 has been transferred to statutory rolls, and \$7,689 to the item for rent in the District of Columbia, the actual increase is \$23,800. In addition, salaries aggregating \$6,100 have been transferred from the appropriation for the wheat guaranty act for work in connection with the classification of cotton, making a total increase of \$29,900. Inasmuch as the wheat price guaranty act of March 4, 1919, contained amendments to the cotton-futures act, to carry out the purposes of which an allotment of \$100,000 was set aside by the President from the funds provided for administration of the wheat price guaranty act, the amount for the enforcement of the cotton-futures act during 1921 represents an actual decrease of \$70,100 in the funds available for this work.

The language of this paragraph has been amended by inserting the words "*as amended March 4, 1919,*" after the words "*United States cotton-futures act,*" in order to show specifically that the amendments contained in the wheat price guaranty act of March 4, 1919, are to be included among the provisions to be enforced under this paragraph.

A provision has been added to recognize and make permanent legislation the amendments to section 6 of the act of March 4, 1919.

Enforcement of the United States grain standards act (p. 86, line 4).—There is an apparent decrease in this item of \$59,977, but as \$6,300 has been transferred to the statutory roll and \$6,377 has been transferred to the item for rent in the District of Columbia the actual decrease is \$47,300.

A proviso has been added amending section 6 of the grain standards act by striking out of the last sentence the words "*made after the parties in interest have had opportunity to be heard.*"

Administration of the warehouse act (p. 86, line 14).—There is an apparent decrease in this item of \$10,600, but as \$600 has been transferred to the item for rent in the District of Columbia the actual decrease is \$10,000.

Completion of wool work (p. 86, line 21).—This item has been decreased from \$35,000 to \$15,000.

ENFORCEMENT OF THE INSECTICIDE ACT.

STATUTORY SALARIES.

(P. 87, line 5.)

There is an apparent increase in the statutory roll of \$1,200, but no actual increase, as indicated in the following table:

Transfer from lump fund for general expenses, which fund has been correspondingly reduced:	
1 clerk, class 1	\$1,200
Apparent increase.....	1,200

GENERAL EXPENSES.

Enforcement of the insecticide act (p. 87, line 21).—There is an apparent decrease in this item of \$9,790, but, as \$1,200 has been transferred to the statutory roll, the actual decrease is \$8,590.

FEDERAL HORTICULTURAL BOARD.

STATUTORY SALARIES.

(P. 88, line 5.)

The statutory roll of the Federal Horticultural Board carries an apparent increase of \$2,000, but there is no actual increase, as indicated in the following table:

Transfer from lump fund for enforcement of plant quarantine act, which fund has been correspondingly reduced:	
1 executive clerk.....	\$2,000
Apparent increase.....	\$2,000

GENERAL EXPENSES.

Enforcement of the plant-quarantine act (p. 88, line 18).—There is an apparent increase in this item of \$52,750, but, as \$2,000 has been transferred to the statutory roll, the actual increase is \$54,750.

It is proposed to develop a port inspection service for the purpose of cooperating with officials of the Customs Service and with State officials in the enforcement of quarantines established under the provisions of the plant-quarantine act. The department is now enforcing 14 quarantines prohibiting or restricting the entry of foreign plants, fruits, and plant products. It is also enforcing seven orders regulating and restricting the entry of additional foreign products. These quarantines and orders are being enforced in cooperation with the Customs Service, but the burden on that service has grown to such an extent that it has been necessary for the Department of Agriculture to take over the actual enforcement of these quarantines at the principal ports of entry, as far as possible, through the service now maintained to prevent the entry into the United States of the pink bollworm of cotton through importations from Egypt, Mexico, and other foreign countries. California and Florida are the only States which have established adequate port inspection services. The department has been able to collaborate with and secure the aid of these State services in the enforcement of the Federal quarantines and restrictive orders now in force. The value of these State services has been fully demonstrated; their work affords a large measure of protection to the whole country. It has become apparent that the port inspection service of this department, already undertaken in a limited way, should be greatly strengthened and enlarged. Without such service new plant enemies may constantly be brought into the United States, thus practically nullifying the protection of existing quarantines.

Eradication of the potato wart (p. 89, line 1).—There is a decrease in this item of \$14,700.

Plant quarantine in the District of Columbia (p. 89, line 14).—A new provision has been added amending the plant quarantine act approved August 20, 1912, by adding at the end thereof the following section:

That the plant quarantine act approved August 20, 1912 (37th Stat., p. 315), be, and is hereby, amended by adding at the end thereof the following section:

Sec. 15. *That in order further to control and eradicate and to prevent the dissemination of dangerous plant diseases and insect infestations and infestations no plant or plant products for or capable of propagation, including nursery stock, hereinafter referred to as plants and plant products, shall be moved or allowed to be moved, shipped, transported, or carried by any means whatever into or out of the District of Columbia, except in compliance with such rules and regulations as shall be prescribed by the Secretary of Agriculture as hereinafter provided. Whenever the Secretary of Agriculture, after investigation, shall determine that any plants and plant products in the District of Columbia are infested or infected with insect pests and diseases and that any place, articles, and substances used or connected therewith are so infested or infected, written notice thereof shall be given by him to the owner or person in possession or control thereof, and such owner or person shall forthwith control or eradicate and prevent the dissemination of such insect pest or disease and shall remove, cut, or destroy such infested and infected plants, plant products, and articles and substances used or connected therewith, which are hereby declared to be nuisances, within the time and in the manner required in said notice or by the rules and regulations of the Secretary of Agriculture. Whenever such owner or person can not be found, or shall fail, neglect, or refuse to comply with the foregoing provisions of this section, the Secretary of Agriculture is hereby authorized and required to control and eradicate and prevent dissemination of such insect pest or disease and to remove, cut, or destroy infested or infected plants and plant products and articles and substances used or connected therewith, and the United States shall have an action of debt against such owner or persons for expenses incurred by the Secretary of Agriculture in that behalf. Employees of the Federal Horticultural Board are hereby authorized and required to inspect places, plants, and plant products and articles and substances used or connected therewith whenever the Secretary of Agriculture shall determine that such inspections are necessary for the purposes of this section. For the purpose of carrying out the provisions and requirements of this section and of the rules and regulations of the Secretary of Agriculture made hereunder, and the notices given pursuant thereto, employees of the Federal Horticultural Board shall have power with a warrant to enter into or upon any place and open any bundle, package, or other container of plants or plant products whenever they shall have cause to believe that infestations or infestations of plant pests and diseases exist therein or thereon, and when such infestations or infestations are found to exist, after notice by the Secretary of Agriculture to the owner or person in possession or control thereof and an opportunity by said owner or person to be heard, to destroy the infested or infested plants or plant products contained therein. The police court or the municipal court of the District of Columbia shall have power, upon information supported by oath or affirmation showing probable cause for believing that there exists in any place, bundle, package, or other container in the District of Columbia any plant or plant product which is infested or infested with plant pests or disease, to issue warrants for the search for and seizure of all such plants and plant products. It shall be the duty of the Secretary of Agriculture, and he is hereby required, from time to time, to make and promulgate such rules and regulations as shall be necessary to carry out the purposes of this section, and any person who shall move or allow to be moved, or shall ship, transport, or carry, by any means whatever, any plant or plant products from or into the District of Columbia, except in compliance with the rules and regulations prescribed under this section, shall be punished, as is provided in section 10 of this act."*

This amendment to the plant quarantine act, which received the approval of both the House and Senate Committees on Agriculture during consideration of the estimates for 1920, but failed of enactment, confers on the Secretary of Agriculture authority to regulate the movement of plants and plant products, including nursery stock, from or into the District of Columbia, and power to control injurious plant diseases and insect pests within the District. There is at present no law under which the movement of diseased and insect-infested nursery stock and other plants and plant products into the District of Columbia from surrounding or other States or from the District of

Columbia into surrounding or other States can be adequately controlled; nor is there authority for control and extermination within the District of Columbia of plant pests and diseases. The powers requested are such as are exercised in practically all the States and Territories of the United States and are necessary for the alignment of the District of Columbia with plant pest control exercised elsewhere.

The immediate need of this legislation is evidenced by the fact that the oriental fruit moth, which threatens seriously to affect the fruit industry of the United States, gained entrance in large part through importations of ornamental stock into the District of Columbia, and there exist now within the District thousands of peach, cherry, plum, apple, and other trees infested with this insect, affording breeding sources from which the moth has spread to the adjacent States of Maryland and Virginia.

MISCELLANEOUS.

DEMONSTRATIONS ON RECLAMATION PROJECTS.

(P. 92, line 18.)

There is an apparent decrease in this item of \$18,600, but, as \$1,600 has been transferred to the statutory roll of the Bureau of Plant Industry, the actual decrease is \$17,000.

FIGHTING AND PREVENTING FOREST FIRES.

(P. 93, line 1.)

This is a new item. It carries an appropriation of \$250,000, but includes \$150,000 now provided in the item for fighting forest fires under general expenses of the Forest Service, so that the actual increase in the fund for fighting forest fires is only \$100,000. It was the committee's thought that this appropriation would be treated as an insurance fund, to be expended only in case of actual necessity. For several years past the appropriation provided for fighting forest fires has been insufficient and annually the department has had to submit estimates for deficiency appropriations.

COOPERATIVE FIRE PROTECTION OF FORESTED WATERSHEDS OF NAVIGABLE STREAMS.

(P. 93, line 5.)

There is a decrease in this item of \$25,000.

EXPERIMENTS AND DEMONSTRATIONS IN LIVE-STOCK PRODUCTION IN THE CANE-SUGAR AND COTTON DISTRICTS OF THE UNITED STATES.

(P. 93, line 15.)

There is a decrease in this item of \$13,500. The words "*the erection of barns and other necessary buildings*" have also been omitted.

EXPERIMENTS IN DAIRYING AND LIVE-STOCK PRODUCTION IN SEMI-ARID AND IRRIGATED DISTRICTS OF THE WESTERN UNITED STATES.

(P. 94, line 1.)

There is a decrease in this item of \$10,000. Authority for "*the erection of barns and other necessary buildings*" has been eliminated from this item.

PASSENGER-CARRYING VEHICLES.

(P. 94, line 11.)

This paragraph carries no appropriation. The amount authorized to be expended for the purchase, maintenance, repair, and operation of passenger-carrying vehicles outside of the District of Columbia has been reduced by \$15,000.

The committee has also eliminated the word "*purchase*" from this item, as well as the proviso permitting the expenditure of \$15,000 from lump-fund appropriations of the department for the purchase of passenger-carrying vehicles.

EXCHANGE OF PARTS OF VEHICLES.

(P. 94, line 21.)

The following new paragraph has been inserted:

That hereafter the Secretary of Agriculture may exchange used parts, accessories, tires, or equipment of motor-propelled and horse-drawn vehicles in part payment for new parts, accessories, tires, or equipment of such vehicles authorized to be purchased by him, to be used for the same purposes as those proposed to be exchanged.

This legislation is recommended in order to provide authority for the exchange of parts of automobiles in part payment for similar new parts for their replacement, with a view to place the operation of automobiles by the department on an economical and businesslike basis. Tires, for example, often are sold upon a guaranteed mileage basis, the manufacturer agreeing, in case they prove defective and fail to make the guaranteed mileage on account of imperfection in material or workmanship, to replace them at a figure calculated to compensate for the lack of service rendered by them.

ERADICATION OF THE FOOT-AND-MOUTH AND OTHER CONTAGIOUS DISEASES OF ANIMALS.

(P. 95, line 3.)

The amount of this item has been reduced from \$1,000,000 to \$50,000. An annual appropriation of \$1,000,000 has been provided in the agricultural appropriation act for several years past. This has been regarded merely as an insurance against the foot-and-mouth disease, and a very small amount of the fund has been expended annually. The language of the paragraph has been amended so as to continue the availability of the unexpended balance of the \$2,500,000 included in the appropriation act for the fiscal year 1916. The balance remaining under that appropriation is approximately \$514,000, which, it is believed, will amply provide for possible outbreaks of the disease during the next fiscal year.

ERADICATION OF PINK BOLLWORM.

(P. 96, line 16.)

There is an apparent decrease in this item of \$307,240, but as \$9,840 has been transferred to statutory rolls, the actual decrease is \$297,400.

MILEAGE RATES FOR MOTOR VEHICLES.

(P. 98, line 8.)

The paragraph fixing maximum mileage rates for motor vehicles has been amended so as to make its provisions applicable to the next fiscal year.

INVESTIGATIONS AND PREVENTION OF PLANT-DUST EXPLOSIONS AND FIRES.

(P. 98, line 15.)

This is a new item and provides an appropriation of \$25,000.

Plant-dust explosions and fires in grain mills and elevators, thrashing machines, and cotton gins have resulted in the loss of scores of human lives as well as enormous property losses. The campaign conducted cooperatively by the Bureau of Chemistry, Bureau of Markets, and Bureau of Plant Industry under the funds provided in the food-production act last year were of great benefit to the agricultural, grain, and milling industries of the country in reducing these losses. It also brought out many problems which previous investigations did not solve, and indicated very clearly the importance of making provision for the continuation of the investigational work upon which the campaign was based. Explosions and fires in three types of plants were dealt with, namely, mills and elevators, thrashing machines, and cotton gins. As the funds provided for the work under the food-production act were withdrawn June 30, 1919, it was necessary to discontinue the demonstration work on that date and to take steps to terminate the appointment of the men engaged upon it. Because of the savings that had been effected, the United States Grain Corporation indicated its desire to carry on the work, in so far as it related to grain elevators and flour mills, and reemployed some of the men formerly engaged thereon, and it is now cooperating with this department in so far as the very limited funds of the Bureau of Chemistry will permit.

This work is conducted chiefly as an educational campaign of prevention, and it is impossible, with existing funds and facilities, to undertake in an adequate manner the essential investigational work which was suspended at the outbreak of the war. The activities of the department in connection with the prevention of plant-dust explosions and fires involve the close and effective cooperation of the Bureau of Chemistry, Bureau of Markets, and Bureau of Plant Industry. Each of the bureaus is equipped to deal with a particular phase of the problem, and there is a thorough understanding among them regarding the matter.

ACCUMULATIVE LEAVE OF EMPLOYEES AT INSULAR STATIONS.

(P. 99, line 3.)

The following new item has been inserted:

Hereafter, if any employee of the Department of Agriculture assigned to permanent duty in Alaska, Hawaii, Porto Rico, Guam, and the Virgin Islands shall elect to postpone taking any or all of the annual leave to which he may be entitled, he may, in the discretion of the Secretary of Agriculture, subject to the interests of the public service, be allowed to take at one time in any calendar year unused annual leave which may have accumulated within not to exceed four calendar years immediately preceding and be paid at the rates prevailing during the year such leave has accumulated.

This legislation is recommended in order to make the accumulative leave privilege applicable to all employees of the department assigned to permanent duty in the insular possessions and in Alaska. The existing law applies only to the employees of the States Relations Service.

Appropriations:	
Bill for 1921, H. R. 12272, report.....	1395-1431
Department, for 1920, table by titles.....	1399

Appropriations—Continued.	
Estimates—	Page.
For 1921.....	3-15
For purchase of California experiment vineyards.....	1357-1367
Total 1921, with comparisons.....	1395-1396
Architects, American Institute, statement of Secretary E. C. Kemper.....	577-579
Arizona:	
Benefits in 1919 from national forests.....	1397
Cotton variety testing for Virgin Islands.....	1022
Arkansas:	
Extension work, funds, projects, etc.....	964, 971
Shippers' suppression of commission-merchant frauds.....	1198-1199
Arlington farm, report on.....	1406
Army:	
Cars, discussion of use in department.....	32-33
Chief signal officer, cooperation with Weather Bureau....	78, 128, 129, 130, 136, 137
Cooperation with Forest Service.....	571, 581, 585, 586, 587
Horses, breeding, work of department.....	324
Ash, Robert, statement for National Lumber Manufacturers' Association....	557-565
Assistant secretaries, number and changes, remarks.....	32-33
Auditors, number and functions, remarks.....	19-24
Audubon Society, withdrawal of aid in bird protection, note.....	779
Automobiles:	
Exchange of parts, discussion.....	1349-1350
Hire for Forest Service.....	1329-1332
Need for use in department, discussion.....	31-33
Operation, cost per mile, various makes.....	1331
Private, operating costs, national forest work.....	1331-1332
Aviation:	
Aid, work of Weather Bureau.....	78, 128-137
Fields, fire patrol.....	494, 499
Baby beef clubs, effect on farmer boys.....	1050-1051
Back, E. A., statement on stored-product insect investigations.....	762-763
Bailey, Mr., discussion of:	
Agriculture buildings location.....	1118
Messenger locations.....	1118
Balloon:	
Requirements in cotton cloth.....	1202
Station, establishment at Drexel, Nebr.....	149
Balloons:	
Pilot, observations of upper air.....	128, 132
Soundings, description and work.....	130-132
Bank deposits, Southern States.....	971
Banks, establishment of American in Brazil.....	1149
Barberry, eradication, States with regulation laws.....	415
Barbour, Representative, statement on California grape industry.....	1377-1380
Barkbeetles, control in national forests.....	556
Barnett, Miss Claribel R., statement as librarian.....	913, 320
Baxter, Dahl, kite maker, recommendation.....	96
Bee-culture investigations, report on.....	1414
Beef:	
Cattle, production in Louisiana, demonstration work.....	1307, 1308, 1309
Fattening, cost accounting, plan of work.....	48-50
Production—	
On northern cut-over lands, discussion.....	317-321
Studies and work of Animal Husbandry Division.....	293-304
Bees, wintering, calorimeter studies.....	1012, 1013
Beetle, Japanese:	
Control, supplemental estimate, letter from Secretary Houston.....	740-741
Control work.....	740-741, 745-747
Supplemental estimate by Secretary Houston.....	740-741
Beets, cost of production, studies, plans, etc.....	51-52
Beltsville experiment station, animal husbandry, work.....	312-314
Beverages, examination by Chemistry Bureau.....	698

	Page.
Biological Survey:	
Activities under lump-sum fund, table.....	800
Appropriations, 1921, comparisons.....	1396
Statutory salaries and expenses, report on.....	1415-1416
Transfers of clerks, discussion.....	775, 776
Bird reservations:	
Administration and control.....	779
Remarks.....	776-777
Birds:	
Mammals, food habits, appropriation, report on.....	1415
Food-habits investigation, remarks.....	786
Bison:	
American, loan or exchange, omission.....	14
Range, Montana, note.....	776
Blackleg, immunization work of department.....	329, 334
Boll weevil:	
Comparison with pink bollworm.....	1315, 1320
Control by dust spray, machinery and cost.....	1068-1070
Damage to Sea Island cotton.....	1203
Bollworm, pink:	
Appropriations, 1921, report on.....	1396
Eradication—	
Report on.....	1430
Work.....	1314-1328
Introduction in cargoes of cotton seed.....	1284
Transfer of work from lump-sum to statutory roll.....	1314
Bonus, payment to new employees.....	649-650
Books:	
Library, purchase.....	915-917
Number in library.....	913-919
Borax, effect on crops, research work.....	1060
Bordeau mixtures, testing.....	1293
Borer, corn, European, introduction, location, and control.....	1035, 1037-1038
Boston port, need of plant inspectors.....	1286
Box:	
Manufacturers Association, statement of Mr. J. C. Nellis.....	572-577
Testing work of forest products, laboratory.....	573-577, 582-583, 587
Boys and girls, club work.....	933, 941, 945-946, 956-961, 962-964, 969, 1029, 1050, 1054
Boys, dissatisfaction on the farm, remedy.....	1041-1042, 1050-1051, 1055
Brazil:	
Live-stock industry, field for cooperation of department.....	1147-1150
Pink bollworm, introduction and spread.....	1315
Briggs, Representative, statement on nut industry.....	447-450
British dirigible, trans-Atlantic flight, aid of Weather Bureau.....	134
Brown, Everett, statement as president of Chicago Live Stock Exchange.....	177-179, 214-218
Bud variation, study, cooperative work, Chemistry Bureau.....	691-692
Buildings:	
Alaska experiment stations.....	1025-1026
Live-stock demonstration farm, Louisiana.....	1300-1301
Mount Weather, and land, description.....	146-149
National forest, cost limitations.....	522-523
Plant inspection, location and cost.....	1283
Public, allotment of space to department.....	921-923
Bulbs, growing, investigations.....	451-452
Bull associations, work and discussion.....	268-272
Burning, test for silk, wool, and cotton.....	1012
Butter, comparison with oleomargarine.....	684-685
Calcium arsenate, discovery, use, and testing for arsenic oxid.....	1292, 1293
California:	
Aviation fields for fire-patrol work.....	494
Citrus fruits, by-products.....	688, 691
Fruit growers, need of market news reports.....	1151-1154
Plant inspection and quarantine work.....	1285-1286
Sequoia National Forest boundary, reference.....	549
Viticultural industry, effect of prohibition, discussion.....	1352-1367, 1373-1374
Calorimeter respiration, use in investigations, home economics.....	1010, 1012-1013
Calvert, E. B., statement as chief clerk, Weather Bureau.....	83-84

	Page.
Calves, price decrease and causes.....	877-878

Cause of forest fires.....	485, 487
Fire warnings.....	139
Canada, civil service, advice of Young & Co. on efficiency.....	674
Canadian Government, investigation of reindeer industry.....	783
Candied peels, orange and lemon, by-product of citrus fruits.....	687
Candler, Representative, discussion of:	
Animal—	
Diseases, work.....	349
Husbandry, work.....	295-296, 306, 315-316, 328
Barberry eradication.....	418
Bulb growing.....	451-453
Cane sirup.....	428
Dry-land farming.....	429-431
Egyptian cotton.....	426
Fertilizers.....	397, 399, 400, 402
Forest products.....	564, 570-572, 577, 579, 580
Receipts.....	532-534
Kelp-potash work.....	730-732, 736
Land purchase.....	370, 371
Lump-sum appropriations.....	369
National forests.....	523
Potato varieties and diseases.....	391
Salaries, Forest Service.....	513, 516-520
Seed purchases.....	409
Soil survey work.....	726-728
Statutory roll.....	363, 365
Tuberculosis Eradication, work.....	164, 215, 235, 239, 241
Candling eggs, laws and demonstration work.....	678
Cane, sugar:	
Damage by gophers.....	794
Districts, live stock production, experiments, and demonstrations....	1299-1310
Experiments, 1921 appropriations, report on.....	1396
Growing in Virgin Islands, new variety, etc.....	1021
Canker, citrus, control investigation, and appropriations.....	377-385
Canning:	
Salmon on Yukon River.....	777-778
Sweet corn, letter and discussion.....	1387-1389
Cantaloupe, shipments from Imperial Valley, situation.....	1164-1167
Carbolic acid, use in dyes.....	692
Caribou, use in breeding reindeer for improvement, notes.....	780, 782, 783, 785
Carriage drivers, employment and pay.....	29-31
Carrier pigeons, use by fire patrols, national forests.....	494, 495, 501-502
Cars:	
Fumigation, Mexican border, costs, etc.....	1323-1326
Refrigerator, description, uses, and value.....	1129-1134
Casein, uses and production, work of Dairy Division.....	279
Cattle:	
American breeds, competition with England in South America.....	1145-1146
Book—	
American, demand from South America.....	1143
Publication in Portuguese and Spanish, by Agricultural Department.....	1142-1143
Brazil, types.....	1147
Breeding, improvement in South.....	1150-1151
Export, supervision work.....	158-159
Exportation to South America, recommendations by David Harrell.....	1140-1141
Grazing, national forests, number, rates, and permits....	536-538, 541-546, 602, 604
Imported, charges for disinfection and care.....	1325
Pure bred, recent purchases for South America.....	1142-1145
Range investigations.....	592, 594
Regions, Weather Bureau work.....	106-109, 120
Slaughtered in eight markets, 1917, 1918, 1919; tuberculous findings, statistics.....	188-190
Tick eradication, work and discussion.....	259-264
Tuberculous, indemnities, discussion.....	212, 227-259

	Page.
Cooperation:	
Chemistry Bureau with other departments.....	650-655
Crops Estimates Bureau and States Relations Service new language.....	1419
Markets—	
Department with States, purpose and methods.....	1205-1216
Failures of organizations.....	1217
Promotion by department.....	1219-1220

Statement on extension work, South	949-951, 956-958, 961-971
Report, extension work, South, January 12, 1920	969-971
Seaman A., founder of extension work in South, notes	961, 962
Kodiak Experiment Station, live stock, silos, etc.	1026
Labor:	
Farm—	
Scarcity and high prices	1040, 1041, 1048, 1049
Studies proposed	211
Household, energy expenditure, measurement	1009-1010

	Page.
Labor-saving:	
Devices, need in farm homes.....	1054-1055
Machinery, Publications Division, report on.....	1417
Laboratories:	
Chemical, work for Army and Navy, etc.....	652-655
Fruit-insect studies, location and work.....	741-748
Laboratory:	
Forest products—	
Box testing work, apparatus, etc.....	573-577
Commendations of lumber producers, etc.....	557-589
Cooperation with wood users.....	561, 573, 581-579
Investigations.....	581-589
Home economics office.....	1016
Supplies, instruments, and equipment, Forest Service.....	557
Lamb liver, edibility, studies.....	1007
Laminated wood, researches by Forest Products Laboratory.....	584, 586, 587
Land:	
Classification—	
And entry surveys, Forest Service, report on.....	1409
National forests, surveys, exchanges, etc.....	546-551
Economies, study proposed.....	42
Policies, studies, plan of work.....	71-72
Tenure, studies, plan of work.....	68-69
Values, studies, work.....	69-71
Lands:	
Agricultural—	
Classification, report on.....	1412
Elimination from national forests.....	550-551
Forest, purchase under the Weeks Act.....	1328-1329
National forests, surveys and exchanges.....	546-551
Public, free grazing.....	606, 608-611
Langworthy, Dr. C. F., statement as chief of "Home Economics".....	1005-1017
Lannen, Thomas E., statement on grape growing in California.....	1386-1387
Lanoline, recovery from wool-scouring waste.....	701
Lantern slides for Farmers' Institute lectures.....	1018
Law:	
Enforcement, employees' protection, provisions.....	15
Federal, for protection of wardens and others.....	798-799
Laws, egg candling.....	678
Lea, Representative, statement on California grape industry.....	1368-1373
Leather:	
Investigations.....	702-705
Production investigations.....	703-705
Leave:	
Absence, field employees and insular-stations employees.....	15
Cumulative, for employees in insular possessions.....	1351, 1431
Field employees.....	1350-1351
Increase to employees of Forest Service.....	1345
Lee, Representative, discussion of:	
Agricultural commissioner in England.....	1146, 1148, 1149
Air Service.....	494, 499
Alaska stations.....	1026, 1028
Animal Industry Bureau, work.....	158, 167, 259-273, 325, 344, 359
Barberry eradication.....	417
Black rust of oats.....	423
Bulb importations and distribution.....	450-451
Egg investigations.....	680
Estimates to speculators, not to farmer.....	867
Extension work in South.....	963, 968
Farmers' Institute work.....	1018
Forest products.....	561-568, 577, 580
Franking privilege for county agents.....	888
Fruit growing.....	453
Fur-bearing animal transfer.....	786
Guam experiment station.....	1029, 1030
Home economics.....	1014
Live stock.....	1146, 1148-1149

	Page.
Lee, Representative, discussion of—Continued.	
Migratory bird work.....	799
Mr. Knapp's work in South.....	961, 968
National forests, receipts.....	526, 527, 531
Nursery products.....	912
Nut growing.....	431
Pecan growing.....	434, 436
Plant diseases.....	373, 386
Potash investigations.....	401
Reindeer.....	782, 783
Roads Bureau work.....	1082, 1089, 1104
Rodent pests.....	789, 794
Salaries, Forest Service.....	508
Seedlings, diseased, importations.....	404
Sudan grass, adulteration.....	408
Sugar cane.....	1021
Sweet potato by-product utilization.....	1392
Sweet potato introduction, etc.....	1022, 1023, 1025
Tea inspection.....	664
Tobacco seed.....	425, 426
Weather, effect on wheat crop.....	884
Wheat price guaranty.....	881
Wolf eradication in Texas.....	771
Lemon oil, by-product from citrus fruits.....	687, 689
Lemons, cull, by-products utilization.....	687-691
Lesher, Representative, discussion of:	
Animal Industry Bureau, work.....	168, 270
Checking accounts.....	22
Closing of heating plant.....	28
Cost of production work.....	48-49
Corn borer.....	755
Dye investigation.....	693
Firemen, force and work.....	28

New Mexico, benefits in 1919 from national forests.....	1397
New York:	
Appropriation for forest protection.....	554
Corn borer introduction.....	1035
Port, need of plant inspectors.....	1286
State forestry officials, salaries.....	510-511
Nitrates, sources of supply, and work of Soils Bureau.....	716-720
Nitrogen, fixation from atmosphere, work of Soils Bureau.....	716-719
Nixon, Mr., discussion of cotton standards.....	1264-1268, 1271-1275
North Carolina, extension work, funds and projects, etc.....	964, 971
Northern States and West, extension work.....	933, 944-949, 951-953, 958-961, 975-993, 997-1002
Nurseries, forest, and tree planting cost.....	612-613
Nursery:	
Forest, Michigan National Forest.....	629
Industry, statement by American Association president.....	909-912
Investigations, report on.....	1406
Stock, propagation investigations.....	452-468
Nuts:	
Food value, investigations.....	433-434
Pecans, almonds, walnuts, etc., soil adaptability.....	430-450
Production industry, statement by Representative Raker.....	1382-1386
Oaths administration, authority, change of wording.....	14
Oats, acreage and production, in South, increase.....	970
Observers:	
Voluntary, number, etc.....	104, 141-143
Weather, payment for observations.....	141-143
Oil, coconut, composition and value.....	682, 685-686
Oils:	
Rancid, refining.....	685
Vegetable, digestibility, studies.....	1007
Oklahoma, extension work, funds and projects, etc.....	964, 971
Oleomargarine, comparison with butter.....	684-685
Oranges, cull, by-products utilization.....	687-691
Orchard fruits, disease investigations.....	375-387
Ore cars from Mexico, disinfection.....	1325
Oregon:	
Appropriation for forest protection.....	553
Aviation fields for fire-patrol work.....	494, 499
Lumber resources.....	571
Ormsby, A. A., statements on work of office of exhibits.....	844-850
Osborne, Representative, statement on:	
California vineyard purchase.....	1380-1382
Need of market news reports for California shippers.....	1151-1154
Oysters, fish, etc., investigations, report on.....	1411
Packages, egg, improvement, need of uniformity, etc.....	676-677
Packer hides, comparison with country hides.....	704-705
Paper:	
Companies, reforestation work.....	617
Making, sources, development.....	559, 567
Pasture investigations, southern coastal plains.....	475-476
Patents, Government, difficulties.....	692, 694
Patrols, fire, work of Air Service.....	493-504
Patterson, J. M., statement on nut growing.....	432, 441-443
Payette National Forest, increase in expenses, estimate and details.....	524-527
Peanut flour, food value.....	683
Peanuts:	
Growing in South, value and uses.....	968
Hog feeding, results.....	949-951, 968
Prices, etc., data distribution, etc.....	1192-1195
Pearson, Dr. R. A., representing Land Grant College Association.....	1033-1046
Pecan:	
Insect-control work.....	742-743, 744
Insects, investigation.....	376

Pecans:	Page.
Production and annual value	439, 442
Soil adaptability, etc	430-431, 434-437, 439-450
Peck, F. W., statements on cost-of-production work.....	50-51, 54-55, 58-59
Pecos Valley, Tex., pink bollworm control work	1317-1320, 1323
Penitentiary, Louisiana, transfer of use of lands to Agriculture Department.....	1302-1304
Pennington, Mary E., resignation from Chemistry Bureau, salary, etc....	636, 669, 671
Pennsylvania:	
Corn borer introduction	1035
Potato wart disease extermination work.....	1287-1288
Periodicals, purchase for library.....	915-916
Permits:	
Grazing	537, 597, 598, 599, 601, 602-605, 607-608
Special-use, national forests	538-539
Pettis, Mr., New York State Forester, salary.....	510-511
Phosphate fertilizer investigations	720-722
Photographic:	
Dyes, work of Chemistry Bureau	693
Equipment, Publications Division, new language, report on.....	1418
Photoprints, lantern slides, etc., sales, receipts by department in 1919.....	1398
Phthalein dyes investigations	692
Phylloxera, resistant grape stock.....	1354
Pie crust preparation, studies.....	1005, 1015
Pigeons, carrier, use by fire patrols, national forests.....	494, 495, 501-502
Pigments in food, relation to vitamins, study.....	1053
Plant:	
Diseases, investigations and appropriations.....	373-375
Industry Bureau—	
Appropriations, 1921, comparisons.....	1396
Cooperation with States Relations Service.....	995
Estimates and changes in phraseology.....	8, 9, 12
Lump-fund activities, 1920, 1921.....	479-482
Statements of chief and others.....	361-482, 1352-1357
Statutory salaries and expenses, report on	1404-1406
Quarantine—	
Act enforcement, report on.....	1426
District of Columbia, new language, report on.....	1427-1428
Quarantines, enforcement.....	1282-1284, 1291
Plant-dust explosions and fires:	
Appropriations, 1921, comparisons.....	1396
Investigations and control work.....	1333-1339
Plant-introduction farms, acquisition by purchase or gift.....	469-471
Plants:	
Foreign, introduction and investigations.....	469-475
Nutrition investigations.....	395-403
Yielding drugs, spices, poisons, etc., investigation, testing, etc.....	404-405
Poisonous plants investigations, report on.....	1405
Pomological investigations, report on	1406
Pork, soft:	
Cooking quality studies.....	1007
Studies and work of Animal Industry Bureau.....	314-317, 321
Porto Rico Experiment Station:	
Estimate.....	1033
Work, results.....	1027
Ports:	
Inspection of plants, employees, etc.....	1283-1286
Southern, need of plant-inspection work.....	1286
Post Office Department, cooperative work of Chemistry Bureau.....	651, 653
Posters, use and value in agricultural work, cost, etc.....	816-820
Potash:	
Borax extraction, process.....	724-725
Deposits, borax content, discussion.....	722-725
Investigations, report on.....	1412
Kelp, statement of receipts in Soils Bureau experiments.....	1413
Prices, and cost of production from kelp.....	730-731
Kelp, production, cost, and profits.....	730-731
Recovery from wool-scouring waste.....	701-702
Sources, investigations.....	722-725, 728-737
Situation, discussion.....	729-731

	Page.
Potato:	
Diseases, investigation.....	388-395
Growers, benefits from market news service.....	1167-1169
Wart—	
Disease, nature, spread, and control.....	1287-1289
Eradication, report on.....	1426
Potatoes:	
Acreage and production in South, increase.....	970
Growing and standardization, demonstration work.....	947
Marketing associations in Michigan.....	1215
Marketing, cooperative.....	948
Wart-resistant varieties.....	1287
Potter, A. F., statement as Associate Forester.....	541-546
Poultry:	
Eggs, etc., investigations, report on.....	1411
Investigations, Chemistry Bureau.....	669
Products, data collection, etc.....	1188, 1189
Precooling, fruit, methods, cost, etc.....	1129-1138
Predatory animals, destruction.....	786, 794-795
Price-quotation service, cotton marketing, work.....	1239-1240
Prices:	
Cotton, investigations by Markets Bureau.....	1229
Farm products, discussion.....	1040-1041
Livestock and meats, at stockyards, reports.....	1176-1188
Relation to cooperative marketing.....	1212-1213
Road-building, increase.....	1056-1057
Printers, Weather Bureau, salaries.....	93, 94
Printing:	
Meat inspection, report on change in law.....	1403-1404
Work, Weather Bureau increase, items.....	106
Property, department, sales receipts of department in 1919.....	1399
Public buildings:	
Commission, space allotment to department.....	921-923
Construction, uniform standards.....	579
Publication work.....	841-842
Publications:	
Congressional distribution, allotments, etc.....	826-828
Distribution by Division of Publications, practices.....	826-828
Division—	
1921 appropriations, comparisons.....	1396
Consolidation of work and transfers.....	17-19
Estimates and changes in wording.....	8, 10, 13
Increases recommended, discussion, etc.....	810-818
Statements of chief and others.....	801-854
Statutory salaries and expenses, report on.....	1416-1418
Work, scope and magnitude.....	802-803
Preparation, work of Publications Division.....	802-805
Smith-Lever fund limitation.....	932, 940, 941
Trading by Congressmen, practices.....	827
Publicity work, Home Economics office.....	1006-1007, 1016
Pulp-wood supply investigation.....	614-615
Purnell, Representative, discussion of:	
Animal—	
Diseases work.....	349-350
Husbandry, work.....	316
Appropriation for nut growing.....	439
Citrus by-products utilization.....	688, 689
Digestibility of nuts.....	437
Dust treatment for boll weevil.....	1069
European corn borer.....	754
Extension work and return of service men to farms.....	1041-1042
Food value of various nuts, etc.....	434, 435
Forest insects.....	555
Guam experiment station.....	1030
Leather industry.....	707
Library estimates.....	918, 919, 920
Photographer.....	363
State cooperation in marketing.....	1207-1208, 1211-1213
State crop estimation.....	865

Purnell, Representative, discussion of—Continued.	Page.
Teachers in Alaska.....	1029
Weather Bureau work.....	124-127, 130-132
Pyrethrum powder, adulteration, testing.....	1292
Quaintance, Dr. A. L., statement on deciduous fruit insect investigations..	741-748
Quarantine:	
Plant, District of Columbia, new language, report on.....	1427-1428
Stations, Mexican border.....	1320, 1323-1326

Hearings.....	925-1062
Statutory salaries and expenses, report on.....	1420-1422
Roads and schools, fund from forest receipts.....	530, 531
Stations:	
Fire control by airplanes.....	494, 499
Ranger, additional land.....	629
Statistics, cooperative extension work.....	936-938, 972-973
Statutory:	
Positions, difficulties.....	642, 670-672
Roll—	
Changes to lump sum.....	637-650, 667
Employees, Forest Service, transfer to lump sum.....	504-521
Entomology Bureau, increase and decrease.....	739-740
Horticultural Board, changes.....	1281-1282
Increases, changes, transfers, etc.....	362-373
Library, changes.....	915
Markets Bureau, transfers.....	1116
Transfer of pink bollworm work.....	1314
Transfers from lump fund, changes in title, etc.....	925- 930, 973, 981, 982, 1004, 1015
Weather Bureau, transfers, etc.....	81-100, 111
Rolls—	
Changes for year 1921.....	7, 9
Disadvantages.....	368
Steer hides, superiority.....	704, 705
Steers, shipping and marketing.....	949
Stock feed, copra, value.....	686
Stockyard industry, war-time work, regulations enforcement, etc.....	1170-1188
Stockyards:	
Law violations and prosecutions.....	1170-1176
Regulation, item omitted, report on.....	1424
Supervision, discontinued.....	1115-1116
Stone, Dr. W. E., statement on extension work.....	1046-1050
Storage changes, fruits and vegetables.....	1012-1013
Storm warnings value to Nation.....	118-120
Stumpage:	
Increase, national forests.....	533
Prices—	
For 1919.....	535
Increase.....	535, 564

	Page.
Sugar:	
Investigations, duplication, by Bureau of Standards.....	705 706
Manufacture from sweet potatoes, House joint resolution 529, text....	1389-1390
Sugar plants:	
Investigations.....	426-428
Investigations, report on.....	1406
Supervisors, forest, qualifications, work, and salaries.....	506-521, 524
Supplies and equipment, Forest Service, report on.....	1409
Survey, pink bollworm, work, Texas and Mexico.....	1327
Swamp lands, reclamation, work.....	1067-1068
Sweet potato:	
By-product utilization, letter read by Representative Crisp.....	1390
By-products, value, etc., statement by Dr. Alsberg.....	1391-1392
Utilization.....	696-697
Sweet potatoes:	
Average yield in Georgia.....	1391
By-products, utilization, statement by Representative Crisp.....	1389-1392
Growing in Virgin Islands.....	1022
Storage, houses, etc.....	1134-1138
Sugar content in Georgia.....	1391
Swine, immunization, work of department.....	156
Tanning materials, investigations.....	703
Taxes, fire control, by States.....	498
Taxes, income, relation of market news service.....	1169-1170
Taylor, H. C., statement as Chief, Farm Management.....	35-37
Taylor, William A.:	
Letter to chairman on canning sweet corn.....	1388-1389
Statement as Chief, Plant Industry Bureau.....	361- 72, 384-409, 419-421, 424-431, 443-444, 450-454, 458-464, 468- 482, 1299-1314, 1352-1367, 1369-1372, 1373-1374, 1387-1389
Discussion of viticultural industry.....	1352-1356
Tea:	
Appeals board.....	659, 663, 666
Importation act, enforcement, new law, report on.....	1411
Inspection—	
Ports, location.....	660
Service, transfer to Agriculture Department.....	655-667
Tasters.....	661
Teachers, publications helpful to.....	1019
Teele, R. P., statement as irrigation economist, Roads Bureau.....	1093-1097
Telegraph:	
Lines, Weather Bureau.....	87, 91
Receipts in 1919 from department lines.....	1398
Tennessee, extension work, funds, and projects, etc.....	964, 971
Texas:	
Cooperation in bollworm control.....	1317, 1321-1323
Corn production.....	966
Extension work—	
Funds and projects, etc.....	964, 971
Origin, funds, projects, etc.....	962, 964, 971
Pink bollworm introduction, and control work.....	1314-1326
Textiles, investigations.....	1010-1011
Thompson, C. W., statement, in charge of Marketing Cooperation.....	1205-1223
Thrashers:	
Dust explosions, preventive methods.....	1337
Loss from explosions in Northwest.....	1333
Thunder Mountain area, addition to national forests.....	524-525
Tick eradication:	
Report.....	1403
Work and discussion.....	259-264
Timber:	
Estimation and appraisal.....	620
Free use, settlers, and Army and Navy, etc.....	531, 532, 534, 539
Losses from forest fires.....	487, 498
Receipts.....	529, 533, 536
Sales—	
Cruising, etc.....	508, 513, 514, 533, 535-536
1919 receipts.....	1397
Salvaging after fire.....	491-492
Supply, decrease.....	620

	Page.
Timberland owners—	
Cooperation, fire-control work.....	495-496, 497, 499, 501, 553
Taxes for fire control levied by States.....	498
Timothy seeding on forest ranges.....	594
Tincher, Representative, discussion of:	
Air Service.....	489-500
